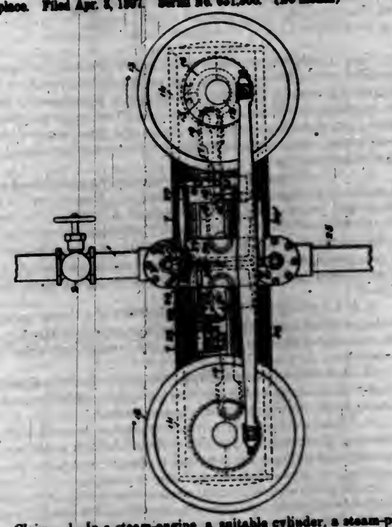
2. In cutting apparatus for mowers, the combination of an inner casing having vertical sides and an outwardly-extending lip at its bottom, an outer casing having its sides extended and pivoted to the sides of the inner casing and limited in its downward movement by engaging with the said lip thereof, a top plate closing the outer casing, gear-wheels having upper and lower tubular gudgeons journaled in the top and bottom of the outer casing, bolts passing through the said tubular gudgeons and connecting upper and lower parts of the outer casing, overlapping cutters secured to the gear-wheels, and a primary gear-wheel alining transversely with the cutter gear-wheels and having an edge and top gearing formed on the arc of a circle having the pivotal connection between the two casings as a center, substantially as set forth.

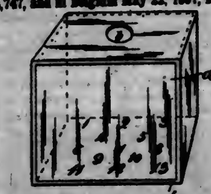


604,414. DEVICE FOR SUPPORTING AND STRETCHING BED-COMFORTABLES. REUBEN T. PALMER, Jr., and FREDERICK W. MINER, New London, Conn. Filed Apr. 24, 1896. Renewed Oct. 18, 1897. Serial No. 655,693. (No model.)

Claim.—In a fabric-supporting device, the combination, with a

rectangular frame, two of the opposite sides of which are longitudinally slotted, a bolt through each slot, a block upon the inner end of the bolt, provided with a pocket, a clamping-tube extending between and resting within each of the oppositely-located pockets, and a series of clamps adjustably secured to said side pieces intermediate the blocks, substantially as set forth.

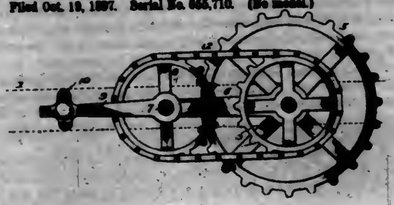
604,415. STEAM-ENGINE. JAMES A. BEARDSLEE, St. Louis, Mo., assignor of two-thirds to James H. Butterall and Peter Hensel, same place. Filed Apr. 5, 1897. Serial No. 631,209. (No model.)



Claim.—1. In a steam-engine, a suitable cylinder, a steam-pipe communicating therewith, a valve casing at the juncture of the pipe with the cylinder-wall, a rock-valve in said casing, a piston for the cylinder, a drive-shaft, a crank-disk carried by the shaft, a pitman connecting the disk with the piston, an arm carried by the valve and disposed along the outside of the casing, intermediate yielding connections between said arm and drive-shaft for regulating the point of cut-off for said valve, rigid connections between the said arm and drive-shaft in connection with the said yielding connections for rocking the valve during the reciprocation of the piston, a supplemental air-cylinder, a piston for said cylinder, air-regulating cocks carried by the cylinder-walls on either side of the piston for offering predetermined resistance to the reciprocation of the piston of said supplemental cylinder, and suitable connections between the rock-valve and the piston of the supplemental cylinder, substantially as set forth.

2. In a steam-engine, a suitable cylinder, a steam-pipe communicating therewith, a valve-casing at the juncture of the pipe with the cylinder-wall, a rock-valve in said casing, a piston for the cylinder, a drive-shaft, a crank-disk or arm carried by the shaft, a pitman connecting the disk with the piston, an arm carried by the valve and disposed along the outside of the casing thereof, intermediate connections between said arm and the drive-shaft for rocking the valve during the reciprocation of the piston, a supplemental air-cylinder, a piston therefor, intermediate connections between said piston and rock-valve, and suitable valve-controlled openings disposed on the cylinder-walls for offering a predetermined resistance to the reciprocation of the piston of the supplemental air-cylinder and to the oscillation of the rock-valve, whereby the speed of the engine is controlled, substantially as set forth.

3. In a steam-engine, a cylinder, a steam-pipe leading thereinto, a piston reciprocating within the cylinder, a drive-shaft, an exhaust-pipe leading from the cylinder, a valve controlling the steam-pipe and a similar valve controlling the exhaust-pipe, an arm carried by each valve along the outside of the casing thereof, an eccentric controlled arm in connection with the drive-shaft, suitable link connections between the arm and the arm carried by the exhaust-valve, an oscillating lever having one end pivotally secured to the eccentric controlled arm, a link pivotally connected to the end of the opposite arm of the oscillating lever, a lateral extension or guideway forming a part of the arm carried by the steam-valve, a block mounted in said guideway and pivotally secured to the opposite end of the link, a controlling-screw for said block, a spring confined within the guideway and bearing against the opposite face of the block whereby a yielding connection is formed between the link and the steam-valve, an adjusting-screw for the spring, a supplemental air-cylinder carried by the engine, a piston and piston-rod therefor, a slotted connection between the outer end of the piston-rod and the arm secured to the steam-valve, air cocks or valves disposed at each end of the air-cylinder to offer any predetermined resistance to the reciprocation of the piston therein, the parts operating substantially as and for the purpose set forth.

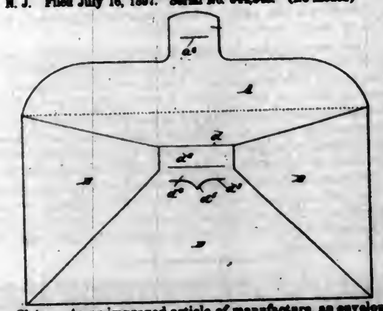


4. In a steam engine, a suitable cylinder, a steam-pipe communicating therewith, a valve casing at the juncture of the pipe with the cylinder-wall, a rock balance-valve in said casing, two oppositely-reciprocating pistons in said cylinder, a drive-shaft for each piston, a crank-disk carried by each shaft, a pitman connecting each disk with its corresponding piston, an arm carried by the valve and disposed along the outside of the casing, intermediate rigid and yielding connections between said arm and one of the drive-shafts adjacent thereto for rocking the valve during the reciprocation of the piston and for setting the point of cut-off for said valve, a driving-pulley for each drive-shaft, and a connecting-rod connecting the pullays, whereby the same speed is imparted to both drive-shafts simultaneously, substantially as set forth.

604,416. TOY OR PUZZLE. JACOB REEPMAKER, Rotterdam, Netherlands. Filed May 28, 1897. Serial No. 638,663. (No model.) Patented in England May 15, 1897, No. 13,039; in France May 20, 1897, No. 264,747, and in Belgium May 22, 1897, No. 99,567.

Claim.—The combination in a toy or puzzle of a box or receptacle *a* having an aperture *b* in the top thereof and a bottom *f* divided into spaces or marked with letters numerals pictures figures or the like, with as many puppets or figures *d* as there are spaces numerals letters pictures or the like at the bottom of the box and marked to correspond therewith, and a piece *c* of wood or other suitable material adapted to be inserted in the aperture *b* and by means of which piece each of the said puppets or figures may be placed in an erect position on the space letter figure numeral picture or the like at the bottom of the box designed to receive it, substantially as set forth.

604,417. MECHANICAL MOVEMENT. SAMUEL T. RICHARDSON, Baltimore, Md., assignor of one-third to Albert B. Holland, same place. Filed Oct. 19, 1897. Serial No. 655,710. (No model.)



Claim.—A pedal-motor movement comprising a fixed sprocket-disk 3, and a sprocket-wheel 5, adapted to rotate on the axis of said disk and formed with the radial arm 6, carrying the stud 7 in combination with the sprocket-wheel 8, journaled on said stud and provided with crank 9, and the sprocket-chain 12 encompassing said disk and wheel 8, substantially as and for the purpose set forth.

604,418. ACCUMULATOR-PLATE. ISIDOR ROSLER, Berlin, Germany, assignor to Lehmann & Mann, same place. Filed Mar. 10, 1898. Serial No. 673,416. (No model.)

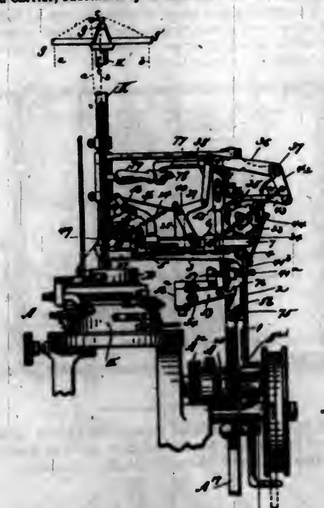
Claim.—An accumulator-plate, consisting of a continuous zigzag core-piece, the surfaces of which on both sides are fitted with triangular webs wholly separated from each other substantially as described.

604,419. ENVELOP. ELBERT V. D. ROUSSEAU, Bound Brook, N. J. Filed July 16, 1897. Serial No. 644,843. (No model.)

Claim.—As an improved article of manufacture, an envelop provided with the usual folding flap on which is formed a tongue or projection having a transverse slot therein, the back of said envelop being provided with two slots whereby a strip is formed, the lower side of which is provided with a projecting tongue, the tongue on the said flap being adapted to pass through the said slits formed in the back of said envelop and the tongue formed on said strip being adapted to engage the transverse slot formed in the tongue of the flap, substantially as and for the purpose described.

604,420. KNITTING-MACHINE. JAMES R. ROWE, Pawtucket, R. I., assignor to the R. Jenckes Manufacturing Company, same place. Filed Oct. 9, 1896. Serial No. 608,337. (No model.)

Claim.—1. In a knitting-machine, the combination with a rotary cam-cylinder, of means independent of said cam-cylinder for guiding a plurality of threads, and means for carrying said threads successively to the needles, substantially as described.



2. In a knitting-machine, the combination with a rotary cam-cylinder, and a thread-guide moving with said cylinder, of means independent of said cam-cylinder for guiding a plurality of threads, and means for carrying said threads successively to said guide and to the needles, substantially as described.

3. In a knitting-machine, the combination with a rotary cam-cylinder, of stationary guides for a plurality of threads, and means for carrying said threads successively to the needles, substantially as described.

4. In a knitting-machine, the combination with a rotary cam-cylinder, of a thread-guide independent of said cylinder, a thread-guide moving with said cylinder provided with a lateral opening, a thread-carrier, and means for operating said carrier to carry the thread to said guide through said opening, substantially as described.

5. In a knitting-machine, the combination of a traveling thread-guide provided with a lateral opening, a thread-carrier independent of said guide, means for operating said thread-carrier to carry the thread to said guide through said opening, and means for quickly returning said carrier, substantially as described.

6. In a knitting-machine, the combination of a traveling thread-guide, provided with a lateral opening, a thread-carrier independent of said guide, means for operating said carrier to carry the thread to said guide through said opening, and a spring for quickly returning said carrier, substantially as described.

7. In a knitting-machine, the combination of a main thread-guide provided with a lateral opening, a thread-guide from which the knitting-thread passes to the main thread-guide, a thread-carrier, means for operating said thread-carrier to carry a thread to the main thread-guide through said opening, means for quickly returning said carrier to its normal position, and means for severing the knitting-thread, substantially as described.

8. In a knitting-machine, the combination of a main thread-guide provided with a lateral opening, a thread-guide from which the knitting-thread passes to the main thread-guide, a thread-carrier, means for operating said thread-carrier to carry a thread to the main thread-guide through said opening, means for quickly returning said carrier to its normal position, and means operated by the return movement of said carrier for severing the knitting-thread, substantially as described.

9. In a knitting-machine, the combination of a thread-engaging device, a thread-holder and means for operating said engaging device and holder to carry a thread to the needles, substantially as described.

10. In a knitting-machine, the combination of a thread-guide, a thread-holder and means for operating said guide and holder to carry a thread to the needles, substantially as described.

11. In a knitting-machine, the combination of a plurality of thread-engaging devices, a plurality of thread-holders, and means for operating said engaging devices and holders to carry the threads successively to the needles, substantially as described.

12. In a knitting-machine, the combination of a thread-engaging device, a thread-holder and means for moving said device and holder into position upon opposite sides of the needles whereby the thread is carried between adjacent needles, substantially as described.

13. In a knitting-machine, the combination of a thread-guide, a thread-holder, and means for moving said guide and holder into position upon opposite sides of the needles, substantially as described.

14. In a knitting-machine, the combination of a plurality of thread-engaging devices, a plurality of thread-holders, means for moving said engaging devices and holders into position upon opposite sides of the needles, and means for successively operating said holders, substantially as described.

15. In a knitting-machine, the combination of a pivoted thread-holder, a thread-engaging device carried with said holder and means for moving said holder to and from the needles and rocking said holder on its pivot, substantially as described.

16. In a knitting-machine, the combination of a slide, a thread-holder and thread-engaging device pivoted to the end of said slide, means for reciprocating said slide to rock said holder and engaging device, and means for moving the end of said slide to and from the needles, substantially as described.

17. In a knitting-machine, a plurality of thread-holders, means for moving said holders to and from the needles, and means for operating said holders successively, substantially as described.

18. In a knitting-machine, a pivotal plate carrying two thread-holders, means for rocking said plate on its pivot, and two stops for successively operating said holders, substantially as described.

19. In a knitting-machine, a pivoted plate carrying two thread-holders, means for rocking said plate on its pivot, two stops for operating said holders and means for controlling the operation of said stops, substantially as described.

20. In a knitting-machine, two grippers having their movable jaws connected, two movable stops for operating said grippers, means for reciprocating said grippers, and means for alternately arresting the movement of said stops, substantially as described.

21. In a knitting-machine, a pivoted plate carrying a fixed jaw, a movable jaw pivoted to said plate and provided with two projecting arms, two stops for engaging said arms, means for controlling the operation of said stops, and means for rocking said plate, substantially as described.

22. In a knitting-machine, a plurality of thread-holders, a plurality of stops for operating said holders, slides carrying said stops, a wheel provided with a series of projections for each slide, and means for operating said wheel, substantially as described.

23. In a knitting-machine, the combination of a pivoted arm a slide mounted on said arm, a plate pivoted to said slide, and carrying a thread-guide and thread-holder, one or more links connecting said plate and arm, and means for operating said slide and arm, substantially as described.

24. In a knitting-machine, the combination of a thread-holder, a thread-guide, means for moving said holder and guide to and from the needles, and means for forcing the thread into said holder, substantially as described.

25. In a knitting-machine, the combination of two thread-grippers, two thread-guides, means for moving said grippers and guides to and from the needles, means for alternately operating said grippers, and means for forcing the thread to be gripped between the jaws of the open gripper, substantially as described.

26. In a knitting-machine, a pivoted support, an arm projecting therefrom, a lever pivoted to said arm, a second lever pivoted to a stationary pivot and to said former lever, and stops on said levers to hold the three pivotal points in line, substantially as described.

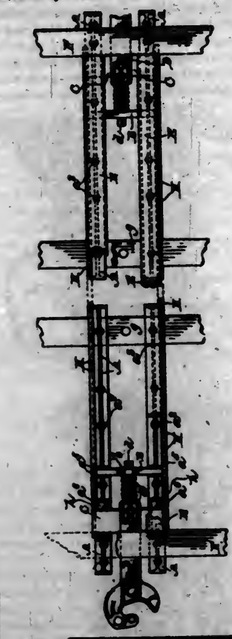
27. In a knitting-machine, a thread-guide provided with a lateral passage for the entrance of the thread, means for carrying a thread to said guide and means for preventing the escape of the thread through said passage, substantially as described.

28. In a knitting-machine, a thread-guide having a lateral passage for the entrance of the thread, and a safety-stop in said passage, substantially as described.

29. In a knitting-machine, a thread-guide having a lateral passage for the entrance of the thread, said passage being enlarged at its entrance end and provided with diverging sides, substantially as described.

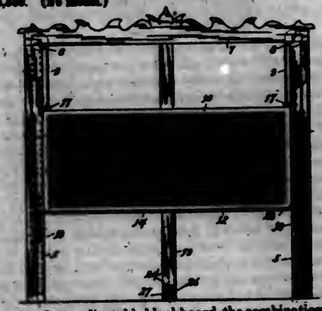
604,421. DRAFT-BEAM FOR CARS. THOMAS W. SALENS, Marshall, Tex. Filed Nov. 13, 1897. Serial No. 658,260. (No model.)

Claim.—1. A draft-beam for cars provided with transverse slots extending through the said beam, one of said slots being adapted to receive a follower plate and hold the same rigidly and the other slot being adapted to receive a key-plate for securing a coupler in place, the construction being such that the key-plate may slide in said slot according to the movement of the coupler, substantially as described.



2. In a draft mechanism for cars, the combination with a suitable coupler, of draft-beams secured to the under side of the car, said beams being provided with apertures extending through said beams for receiving follower-plates and key-plates whereby the coupler may be secured to said beams, the construction being such that the said follower plate may be held rigidly in place and the key-plate may be allowed to slide in its slots to conform to the movement of the coupler, substantially as described.

3. In a draft-gear for cars, the combination with a suitable coupler, of draft-beams provided with transverse apertures, a follower-plate adapted to engage one set of said apertures and be held rigidly therein, and a key-plate passing through the draw-head and the other set of apertures and adapted to slide therein and connecting draw-rods for joining the outer ends of the said key-plates at the opposite ends of the car, substantially as described.

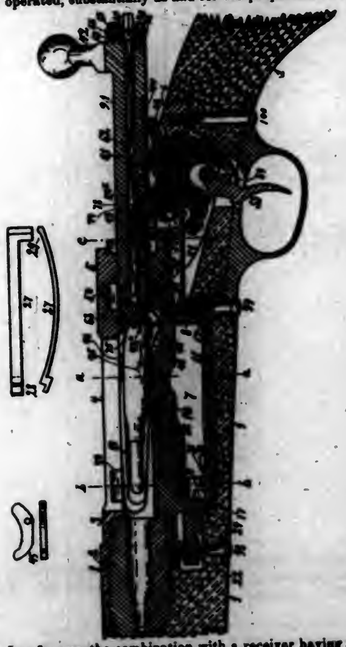


4. In a draft-gear for cars, the combination with a suitable coupler, of draft-beams adapted to receive the coupler between them, said beams being made alike whereby they are interchangeable, the said beams being also provided with transverse apertures whereby they are adapted to receive and hold rigidly follower-plates and to receive and movably hold key-plates for securing the coupler in position, substantially as described.

5. A draft-beam for cars provided with a transverse vertical slot for rigidly securing a follower-plate and a transverse longitudinal slot for receiving and movably holding a key-plate, the construction being such that the key-plate is guided in its movement with a coupler, substantially as described.

6. A draft mechanism for cars comprising metallic beams adapted to be secured to the car-sills, the said beams being provided with vertical slots for rigidly securing a follower-plate and being also provided with longitudinal slots for movably holding and guiding a key-plate whereby a coupler may be secured to said beams, substantially as described.

604,422. BLACKBOARD. GODFRAY J. SCHREIBER, Sheboygan, and KARL F. G. BRENNER, Kaukauna, Wis. Filed Mar. 30, 1897. Serial No. 629,260. (No model.)



Claim.—In an adjustable blackboard, the combination, of a frame, the side pieces thereof being in the form of boxes or casings, a blackboard slidable between the side boxes and having a rack-bar formed thereon, coiled springs within said side boxes, cords passing over pulleys and having one of their ends secured to the blackboard and their opposite ends secured to the coiled springs, a vertical boxing or casing, a lever pivoted therein, and having one end passing through an opening in its boxing in order to engage the rack-bar, a spring adapted to normally hold the lever in engagement with the rack-bar, and a bell-crank lever pivoted within the vertical box or casing, and having one end engaging the other lever, and its opposite end passing through an opening in the boxing or casing in position to be operated.

604,428. MAGAZINE BOLT-GUN. GUNNERUS SCHEE, Christiania, Norway. Filed Apr. 26, 1897. Serial No. 633,906. (No model.) Patented in Norway June 6, 1896, No. 4,612, and Oct. 10, 1896, No. 4,617.

Claim.—1. In a magazine bolt-gun, the combination with a receiver and a breech-bolt moving back and forth therein; of a maga-

zine communicating therewith and forming a part of a cylinder around the receiver and having a lid or cover for admitting the cartridges to be dropped sidewise down into the magazine without changing the position of the gun and a spring-actuated cartridge-carrier adapted to feed the cartridges into the receiver, said cover consisting of a curved plate sliding with its ends in suitably-provided curved grooves and which presses the carrier back and locks it so it offers no resistance to the filling of the magazine, and when the cover is closed the carrier is set free to chase all the cartridges toward the inlet to the receiver, said cover having also a projection by which it is easily operated, substantially as and for the purposes set forth.

2. In a firearm, the combination with a receiver having a cylindrical inside provided with a side inlet and top exit for cartridges, the gap 93, extending rearwardly from said top exit to the rear end of the receiver, the notches 48×, 49 and 50 formed in the upper wall of the receiver; the round breech-bolt 21 adapted to slide in the receiver and having the lugs 47, 48, and the arm 42, adapted to interlock with said notches, said breech-bolt having further the circular groove 74, and the rear central projection 67; the flexible extractor-bar 71, sliding in the gap 93, and being provided at its front end with a hook for extracting the empty cartridges from the rear end of the gun-barrel, and having its rear end extended across the rear end of the breech-bolt, and journaled upon the projection 67 thereof, also having the tooth or hook 73, engaging the circular groove 74 in the front side of a semicircular projection near the rear end of the breech-bolt and means for ejecting the shells of the cartridges from the receiver, substantially as and for the purposes set forth.

3. In a firearm, the combination with the round breech-bolt 21, adapted to be rocked from side to side in the receiver for interlocking or releasing it, and having an axial hole through it, and its rear end formed with a hollow cylindrical extension 67, with cams or teeth in its bottom; the firing-pin 62, having a round body extending through the central hole in the bolt and having the rigid collar 65, inserted in the cavity 66 of the cylindrical extension of the breech-bolt, and provided with teeth or cams upon its front side corresponding to those in the bottom of the cavity, and the rearwardly-extending four-cornered end 64; the cartridge-extractor 71, journaled to the rear end of the breech-bolt and having the angular portion 70, with a square hole in it fitting the end 64, of the firing-pin to prevent it from turning with the bolt, said extractor being guidingly inserted in a gap in the receiver, permitting it to slide but not to oscillate, substantially as and for the purpose set forth.

4. In a firearm, the combination with the receiver 4, 5, 6, the round breech-bolt 21, inserted in the receiver and having the operating-lever 42, with the segmental notch, and the firing-pin 62, extending through it, and beyond its rear end, said bolt being adapted to slide and oscillate so as to lock and unlock itself with the receiver; said receiver having the diagonal or spiral-shaped recesses 84 85; the transversely-curved hammer-lifter 79, adapted to fit and retain itself in said grooves with its front and rear edges, and between the shoulders 89 and 90 of the breech-bolt with its side edges, it also having the square rear edge 78, for cocking the hammer of the gun; the hammer 54, mounted at the rear of the receiver adjacent to the rear edge of the hammer-lifter, and means for keeping the hammer-lifter in position when the breech-bolt is retracted, and means for driving and for releasing the hammer, substantially as shown, and described, and for the purpose set forth.

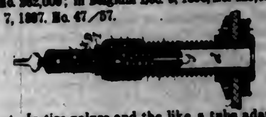
5. In a magazine bolt-gun, the combination with the receiver 4 5 and the breech-bolt moving therein, of a segmental horizontal magazine extending underneath and up along one side of the receiver, the said upwardly-extending portion being provided near its top with an inwardly-opening mouth communicating with the receiver and an outwardly-opening mouth for receiving the cartridges, and the lid 16, for closing said outwardly-opening mouth, said lid consisting of a curved plate having its ends sliding in suitably-provided grooves and its upper edge formed into an outward upwardly projecting wing by which the lid is operated and the cartridges quickly guided into the magazine substantially as and for the purpose set forth.

6. In a magazine bolt-gun, the combination with the receiver 4 5 and the breech-bolt moving therein, of a segmental horizontal magazine extending underneath and up along one side of the receiver, the said upwardly-extending portion being provided near its top with an inwardly-opening mouth communicating with the receiver and an outwardly-opening mouth for receiving the cartridges, and the curved, sliding lid 16, for closing said outwardly-opening mouth; said magazine having the end walls 8 and 9 projecting transversely out from the receiver, and provided with the curved grooves 17 for the ends of said sliding lid to slide in, substantially as and for the purpose set forth.

7. In a magazine bolt-gun, the combination with the receiver 4 5 and the breech-bolt moving therein, of a segmental horizontal magazine extending underneath and up along one side of the receiver, the said upwardly-extending portion being provided near its top with an inwardly-opening mouth communicating with the receiver and an outwardly-opening mouth for receiving the cartridges, and the curved, sliding lid 16, for closing said outwardly-opening mouth; said magazine having the end walls 8 and 9 projecting transversely out from the receiver, and provided with the curved grooves 17 for the ends of said rolling lid to slide in; the flat downwardly-sliding lid 12, closing the opposite side of the magazine, and having the segmentally-curved extension 11, overlapping the lower part of the sliding lid 16, and forming the bottom of the magazine, substantially as and for the purpose set forth.

8. In a magazine bolt-gun, the combination with the receiver 4 5 and the breech-bolt moving therein, of a segmental horizontal magazine extending underneath and up along one side of the receiver, the said upwardly-extending portion being provided near its top with an inwardly-opening mouth communicating with the receiver and an outwardly-opening mouth for receiving the cartridges, and the curved, sliding lid 16, for closing said outwardly-opening mouth; said magazine having the end walls 8 and 9 projecting transversely out from the receiver, and provided with the curved grooves 17 for the ends of said lid to slide in; the flat downwardly-sliding lid 12, closing the opposite side of the magazine, and having the segmentally-curved extension 11, overlapping the lower part of the sliding lid 16, and forming the bottom of the magazine; the front end wall of the magazine having the horizontal slot or notch 24 opening toward the sliding lid 12, the pendent stem 22 at the lower side of the receiver forward of the magazine, the cartridge carrier 23, 26 95 having its arm 23 pivotally placed upon said stud 22, and retained thereon by the said notch 24, in which it swings, and by the flexible arm 26 and head 95, and the auxiliary spring 27, empties the magazine into the receiver, substantially as shown and described.

9. In a magazine bolt-gun, the combination with the receiver 4 5 and the breech-bolt moving therein, of a segmental horizontal magazine extending underneath and up along one side of the receiver, the said upwardly-extending portion being provided near its top with an inwardly-opening mouth communicating with the receiver and an outwardly-opening mouth for receiving the cartridges, and the curved, sliding lid 16, for closing said outwardly-opening mouth; said lid being provided at its lower front corner with the locking-notch 31, the spring-pressed cartridge-carrier 23, 26 95, pivotally secured to the receiver in front of and extending into and swinging in the magazine and having the tooth 25 operated by the lower edge of the lid and engaging the locking-notch 31 of the lid when the latter is open, substantially as and for the purpose set forth.



10. In a magazine bolt-gun, the combination with the receiver 4 5 and the breech-bolt moving therein, of a segmental horizontal magazine extending underneath and up along one side of the receiver, the said upwardly-extending portion being provided near its top with an inwardly-opening mouth communicating with the receiver and an outwardly-opening mouth for receiving the cartridges, and the curved, sliding lid 16, for closing said outwardly-opening mouth; said lid being provided at its lower front corner with the clearing-notch 30 and the locking-notch 31; the spring-pressed cartridge carrier 23 26 95 pivotally secured to the receiver, but extending through a slot into and swinging in the magazine, is provided with the tooth or lug 25 operated by the lower edge of the lid and engaging the locking-notch 31, when the lid is open and finding a clearing in the notch 30 when the lid is either in motion or closed, substantially as and for the purpose set forth.

11. In a magazine bolt-gun, the combination with the receiver 4 5 and the breech-bolt moving therein, of a segmental horizontal magazine extending underneath and up along one side of the receiver, the said upwardly-extending portion being provided near its top with an inwardly-opening mouth communicating with the receiver and an outwardly-opening mouth for receiving the cartridges, and the curved, sliding lid 16, for closing said outwardly-opening mouth; the cartridge-carrier arm 23, pivoted to the receiver and extending through a slot or notch in the end wall of the magazine, and formed with the upwardly-tending spring-arm 26, provided at its free end with a head 95, either side of which is adapted to touch and move the cartridges sidewise and upward in the magazine, the auxiliary spring 27, pressing against the arm of the carrier so as to assist it in its horizontal movement; means for locking the carrier and lid when opened; and a suitable cut-off at the mouth or port extending from the magazine into the receiver, substantially as and for the purpose set forth.

12. In a magazine bolt-gun, the combination with a receiver and a magazine embracing a portion of the receiver and having a gate for the cartridges to enter sidewise into the receiver, of a cartridge cut-off consisting of a rock-shaft provided with a rocker-arm and having a half-round portion rocking in a groove in one side of the gate, the spring-arm 39, inserted in a groove in the rock-shaft and having its free end curved outward and engaging the transverse groove 41, in the receiver, substantially as and for the purpose set forth.

13. In a magazine bolt-gun the combination with a receiver and a magazine embracing a portion of the receiver and having a gate for the cartridges to enter sidewise into the receiver, of a cartridge cut-off consisting of a rock-shaft provided with a rocker-arm and having a half-round portion rocking in a groove in one side of the gate, the spring-arm 39, inserted in a groove in the rock-shaft and having its free end curved outward and engaging the transverse groove 41, in the receiver; the rear end of said rock-shaft extending beyond the rocker-arm and is journaled in the bearing 37, having the slot or notch 38, for the rocker-arm to pass through in removing or replacing the rock-shaft, substantially as shown and described.

604,424. TIRE-VALVE OR THE LIKE. GEORGE H. F. SCHRADER, New York, N. Y. Filed Nov. 13, 1896. Serial No. 612,565. (No model.) Patented in England Dec. 3, 1896, No. 27,032; in France Dec. 3, 1896, No. 262,000; in Belgium Dec. 3, 1896, No. 126,090, and in Austria Jan. 7, 1897. No. 47/57.

Claim.—1. In tire-valves and the like, a tube adapted to be fastened to a tire and having an open end, in combination with a valve member adapted to be coupled to the end of such tube, consisting of a tubular member having an internal valve seat and chamber and an external groove near one end and at that end fitting into such tube until said groove is entirely within the latter, a packing-ring fitting said groove and surrounding said member and completely inclosed between the opposing walls of said parts, a valve proper in said chamber and inclosed therein, and a screw-threaded coupling engaging said member for coupling it to such tube with its end therein.

2. In tire-valves and the like, a tubular valve member having a valve-seat and an end for entering the interior of a tire-tube, and a valve proper within said member, in combination with an internally-screw-threaded coupling irremovably swiveled to said member for fastening it to such tube and intercngaging shoulders on the coupling and member for holding the member within such tube and preventing separation of the coupling and member.

3. In tire-valves and the like, a valve member having an internal chamber and valve-seat and a valve proper completely inclosed in said chamber, said member having an end for entering within the valve-tube of a tire, in combination with a screw-threaded sleeve surrounding said member for coupling it to such tube, having an inwardly-projecting flange, and shoulders on said member and sleeve engaging and transmitting the axial motion of the latter in both directions to the former.

4. In tire-valves and the like, a valve member having an internal valve-seat near its outer end, and constituting a valve-casing having a long end for projecting far into the interior of a tire-tube, and a valve proper inclosed therein, an external packing-ring intermediate of the ends of the casing and surrounding said long end thereof for entering entirely within the interior of such tube, and a coupling-sleeve surrounding the casing outwardly of said ring.

5. In tire and other valves, a member D, having an internal valve-chamber and valve seat, and an external tapering end surrounding said chamber for fitting entirely into the valve-tube of a tire, and having a projection outwardly of said end for preventing rotation of said member, a ring of packing material surrounding and held on said end, and a valve proper inclosed in said member, and means holding said valve proper therein.

6. For tire valves and the like, a valve member D having an internal valve chamber and seat, a plug closing the inner end of said chamber, a valve proper in the latter, a spring between said valve and plug, said member having a groove around its inner end, a packing-washer in said groove, a cap at the outer end of said member and a sleeve swiveled to said member between said cap and its inner end, substantially as and for the purpose set forth.

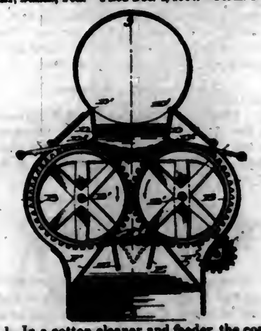
604,425. TIRE-VALVE, &c. GEORGE H. F. SCHRADER, New York, N. Y. Filed Nov. 19, 1896. Serial No. 612,667. (No model.) Patented in England Dec. 3, 1896, No. 27,533; in France Dec. 3, 1896, No. 262,000; in Belgium Dec. 9, 1896, No. 126,090, and in Austria Jan. 7, 1897, No. 47/57.

Claim.—1. In tire and other valves, a valve member adapted to be coupled to the end of a valve-tube, consisting of a tubular member having an end for fitting within the hollow end of said tube, an annular seat beyond such portion, an inlet leading from its outer end to and opening at such seat, and an annular groove surrounding the end of its body which enters within the end of such tube, a packing-washer in said groove for entering entirely into the hollow interior of such tube for making a leak-tight joint between said member and such valve-tube, said member having a wall above said groove for passing into the hollow end of said tube outwardly of said washer and holding the latter therein, and a coupling swiveled to said member for screwing on said tube and coupling the member thereto, whereby said ring can be clamped between the outer wall of said member and the internal wall of said tube and a leak-tight joint between the two, inwardly of the outer end of the latter, can be made.

2. In tire-valves and the like, a tubular member having a tapering end for fitting into the hollow interior of a valve-tube, having an annular seat beyond such portion, for passing into the valve-chamber of such tube, and an inlet leading from its outer end to said seat, a coupling swiveled to said member outwardly of its tapering end for clamping it to said tube, a valve proper beyond said member movable axially of it and seating on its inner end, and means securing said valve proper movably to said member and preventing its accidental escape therefrom.

3. In tire and other valves, a valve-tube, having a valve-chamber and an enlarged socket leading thereto, in combination with a valve member comprising a tubular part having a tapering portion near one end adapted to fit entirely into the socket of said tube, having an annular groove surrounding such portion and passing entirely into such tube, an annular seat beyond such portion, and an inlet extending through it from its outer end to said seat, a valve proper secured to said member opposite the seat thereof, and movable axially of the member, and a coupling swiveled to said member outwardly of its tapering end for coupling it to a valve-tube.

4. In tire and other valves, a valve-tube, having an open socket in its end, in combination with a tubular valve member, having a valve-seat, an inner end fitting into the socket of said tube, an outer shoulder outwardly of said end, and a screw-thread for receiving a cap, a valve proper carried by said member movable axially thereof and engaging said seat, a cap screwing onto said member and having a shoulder outwardly of the shoulder thereof, and an internally-screw-threaded sleeve outwardly of said seat, surrounding said member and having an internal flange between the shoulder thereof and the shoulder of said cap, whereby said shoulders retain said sleeve on said member, substantially as and for the purpose set forth.



5. For tire and other valves, a valve proper, and a spiral spring therefor irremovably connected together.

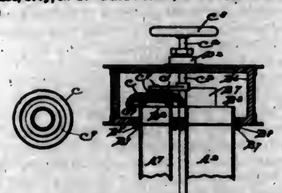
6. For tire and other valves, a tubular member having a seat, an inlet leading through it to said seat, and having an end for entering into the hollow interior of a valve-tube, and a shoulder outwardly

thereof, in combination with a sleeve swiveled to said member for coupling it to such tube, engaging said shoulder and held thereby outwardly of said end, and a valve proper engaging said seat and having a stem traversing said inlet and permanently and irremovably fixed therein.

7. In tire and other valves, a valve member D, having outer shoulder *o*, reduced portion L for fitting into the hollow interior of a tire-tube, and groove M on its exterior, surrounding such portion having an inlet *g* extending through it, and a valve-seat H on its end, in combination with a valve proper I engaging said seat at the inner end of said member, a sleeve E swiveled to said member outwardly of said groove and engaging said shoulder, a packing-ring in said groove for passing entirely into such tube, and a cap for said member.

604,426. COTTON ELEVATOR, CLEANER, AND FEEDER. JOHN W. SEIFERT, Dallas, Tex. Filed Dec. 4, 1897. Serial No. 660,775. (No model.)

Claim.—1. In a cotton cleaner and feeder, the combination with a casing, of reticulated cylinders geared to rotate toward each other, an air-exhaust communicating with the interior of said cylinders, and adjustable dampers for regulating the air-exhausting area of said cylinders; substantially as specified.



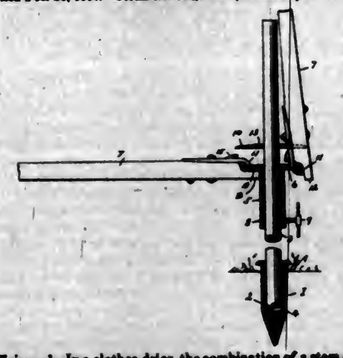
2. In a cotton cleaner and feeder, the combination with a casing, of reticulated cylinders geared to rotate toward each other, an air-exhaust communicating with the interior of said cylinders, and adjustable dampers provided with flexible flaps in contact with said cylinders; substantially as specified.

3. In a cotton cleaner and feeder, the combination with a casing, of reticulated cylinders geared to rotate toward each other, an air-exhaust communicating with the interior of said cylinders, adjustable dampers for regulating the air-exhausting area of said cylinders, and flap-valves located beneath said cylinders; substantially as specified.

4. In a cotton cleaner and feeder, the combination with reticulated cylinders geared to rotate toward each other, of a casing surrounding said cylinders and provided with apertures above and below the cylinders, closures for said apertures, adjustable dampers above said cylinders and an air-exhaust connection communicating with the interior of said cylinders; substantially as specified.

5. In a cotton cleaner and feeder, the combination with a casing, of oppositely-located reticulated cylinders provided with meshing gears, an air-exhaust communicating with the interior of said cylinders, a driving-gear meshing with the gear upon one cylinder, adjustable dampers above said cylinders, and flap-valves below said cylinders; substantially as specified.

604,427. APPARATUS FOR MANUFACTURING GAS. HENRY C. SHIELDS, Troy, N. Y. Filed Dec. 27, 1895. Serial No. 573,493. (No model.)



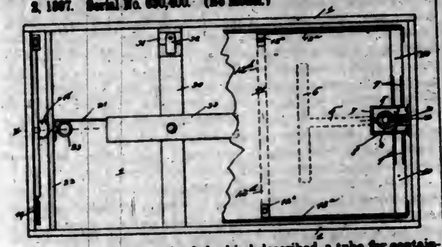
Claim.—1. In a valve, the combination of the valve case, pipes situated side by side and extending above the floor of the case, a pair of valve-seats on the ends of said pipes in approximately the same horizontal plane, a perpendicular crank-shaft approximately equidistant from such seats and extending from the interior through the case-wall, a crank-arm secured to such shaft interiorly of the case, a slide-disk movable on and along the seats, a swivel connection between the disk and crank-arm, the pin of said connection being the center of the motion of the valve, and means located exteriorly of the case for communicating rocking movements to the shaft, substantially as described.

2. In combination a valve-case, pipes extending through its bottom and above the same, the valve pivoted at a point outside the circumference of the pipes to swing on and across their mouths in an approximately horizontal plane, a shaft supported in the case-wall and fixed against endwise motion, and devices intermediate the valve and shaft whereby the rotation of the latter alternately covers and uncovers each pipe-mouth, substantially as described.

3. In a valve, the combination with the valve-case, said case having a sheet-metal side with a pair of openings, pipes extending through said openings, the valve disk, and means for operating the disk, of a detachable nipple-seat registering with each case-opening, and means for detachably securing the nipple-seats to the sheet-metal wall of the case, substantially as described.

604,428. CLOTHES-DRIER. WILLIAM B. SHIELDS, Nashville, Mich., assignor to Wells T. Barker and Lon W. Feighner, same place. Filed Feb. 20, 1897. Serial No. 624,260. (No model.)

Claim.—1. In a clothes-drier, the combination of a stem or standard, drier-arms horizontally connected with the same, and adapted to swing upward in folding, and a locking-plate mounted on the stem or standard at a point above the hinged ends of the arms and provided with fingers engaging said arms and locking the same in a horizontal position, said locking-plate being held in engagement with the arms by gravity and adapted to be rotated partially to bring its fingers opposite the intervals between the arms to permit the latter to swing upward, substantially as described.



2. In a clothes-drier, the combination of a stem or standard, an adjustable sleeve mounted thereon and provided with a flange having openings, drier-arms provided at their inner ends with recesses, hooks secured to the drier-arms and projecting over the recessed portions thereof and linked into the openings of the flange, said hooks being provided with shoulders, and a locking-plate arranged on the stem or standard above the sleeve and provided with fingers engaging said shoulders to lock the drier-arms in a horizontal position, said locking-plate being adapted to be partially rotated to bring its fingers opposite the intervals between the arms for permitting the same to swing upward, substantially as described.

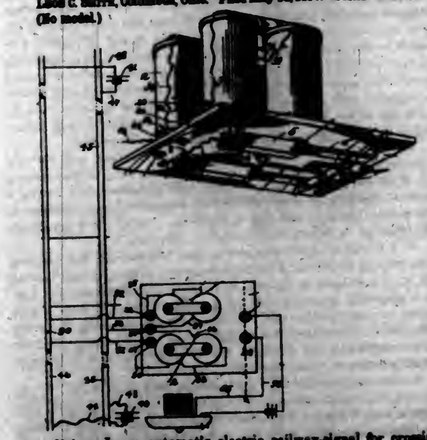
604,429. CHAIN-CLEANING ATTACHMENT. ROBERT W. SIMS, Medford, Mass. Filed Oct. 7, 1897. Serial No. 654,412. (No model.)

Claim.—The combination with a clamp adapted to the lower frame bar of a bicycle and having two horizontal attaching-screws, the threaded ends of which project beyond the clamp, of a vertically-disposed plate or bar slotted to receive said projecting screw ends and vertically adjustable thereon; said plate or bar having a brush on one end, and nuts on said screws at opposite sides of the bar or plate, substantially as described.

604,430. TRUNK. PAUL H. SMITH, Columbus, Ohio. Filed Apr. 2, 1897. Serial No. 630,400. (No model.)

Claim.—1. In a trunk of the kind described, a tube for containing a tray-holding tube or spindle having a longitudinal opening at its inner side and a longitudinal opening at its outer side, webs or walls projecting from each side of said opening at the outer side, pulleys journaled between said walls, and a cord for raising said tube or spindle passed around said pulleys, substantially as set forth.

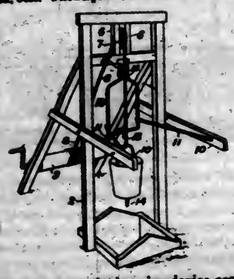
2. In a trunk of the kind described, a tube for containing a tray-holding tube or spindle having a longitudinal opening at one side, pulleys journaled in said tube, a block comprising the parts 15ª and 15ᵇ supporting the tray-holding tube or spindle, a cord attached to said block and passing over said pulleys, substantially as described.



3. In a trunk of the kind described, a tube containing a tray-supporting spindle, a cord and pulleys for elevating said spindle, a lever 20 for operating said cord having one arm connected with the cord and the other arm having a socket 20ª extending through the arm, and a handle-bar movable in said socket so as to form an extension to the lever and to be contained within the trunk without disconnecting said lever and handle, substantially as shown and described.

4. In a trunk, the combination with a vertical tube or spindle having a horizontal bar 5ª at its upper end and a fork 5ᵇ, the parts of which fork are adapted to engage the opposite sides of the end board of a tray, substantially as described.

5. The combination with a vertical tube or spindle having a horizontal bar at its upper end, of a frame consisting of a wall 7, rearwardly-extending walls 8, and laterally-extending forks 9, substantially as described.



6. In a trunk, a tray having metallic side braces consisting of a horizontal portion 12ª extending from the opposite corners of the end of said tray along the upper edges thereof, a portion 12ᵇ extending diagonally downward toward the lower corners of the tray, vertical portions 12ᶜ extending to the bottom of the tray, and a transverse bar 12ᵈ across the bottom of the tray connecting the lower ends of portions 12ᶜ, substantially as described.

604,431. ELECTRIC SIGNAL FOR RAILWAY-CROSSINGS. LEWIS C. SMITH, Columbus, Ohio. Filed May 18, 1897. Serial No. 637,130. (No model.)

Claim.—In an automatic electric railway-signal for crossings, the combination with two sets of magnet-spools 1 and 2, armature-bars 3 and 4, oppositely-located stop projections 15 and 16 on said bars, each of said stop projections having one of its faces inclined and its remaining face provided with a shoulder as described, of a cut-out bar pivoted between said armature-bars, the ends of said cut-out bar being adapted when said armature-bars are moved toward them to come into contact respectively with the inclined faces and shoulders of said stops, a bell-contact bar with which said armature-bars are adapted to come into contact, and connections substantially as described whereby circuits may be established through the magnets 1 and 2 with the track-rails on opposite sides of the crossing, substantially as and for the purpose specified.

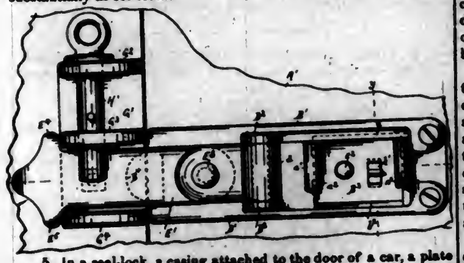
604,432. AUTOMATIC DUMPING-BUCKET. WILLIAM F. SMITH, Cripple Creek, Colo. Filed Apr. 26, 1897. Serial No. 633,963. (No model.)

Claim.—1. An automatic dumping device comprising a frame, a stirrup or bail provided with an open loop to engage a chain secured to the bottom of the bucket when the latter has risen to a proper elevation, arms pivotally secured to the said stirrup or bail and frame and adapted to move the stirrup or bail and bucket to dump the same, substantially as described.

2. An automatic dumping device comprising a framework, a stirrup or bail provided with an open loop to engage a chain secured to the bottom of the bucket when the latter has risen to a proper elevation, a finger located at the upper extremity of the said stirrup or bail, adapted to engage a catch and keep the stirrup or bail elevated, and arms pivotally connected to said stirrup or bail, and to the frame, and adapted to move the stirrup and bucket to dump the latter, substantially as described.

3. An automatic dumping device for dumping buckets comprising a frame, a stirrup or bail provided with an open loop to engage a chain secured to the bottom of the bucket, a finger located at the upper extremity of the stirrup or bail adapted to engage a catch arranged upon the frame, the said finger being provided with an opening to receive pulleys or sheaves, a rope adapted to pass between said pulleys, one end of which rope is secured to the bail of the bucket and the other to a windlass, and arms adjustably connected to the frame and pivotally secured to the stirrup or bail and adapted to move the latter with the bucket downward and dump the same, substantially as described.

4. An automatic dumping device comprising a framework, a stirrup or bail provided with an open loop to engage a chain secured to the bottom of the bucket, a finger located upon said stirrup or bail, and a catch arranged upon the framework, said catch being provided with vertical grooves or channels in one of which is located a ledge adapted to engage said finger, substantially as and for the purpose described.



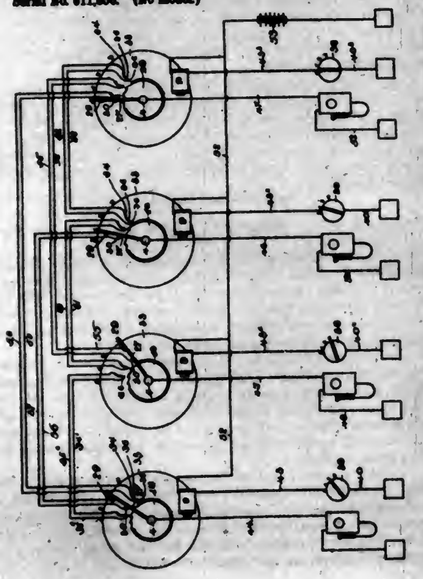
604,433. SEAL-LOCK. JOHN W. STEVENS, St. Paul, Minn. Filed June 16, 1897. Serial No. 640,206. (No model.)

Claim.—1. In a seal-lock, a casing adapted to receive a breakable seal, a lever held normally poised against the rear of said seal, a wheel provided with projections on its rim and mounted to be revolved in said casing with one of said projections adapted to enter a cavity in the seal, and means for holding said wheel from revolving backward, substantially as and for the purpose set forth.

2. In a seal-lock, a casing attached to the door of the car, a breakable seal held irremovably in said casing, a lever held normally poised against the rear of said seal, a hasp with a cam thereon and pivoted upon or adjacent to said casing and adapted to hold the door closed, said lever being poised with one end against the back of said seal and the other held against said cam by a spring, substantially as and for the purpose set forth.

3. In a seal-lock, the combination of a casing attached to the door of a car, a plate attached to the stop adjacent to the casing, a breakable seal held irremovably in said casing, a hasp hinged to said casing and adapted to break said seal when actuated and provided with a lip adapted to engage said plate and hold the door closed, substantially as shown and described.

4. In a seal-lock, the combination of a casing attached to the door of a car, a breakable seal held irremovably in said casing, a plate attached to the stop adjacent to the casing and having perforated lugs projecting therefrom, a hasp hinged to said casing and adapted to break said seal when actuated, and with side projections adapted to engage said lugs, whereby said door is held closed and means provided for the employment of a padlock or bolt as additional security, substantially as set forth.

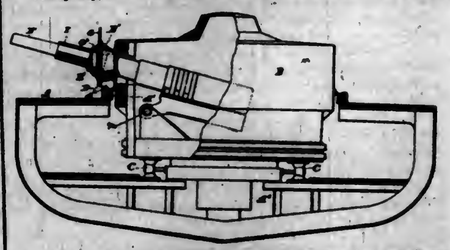


5. In a seal-lock, a casing attached to the door of a car, a plate attached to the stop adjacent to the casing, a breakable seal held irremovably in said casing a hasp hinged to said casing and adapted to hold said door closed and to break said seal when actuated, and a lip upon said casing projecting beneath said plate upon said stop, substantially as and for the purpose set forth.

6. In a seal-lock, a casing adapted to receive a breakable seal, a wheel provided with projections on its rim and mounted to be revolved in said casing with one of said projections adapted to enter a cavity in said seal, and a pawl to hold said wheel from revolving backward, substantially as set forth.

7. In a seal-lock, a casing, a breakable seal supported in said casing and with a cavity therein, a tumbler mounted to be revolved and provided with projections adapted to enter the path of the seal, said projections being so placed upon said tumbler that as the tumbler revolves one projection passes out of the path of the seal the next passes into the path of the seal and enters the cavity therein, whereby the path of the seal is never free from one of the projections, and the seal is prevented from being inserted into the casing without revolving said tumbler and automatically locking the seal therein, and means for preventing said tumbler from revolving backward, substantially as set forth.

604,434. TELEPHONE SIGNAL SYSTEM. WALLACE A. STILWELL and ALEXANDER BARSNIK, Salina, Kans. Filed Nov. 10, 1896. Serial No. 611,856. (No model.)



Claim.—1. A telephone-exchange system, comprising a central office in which is located a series of switchboards, one for each distant subscriber's station, a pair of conductor-wires leading from each board to each of the other switchboards, one of these wires terminating in a spring contact-point 34 which normally contacts with one of a series of contact-shoes 35, which are connected by a common conductor 54, and also connected to a union-post 37 which is normally in contact with a rotating contact-arm 27 having a ground connection through the corresponding telephone, and the other wire of each pair leading from a fixed contact-post 36 located in the path of and adapted to be engaged by a spring contact-finger 30 carried by said rotating contact-arm 27, as and for the purpose set forth.

2. A telephone-switchboard comprising two series of fixed contacts arranged in concentric circles, a common conductor normally connected with each contact of one of the series, a series of wires arranged in pairs, the ends of the wires of each pair terminating in a contact in each series, a switch arm movably secured relatively to the series of contacts and normally electrically connected with the common conductor and permanently connected through a telephone-station with the ground, said switch adapted to simultaneously connect with the contiguous ends of any pair of wires in said series, as and for the purpose set forth.

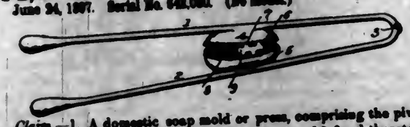
3. A telephone signal system comprising an electrically-operated switch having a movable switch-arm carrying two contact-points as 29 and 30, and permanently connected through a telephone-station with the ground, of a series of individual conductors arranged in pairs, the contiguous ends of each pair terminating in the path of said contact-points 29 and 30, one end of one wire of each of which pairs is connected to an insulated contact-post as 36, and the other wire to a contact-spring as 34, normally in contact with a common conductor as 54, said common conductor having a normal ground connection through the switch-arm, as and for the purpose set forth.

604,435. TURRET FOR WAR VESSELS. WILLIAM D. SEVERS, Jersey City, N. J. Filed June 4, 1896. Serial No. 594,242. (No model.)

Claim.—1. A revoluble turret having two obliquely-located ports or gun-apertures, guns correspondingly arranged one on each side of the radial line, each elevated and depressed by turning on an axis m arranged squarely relatively to the gun near the corresponding oblique aperture, and an angularly-projecting casing B' rigidly connected to the turret and surrounding each aperture, and extending outward parallel each to the other, provided with parallel ways one on each side, equidistant from the axis m, in combination with a shutter engaged with each gun and with the ways so as to traverse up and down in the latter as the gun is elevated and depressed, all arranged for joint operation substantially as herein specified.

2. A turret or shield arranged to turn horizontally, and carrying a gun turning therewith, a shutter connected to the gun and moving with it up and down as it is elevated and depressed, and having a spherical aperture, in combination with a spherical ring arranged to turn in such aperture and also to allow the gun to move longitudinally through it, substantially as herein specified.

3. A turret or shield arranged to turn horizontally and carrying a gun turning therewith, a shutter connected to the gun and moving with it up and down as the gun is elevated and depressed, and having a spherical aperture, and flat portions *g*, *g*, each with a hole therein, in combination with an inclosed spherical ring H having trunnions H', H², engaged in such holes so as to aid in supporting the shutter on the gun and allow the free turning of the ring H thereon, all substantially as herein specified.



4. The combination with a revolving turret or shield B, of a gun F turning therewith and having a cylindrical exterior along its midlength, a ring H having a generally spherical exterior form inclosing such cylindrical portion of the gun and an inclosing part G', G², matching to the spherical exterior of said ring, the gun extending outward and adapted to move longitudinally within the ring and to accommodate the elevation and depression by the rolling of the ring, all substantially as herein specified.

5. A ship or floating support, a revoluble turret, projecting above the upper deck thereof and capable of being revolved horizontally, a gun inclosed therein and turning therewith, elevated and depressed on an axis within the turret contiguous to the gun-port, an externally-projecting casing rigidly connected to the turret and having guideways in which a shutter plays up and down to accommodate the elevation and depression of the gun, a device H rocking in such shutter adapted to permit a cylindrical portion of the gun to work longitudinally through such device, all combined and arranged for joint operation substantially as herein specified.

6. A turret or shield arranged to turn horizontally and carrying a gun turning therewith, a shutter connected to the gun and moving with it up and down as the gun is elevated and depressed, and having a spherical aperture, in combination with an inclosed spherical ring and with a sleeve I, carried on the gun, all arranged for joint operation substantially as herein specified.

7. A ship or floating support, a revoluble turret carried thereon inclosing a gun elevated and depressed in a suitable gun-port in said turret, a yielding diaphragm closing the joint between the turret and ship, allowing liberty for both a revolving and lateral movement, and a shutter closing the joint between the gun and turret, all substantially as herein specified.

604,436. SOAP-PRESS. HARRY H. SWARES, Reading, Pa. Filed June 24, 1897. Serial No. 642,020. (No model.)

Claim.—1. A domestic soap mold or press, comprising the pivoted lever-handles 1 and 2, the separable disks 4 and 5 fixed thereto, and provided with intermeshing edges, substantially as shown and described.

2. The domestic soap mold or press, comprising the pivoted handles 1 and 2, the cup-shaped disk 4 fixed to the handle 1, and provided with a series of guide-ears 6 6, and an intervening series of recesses 7 7, and the oppositely-disposed cup-shaped disk 5 formed with a series of guide-ears 8 and intervening recesses 9 alternating with the corresponding guide-ears and recesses on the disk 4, substantially as shown and described.

604,437. CLOTHES RACK OR DRIER. URBIN P. TARDIF, Toronto, Canada. Filed Apr. 9, 1897. Renewed Mar. 24, 1898. Serial No. 675,041. (No model.)

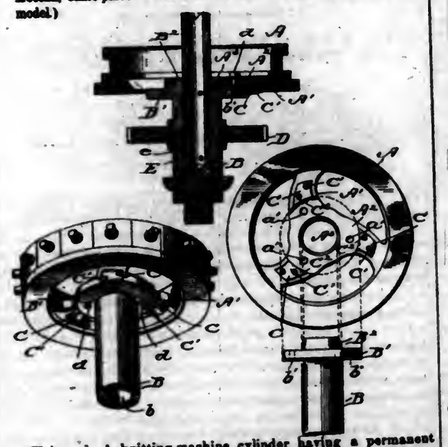
Claim.—1. In a clothes rack or drier the combination of the vertical case, a movable bracket within the case arranged to assume a vertical position when the arms are folded into the case and a horizontal position when the arms are required for use, and a vertically-slidable front for the case, adapted to support the bracket in its horizontal position, and close the front of the case when the bracket and arms are contained within the case, substantially as specified.

2. In a clothes rack or drier the combination of a vertical case, a vertically-slidable front for the case, a flange at the top of the front, flanged plates connected to the front, adapted to enter grooves in the sides of the case, flanged plates connected to the sides of the case, overlapping the front, a hook connected to the back of the front, and a vertically-movable bracket within the case consisting of a base, and a top plate, a series of arms connected to the bracket between the base and top plate, and a staple connected to the bottom of the base adapted to engage the hook at the back of the front, substantially as specified.

604,438. FIRE-KINDLER. WILLIAM R. R. TRAEP, Glidden, Iowa. Filed June 26, 1897. Serial No. 642,452. (No model.)

Claim.—1. A fire-kindler comprising a lamp or vessel, a tube extending therefrom carrying a wick and match, a support secured to the upper portion of the vessel, a spring-actuated striker carried by said support, an alarm-clock, and mechanism connected to and operated thereby for releasing the striker, in the manner and for the purpose described.

2. A fire-kindler comprising a lamp or vessel having a tube extending upwardly from the top portion thereof, a wick within said tube, a match arranged in proximity to the wick, a support carrying an upright guide, a spring-actuated striker secured near one end of said support, a trigger to hold said striker in a raised position, an alarm-clock, and a bar or rod having one end thereof connected to said trigger and the opposite end attached to a movable part of the alarm-clock, as and for the purpose set forth.



3. An apparatus for kindling fires, comprising a lamp or vessel having an upwardly-extending tube and a wick and match arranged within said tube, a support fitted over said tube, an upwardly-extending guideway on the support, a spring-actuated trigger carried by said support, an alarm-clock, and operating mechanism secured to and adapted to be operated by the alarm-clock to ignite the match when the alarm is sounded as and for the purpose described.

604,439. APPARATUS FOR EXTINGUISHING FIRE AND DISTRIBUTING DISINFECTANTS. WALTER M. THOMPSON and CHARLES HUNKINS, Cincinnati, Ohio. Filed May 23, 1896. Serial No. 592,816. (No model.)

Claim.—In an apparatus of the character described, the combination of a through water-pipe having a stop-cock, a series of vertically-disposed receptacles, baskets or holders suspended therein, a branch pipe connecting said through water-pipe with the upper part of the first receptacle of the series, said branch pipe having a stop-

cock, a pipe connecting the lower part of said receptacle with the upper part of the next succeeding receptacle, a pipe connecting the lower part of the last receptacle of the series with the through water-pipe and a check-valve in the latter connecting-pipe.

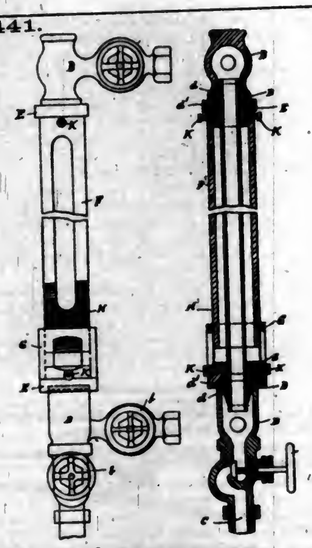
604,440. KNITTING-MACHINE CYLINDER. EUGENE VERMILYEA, Waterford, N. Y., assignor of one-half to Samuel Snyder and John Metcalf, same place. Filed Nov. 17, 1897. Serial No. 658,799. (No model.)

Claim.—1. A knitting-machine cylinder having a permanent part extending across the bottom of the ring, and provided with a detachable hub or sleeve, and means for detachably fastening the upper end of the said hub to the said part, substantially as set forth.

2. A cylinder having a permanent part extending across the bottom of the ring, having a central, conoidal opening, and provided with a hub or sleeve which is provided with a conical upper end adapted to fit into this opening, and an outwardly-extending part and means for detachably fastening said outwardly-extending part to the said bottom part of the cylinder substantially as set forth.

3. In combination with a cylinder having a permanent part extending across the bottom of the ring and lugs or plates with curvilinear edges detachably fastened to the under side of the said part, a hub or sleeve having a rigid disk or collar on its upper end the periphery of which fits against the said lugs and means for detachably fastening said collar to the said bottom part of the cylinder substantially as set forth.

4. A hub or sleeve having a conoidal top, B^3, and a disk or collar, B', in combination with a cylinder having a permanent part extending across the bottom of the ring and provided with a central, conoidal opening adapted to fit the upper end of the said hub, lugs removably attached to the under side of the said part and having curved, inner edges fitting the periphery of the said disk and means for detachably fastening the latter to the said bottom part of the cylinder substantially as set forth.



5. A cylinder, A, provided with a permanent spider-frame, A', extending across its bottom and having a central, conoidal opening, B^3, in combination with a hub or sleeve having a conoidal, upper end, R^3, adapted to fit into the said opening, and a disk, B', adapted to fit against the bottom of the said frame, means for fastening the said disk to the said frame and lugs which are detachably fastened to the said frame and provided with curved, inner edges which fit against the said disk substantially as set forth.

6. In combination with the tubular, suspending-stud, E, having holes, *c*, the sleeve or hub, B, having a conoidal, upper end, B^3, and the cylinder, A, having a rigid part extending across it at the bottom, and provided with a central, conoidal opening, A^3, the said sleeve and cylinder being detachably fastened together, substantially as set forth.

604,441. GAGE-GLASS MOUNTING. ALBION VILE, Cardiff, England. Filed Dec. 21, 1897. Serial No. 662,888. (No model.)

Claim.—In combination, the gage-glass, the fittings B, B, the hat washers about the ends of the gage-glass, the metallic washers E, E, about the gage-glass for forcing the base-flange of the hat washers against the fittings, and the extension-piece F between the washers with the piece G screw-threaded into connection with the extension-piece and connected with the lower washer by a swivel-joint, substantially as described.

604,441.

604,442. CAR-BUFFER. ARTHUR M. WAITT, Cleveland, Ohio. Filed Sept. 21, 1897. Serial No. 652,448. (No model.)

Claim.—1. In a car-buffer, the combination with a friction-plate socket, of a telescoping friction-plate having a blind pocket inaccessible from the exterior or bolt-socket on its interior face, a bolt for securing the friction-plate to the friction-plate socket, means for movably securing the bolt in the bolt-socket on the interior face of the friction-plate, a nut for the bolt, and a nut-recess in the friction-plate socket, substantially as and for the purposes specified.

2. In a car-buffer, the combination with a friction-plate socket having a countersunk bolt-hole in its bottom, of a telescoping friction-plate having a slotted bolt-socket on its interior face, a slotted bolt, and a key for connecting the friction plate and friction-plate socket, substantially as and for the purposes specified.

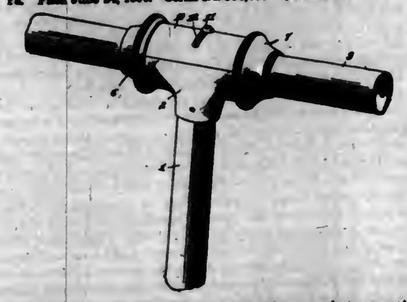
3. In a car-buffer, the combination with a friction-plate socket or base and a friction-plate or movable section, of a plurality of buffer-springs and means for maintaining one or more of said springs under partial compression independently of the friction-plate or movable section of the buffer, substantially as and for the purposes specified.

4. In a car-buffer, the combination with a friction-plate socket, a telescoping friction-plate, and a plurality of buffer-springs interposed between the socket and friction-plate, of anchors for maintaining one or more of said springs under partial compression within the friction-plate socket and independently of the movable friction-plate, substantially as and for the purposes specified.

5. In a car-buffer, the combination with a friction-plate, and a friction-plate socket having lugs on its interior, of interposed buffer-springs, and Z-shaped anchors for holding part of said springs under compression, substantially as and for the purposes specified.

6. In a car-buffer, the combination of a cup friction-plate, and a friction-plate socket, one of said parts having a raised spring-seat for the inner or lighter buffer-spring, a plurality of buffer-springs of equal length, and means for maintaining part of said springs under partial compression independently of the friction-plate, substantially as and for the purposes specified.

7. In a car-buffer, the combination with a socket having recessed offsets and anchor-lugs on its interior, of a cup friction-plate having legs on its exterior which engage in the recesses of the socket and interior lugs which engage the spring-anchors, interposed buffer-springs, and anchors which maintain one or more of said buffer-springs under partial compression, substantially as and for the purposes specified.

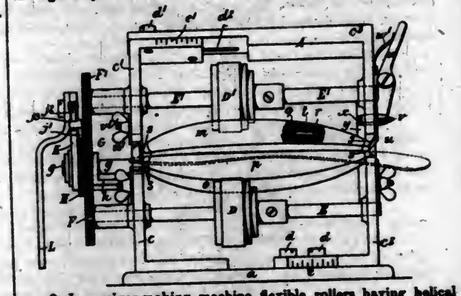


8. In a car-buffer, the combination of a socket, a telescoping friction-plate, an interposed buffer-spring, and means for maintaining the buffer-spring under partial compression independently of the telescoping friction-plate, substantially as and for the purposes specified.

604,443. BOTTLE-STOPPER. WILLIAM WALKER, Summit, N. J. Filed Oct. 1, 1897. Serial No. 653,602. (No model.)

Claim.—Means for hermetically sealing bottles, comprising, in combination, a vessel having a neck, a shouldered offset at the upper end of said neck, an annular flange of greater internal diameter than the diameter of said neck, said flange being upwardly directed to afford a holding-surface, a cork in said neck, a screw-fastening between the same, and a hardened, non-resilient sealing substance between and engaging the said cork and the inner holding surface or wall of said flange and entering the interstices of the same.

604,444. BICYCLE-HANDLE. MONTEREY WALLIS, Philadelphia, Pa. Filed June 24, 1896. Serial No. 596,703. (No model.)



Claim.—1. In combination, a socket-tube, a socket connected thereto, a barrel provided at one end with an overhanging flange to engage one end of the socket, a lug projecting from the bottom of the socket to engage notches in the barrel, a collar having an overhanging flange to engage the opposite end of the socket, said socket being shaped to produce an annular space when applied to a handle-bar, the collar having a flange to rest on the handle bar, a cap semi-circular in cross-section fitting under the flanges of the collar and barrel, said cap having a transverse slot, a screw seated in the barrel and protruding through the slot, the edges of said cap meeting and resting on the edges of the socket, a spring encircling the bar within the space and abutting the flange, and a ring 16 fitting partially in the space to confine the spring, as and for the purpose described.

2. An adjustable handle-bar, a semicircular socket, a barrel adapted to fit in said socket, a lug projecting upward to engage slots in the barrel, a semicircular plate adapted to fit over the barrel, the edges of the plate fitting against the edges of the socket, a cap formed with one end of the barrel having an annular flange encircling the socket and plate, a similar cap on the end adapted to slide back and forth and clamp the parts together, and a handle-bar clamped within the barrel, substantially as described.

604,445. CIGAR-MACHINE. OTTO WARTMANN, London, England. Filed Feb. 17, 1897. Serial No. 623,783. (No model.) Patented in England Mar. 26, 1896, No. 6,698.

Claim.—1. In a cigar-making machine, flexible rollers having helical wire-coil foundations, each roller having a continuous surface without division or joint, and of the same diameter throughout as the corresponding part of the cigar to be produced, and means for rotating said rollers acting frictionally upon said rollers intermediate their respective ends, in combination with fixed mandrels supported at both ends on which said rollers are mounted and adapted to revolve, said mandrels being curved so that the rollers fit against and shape the cigar in process of formation, substantially as set forth.

2. In a cigar-making machine, flexible rollers having helical wire-coil foil foundations, each roller having substantially the shape and size of the cigar to be produced, and means for rotating said rollers acting frictionally upon said rollers intermediate their respective ends, in combination with fixed curved mandrels supported at both ends on which said rollers are mounted, each mandrel being so shaped that one side of the roller thereon conforms to the contour of the cigar in process of formation, substantially as set forth.

3. In a cigar-making machine, flexible rollers having helical wire foundations, each roller having a continuous surface without section or joint and being in every part substantially of the same diameter as the corresponding part of the cigar to be produced, in combination with fixed mandrels on which said rollers are mounted, each mandrel being supported at both ends and so shaped that one side of the roller thereon conforms to the contour of the product, friction-wheels in contact with said rollers intermediate their respective ends, and ratchet-and-pawl gearing whereby intermittent revolution of said friction-wheels is produced, substantially as set forth.

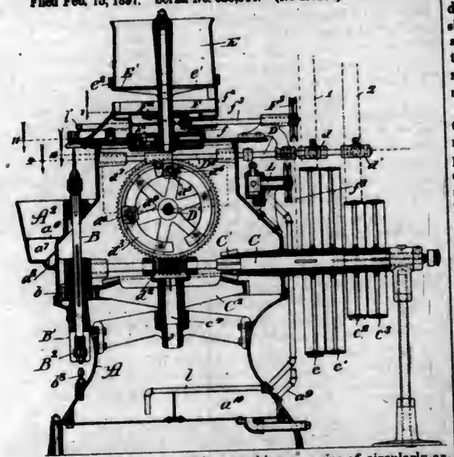
4. In a cigar-making machine, flexible rollers each of which has a continuous surface without section or joint and substantially the size and shape of the cigar to be produced, in combination with rigid curved mandrels on which said rollers are mounted, each mandrel being supported at both ends and so formed that one side of the roller thereon corresponds with and fits the contour of the cigar, friction-gearing intermediate the respective ends of said rollers and in contact therewith, and ratchet-and-pawl mechanism for actuating said friction-gearing, substantially as set forth.

5. In a cigar-making machine, the combination of flexible rollers, rigid mandrels supported at both ends on which said rollers are mounted, and friction driving-gear in contact with said rollers intermediate their respective ends, substantially as set forth.

6. In a cigar-making machine, the combination of flexible rollers, rigid mandrels supported at both ends on which said rollers are mounted, friction driving-gear in contact with said rollers intermediate their respective ends, and ratchet-and-pawl mechanism whereby intermittent revolution of said friction-wheels is produced, substantially as set forth.

7. In a cigar-making machine, the combination of continuous-surfaced shaping-rollers, and friction driving-gear in contact with said rollers intermediate their respective ends, substantially as set forth.

8. In a cigar-making machine, the combination of shaping-rollers, friction driving-gear in contact with said rollers intermediate their respective ends, and ratchet-and-pawl mechanism whereby intermittent revolution of said friction-wheels is produced, substantially as set forth.



604,446. DOFFER-GUARD AND STOPPER FOR LUBRICATING-TUBES FOR SPINDLES. JOSEPH W. WATTLES, Canton, Mass. Filed Oct. 12, 1897. Serial No. 654,943. (No model.)

Claim.—1. The combination, with a bolster-holder, a spindle, and a cylindrical body extending upward from the holder and provided with a projection on its side, of a sleeve-like member adapted to fit and slide upon said cylindrical body, and provided with both a projecting flange at its upper end and a vertical and a horizontal slot in its side for engagement with said projection, whereby the spindle may be either held within the holder, or its withdrawal therefrom permitted, as may be desired, substantially as described.

2. The combination, with the spindle C provided with the whirl *c* having the circumferential flange *c'* at its lower edge, the bolster-holder A, and the tube E provided with the pin or projection f^3 extending outward from its side, of the doffer-guard fitted to such tube and provided at its upper end with a flange, *f'*, for engagement with the flange *c'* on said whirl *c*, and with vertical and horizontal intersecting slots f^3 and f^4 in its lower portion for engagement with said pin or projection, the latter of which slots is so disposed with respect to the former slot that the action of the spindle upon the doffer-guard, when the spindle is in rotation, tends to hold such guard in a locked position upon its locking pin or projection; substantially as described.

604,447. NUT-TAPPING MACHINE. GEORGE WEISS, Chicago, Ill. Filed Feb. 15, 1897. Serial No. 623,501. (No model.)

Claim.—1. In a nut-tapping machine, a series of circularly-arranged tapping-spindles provided with spur-pinions, radially-arranged chutes and pushers coacting therewith, in combination with a centrally-located driving-gear meshing with the pinions on the tapping-spindles and receiving its motion directly from the driving-shaft, and a driving-shaft arranged at right angles to the rotation of the centrally-located driving-gear and arranged to drive the same, substantially as described.

2. In a nut-tapping machine, the combination of a frame portion, a set of spindles rotatably and vertically mounted in such frame portion on substantially equidistant points of a circle, mechanism for operating the spindles in the desired manner and feeding them forward, a centrifugally-acting plate for feeding the nuts forward to position, a series of radially-arranged pushers for feeding the nuts forward after they have left the centrifugally-acting plate into position to be acted on by the tapping-spindles, and a centrally located disk provided with a series of cams adapted to impart the desired motion to the pushers, substantially as described.

3. In a nut-tapping machine, the means for feeding the nuts forward into position, which consists of an oscillating cam moving in a horizontal plane, a set of radially-mounted pushers provided with portions engaging with the cam, whereby the pushers are moved in and out at the desired times, and means for vibrating the cam in a right-hand and left-hand manner, substantially as described.

4. In a nut-tapping machine, the means for feeding the nuts forward into position, which consists in the combination of a double set of oscillating cam-disks arranged in different horizontal planes provided with a set of eccentric cam-grooves, a set of radially-mounted pushers provided with portions arranged so that one half engages with the cam-grooves of such disks whereby the pushers are moved in and out at the desired times, and means for vibrating the cam in a right-hand and left-hand manner, substantially as described.

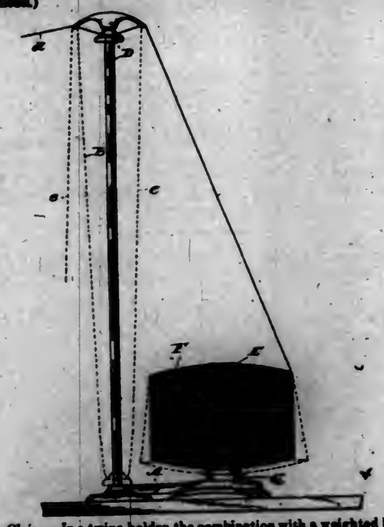
5. In a nut-tapping machine, the means for pushing the nuts forward into position, which consists of a set of pushers each made in two portions one portion slidingly mounted in the other—one portion of each pusher having a notch and the other portion a spring-actuated pin to engage with the notch and permit the parts to be collapsed or extended, substantially as described.

6. In a nut-tapping machine, the means for feeding the nuts forward, which consists of a set of vibrating cam-disks having a set of eccentric cam-grooves, a set of radially-mounted and movable pushers engaging with the grooves so that the vibrations of the cam reciprocate the pushers in the desired manner, an independently-movable outer portion of each pusher slidingly mounted in the main portion of the pusher and provided with a notch in its upper surface, a spring-actuated plug in the main portion of the pusher adapted to engage with the notch in the independently-movable portion of the pusher and hold the same in position or permit it to move relatively inwardly when striking a rigid article, a pin g^3 arranged on a stationary portion of the machine and in the path of the pusher to force the pushers into their extended position, substantially as described.

7. In a nut-tapping machine, the means for operating or feeding forward the nuts, which consists in the combination of a main driving-shaft, an intermediate driving-shaft, means for transmitting power or motion from the main driving-shaft to the intermediate shaft in a vibratory manner, a reciprocating sliding bar H^3 provided with lugs adjustably mounted thereon, a lever-arm secured to the intermediate driving-shaft and arranged to contact the lugs and reciprocate said sliding bar, a cam vibratingly mounted in a horizontal plane, mechanism on the sliding bar engaging with the vibrating cam to vibrate the same by the reciprocations of the sliding bar, and a set of reciprocating pushers arranged to be actuated by the cam to feed the blank nuts forward into position, substantially as described.

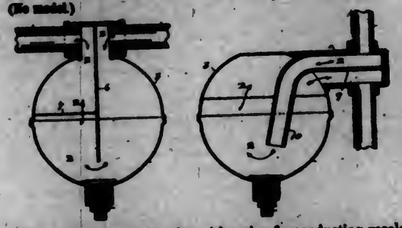
8. In a nut tapping machine, the means for holding and feeding the nuts forward, which consists in the combination of a hopper arranged to have a step-by-step rotation, a circular ratchet on such hopper, a vertical shaft provided with a dog or pawl eccentrically mounted on the upper portion thereof to move the hopper in a step-by-step manner, a lever-arm on the lower portion of said vertical shaft, a sliding bar H^3 provided with adjustable lugs I I' arranged to contact the lever-arm and vibrate the same during the reciprocations of the sliding bar, a second set of lugs A^5 and A^6 on said sliding bar, a vibrating shaft D' provided with a lever-arm D^4 arranged to contact the second set of lugs and reciprocate the sliding bar, and means for transmitting power and motion to the vibratory shaft, substantially as described.

9. In a machine of the class described, the belt-shifting device which consists of a combination of tight and loose pulleys of different diameters one of which is provided with an inner or intermediate abrupt bevel-edge, a belt-guiding loop of substantially greater length than the width of the belt, and an adjustable friction-bearing for preventing the yielding of the shipper-rod and its loop to anything other than the positively-actuating mechanism, and a shipper-rod for carrying the belt-guiding loop mounted in the adjustable friction-bearing, substantially as described.



604,448. NOSE-GUARD FOR EYEGLASSES. GEORGE W. WELLS, Southbridge, Mass., assignor to the American Optical Company, same place. Filed June 21, 1897. Serial No. 641,563. (No model.)

Claim.—1. In a nose-guard for eyeglasses, the combination with the main part of the nose-guard, of a two-leaf or double spring extending at the back thereof, and two nose-pads secured thereto and moving therewith, one leaf or part of said spring being intermediate the other leaf or part of the spring and the back of the main part of the nose-guard, and secured to said main part, substantially as shown and described.



2. In a nose-guard for eyeglasses, the combination with the main or rigid part of the nose-guard, of a spring extending at the back thereof, and two nose-pads secured thereto and moving therewith, and a second spring intermediate the first-mentioned spring and the back of the main part of the nose-guard, and secured at one end to said main part, and at its other end to one end of said first-mentioned spring, substantially as shown and described.

604,449. TWINE-HOLDER. EDWARD B. WHITE, Dayton, Ohio. Filed Oct. 24, 1896. Renewed Oct. 18, 1897. Serial No. 655,022. (No model.)

Claim.—In a twine-holder, the combination with a weighted base having a stud or support for the twine and a vertical rod attached thereto, of the opposite horizontally-extending arms at the top of the rod having inclined guide-openings, and a weight sliding on the rod provided with opposite inclined guide-openings and a groove on its under side connecting the openings, substantially as and for the purpose shown and described.

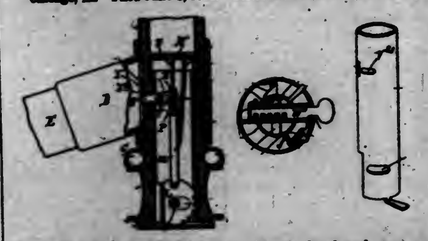
604,450. GASOLINE-FILTER. CHARLES S. WHITE, Minneapolis, Minn., assignor of one-half to J. Henry Bear, same place, and George H. Morse, Elm Prairie, Minn. Filed June 17, 1895. Serial No. 553,003. (No model.)

Claim.—1. The combination with a pipe for conducting gasolene to a burner, of a filter consisting of a hollow body providing downward inflow and upward outflow conduits in communication only near the bottom of the chamber of said hollow body, and a screen in the outflow-conduit arranged suitably above the plane of communication between the conduits, and means for removing settlings from said chamber, substantially as set forth.

2. The combination with a pipe for conducting gasolene from a source of supply to a burner, of a filtering device consisting of a downwardly-curved section coupled into the pipe and provided with a filtering medium arranged to intercept the upward flow from such curved section to the outflow-pipe, substantially as set forth.

604,451. CAR-BUFFER. HERMAN F. BALL, Cleveland, Ohio. Filed Sept. 21, 1897. Serial No. 652,442. (No model.)

Claim.—1. In a car-buffer, the combination of a flanged spring-box or base-section, a flanged cup friction-plate which incloses and telescopes with the spring-box or base-section, interposed buffer-springs, and a removable collar or slip-ring which encircles the flanged spring-box or base-section and is detachably connected with the flanged cup friction-plate, substantially as and for the purposes specified.



2. In a car-buffer, the combination of a flanged spring-box or base-section, a flanged cup friction-plate, interposed buffer-spring, a removable slip-ring which encircles the base-section or spring-box and is detachably attached to the cup friction-plate, and means for preventing the rotation of the cup friction-plate on the base-section or spring-box, substantially as and for the purposes specified.

3. In a car-buffer, the combination of a base-section or spring-box having a notched flange, a flanged cup friction-plate having one or more inner ribs which engage the notched flange of the base-section, interposed buffer-spring, and a slip-ring, substantially as and for the purposes specified.

4. In a car-buffer, the combination with a base-section or spring-box having a notched flange, of a flanged cup friction-plate having one or more ribs on its interior which engage the notches of the flange of the spring-box, interposed buffer-spring, and a notched slip-ring, substantially as and for the purposes specified.

604,452. LOCKING DEVICE FOR BICYCLES. JOHN C. BARR, Chicago, Ill. Filed June 8, 1896. Serial No. 594,673. (No model.)

Claim.—1. The combination of a bicycle head and stem, each provided with an aperture with a bolt-controlling device within each stem and its bolt in proper relation to said apertures, a cylindrical shield to control each apertures, a lock for each shield and means whereby each lock is controlled by the keys so as always to free the shield when the key is introduced.

2. The combination of a bicycle head and stem, each provided with an aperture with a bolt-controlling device within each stem, and its bolt in proper relation to said aperture, a cylindrical shield to control each apertures, a lock for each shield and means whereby each lock is controlled by the key so as always to free the shield when the key is introduced, and a frame portion outside the apertures in the head and stem to conceal them and the bolt and prevent access thereto.

3. In a bicycle-lock, the combination of the head and stem with a bolt-controlling device within the stem and adapted to lock the head and stem together, apertures in the stem adapted to receive said bolt, a transverse key-chamber below the stem, a reciprocating key adapted to move therethrough and connecting means whereby the reciprocation of said key operates the bolt.

4. In a bicycle-lock the combination of a locking device inserted in the stem with a key-chamber below the stem, and a spring-lock to lock the key in and to close the key-aperture when the key is removed.

5. In a bicycle-lock, the combination of a slotted casing containing mechanism to be received in the stem with a cylindrical shield for the slot in said casing, a lock to secure the shield in its operative position and a key to control said lock.

6. A lock for bicycles, comprising a pivoted bolt, bolt-receiving apertures in the stem and head opposite a frame-tube of the bicycle, a controlling device for said bolt concealed within the stem of the bicycle, a connecting-rod pivotally connected with said controlling device and provided with a slot, a projecting part on said bolt engaging said slot, a key-chamber near said controlling device, said controlling device projecting into said key-chamber so as to be engaged by the key.

7. A bicycle-lock, comprising a pivoted locking-bolt within the stem and adapted to pass into an aperture in the stem and head and lock them together, a spring-actuated arm within said stem and forming part of said bolt, a toothed plate pivotally connected with said

arm, a key-chamber into which said toothed plate projects, the parts so positioned that when the key is inserted in said key-chamber it engages said toothed plate and actuates the bolt.

8. A bicycle-lock comprising a cylindrical case or frame adapted to be received in the lower part of the stem, a key-chamber at the lower part of such stem, a locking-bolt within said stem and adapted to pass through an aperture in the stem and head and lock them together, an actuating device for said bolt projecting into said key-chamber, said bolt normally in a locked position, the parts so constructed that when the key is inserted in said key-chamber, the bolt is held in an unlocked position and a connecting device for said key contained within said case, and adapted to engage said key and hold it in the lock.

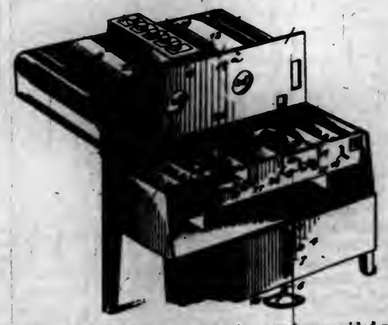
604,453. SECONDARY ELECTRIC CLOCK. AARON D. BLODGETT, Newton, Mass. Filed May 29, 1897. Serial No. 638,670. (No model.)

Claim.—1. In a device of the character specified, the combination of the lever E adapted to be reciprocated, with the portion E' pivoted to the said lever at e^3 having its feed-pawl provided with an inclined surface e^9 and having its rear end provided with the face e^8, with the stop or pins e^7, e^{10} arranged as specified and acting in conjunction with the teeth or notches of the feed-wheel as described, and said feed-wheel.

2. The combination in a device of the character specified of the spur-wheel having the feeding teeth or notches, the detent-pawl having a point to engage said teeth or notches and the extension f^4, and a movable projection or lock moved against said extension to lock the detent as the feed-pawl approaches or reaches the end of its forward feeding movement, and said pawl.

3. The combination in a device of the character specified of the oscillating arm E, the spring E^2, the support e^6 pivoted at A, having the curved slot A^3 and a clamping nut or device A^4, as and for the purposes described.

4. The combination in a device of the character specified of the main shaft C, the feed-wheel E^2 mounted thereon having feeding spurs or notches, the sleeve D mounted upon said shaft and free to be turned backward and forward a limited extent thereon, an arm E extending outward from said sleeve, an armature attached to said sleeve and having outwardly-extending arms, the magnets D^2, D^3 arranged in respect to the arms of the armature as shown and described, a feed-pawl E' pivoted to the arm E and shaped at its end as specified, the arm moving spring E^3, the stops or pins e^7, e^{10}, the detent F having the inclined end f^7 and the extension f^6 and the movable detent-locks f^3, f^5, all arranged to operate as and for the purposes set forth.



5. In a time-dial movement of the character specified, the combination of a spur-wheel having a single set of teeth, a lever adapted to be oscillated at stated intervals, a feed or driving pawl carried by said lever, a detent-pawl and means substantially as specified for seating the driving-pawl between the teeth of the said wheel at the end of its backward movement, for seating the detent-pawl between the teeth of said wheel at the end of the driving or forward movement, and for locking the driving-pawl and detent-pawl in engagement with the teeth of said wheel while the lever is stationary or at rest.

6. The combination in a time-dial movement of a wheel having a single set of teeth, a lever adapted to have oscillating movements imparted to it at stated intervals, a feeding or driving pawl for imparting an intermittent progressive feeding movement to said wheel carried by said lever, means for seating said pawl between the teeth of the wheel as said lever approaches the end of its backward movement and made operative because of said backward movement of the lever, a detent-pawl and a projection upon said lever adapted to be brought into contact with said pawl as the said lever is approaching the end of its forward movement, and to be held in contact with said pawl while the lever is in its forward position, and an additional projection upon said lever adapted to be brought into contact with said pawl as the said lever approaches the end of its backward movement, whereby the said lever acts to lock the detent as it approaches and recedes from the end of each of its movements, and to hold the said detent while at the end of said movements.

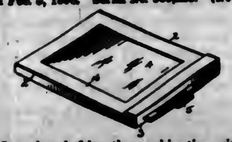
7. The combination in a time-dial movement of a wheel having a single set of teeth, a lever adapted to have oscillating movements imparted to it at stated intervals, a feeding or driving pawl for imparting an intermittent progressive feeding movement to said wheel carried by said lever, means for seating said pawl between the teeth of the wheel as said lever approaches the end of its backward movement and made operative because of said backward movement of the lever, as and for the purposes set forth.

8. The combination in a time-dial movement of a wheel having a single set of teeth, a lever adapted to have oscillating movements imparted to it at stated intervals, a feeding or driving pawl for imparting an intermittent progressive feeding movement to said wheel carried by said lever, and means such as a pin and a cooperating surface or arm of the feed-pawl for seating said pawl between the teeth of the wheel as said lever approaches the end of its backward movement, and made operative because of said backward movement of the lever, as and for the purposes set forth.

604,454. KITCHEN-CABINET. THOMAS W. BOYETTE, Dallas, Tex. Filed May 27, 1897. Serial No. 638,422. (No model.)

Claim.—1. A kitchen-cabinet having a casing provided with a tilting lid, bins supported by said lid, and sifting and conveying devices arranged within the casing respectively in communication with the bins and adapted to be exposed by tilting said lid, substantially as specified.

2. A kitchen-cabinet having a casing and inclosed sifting and conveying devices, said casing being provided with a tilting lid and a drop-door having meeting edges, bins supported by said lid in communication respectively with the sifting and conveying devices and adapted to be inclined with the lid to expose the interior of the casing, and a common locking device connecting the meeting edges of said lid and door, substantially as specified.



3. A kitchen-cabinet having a casing provided with a tilting top lid and a front drop-door, adapted to meet at their contiguous edges, bins supported by said lid in communication with the interior of the casing, and a common locking device for said lid and door, including an eye on the door engaging a socket formed in a beveled surface carried by the lid, and a pin for engaging said eye, substantially as specified.

4. A kitchen-cabinet having a casing provided with a drop-door, a scale mounted upon the drop-door and arranged in its normal position when the door is in its open position, said scale having a detachable pan and a spring-actuated stem or shank, extending beyond the free edge of the door and adapted to engage a socket in the casing, to lock the door in its closed position, substantially as specified.

5. A kitchen-cabinet having a casing provided with an open top fitted with a lid, bins supported by said lid, troughs arranged within the casing in communication with the bins, the outlet ends of the bins being located at the rear ends of the troughs, said troughs being provided at their front ends with outlet-spouts, and conveyors arranged in the troughs and having exposed operating devices, the lid and supported bins being adapted to be tilted rearwardly to expose the interiors of the troughs, substantially as specified.

6. A kitchen-cabinet having a casing provided with parallel guides, removable stop-plates closing the front ends of said guides, sifting devices having slides mounted upon said guides and adapted to be removed through the open front ends of the guides, the sifting devices having agitators of which the shafts extend through the bearings in the stop-plates, and bins mounted upon the top of the casing and adapted to discharge into the sifting devices when the latter are in their normal positions under the bin-outlets, substantially as specified.

604,455. PHOTOGRAPHIC PLATE HOLDER. FRANK A. BROWNELL, Rochester, N. Y., assignor to the Eastman Kodak Company, same place. Filed Feb. 5, 1896. Serial No. 578,322. (No model.)

Claim.—1. In a plate-holder, the combination with the back having the slotted strip at one end and the flap therein, of the plate-container hinged to the opposite end of the back, open at the front, and having the way for the slide or shutter and the hinged back cover flap, and the slide or shutter operating in the strip and container, substantially as described.

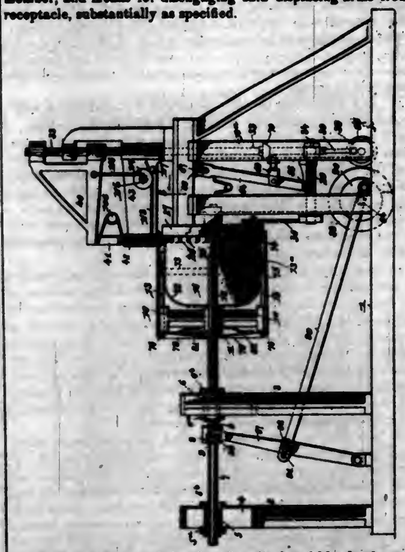
2. In a plate-holder, the combination with the back having the slotted strip at one end, of the plate-container open at the front and hinged to the opposite end of the back, and having the ways for the slide and the back cover flap hinged to the rear side of the outer free end of the container and adapted to fold beneath it, and the slide or shutter cooperating with the back and container, substantially as described.

3. In a plate-holder, the combination with the back, having the slotted strip at one end, of the plate-container open at the front and hinged to the opposite end of the back, and having the way for the slide, and the back-cover having the corrugations and hinged to the back of the container, and the slide or shutter cooperating with the back and container, substantially as described.

4. In a plate-holder, the combination with the back, having the strip at the end of the plate-container hinged to the holder-back, consisting of the outer face-frame 16 the frame 18, and the inner frame 17 having the back cover flap 11, and a slide or shutter, substantially as described.

5. In a plate holder, the combination with the strip 3 having the passage for the slide or shutter, and the recesses above and below it, of the flap 6, the flexible hinge-strip 7 secured to the strip 3, and the springs 9, substantially as described.

604,456. BRAKE-BEAM. LUTHER C. BURDEN, Chicago, Ill., assignor to the Chicago Railway Equipment Company, same place. Filed Dec. 20, 1897. Serial No. 664,502. (No model.)



Claim.—1. In a trussed brake-beam, the combination with the tension member and tension-nut, of a rocking block or bearing for the nut, substantially as and for the purposes specified.

2. In a trussed brake-beam, the combination with the tension-rod and tension-nut, of a perforated bearing-block having the form of the segment of a sphere, and a brake-head having a corresponding seat for the reception of the bearing-block; substantially as and for the purposes specified.

604,457. BASKET-MAKING MACHINE. THOMAS CRIMMIN, Bridgeport, Ala. Filed June 4, 1897. Serial No. 639,457. (No model.)

Claim.—1. In a machine of the class described, a folder having an interior form, and a reciprocatory exterior member supported by an axial shaft connected with said exterior member at its outer end, radially-movable displacing-arms mounted upon the outside of the exterior member of the folder and provided at their inner sides with means for engaging a completed receptacle, and removing the latter from the form during the backward movement of the exterior member, and means located contiguous to the supporting-shaft of the exterior member, for spreading the displacing-arms to release the receptacle, the receptacle being removable from the exterior member at its inner end, substantially as specified.

2. In a machine of the class described, a folder having an interior form and a reciprocatory exterior member, radially-movable displacing-arms mounted upon the exterior member of the folder and provided contiguous to their extremities with interior shoulders for engaging the edge of a completed receptacle, and removing the latter from the form during the backward movement of the exterior member, and means for disengaging said displacing-arms from the receptacle, substantially as specified.

3. In a machine of the class described, a folder having an interior form and an exterior reciprocatory member, shouldered displacing-arms pivotally mounted upon the reciprocatory member and provided with trip extensions, and a stop located in the paths of the extremities of said trip extensions to spread the detaching arms when the reciprocatory member is retracted, substantially as specified.

4. In a machine of the class described, a folder having an interior form, an exterior reciprocatory member, pivotal detaching-arms mounted upon the reciprocatory member and shouldered to engage a receptacle on the form, said detaching-arms having inturned trip extensions, a stop located in the paths of the trip extensions, whereby when the reciprocatory member is retracted the detaching-arms are spread to release a receptacle, and a locking device for securing the detaching-arms in their spread position, substantially as specified.

5. In a machine of the class described, a folder having an interior form, an exterior reciprocatory member, pivotal detaching-arms mounted upon the reciprocatory member and shouldered to engage a receptacle on the form, said detaching-arms having inturned trip extensions, a stop located in the paths of the trip extensions, whereby when the reciprocatory member is retracted the detaching-arms are spread to release a receptacle, and a locking device consisting of a rotatable disk having slots to receive the extremities of the trip extensions and adapted to be turned to retain the latter with the detaching-arms in their spread position, substantially as specified.

6. In a machine of the class described, a folder having an interior form and an exterior reciprocatory member, pivotal detaching-arms mounted upon the reciprocatory member and yieldingly held in position to engage a receptacle on the form, and locking devices for securing said arms in their inoperative or spread position, substantially as specified.

7. In a machine of the class described, the combination with a rotary blank-folding form, a stapling mechanism having a staple-driver mounted for radial movement toward and from the exterior surface of a blank on the form, of a guide disposed parallel with the axis of the form, an anvil mounted in the guide for radial movement toward and from the interior surface of the blank, in alinement with the staple-driver, whereby it may be arranged in contact with the inner surface of a receptacle in the path of impact of said staple-driver, a slide mounted in said guide, and having a cam-face for cooperation with the anvil, and means for actuating the slide, substantially as specified.

8. In a machine of the class described, the combination with a form and stapling mechanism having a staple-driving member operating radially with relation to the form, of an anvil mounted for radial movement in alinement with the staple-driving member, means for moving the anvil to bring it in contact with the inner surface of a receptacle in the line of impact of the staple-driving member, and independently-movable means carried by the anvil for bending the staple-points, substantially as specified.

9. In a machine of the class described, the combination with a

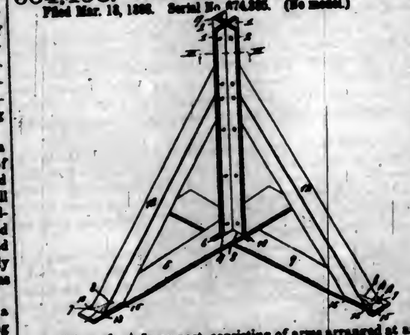
form and stapling mechanism having a staple-driving member, of an anvil mounted for movement in the plane of the staple-driving member and adapted to be arranged in contact with the inner surface of the wall of a receptacle to receive the impact of the staple-driving member, a clenching-plunger mounted upon the anvil, and means for successively advancing the anvil and actuating said clenching-plunger, substantially as specified.

10. In a machine of the class described, the combination with a form and stapling mechanism including a staple-driving member, of an anvil mounted for movement in alinement with the staple-driving member and adapted to be arranged in contact with the inner surface of the wall of a receptacle to receive the impact of the staple-driving member, a clenching-plunger mounted in a guide arranged axially in the anvil, a slide operatively connected with the anvil, a trip carried by the slide and adapted to cooperate with a cam to engage and actuate the clenching-plunger, and means for reciprocating the slide, substantially as specified.

11. In a machine of the class described, the combination with a form and stapling mechanism including a staple-driving member, of an anvil movable in alinement with the staple-driving member whereby it may be arranged in contact with the inner surface of the wall of a receptacle to receive the impact of said member, a die carried by the anvil and provided with a bending-seat having downwardly-convergent walls to inwardly deflect the extremities of a staple, a clenching-plunger operating in a guide communicating with the bending-seat, and means for successively advancing the anvil and actuating the clenching-plunger, substantially as specified.

12. In a machine of the class described, the combination with a form and stapling mechanism including a staple-driving member, of an anvil movable in alinement with the staple-driving member and adapted to be arranged in contact with the inner surface of the wall of a receptacle, a die carried by the anvil and provided with a bending seat having downwardly-convergent and transversely-beveled walls, whereby the extremities of a staple are bent inwardly and deflected laterally, a clenching-plunger, and means for successively advancing the anvil and actuating said plunger, substantially as specified.

13. In a machine of the class described, the combination of a hollow rotary form provided in its side with spaced openings, stapling mechanism having a staple-driving member, a normally stationary anvil arranged within the hollow form in alinement with the staple-driving member and capable of movement toward and from the same when an opening of the form is alined therewith, to arrange the face of the anvil in contact with the inner surface of a receptacle to receive the impact of the staple-driving member, means for advancing the anvil during the operative movement of the staple-driving member, and feeding mechanism for imparting a step-by-step rotary movement to the form, to bring the openings therein successively in alinement with the anvil, substantially as specified.



14. In a machine of the class described, the combination with a rotary form having a circumferential series of openings, stapling mechanism including a reciprocatory staple-driving member, a reciprocatory anvil adapted to be extended radially through the openings in the form and arranged in contact with the wall of a receptacle to receive the impact of the staple-driving member, and a slide operatively connected with said anvil, of a driving-shaft, a stem carrying the staple-driving member operatively connected with a crank on the driving-shaft, a feeding-lever operatively connected with said stem and carrying a pawl for engaging a ratchet on the form, an oscillatory arm connected with said slide, a cam arranged upon the stem, and a push-arm connected with said oscillatory arm and arranged in the path of the cam, substantially as specified.

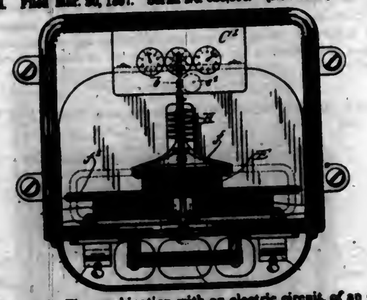
15. In a machine of the class described, the combination with a rotary form having a circumferential series of openings, stapling mechanism including a reciprocatory staple-driving member, a stem carrying said staple-driving member and adapted to receive a continuous reciprocatory movement, an anvil adapted to be extended radially through the openings in the form and arranged in contact with the inner surface of the wall of a receptacle, and a slide for actuating the anvil, of an oscillatory arm connected with said slide and provided with a push-arm, and a peripheral irregular beveled cam carried by said stem for engagement with the extremity of the push-arm, and capable of rotary adjustment to vary the throw of the push-arm, substantially as specified.

16. In a machine of the class described, the combination with a movable folder member and stapling mechanism, and a driving-shaft with which the stapling mechanism is operatively connected, and having a friction-disk, of a friction-wheel operatively connected with the folder member and having movable journal-boxes whereby it may be arranged in peripheral contact with said friction-disk, a toggle-lever connecting the journal-boxes of said friction-wheel with a fixed object, a foot-lever connected with the contiguous ends of the arms of the toggle-lever for adjusting the journal-boxes, and stop mechanism operatively connected with the foot-lever for checking the movement of the friction-wheel at intervals, substantially as specified.

17. In a machine of the class described, the combination with a movable folder member and stapling mechanism, and a driving-shaft with which the stapling mechanism is operatively connected, and having a friction-disk, of a friction-wheel operatively connected with the folder member and having movable journal-boxes whereby it may be arranged in peripheral contact with said friction-disk, a toggle-lever connecting the journal-boxes of said friction-wheel with a fixed object, a foot-lever connected with the contiguous ends of the arms of the toggle lever for adjusting the journal-boxes, and stop mechanism carried by the foot-lever, consisting of a reciprocable stop-bar mounted upon the foot-lever, and a tilting foot-rest or treadle mounted upon the foot-lever and operatively connected with said stop-bar, the friction-wheel being provided with projections for engagement with said stop, substantially as specified.

604,458. FENCE-POST. GERARD A. DENEMARK, Lovejoy, Mo. Filed Mar. 18, 1898. Serial No. 674,325. (No model.)

Claim.—1. A fence-post, consisting of arms arranged at an angle to each other, one of which is provided with notches in its edges, and the other of which terminates just above said notches, a sill, provided with a slot through which the notched end of said arm may be projected until the lower end of the other arm rests upon said sill, and an inclined brace secured at its upper and lower ends, respectively, to said post and to one end of said sill, substantially as described.



2. A fence-post, consisting of arms arranged at an angle to each other, one of which is provided with notches in its edges, and the other of which terminates just above said notches, a sill, provided with a slot through which the notched end of said arm may be projected until the lower end of the other arm rests upon said sill, and with a slot near one end, and a diagonal brace extending through the last-named slot and bearing upon the sill contiguous thereto, and secured at its upper end to said post, substantially as described.

3. A fence-post, consisting of a pair of arms arranged at an angle to each other, one of them provided with notches near its lower end and the other terminating just above said notches, a sill provided with a slot and a communicating opening, through which the notched part of said arm is projected, and in which that portion of the arm between said notches may be rotatably operated, and provided also near one end with a longitudinal slot and a communicating opening, an inclined brace notched near its lower end to form a T-shaped head which may be fitted through said slot and opening and then turned therein until said head is disposed transversely of said opening; said brace having its upper end secured to the post, substantially as described.

4. A fence-post, comprising angle-irons secured together so as to form arms extending at right angles to each other, one of which is notched near its lower end to form a depending inverted-T-shaped head, and the other of which terminates above said notches, a sill provided with a horizontal slot, which is slipped upon said T-shaped head, a second sill provided with a slot that it may also be slipped upon said head below the first-named sill, and with a communicating opening, in order that the neck or stem of said T-shaped head may be turned therein to dispose said sills at an angle to each other, and an inclined brace secured at its lower end to each sill and at its upper end to said post, substantially as described.

5. A fence-post, constructed of angle-iron, and provided with a vertical series of bolts, an angle-bar provided with a corresponding series of vertical slots through which said bolts extend, washers upon said bolts, and clamping-nuts upon the bolts and adapted to clamp the washers upon fence-wires interposed between them and said bar, substantially as described.

604,459. ELECTRIC METER. THOMAS DUNCAN, Fort Wayne, Ind. Filed Mar. 30, 1897. Serial No. 630,208. (No model.)

Claim.—1. The combination with an electric circuit, of an electric meter for measuring the energy of said circuit, provided with a rotating armature, field-coils connected in series in said circuit, volt-coils cooperating with said field-coils to set up a shifting magnetic field to actuate the armature, a transformer having a primary coil in shunt across said circuit, and a closed-circuit secondary coil between which and the primary coil a consequent magnetic field is set up, and a tertiary coil wound to inclose the lines of said magnetic field, and connected with series with the volt-coil, substantially as described.

2. An induction motor meter provided with an armature, coils acting inductively on the armature, a magnetic drag also acting on the armature, and a shield of conducting material inserted between the coils and drag.

3. An induction motor-meter provided with an armature, coils acting inductively on the armature, a magnetic drag also acting on the armature, and a shield of conducting material embracing the armature between the coils and drag.

4. An induction motor-meter provided with a disk armature, coils acting inductively on the armature, a magnetic drag also acting on the armature, and a shield of conducting material embracing the disk between the coils and drag.

5. An induction motor-meter provided with an armature, coils acting inductively on the armature, a magnetic drag also acting on the armature and shield of conducting material inserted between the coils and drag, said shield being slotted to permit the free rotation of the armature therethrough.

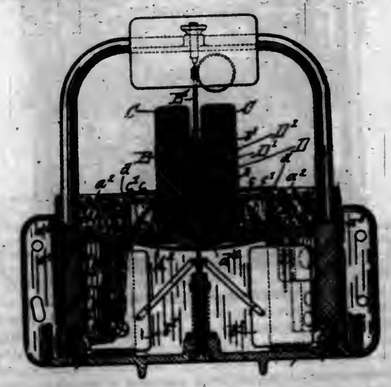
6. A meter provided with a disk armature, coils acting inductively on the armature, a magnetic drag also acting on the armature, a shield of conducting material arranged between the coils and drag and a slot in said shield through which the disk is free to rotate.

7. The combination with the meter-frame, of the armature mounted on its spindle, a bearing on the frame for one end of said spindle, a pivotal arm having a bearing for the other end of said spindle, coils acting inductively on the armature, a magnetic drag also acting on said armature, a shield of conducting material secured to the frame between the coils and drag and forming a support for the pivotal arm, and a slot in said shield through which the armature rotates.

8. An electric meter provided with a rotative part, means for exerting a torque on said part, registering or recording devices therefor, an increasing resistance detachably applicable to said part, and means for measuring the movement of said parts in opposition to said resistance.

9. An electric meter provided with a rotative part, means for exerting a torque on said part, registering or recording devices therefor, a spring detachably applicable to said part, and means for measuring the movement of said part in opposition to the spring.

10. A meter provided with a rotative part, means for exerting a torque on said part, registering or recording devices therefor, a coiled spring detachably applicable between the rotating part and a stationary part, and means for measuring the movement of the part in opposition to said spring.



11. A meter provided with an armature, means for exerting a rotary torque on said armature, registering or recording devices therefor, a spring coiled about the armature-spindle and secured to a fixed part on the meter-frame, and detachable connections between the free end of the spring and the spindle.

12. An electric meter provided with an armature, coils acting inductively on said armature, a spring detachably applicable between the armature and a stationary part, and means for measuring the movement of the armature in opposition to said spring.

13. An electric meter provided with a rotating armature, registering or recording devices, a spring detachably applicable between the armature and a stationary part on the meter-frame, a graduated scale on the armature and a stationary pointer or mark for measuring on the scale the movement of the armature in opposition to said spring.

14. A magnetic drag for electric meters and the like, comprising two horseshoe sections arranged with their ends in proximity, and inserting pole-pieces secured to the ends of the sections at their points of juncture.

604,460. ELECTRIC METER. THOMAS DUNCAN, Fort Wayne, Ind. Filed Aug. 6, 1897. Serial No. 647,203. (No model.)

Claim.—1. An electric meter provided with an annular armature and a plurality of magnetic fields part of which are set up within and part without the armature, two fields being arranged on the same side of the annular wall of the armature on separate axes located on opposite sides of the axis of a field on the other side of said annular wall from said two fields, and means for producing a phase displacement between the inner and outer fields.

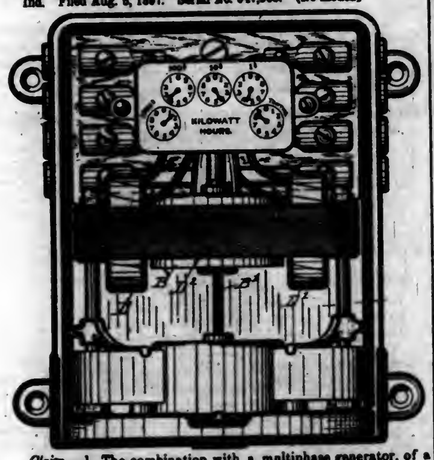
2. An electric meter provided with an annular armature, a magnetic field exterior to the armature located on an axis intersecting the armature, a plurality of magnetic fields within the armature, two inner fields being arranged on separate axes on opposite sides of the axis of the outer field, and means for producing a phase displacement between the inner and outer fields.

3. An electric meter provided with an annular armature, a magnetic field exterior to the armature, and magnetic fields within the armature located on intersecting axes, each extending at an angle to the axis of the outer field.

4. An electric meter provided with an annular armature, a magnetic field exterior to the armature, and a plurality of magnetic fields within the armature arranged on axes intersecting each other and the axis of the outer field at the center of the armature, and means for producing a phase displacement between the inner and outer fields.

5. An electric meter provided with an annular armature, series coils exterior to the armature, and a plurality of coils within the armature arranged on separated axes on opposite sides of the axis of the series coils, and means for producing a phase displacement between the currents in the outer and inner coils.

6. An electric meter provided with an annular armature, coils exterior to the armature, and coils within the armature arranged on separated axes on opposite sides of the axis of the series coils, and a magnetic core within the inner coils.



7. An electric meter provided with an annular armature, coils exterior to the armature, coils within the armature, and a cross-shaped magnetic core upon the poles of which the inner coils are mounted.

8. An electric meter provided with an annular armature, coils exterior to the armature, a cross-shaped core within the armature arranged with its axes at an angle to the axis of the outer coils and inner coils mounted on the poles of said cross-shaped core.

9. An electric meter provided with an annular armature, coils exterior to the armature, a cross-shaped magnetic core within the armature, coils within the armature mounted upon the poles of the cross-shaped magnetic core, and means for adjusting said core about the axis of rotation of the armature.

10. An electric meter provided with a rotary armature, coils acting inductively on said armature to rotate the latter, binding-posts for connecting said coils in circuit and means for adjusting the speed of the armature, comprising terminals of high resistance secured to the ends of said coils and adapted to be inserted varying distances within the binding-posts.

604,461. ELECTRIC METER. THOMAS DUNCAN, Fort Wayne, Ind. Filed Aug. 6, 1897. Serial No. 647,305. (No model.)

Claim.—1. The combination with a multiphase generator, of a meter provided with a rotary armature, a pair of series coils, one connected in one circuit from the generator and the other connected in another circuit from the generator, and two sets of shunt-coils, the set adjacent to each series coil being connected in the other circuit from that in which its adjacent series coil is connected.

2. The combination with a two-phase generator, of a meter provided with a rotary armature, two series coils, adjacent to the armature, one connected in each circuit from the generator and two shunt-coils opposite each series coil on the other side of the armature-wall therefrom, the shunt-coils opposite each series coil being connected across the other circuit from that in which said series coil is connected.

3. The combination with a two-phase generator, of a meter provided with a rotary armature of annular form, a pair of series coils exterior to the armature, one connected in each generator-circuit and two sets of shunt-coils within the armature, the set adjacent to each series coil being connected across the other circuit from that in which said series coil is connected.

4. The combination with a multiphase generator, of an electric meter provided with an annular armature and a plurality of magnetic fields part of which are set up within and part without the armature, one field being set up upon an axis extending between two fields located on the opposite side of the annular wall of the armature from the first field, means for connecting the first field in one of the generator-circuits, and means for connecting the opposite two fields in the other generator-circuits.

5. The combination with a multiphase generator, of an electric meter provided with an annular armature, a magnetic field set up exterior to the armature upon an axis extending between two magnetic fields set up within the armature, means for connecting the first field in one of the generator-circuits, and means for connecting the opposite two fields in the other generator-circuits.

6. The combination with a multiphase generator, of an electric meter provided with an annular armature, a magnetic field set up exterior to the armature, and magnetic fields set up within the armature on intersecting axes extending at an angle of approximately forty-five degrees with the axis of the outer field, means for connecting the outer field in one generator-circuit, and means for connecting the opposite inner field in another generator-circuit.

7. The combination with a two-phase generator, of a meter provided with a cylindric armature, a pair of series coils, one connected in each of the generator-circuits, and two sets of shunt-coils mounted within the armature upon the poles of a cross-shaped magnetic core, the set adjacent to each series coil being connected across the other circuit from that in which that series coil is connected.

8. A magnetic drag for electric meters comprising an armature, magnets arranged with the poles adjacent to said armature, a magnetic core arranged with its poles opposing and on the opposite side of the armature-wall from the magnet-poles and means for adjusting the relative positions of the opposing magnet and core poles.

9. A magnetic drag for electric meters comprising an annular armature, magnets exterior to said armature with their poles approaching the armature, a magnetic core within the armature having poles arranged opposite the poles of the magnet and means for adjusting the relative positions of the magnets and core.

10. A magnetic drag for electric meters comprising an annular armature, magnets exterior to said armature with their poles approaching the armature, a cross-shaped magnetic core within the armature adapted to stand with its poles in alinement with the magnet-poles and means for giving the core an oscillatory adjustment about the axis of the armature to vary the position of its poles with reference to the pole.

604,462. ELECTRIC METER. THOMAS DUNCAN, Fort Wayne, Ind. Filed Aug. 11, 1897. Serial No. 647,809. (No model.)

Claim.—1. In a meter of the class specified, the combination of an annular rotary armature; a magnetic field exterior to said armature; a plurality of magnetic fields within the armature and having intersecting axes each of which is arranged at an angle to the axis of the exterior field; and a friction-compensating magnetic axis arranged at right angles to the axis of the said exterior field.

2. An electric meter provided with an annular armature of low electrical resistance, series coils exterior to said armature, and a plurality of coils within the armature arranged on separate axes on opposite sides of the axis of the series coils, and a magnetic field acting at right angles to the axis of said series coils for the purpose of overcoming the friction of said meter.

3. In an electric induction-meter or motive device an annular rotatable armature, series coils exterior thereto, a plurality of volt-coils arranged within said armature upon intersecting axes and on opposite sides of the axis of the series coils, and an auxiliary starting coil or coils arranged upon laminated pole-pieces integral with the pole-pieces of said volt-coils, the said starting-coils being adapted to set up a magnetic field whose action is at right angles to the axes of the series coils.

4. In an electric induction-meter or motive device the combination of the series coils exterior to the armature and a plurality of volt-coils within the rotatable armature; in combination with a friction-compensating coil whose axis is at right angles to that of the axis of the series coils and adapted to be energized from the same source as the said volt-coils.

5. The combination in an electric meter of the series coils exterior to the rotatable armature; a plurality of volt-coils within the said armature whose axes are inclined to the axis of the said exterior coils; a friction-compensating coil whose axis is at right angles to that of the axis of the series coils and adapted to be energized from the same source as the said volt-coils; and an impedance-coil in series with the said compensating coil or coils.

604,468. ELECTRIC METER. THOMAS DUNCAN, Fort Wayne, Ind. Filed Aug. 26, 1897. Serial No. 649,556. (No model.)

Claim.—1. In a motor-meter, a revolvable metallic armature, and a series of field-coils without said armature whose adjacent poles are in close proximity thereto, and in such relation that the resulting intersecting lines of magnetization are at right angles to each other; in combination with an equal number of volt-coils located within the armature whose lines of magnetization are inclined to the said lines of magnetization of the field-coils, for the purpose specified.

2. In a motor-meter, a revolvable aluminium armature having its reduced upper end adapted to inclose the volt coils; two pairs of series coils without the said armature whose lines of magnetization bisect the armature and intersect each other at right angles; in combination with two pairs of volt-coils located within the armature whose poles are equal in number to the series coils and whose lines of magnetization intersect the said lines of magnetization of the field-coils; and means for retarding the said lines of magnetization of the volt-coils.

3. The process herein described of producing rotation in a revolvable metallic armature for motor-meters, which consists in setting up four or more intersecting lines of magnetization bisecting said armature by alternating electric currents differing in phase, thereby producing a shifting magnetic field about said armature adapted to actuate the same.

4. In an electric motor, a plurality of energizing-coils connected in series in the main line and conveying the current to be measured; a plurality of energizing-coils supplied with current from the mains in parallel and representing the electromotive force of the system; and an impedance coil in series with said volt-coils; in combination with a revolvable metallic armature of low electrical resistance arranged between the two series of energizing-coils as described; and a proper totalizing mechanism.

5. In a motor-meter of the class described a rotatable metallic armature having a contracted upper portion for the motive part of the meter and an enlarged lower portion for the retarding mechanism; a series of field-coils without said contracted portion of the armature; a series of volt-coils within said armature and adjacent to the field-coils; a fixed iron ring 13 embracing said armature out of contact therewith for the purpose specified; and a permanent magnet or magnets arranged within the enlarged portion of the armature for the purpose of increasing its retardation, all substantially as described.

6. In a motor-meter the metallic frame 1 having a marginal groove and aperture lateral ears for the purpose specified; a pair of upright supporting-posts 10 for the motive parts; a yoke 17 surmounted on said posts as shown; the upright tube 35 fixed as shown in a supporting-chair and adapted to rigidly support the volt-coils; the armature-spindle 26 rotatably mounted in a proper bearing and arranged within said upright tube; a rotatable armature fixed on said spindle as shown; the supporting-disk 15 arranged as shown on said posts and adapted to support the field-coils; the ring or band 13 arranged as described about said armature; the permanent retarding-magnets within said armature as described; and means for rigidly fixing the armature-spindle out of contact with the jewel-bearing, all substantially as described.

7. In a motor-meter, the combination of a revolvable metallic armature; a fixed metallic ring encircling said armature out of contact therewith and adapted to conduct the lines of magnetic force through said armature; and a permanent magnet or other source of magnetism arranged within said armature.

8. An electromagnetic drag consisting of a magnet, an annular magnetic conductor forming part of the magnetic circuit of said magnet, and a revolvable armature located within the field of force between said magnet and said conducting-ring and adapted to cut the lines of force of said field.

9. In a motor-meter, an electromagnetic drag consisting of an annular metallic conducting-ring, in combination with a revolvable cylinder of low resistance and inclosed by said ring; and a compound magnet or magnets within said revolvable armature as shown, having like poles terminating in a common pole-piece of iron, as described.

604,464. ELECTRIC METER. THOMAS DUNCAN, Fort Wayne, Ind. Filed Sept. 11, 1897. Serial No. 651,370. (No model.)

Claim.—1. The herein-described method of measuring alternating electric currents which consists in setting up or establishing a shifting field of magnetism from three intersecting lines or axes of magnetization, and adapted to actuate a rotatable armature in a motor-meter arranged within the energizing-coils producing said lines of magnetization.

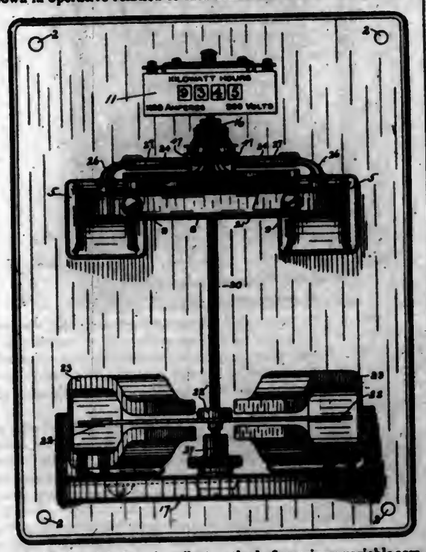
2. The process of producing rotation in a revoluble metallic armature for meter-meters, arranged within the energizing-coils, which consists in setting up a shifting field from three intersecting lines or axes of magnetization two of which are synchronous in phase but differ in phase from the third, and bisecting said armature, as described.

3. The herein described method of measuring alternating currents by producing a shifting field from three intersecting lines or axes of magnetization, bisecting and adapted to actuate a rotatable metallic armature arranged within the energizing-coils, one of said lines or axes being set up by the series coils, the remaining lines or axes of non-synchronous phase being set up by the shunt-coils at an angle to each other and being inclined to the line or axes of the series coils.

4. In a motor-meter the combination of the series coils connected in series in the main line and conveying the current to be measured; a pair of shunt-coils arranged within said series coils; and a revolvable metallic armature mounted within said shunt-coils.

5. In an electric meter the combination of the series coils conveying the current to be measured; a plurality of shunt or volt coils arranged within said series coils and adapted to set up intersecting lines or axes of magnetization whose phase is non-synchronous with that set up by the said series coils; and a revoluble armature arranged within said shunt-coils adapted to be actuated by intersecting lines of magnetization set up by the said series coils and said shunt-coils.

6. In an electric meter the series coils conveying the current to be measured; the shunt-coils adjustably mounted within said series coils; the revoluble armature arranged within said shunt-coils and provided with a metallic core 42, and adapted to be actuated by intersecting lines of magnetization set up by said series and shunt coils.



7. The combination of the series coils conveying the current to be measured; the shunt-coils adjustably mounted within said series coils, at an angle to each other and to the series coils; the revoluble armature arranged within said shunt-coils, and adapted to be actuated by said series and shunt coils; and means for varying at pleasure the inclination of said shunt-coils to each other.

8. The combination of meter-supporting bracket 1 having upon its rear face a closed fan-receiving recess or pocket 11, for the purpose specified and provided upon its front face with a continuous cover-receiving groove or recess; and a dust-proof cover adapted to snugly fit said recess, all substantially as described.

604,465. ELECTRIC METER. THOMAS DUNCAN, Fort Wayne, Ind. Filed Sept. 24, 1897. Serial No. 652,943. (No model.)

Claim.—1. In a meter for measuring large electric currents a stationary field-conductor having a detachable section for the purpose specified; a disk-like armature comprising a series of sector-like coils assembled as shown, and arranged in inductive relation to said conductor; and a commutator arranged as shown and provided with proper contact-brushes.

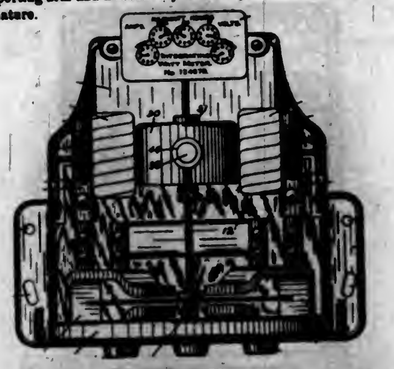
2. In a meter for measuring large electric currents a stationary field-conductor having a detachable section for the purpose specified; a disk-like armature comprising a series of sector-like coils assembled as shown, and arranged in inductive relation to said conductor; a commutator arranged as shown and provided with proper contact-brushes, and one or more adjustable compensating coils arranged as shown in operative relation to said armature.

3. The hereinbefore-described method of securing a variable compensation for the increased friction incident to use in an electric meter, consisting in accelerating the rotation of the armature by the influence of one or more adjustable compensating coils arranged in coöperative relation therewith.

4. The combination of a stationary field-casting traversed by the main current, provided with a horizontal central opening adapted to contain the rotary armature as shown; a rotary disk-like armature mounted in said opening of the field-casting as shown, in inductive relation therewith; a commutator and contacting brushes; a retarding device and a proper totalizing mechanism.

5. The combination of the two-part stationary field-casting traversed by the main current; a rotary disk-like armature arranged in inductive relation to said field-casting; an adjustable compensating coil or coils in coöperative relation to said armature; a disk 13; and permanent magnets embracing said disk as shown.

6. In an electric meter adjustable compensating coils 24 mounted as shown in inductive relation to the rotary armature and adapted to compensate for the increased friction incident to use, substantially as described.



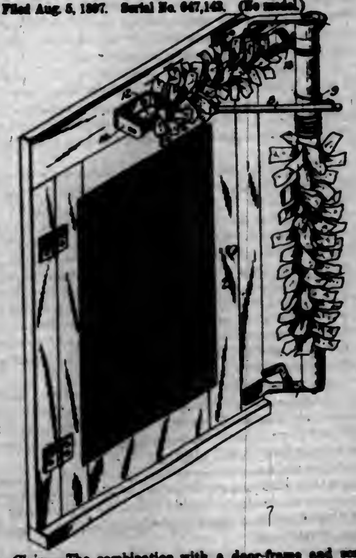
7. In a motor-meter the combination of a series field carrying the main current; a revoluble armature in inductive relation to said field; and an adjustable compensating coil or coils in coöperative relation to said armature for the purpose specified.

604,466. ELECTRIC METER. THOMAS DUNBAR, Fort Wayne, Ind. Filed Nov. 8, 1897. Serial No. 657,730. (No model.)

Claim.—1. In an electric-motor meter the combination of a series field representing the main current; a revoluble armature in inductive relation to said field; a volt coil or coils arranged in inductive relation to said armature; a secondary coil closed through a suitable resistance and acting inductively in coöperation with the said volt coil or coils upon the said armature; and a compensating device comprising an iron core 39 and a closed circuit or secondary 40, the said compensator being adapted for adjustment relative to said armature for the purpose specified, substantially as described.

2. In an electric-motor meter, a compensating device 38 comprising an iron core 39 and a secondary 40, and means for adjusting the same, the said device being adapted for an angular adjustment relative to the armature, and is adapted to neutralize the friction and inertia of the moving parts of the meter, all substantially as described.

3. In a motor-meter, the combination of a series field traversed by the main current; a revoluble armature in inductive relation to said field; and an adjustable compensating device 38 adapted to counterbalance or neutralize the friction and inertia of the moving parts of the meter, and comprising an iron core fixed upon a pivoted supporting-arm and a secondary 40 in coöperative relation with said armature.



604,467. SEALING DEVICE. GEORGE W. GORDON, Conyngham, Pa. Filed Feb. 27, 1897. Serial No. 625,264. (No model.)

Claim.—A can or jar having an annular flaring recess in its upper part, said recess in its lower part terminating in a groove, an elastic cushion or gasket fitting said recess, a screw-cap having a flaring lower rim terminating in an upward curved portion resting on said gasket, whereby when screwed home the gasket is bulged outwardly, all arranged as set forth.

604,468. SCREEN-DOOR FASTENING. ELIJAH J. HAGAR, Bayard, Iowa, assignor of one-half to Robert C. Ochiltree, same place. Filed Aug. 5, 1897. Serial No. 647,143. (No model.)

Claim.—The combination with a door-frame and screen-door hinged thereto, of the vertical spring-roller, provided with strips or streamers, and formed with a slot or groove at the lower end, the pivoted arm, the cord secured to and wound around said roller, the arm secured to the door with which said cord is also connected, the horizontal spring-roller, provided with strips or streamers, the cord wound around and secured thereto and to the vertical roller, substantially as described.

604,469. HORSE-DETACHER. CHARLES R. HARDIN and JAMES D. MOSBY, Kansas City, Mo. Filed Aug. 24, 1897. Serial No. 649,373. (No model.)

Claim.—1. In a horse-detacher, the combination of a pivoted box, a double or whiffle tree secured thereto, a top plate or cover for said box, and means to raise the whiffle or double tree out of said box, substantially as described.

2. In a horse-detacher, the combination of a pivoted box, a trip-plate held upon its base, a whiffle or double tree within the box and resting upon said plate, a top plate or cover for the box, and means to lift said trip-plate, said whiffle or double tree and said top plate, that the whiffle or double tree may be drawn from the box, substantially as described.

3. In a horse-detacher, the combination of a pivoted box, a trip-plate therein, a sectional whiffle or double tree within said box and upon said trip-plate, a top plate held down upon the whiffle or double tree with a yielding pressure, and means to raise said trip-plate against the resistance of said spring-pressure to expel the whiffle or double tree from the box, substantially as described.

4. In a horse-detacher, the combination of a pivoted box, provided with a pair of rods or stems projecting vertically upward, a notched trip-plate resting upon the base of said box, a sectional whiffle or double tree provided with registering notches and located in said box and upon said plate, a top plate held down upon said whiffle or double tree with a yielding pressure, and means to raise the trip-plate, substantially as described.

5. In a horse-detacher, the combination of a pivoted box, provided with a pair of rods or stems projecting vertically upward, a notched trip-plate resting upon the base of said box, a sectional whiffle or double tree provided with registering notches and located in said box and upon said plate, a top plate provided with holes fitting upon said stems or rods, nuts or collars upon the upper ends of said rods or stems, and expansive springs interposed between said top plate and said nuts or collars, substantially as described.

6. In a horse-detacher, the combination of a pivoted box, provided with a pair of rods or stems projecting vertically upward, a notched trip-plate resting upon the base of said box, a sectional whiffle or double tree provided with registering notches and located in said box and upon said plate, a top plate provided with holes fitting upon said stems or rods, nuts or collars upon the upper ends of said stems or rods, expansive springs interposed between said top plate and said nuts or collars, a stem depending from the trip-plate, a collar or nut upon its lower end, a lever loosely embracing said stem above said nut or collar, and a spring interposed between said plate and said lever, substantially as described.

7. In a horse-detacher, a pivoted box provided with a front side hinged at its lower edge, an L-shaped top plate overlapping the front side and free edge of said hinged plate, a whiffle or double tree arranged in said box, and means to raise said top plate to release said hinged plate, substantially as and for the purpose described.

8. In a horse-detacher, a pivoted box provided with a front side hinged at its lower edge, an L-shaped top plate overlapping the front side and free edge of said hinged plate, a whiffle or double tree arranged in said box, a spring for holding said top plate down upon the whiffle or double tree, and means for overcoming the pressure of said spring and raising said top plate, for the purpose described.

9. The combination of a vehicle provided with forwardly-opening loops at the under side of the shafts and a detachable whiffle-tree, with bands secured to the back and breech straps of the harness and encircling the shafts and the loops, and rollers journaled in said bands and interposed between the shafts and said forwardly-opening loops, substantially as and for the purpose described.

604,470. BUTTONHOLE-GAMER. ARTHUR M. HEATH, London, England. Filed Sept. 17, 1896. Renewed Apr. 26, 1897. Serial No. 633,602. (No model.)

Claim.—A fabric provided with a buttonhole or stud-hole, provided with the usual stitching, reinforced by a metallic ring composed of wire or similar material, the ends of said wire being twisted together and formed into separate loops or eyes *c c*, substantially as set forth.

604,471. ELECTRIC BRUSH. EMMA M. HELLWIG, Chicago, Ill. Filed Dec. 11, 1893. Serial No. 615,268. (No model.)

Claim.—1. In an electric brush, the combination with the body having a cavity in its upper face and a handle carrying a contact-plate, bristles set in the lower face of the body, two metal sockets set in the base of the cavity but out of contact with the bristles, a conductor connecting the latter with one of said sockets, and an insulating and waterproof covering over the conductor and the upper ends of the bristles; of a wire connecting said handle contact-plate with the other socket, a battery located within said cavity above the insulation, and means for connecting its poles with the two sockets, as and for the purpose set forth.

2. In an electric brush, the combination with the body having a cavity in its upper face and a contact-plate, bristles set in the lower face of said body, two metal sockets set in the base of the cavity, means for electrically connecting the bristles with one of the sockets, and an insulating and waterproof covering over the upper ends of the bristles; of an electrical connection between the contact-plate and the other socket, a battery located within said cavity above the insulation and whose poles have plates provided with outwardly-opposing slots and are adapted to engage said sockets, and thumb-screws removably connecting said slotted plates with the sockets, as and for the purpose set forth.

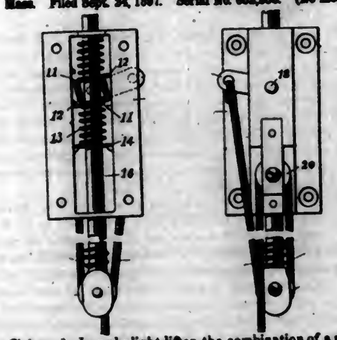
604,472. COMPOSITE PRINTING-PLATE AND METHOD OF MAKING SAME. STEPHEN H. HORGAN, Hoboken, N. J., assignor of one-half to the Trihune Association, New York, N. Y. Filed Mar. 10, 1897. Serial No. 626,855. (No model.)

Claim.—1. A combined stereotype and half-tone plate, said plate being, provided at opposite edges with flanges in substantial axial alinement with the stereotype, said flanges being wider at the outside ends thereof than at the points of attachment with said plate.

2. A half-tone plate having a solder-foil fastened to the back thereof, said foil extending beyond the edges of the plate so as to form overlapping flanges.

3. A half-tone plate provided with flanges at the ends or sides thereof, said plate having a solder-foil fastened to the back thereof, which foil extends beyond the edges of the plate so as to form overlapping flanges.

4. The method of securing an original half-tone plate in a matrix, consisting in indenting the matrix at the place where the plate is to be secured, inserting in such indentation face downward a half-tone plate to which is attached on the back thereof a solder-foil which extends beyond the edges of said plate, and then pasting or otherwise securing to the matrix the portions of solder-foil which extend beyond the edges of the plate.

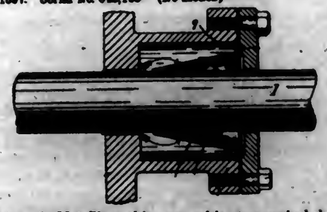


5. The method of securing an original half-tone plate in a stereo-

type, consisting in inserting in a matrix a half-tone plate having downwardly-projecting flanges at the ends or sides thereof, said flanges being disposed in substantial axial alinement with the stereotype and wider at the outside ends thereof than at the points of attachment with said plate, and then pouring over the face of the matrix the molten metal of which the stereotype is made.

6. The method of securing an original half-tone plate in a stereotype, consisting in inserting in a matrix face downward a half-tone plate to which is attached on the back thereof a soldering-foil which extends beyond the edges of said plate, pasting or otherwise securing to the matrix the portions of solder-foil which extend beyond the edges of the plate, and then pouring over the face of the matrix the molten metal of which the stereotype is made.

7. The method of securing an original half-tone plate in a stereotype, consisting in inserting in a matrix a half-tone plate having downwardly-projecting flanges at the ends or sides thereof and having attached to the back thereof a solder-foil which extends beyond the edges of said plate, pasting or otherwise securing to the matrix the portions of solder-foil which extend beyond the edges of the plate, and then pouring over the face of the matrix the molten metal of which the stereotype is made.

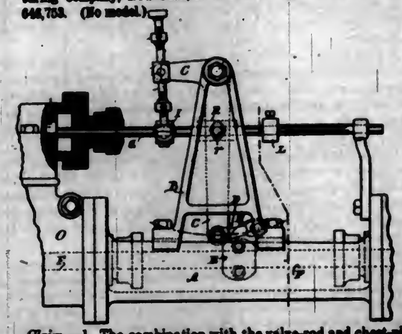


604,473. SKYLIGHT-LIFTER. SAMUEL I HOWARD, Worcester, Mass. Filed Sept. 24, 1897. Serial No. 652,536. (No model.)

Claim.—1. In a skylight-lifter, the combination of a slide, a frictional catch for said slide, a releasing-lever, and a flexible cord or connection connected to simultaneously operate the releasing-lever and slide so that a straight downward pull or tension on the cord will release the catch and shift the slide, and so that, when the cord is slackened, the catch will automatically secure the slide in its adjusted position, substantially as described.

2. In a skylight-lifter, the combination of a slide, a frictional catch comprising tilting plates and springs for normally holding said plates in engagement with the slide, a releasing-lever for said plates, pulleys journaled on the slide and a stationary point respectively, an operating-cord secured to the releasing-lever and passing over said pulleys so that a straight pull or tension on the cord will release the catch, and shift the slide, and so that, when the cord is slackened, the catch will automatically secure the slide in its adjusted position, substantially as described.

604,474. METALLIC PACKING. NATHAN JESSUP, Indianapolis, Ind., assignor of one-half to John A. Smith, Rossville, Ind. Filed Aug. 13, 1897. Serial No. 648,163. (No model.)



Claim.—1. Metallic packing comprising two conical sleeves, one within the other and both split longitudinally so their small ends will contract under pressure but the splits in each being located at different places, an outwardly-extending annular flange secured to the large end of the conical sleeves and means for securing such flange against the head of the cylinder.

2. Metallic packing in two or more parts each comprising a section of two conical sleeves, one within the other, a section of an outwardly-extending annular flange secured to the large end of the sleeves, the lines on which the sleeves are cut being at different points so that the sections of the sleeves will overlap, and means for securing such flange against the head of the cylinder, substantially as shown.

3. The combination with a cylinder or other steam-chest having a packing-chamber, a follower to close said packing-chamber, and a piston-rod extending therethrough, of metallic packing comprising two conical sleeves, one within the other, split longitudinally at different points so that their small ends will contract under pressure, and an outwardly-extending annular flange secured to the large ends of said sleeves, said packing being placed in the packing-chamber surrounding the piston-rod with the small end of the sleeve engaging it and the annular flange clamped between the end of the steam-chest and the follower.

604,475. VALVE MECHANISM FOR STEAM-PUMPS. GUSTAF DE LAVAL, Cambridge, Mass., assignor to the Gen. F. Make Manufacturing Company, New York, N. Y. Filed Aug. 2, 1897. Serial No. 646,703. (No model.)

Claim.—1. The combination with the valve-rod and chest-piston of valve moving piston and piston-rod, of a head upon the piston-rod, a beat-lever and link connection between the same and the head on the piston-rod, an arm upon the piston-rod, a tappet-rod and universal-joint connection between the same and the arm on the valve-rod, and adjustable tappets upon said rod acted upon by the short arm of the beat lever, substantially as set forth.

2. The combination with the engine and valve-moving piston and its rod, of a head and means for clamping the same to the piston-rod of the engine, a stationary frame and pivot, a beat lever supported by the pivot and a connection between the lower end of the beat lever and the head on the piston rod, an arm extending out from the valve-rod, a tappet-rod and ball connection to the arm, adjustable tappets on the rod and a tappet surrounding and sliding upon the tappet-rod and a pivotal connection between the same and the short end of the beat lever, substantially as set forth.

3. The combination with the engine and valve-moving piston and its rod, of a head and means for clamping the same to the piston rod of the engine, a stationary frame and pivot, a beat lever supported by the pivot and a connection between the lower end of the beat lever and the head on the piston-rod, an arm extending out from the valve-rod, a tappet-rod and ball connection to the arm, adjustable tappets on the rod and a tappet surrounding and sliding upon the tappet rod and a pivotal connection between the same and the short end of the beat lever, a tappet surrounding and sliding freely on the valve rod and having a stud projecting into a slot in the beat lever, and a collar upon the valve-rod for insuring the movement of the valve by the direct action of the beat lever and connection to the piston-rod, substantially as set forth.

4. The combination with the engine and its valve-moving piston, of a two-part head clamped to the piston-rod, a stationary triangular frame and a pivot carried thereby, a beat lever upon the pivot, a link pivoted at one end to the lower end of the beat lever and at the other end to the two-part head on the piston-rod, a rod extending from the valve-moving piston and an arm upon the same, a tappet-rod and ball connection to the arm, adjustable tappets on the rod, a tappet surrounding and sliding freely upon the rod and a pivotal connection for the same to the short end of the beat lever, a tappet surrounding the valve-rod and a stud thereon extending into a slot in the beat lever, and an adjustable collar upon the valve-rod against which and the arm, the sliding tappet is caused to act by the swinging movement of the beat lever, if the valve-moving piston and valve are not moved by the pressure, substantially as set forth.

604,476. ADJUSTABLE CORN-HUSKER. WILLIAM F. LELLIE, Dentrice, Nebr. Filed Sept. 15, 1897. Serial No. 651,768. (No model.)

Claim.—1. The combination of a wristband having two straps and means for connecting them to the band, a hook-carrying plate secured to one strap of said band and formed with an arm, a plate flexibly secured to this arm, and another curved plate flexibly secured to the hook-carrying plate, the free ends of both the attached plates being connected to the other strap of the wristband, substantially as described.

2. A corn-husking implement comprising a wristband having two straps and means for connecting them to the wristband, a hook-carrying plate attached to one strap, a plate slidably and pivotally attached to said hook-carrying plate, and another curved plate pivotally attached to said hook-carrying plate; the free ends of both attached plates being connected to the other strap and forming therewith a flexible thumb-shackle, substantially as described.

3. A corn-husking implement comprising a wristband having two straps and means for attaching the same to said band, a plate, 7, attached to both straps, a hook-carrying plate attached at one end to one strap and with its hook-formed end free from said straps, a plate flexibly attached to the hook-carrying plate on one side of the hook thereof, and another curved plate flexibly attached to the hook-carrying plate on the opposite side of the hook thereon; the attached plates being loosely connected and forming a flexible thumb-shackle, substantially as described.

4. In a corn-husking implement, the combination with a hook-carrying plate, metallic plates flexibly connected to the hook-carrying plates and forming therewith a loose thumb-shackle, and a bifurcated wristband connected with the hook-carrying plate and the thumb-shackle plates to join the latter loosely together and confine the same in place when the device is worn on the hand, substantially as described.

5. A corn-husking implement comprising a wristband having two straps, a palm-plate attached thereto, a hook-carrying plate, shackle-plates pivoted to the hook-carrying plate and connected at their free ends by one of the straps of the wristband, and a loop embracing one of the straps and arm of the hook-carrying plate, substantially as described.

604,477. LID-LIFTER. LOUIS J. A. MORTH, State Centre, Iowa. Filed Sept. 7, 1897. Serial No. 650,988. (No model.)

Claim.—As an improved article of manufacture a lid-lifter comprising a weighted head 10, a tongue 11 fixed to and extending longitudinally from said head, a stem 12 fixed to and extending longitudinally from the end of the head 10 opposite to the tongue 11, the head 10 being formed with an annular recess surrounding the stem, a sleeve 13 mounted for revolution on the stem, one end of which sleeve is inserted within the annular recess in the head, a handle on the outer engaging the outer end of said sleeve and locking the same to the head and a deflecting-plate 14 mounted rigidly on the sleeve and spaced apart from the adjacent end of the head.

604,478. COMBINATION-TOOL. GEORGE S. HEISLEY, ALEXANDER MATTLAGE, and GEORGE BERKHEIMER, Pardee, Mo. Filed July 2, 1897. Serial No. 643,946. (No model.)

Claim.—1. The herein-described tool for the purpose named, having a shank terminating at one end in a hatchet poll and blade and at the other end in a fulcrum-foot, and provided at an intermediate point with a recessed enlargement having communicating side openings and a socket, fixed and movable dies, seated respectively in said socket and recess, of greater width than the lateral opening to close the same and exclude dust when the movable die is advanced, and a lever operatively connected with the movable die, substantially as specified.

2. A car-coal press having its shank provided with an intermediate recessed enlargement provided with side openings communicating with its recess, and with a socket also communicating and alined with the recess, the recess being equal in width with the socket and being open at its inner end, cooperating fixed and movable dies arranged respectively in said socket and in the recess of the enlargement, and removable through the end opening of the latter, and a lever fulcrumed in the recess of the enlargement in operative engagement with the movable die, and fitted snugly in the recess to close the open end thereof when in its normal position, substantially as specified.

3. A car-coal press having its shank provided with an intermediate recessed enlargement having side openings communicating with its recess, and a socket alined with the recess and also communicating therewith, the recess being provided with an open inner end, fixed and movable dies fitted respectively in said socket and recess and removable through the opening of the latter, and a lever removably fulcrumed in the recess of the enlargement in operative engagement with the movable die, and adapted normally to occupy a position in contact with the shank and closing said open end of the recess to exclude dust therefrom, whereby the dies are held from displacement when the lever is mounted in the recess, substantially as specified.

604,479. OIL-DISTRIBUTING APPARATUS. JAMES H. HIBBS, Haddonfield, N. J., assignor, by direct and mesne assignments, to the Dunham Rendbed Company, Camden, N. J. Filed June 30, 1897. Serial No. 643,019. (No model.)

Claim.—1. In a distributing apparatus, the combination with a car, of distributing-pipes connected at the sides of the car by universal joints, and means for adjusting said distributing-pipes both horizontally and vertically and holding them in any desired adjustment, substantially as described.

2. In a distributing apparatus, the combination with a car, of a distributing-pipe arranged transversely beneath the car, additional distributing-pipes connected at the sides of the car by universal joints, means for adjusting said pipes both horizontally and vertically, and flexible connections to said side pipes, substantially as described.

3. In a distributing apparatus, the combination with a car, of a transverse distributing-pipe beneath the car, independent distributing-pipes connected by universal joints at the sides of the car, means for adjusting said side pipes vertically and horizontally, valves for governing the flow of oil to each of said pipes independently, levers for operating said valves and locking devices for said valves, substantially as described.

4. In a distributing apparatus, the combination with a car, of a distributing-pipe pivotally connected at the side of the car, and devices for locking said pipe yieldingly in any desired horizontal adjustment, whereby said distributing-pipe may yield and swing back toward the car upon coming in contact with any obstacle, substantially as described.

5. In a distributing apparatus, the combination with a car, of a distributing-pipe pivotally connected at the side of the car, a vertical shaft upon which said pipe swings and a yielding locking device for holding said pipe yieldingly in any desired position, substantially as described.

6. In a distributing apparatus, the combination with a car, of vertical shafts at the sides of the car, distributing-pipes connected to said shafts, means for turning the shafts to adjust the pipes horizontally, and means for locking the shafts in any desired position, substantially as described.

7. In a distributing apparatus, the combination with a car, of vertical shafts mounted at the sides of the car and distributing-pipes pivotally connected to said shafts for vertical adjustment, and means for sustaining the pipes at any desired vertical angle, substantially as described.

8. The combination of the car, the vertical shafts mounted on the sides of the car, the yokes connected to the lower ends of said shafts, the pipes pivotally mounted in the yokes, and means for adjustably suspending the pipes from the upper ends of the shafts, substantially as described.

9. The combination with a car, of the vertical shafts, the pipes pivotally connected to the lower ends of the shafts, means for vertically adjusting the pipes and sustaining them in any desired position, and means for adjusting the shafts horizontally and locking them in any desired adjustment, substantially as described.

10. The combination with a car, and oil-distributing apparatus carried by the car, of shields sustained by the car in line with the wheels and in proximity to the rails, whereby the oil is prevented from falling upon the rails, substantially as described.

11. In combination with a car, of a transverse oil-distributing pipe carried beneath the car and shields sustained beneath said pipe and over the rails whereby the oil from the pipe is prevented from falling on the rails, substantially as described.

12. The combination with a car and oil-distributing apparatus, of shields for preventing the oil from falling on the rails, said shields having upturned end flanges, substantially as described.

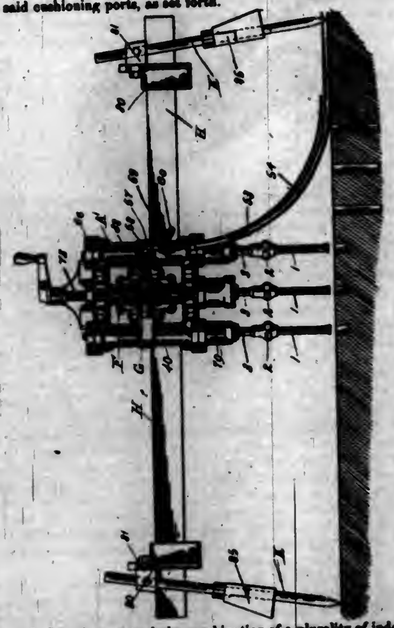
13. The combination with a car and a perforated oil-distributing pipe, of a steam-pipe communicating with said distributing-pipe, whereby heat and pressure may be applied to assist the discharge of oil from said latter pipe, substantially as described.

14. The combination with a car and an oil-distributing pipe provided with suitable openings or perforations, of a pressure-pipe arranged within the oil-distributing pipe, said pressure-pipe having openings to permit its contents to mingle with the oil in the distributing-pipe, substantially as described.

15. The combination with a car and an oil-distributing pipe having suitable openings or perforations in its lower side, of a pressure-pipe within said oil-pipe, said pressure-pipe being provided with openings in its lower side opposite the openings in the distributing-pipe, substantially as described.

16. The combination with a car and oil-distributing apparatus mounted on the car, of a main oil-supply pipe, means for connecting said supply-pipe with an oil tank car, a pressure-pipe, and means for connecting said pressure-pipe with a source of fluid-pressure such as steam or air, substantially as described.

17. The combination with a car and oil-distributing apparatus, of shields for preventing the oil from falling on the rails, said shields comprising top plates located over the rails and flexible curtains extending down from said plates upon both sides of the rails, substantially as described.



604,480. IMPACT-TOOL. JAY R. REUDER, Chicago, Ill., assignor to Frederick C. Austin, same place. Filed May 28, 1897. Serial No. 638,514. (No model.)

Claim.—1. An impact tool provided with a ported piston-chamber, a reciprocating piston moving therein, and a couple of cooperating fluid-actuated valves for distributing motive fluid to the piston-chamber independent of the piston movement; and constructed with separate ports for supplying motive fluid separately to the piston-chamber and to the chamber of one of said valves, as set forth.

2. An impact-tool comprising a ported piston-chamber, a reciprocating piston moving therein, a fluid-actuated piston-valve for distributing motive fluid to the piston-chamber, means for distributing motive fluid to the piston-valve independent of the piston movement, and a couple of supply-ports arranged to supply motive fluid separately to the piston-chamber and to the piston-valve chamber, as set forth.

3. An impact-tool comprising a ported piston-chamber; a reciprocating piston arranged therein; a fluid-actuated reciprocating piston-valve for distributing motive fluid to the piston-chamber, a fluid-actuated reciprocating supplemental valve arranged to distribute motive fluid for reciprocating the piston-valve, and arranged also to receive motive fluid from the latter upon the arrival of the same at the ends of its stroke; and a couple of supply-ports for supplying motive fluid separately to the piston-chamber and to the piston-valve chamber, substantially as described.

4. In an impact-tool, the combination of a couple of separated reciprocating piston-heads connected so as to reciprocate in unison and also so as to form a space between them; a piston-chamber therefor provided with a live-motive-fluid-inlet port which communicates with the space between the piston-heads during their reciprocation, and also provided with a couple of cushioning ports which serve to connect the space between the piston-heads with one or the other of the ends of the piston-chamber when the piston-heads are approaching that end of the chamber; and a couple of inwardly-opening automatic check-valves arranged respectively within one and the other of said cushioning ports, as set forth.

5. In an impact-tool, the combination of a plurality of independently-reciprocating pistons confined within a plurality of piston-chambers having their ends connected by ports; and a valve mechanism operating independently of the movement of any one of said pistons, and comprising a couple of cooperating fluid-actuated reciprocating valves, one of which distributes motive fluid to one of said piston-chambers, as set forth.

6. In an impact-tool, the combination of a vertically-adjustable leg; a support, such as the yoke 80, for the leg-holding box; a removable pivotal adjusting-bolt 82 extending through the leg-support; a hollow leg-holding box inclosing the head of the pivotal bolt 82 and having one of its ends closed and fitted between said bolt-head and the leg-support, and the other one open so as to permit the bodily removal of the bolt, and also having its upper and lower sides provided with apertures into which the leg can fit and through which it can slide; and a locking-bolt 84 which extends through one of the vertical sides of the box 81, and serves as a means of locking the leg in adjustment, substantially as described.

7. In an impact-tool, the combination with a couple of separated piston-heads and a spirally-grooved connecting-rod connecting the same, of a toothed collar secured tightly to the walls of the piston-chamber and fitted loosely over the connecting-rod; a correspondingly-toothed and internally-tongued loose collar having a friction connection with the connecting-rod; and a disk also secured to the walls of the piston-chamber and arranged to afford a stop limiting the movement of the loose collar longitudinally of said piston-chamber, substantially as described.

604,481. LOCOMOTIVE. WILLIAM M. RENNELL, New York, N. Y. Filed July 22, 1897. Serial No. 645,502. (No model.)

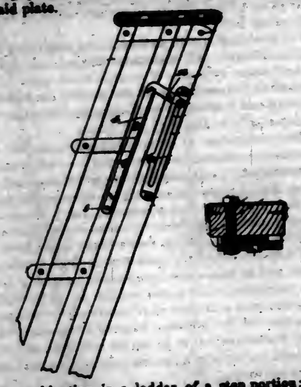
Claim.—1. A locomotive having a boiler provided with fires, a combustion-chamber beneath the boiler and communicating with the fires at one end thereof, the under wall of the combustion-chamber being unbroken throughout its length, an outlet chamber or space in connection with the fires at the opposite end of the boiler, and a stack connected with said outlet chamber or space, substantially as set forth.

2. A locomotive having a boiler provided with fires, walls inclosing the lower portion of the boiler and extending beneath the same throughout its entire length unbroken and on a single plane and forming a combustion-chamber beneath the boiler, walls at the forward part of the boiler forming a space that communicates with said combustion-chamber and with the boiler-fires, walls at the opposite end of the boiler forming a space that communicates with the adjacent ends of the fires, one of said walls separating the last-mentioned space from the combustion-chamber, and a stack connecting with said last-mentioned space, substantially as described.

3. A locomotive having a boiler provided with fires, a combustion-chamber extending beneath the boiler and communicating with the fires thereof at one end under the wall of the combustion-chamber being unbroken throughout its length, a stack communicating with the opposite ends of said fires, and means connected with said combustion-chamber, at the end that is opposite its connection with the fires, for forcing pulverized or comminuted fuel into said combustion-chamber, substantially as set forth.

4. A locomotive having a boiler provided with fires, a combustion-chamber extending beneath the boiler and communicating with the fires thereof at one end, the under wall of the combustion-chamber being unbroken throughout its length, a stack communicating with the opposite ends of said fires, and a pulverizer and blower connected with said combustion-chamber, at the end that is opposite its connection with the fires, for forcing pulverized fuel into said combustion-chamber, substantially as set forth.

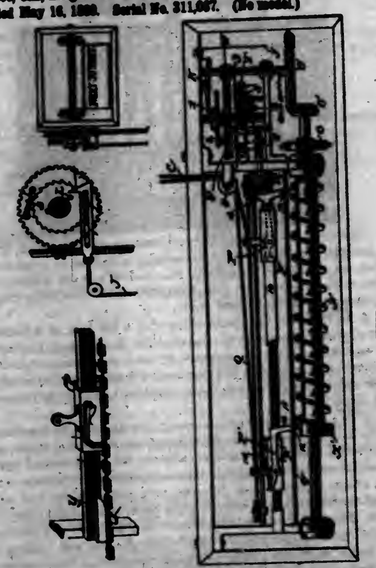
5. A locomotive having a boiler provided with fires, walls extending beneath the boiler forming a combustion-chamber inclosing the open ends of said fires at one end of the boiler and a space that connects said combustion-chamber with said fires, the outer of said last-mentioned walls being curved upwardly and over rearwardly, the under wall of the combustion-chamber being unbroken throughout its length, a stack connected with the opposite ends of said tubes, and means for forcing pulverized or comminuted fuel into said combustion-chamber at the end opposite its connection with said fires, substantially as set forth.



604,482. STEP-LADDER. WILLIAM O. SHARAR, Springfield, Mass. Filed Jan. 20, 1898. Serial No. 667,895. (No model.)

Claim.—1. The combination, in a ladder, of a step portion; a support therefor; a slotted plate secured to the support; a stud on said support; and a brace hinged to the step portion and having a pin adapted to slide in the slot in said plate and provided with a lateral extension or bend adapted to be hooked over said stud.

2. The combination, in a ladder, of a step portion; a support therefor; a stud or projection on one of the parts; a brace on the other part, having a bend or lateral extension adapted to be hooked over said projection; a plate on the ladder, having a longitudinal slot adapted to receive a pin on the brace.



3. The combination, in a ladder, of a step portion; a support therefor; a stud or projection on said support; a brace pivoted to the step portion and having a bend or lateral extension adapted to be hooked over said projection and also having a pin; and a guide-plate secured to the support and slotted to receive said pin.

4. The combination, in a ladder, of a step portion; a support for the step portion; a slotted plate fixed to the support; a bolt on the support; a step carried by the bolt between the guide-plate and the support; and a brace connected to the step portion and having a hook adapted to engage the bolt and also having a pin adapted to slide in the slot of said plate.

5. The combination, in a ladder, of a step portion; a support therefor; a slotted plate secured to the support; a bolt passing through the plate and support, respectively, and held in place by a nut; a reinforcing-plate fitting against the support; and a brace hinged to the step portion and having a bend or lateral extension at its opposite end adapted to be hooked over said bolt and provided with a pin adapted to slide into the slot in said plate.

604,483. STATION-INDICATOR. WILLIAM A. TURNER, San Francisco, Cal., assignor to the American Indicator Company, same place. Filed May 16, 1898. Serial No. 311,087. (No model.)

Claim.—1. The combination with a station-indicating mechanism of the continuous type, of a positively-operated and independent correcting device, for positively moving the indicating mechanism at a certain time independently of its normal motion, whereby the errors accumulated up to that time are corrected, substantially as set forth.

2. In combination, a station-indicator, a continuously-operating driving mechanism therefor, a detachable connection between said indicator and the continuously-operating driving mechanism, and a corrector for moving the indicating mechanism to a predetermined position, substantially as described.

3. In a station-indicating apparatus, the combination of a continuously-operating driving mechanism, an intermittently-operating indicating mechanism, a continuously-operated device for controlling the connection of said driving and indicating mechanisms, and a positively-operated corrector for moving said controlling device independently of its normal motion, to correct errors in its position, substantially as set forth.

4. The combination with mechanism for controlling the operation of a station-indicator, said mechanism being driven continuously by driving mechanism by means of a ratchet and pawl, of a corrector set in operation independently of the driving mechanism, for positively moving said controlling mechanism, to correct errors in its position, substantially as described and shown.

5. The combination of an intermittently-operated station-indicating mechanism adapted to be connected to a continuously-operated driving mechanism, a retaining-bolt for preventing such connection, a traveling chain having spaced teeth for successively displacing said bolt and thus permitting such connection, and a corrector set in operation independently of the driving mechanism for moving said chain to correct errors in its position, substantially as set forth.

6. In a station-indicating apparatus having a continuous driving mechanism, and an intermittently-operated indicating device, a corrector for correcting errors in the position of the indicating device, in combination with a ratchet-wheel intermediate between the driving mechanism and the indicator adapted to transmit the motion of the driving mechanism but to be moved independently of its normal motion by said corrector to a definite point at a definite locality, substantially as set forth.

7. In a station-indicator of the continuous type, the combination of a primary operating mechanism driven by the motion of the wheels, an indicating mechanism, and a detachable connection between said primary operating mechanism and indicating mechanism whereby the indicating mechanism is permitted to be moved independently of the primary operating mechanism, substantially as described.

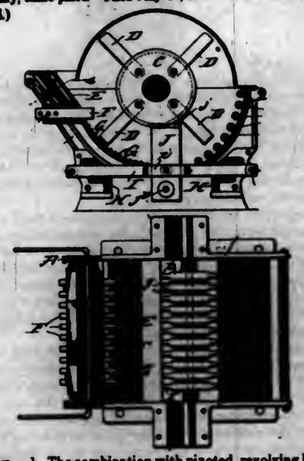
604,484. HOT-WATER HEATER. JAMES WHITE, Melvale, Md. Filed May 19, 1897. Serial No. 637,194. (No model.)

Claim.—1. In a heater, the combination with a fire-box, of rows of upright water-columns, substantially elliptical in cross-section, which are located at the sides of the fire-box and are inclined in relation to the longitudinal axis of the latter, the rows being disposed angularly in relation to each other.

2. In a heater, the combination with a fire-box, of a dome and rows of water-columns at the sides of the fire-box and leading into the said dome, the water-columns of each row being substantially elliptical in cross-section and having their transverse axes inclined to the columns and the rows being disposed angularly in relation to each other.

3. In a heater the combination of a fire-box, a dome located over the fire-box and drop-tubes depending from the dome, which tubes comprise an outer tube closed at its lower end and provided with an internal-threaded collar and an inner supplemental tube open at both ends, of less diameter than the outer tube and provided with an enlarged threaded portion engaging the collar in the outer tube.

4. In a heater, the combination with a fire-box, of a dome and rows of water-columns at the sides of the fire-box and leading into said dome, the water-columns of each row having their transverse axes inclined to the columns and the rows disposed angularly in relation to each other, and drop-tubes depending from the dome, provided with inner supplemental tubes open at both ends and of less diameter than the outer tubes.



5. In a heater, the combination with a fire-box, of an outer water-jacket, inner water-columns at the sides of the fire-box, and flues between the water-columns and the jacket which are in communication with the fire box by the spaces between the columns.

6. In a heater, the combination with a fire-box, and a water-jacket, of a dome, separated upright water-columns in communication with the dome and jacket aforesaid, an outer water-jacket in communication with the water-jacket aforesaid, and flues located between the outer water-jacket and the water-columns in communication with the fire-box by the spaces between said water-columns.

7. In a heater, the combination with a fire-box, of a water-back, inlet-pipes for said water-back, outer water-jackets at the sides and front of the heater, inner water-jackets at the sides of the heater and communicating with the outer water-jacket, an inner water-back communicating with the inner water-jackets, a dome in communication with the inner water-back and the outer water-jacket, upright water-columns in communication with the dome and the inner water-jackets, outlets from the dome, a smoke-outlet, and flues leading from said outlet between the inner and outer water-backs, and the inner and outer water-jackets, and in communication with the fire-box by the spaces between the water-columns.

8. The herein-described heater, comprising a fire-box, water-backs, inlet-pipes leading into the water-backs, outer water-jackets at the sides and front of the heater, an inner water-back at the rear of the fire-box, inner water-jackets at the sides of the fire-box, which jackets are in communication with the outer water-jackets and with the inner water-jacket, a dome having outlets which dome is located above the fire-box and in communication with the front portions of the outer water-jackets and with the inner water-back and the inner water-jackets, said water-columns being located at the opposite sides of the fire-box, a smoke-outlet, flues leading from said outlet between the inner and outer water-backs, and the inner and outer water-jackets, and in communication with the fire-box by the spaces between the staggered water-columns, and drop-tubes depending from the dome above the fire-box, which drop-tubes comprise outer tubes having closed lower ends and inner supplemental tubes of smaller size which are open at both ends.

604,485. BREAKING-MACHINE. MILTON F. WILLIAMS, St. Louis, Mo., assignor to the Williams Patent Crusher and Pulverizer Company, same place. Filed July 17, 1897. Serial No. 644,893. (No model.)

Claim.—1. The combination with pivoted, revolving hammers, of an adjustable breaker-plate, and fingers arranged below said breaker-plate, and projecting between the paths of the hammers; substantially as described.

2. The combination with pivoted, revolving hammers, of an adjustable breaker-plate, and adjustable fingers projecting below said breaker-plate between the paths of the hammers; substantially as described.

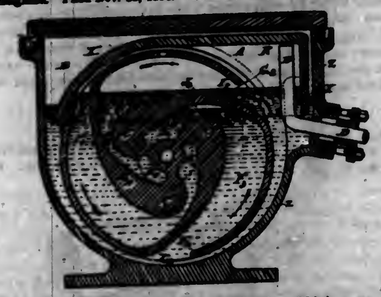
3. In a crusher, the combination with pivoted revolving hammers, of a breaker-plate, a supporting-block therefor, a lug formed on said breaker-plate and extending through a suitable opening in the supporting-block, said lug being formed with an opening or eye in its outer end, a wedge which passes through said lug opening or eye and coöperates with the supporting-block, and liners which are adapted to be inserted between the breaker-plate and its supporting-block, substantially as described.

4. The combination with pivoted revolving hammers, of a breaker-plate upon which the hammers primarily break or crush the material, fingers below said breaker-plate which project into the spaces between the paths of the hammers, said fingers, in conjunction with the hammers, acting upon the material after it leaves the breaker-plate, a concave for receiving the material as it leaves the fingers, and bars for receiving the material as it leaves the concave, said bars permitting small particles of material to pass between them; substantially as described.

5. The combination with pivoted, revolving hammers and their supports, of longitudinally-disposed bars formed with thickened portions at the points where the hammers most nearly approach said bars, bar-supports for supporting the ends of said bars, and fingers clamped between the thickened portion of said bars, said fingers engaging the hammer-supports; substantially as described.

6. The combination with a suitable casing, of a hammer-shaft mounted therein, pivoted hammers carried by said shaft, bar-supports comprising heads which are connected by parallel cross-pieces, bars mounted in said bar-supports between the parallel cross-pieces, spacers between said bars, and through-bolts for clamping said parts in position, substantially as described.

7. The combination with pivoted, revolving hammers, and bars or fingers projecting between the path of the hammers and engaging the peripheries of the hammer-supports; substantially as described.

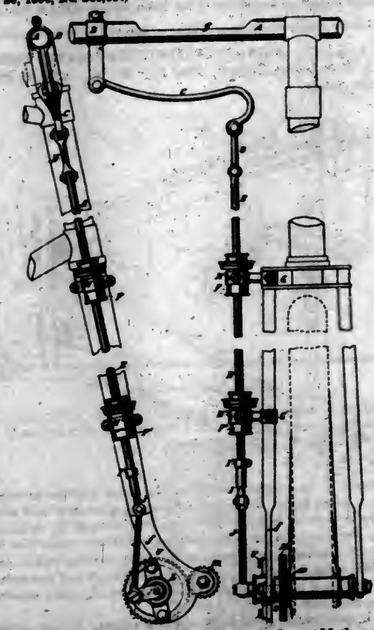


8. The combination with pivoted, revolving hammers, of revolving supports therefor, said supports being formed with peripheral grooves, and fingers which extend between said hammers, said fingers being formed with tongues fitting into the grooves on the hammer-supports; substantially as described.

9. The combination with pivoted, revolving hammers, of their supports, bars I coöperating with said hammers, and fingers J secured between the bars I, engaging said hammer-supports and coöperating with said hammers; substantially as described.

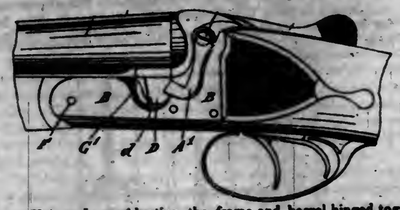
10. The combination with pivoted revolving hammers, of longitudinally-disposed bars, a concentrically-arranged series of transversely-disposed bars located at the rear end of the machine and above the bars first mentioned, all of said bars coöperating with the hammers, the spaces between said bars affording an escape for the material when it is reduced to the proper size, and a curved blind which is fitted in concentrically-arranged grooves behind the transversely-disposed bars for preventing the escape of material between said bars, substantially as described.

11. The combination with pivoted revolving hammers, of a breaker-plate tangentially arranged relative to the path of said hammers, and with the lower end of which breaker-plate said hammers coöperate, of a concave arranged below said breaker-plate and forming a continuation thereof, transversely-disposed corrugations or serrations on the working face of said concave, adjustable fingers arranged between the breaker-plate and concave, said fingers projecting inwardly between the paths of the hammers and bars forming a grinding-surface beyond said concave, substantially as described.



604,486. APPARATUS FOR PRODUCING HIGH VACUUMS. ARCHIBALD BAIRD, Glasgow, Scotland, and WILLIAM STROUD, Leeds, England. Filed Nov. 18, 1896. Serial No. 612,778. (No model.)

Claim.—1. An apparatus for the production of high vacua, comprising a case having an exhaust-tube and a pump-tube and adapted to contain liquid, a cover, a cap located within the case and providing in connection therewith an inner chamber and an outer chamber sealed by the said liquid, and a rotating drum adapted to be partly submerged in the liquid and having a curved air-passage through which air is transferred from the inner chamber; substantially as described.



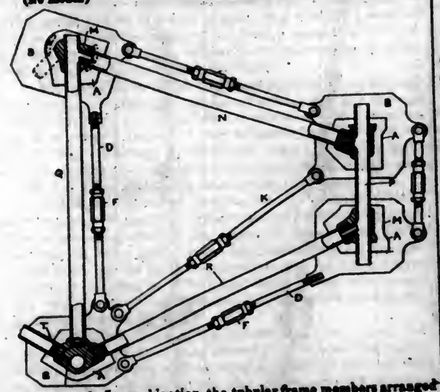
2. An apparatus for the production of high vacua, comprising a case, a cover, a cap located within the case and providing in connection therewith an inner chamber and an outer chamber, the exhaust-tube entering the inner chamber, the pump-tube extending from the outer chamber, and the rotating drum formed with three curved passages terminating at the periphery of the drum in apertures, and near the axis of the drum in apertures; substantially as described.

604,487. BICYCLE. LOUIS BOGNEY, Paris, France. Filed Mar. 18, 1897. Serial No. 628,146. (No model.) Patented in France Sept. 20, 1896, No. 260,067.

Claim.—In combination, the pinion n and gear M, the rod E and the boxes F having stops and ball-bearings and a lubricator carried by said box, substantially as described.

604,488. BREECH-LOADING FIREARM. WILLIAM CASHMORE, Birmingham, England. Filed Dec. 14, 1897. Serial No. 661,880. (No model.) Patented in England Sept. 12, 1896, No. 17,049.

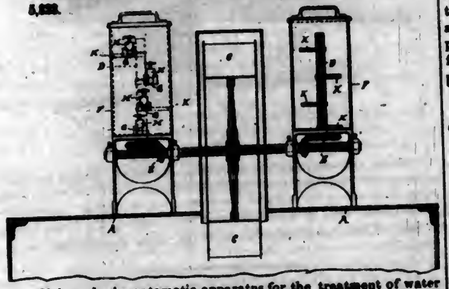
Claim.—In combination, the frame and barrel hinged together by the pin F, the said barrel having the lumps D thereon at its sides to fit down along the sides of the frame, the catches to engage the lumps on the sides of the barrel and the lumps on the frame fitting in front of the barrel-lumps to resist the shock, substantially as described.



604,489. STEAM-ACTUATED VALVE. EDWIN H. DE LANY, Cleveland, Tenn. Filed Aug. 2, 1897. Serial No. 646,796. (No model.)

Claim.—The combination with the valve-chest provided with supply and exhaust ports substantially as described, of a main valve consisting of a hollow cylindrical body having exterior annular grooves and passages therefrom to the interior and an auxiliary valve consisting of a hollow cylindrical body movable within the main valve

and provided with exterior annular grooves and openings leading therefrom to its interior, said valves being open-ended, and means interposed between a movable part of the engine and the auxiliary valve for imparting movement to the latter, substantially as described.



604,490. MEANS FOR MAKING CYCLE-FRAMES. FREDERICK A. ELLIS, London, England. Filed July 13, 1896. Serial No. 599,091. (No model.)

Claim.—1. In combination, the tubular frame members arranged to form a closed figure, the molds at the meeting points of said members, one or more of said members extending through its mold and opening into the outer air, and the washer-and-tube connection for placing the interior of the tubular members in communication, said connection being adapted to permit and limit the flow of the molten metal within and about the tubular members at the joint, substantially as described.

2. In combination, the series of molds adapted to cast sockets about the meeting ends of tubular frame members which are arranged to form a closed figure, and the adjustable rods connecting the molds, said rods having yielding portions to allow for the expansion and contraction of the tubes while the sockets are being cast, substantially as described.

604,491. APPARATUS FOR PURIFYING WATER. ALFRED A. ELLIS, London, England, assignor to the Maignen's Filtre-Rapide and Anti-Calcaire Company, Limited, same place. Filed Dec. 21, 1897. Serial No. 662,869. (No model.) Patented in England Mar. 4, 1897, No. 5,522.

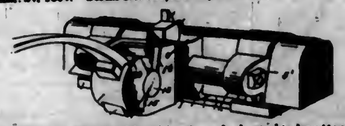
Claim.—1. An automatic apparatus for the treatment of water or other liquids with powdered material, comprising the powder-supply canisters having orifices of ejection at various levels with means for the adjustment of the size of the orifices, means for the ejection of powder therefrom and operating means consisting of a water wheel or motor to automatically proportion the feed of powder to the quantity of water or liquid passing over or through the said operative water wheel or motor.

2. In automatic apparatus for the treatment of water or other liquids with powdered material the combination with a water wheel or motor of a canister or canisters adapted to contain a store of powdered material, rotating spindles and ejecting-arms fitted thereto operated by the said water wheel or motor, orifices at various levels in the sides of said canisters, and screw-regulated shutter-doors adapted to said orifices substantially as and for the purposes described.

604,492. BOX OR CAN. ALAN B. FERGUSON, Baltimore, Md., assignor to Henry F. Miller and George Miller, same place. Filed Oct. 9, 1897. Serial No. 654,653. (No model.)

Claim.—1. The combination with a receptacle having a neck at one end, of a movable cap having an outlet-opening, a disk within said cap having a flange to close said outlet-opening and arranged to form a measuring-chamber within the cap, said disk also having a hole therein, a lug projecting from said disk and adapted to engage the neck of the receptacle, and another disk having a hole and a shoulder to engage said lug, and a lip on said last-mentioned disk, said lip projecting through the outlet-opening of the cap, substantially as set forth.

2. The combination with a receptacle having a neck at one end and a fixed disk at the end of said neck, said disk having a hole therein, of a movable cap having an outlet opening, a disk within said cap and forming a measuring-chamber within the cap, a flange on said disk to close the outlet-opening of the cap, a lug on said disk to enter the opening in the fixed disk, and a third disk within said cap and having a hole therein to register with the holes in the other disks and a lip on said last-mentioned disk and passing through the outlet-opening of the cap, substantially as set forth.



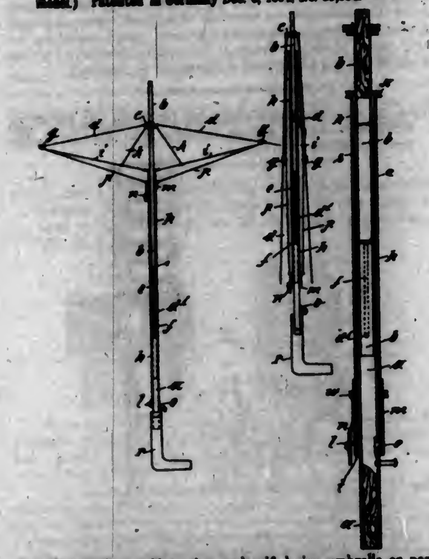
604,493. PROCESS OF PRODUCING ALIMENTARY PRODUCTS. JOHN H. KELLOGG, Battle Creek, Mich. Filed Feb. 16, 1897. Serial No. 623,711. (No specimens.)

Claim.—1. The process of producing the improved alimentary product which consists in blanching and thoroughly cooking nut-kernels, and reducing them to a pulp, then adding water, and sealing the pasty mass in cans, and subjecting such cans to the action of steam at a temperature ranging between 212° and 240° Fahrenheit, for a considerable period, that is to say until the mass becomes changed or modified, as specified.

2. The process of producing the improved alimentary product which consists in blanching and thoroughly cooking nut-kernels, and reducing them to a pulp, then adding water, and sealing the pasty mass in cans, and subjecting such cans to the action of simultaneous pressure and heat ranging between 212° and 230° Fahrenheit for a considerable period, that is to say until the mass becomes changed or modified, as specified.

3. The process of producing the improved alimentary product described, the same consisting in the following steps, first, blanching the nut-kernels; second, thoroughly cooking them; third, reducing them to a pulp; fourth, adding water in the proportion of about one to two; fifth, sealing the soft, pasty and emulsified mass in tin cans, and, sixth, in subjecting such cans to the action of steam at a temperature ranging from 212° to 240° Fahrenheit for a period varying from one to four hours, whereby the mass becomes converted into a product having the characteristics specified.

604,494. THILL-COUPLING. THOMAS H. KELLOGG, Walla Walla, Wash., assignor of one-third to Harry A. Reynolds, same place. Filed Mar. 27, 1897. Serial No. 629,589. (No model.)

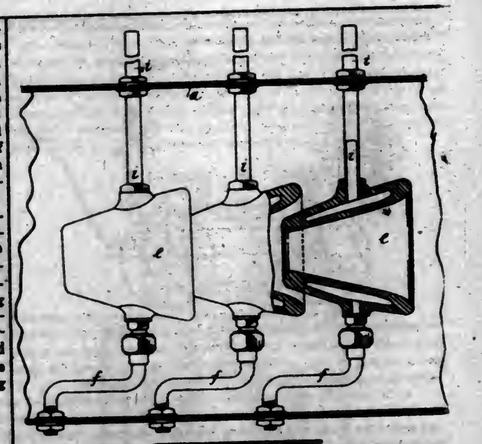


Claim.—1. The combination of a rod adapted to be attached to the axle, a coupler-head movable upon said rod, a bar supported beneath the axle and forming a guideway between the same and the under side of the axle, said coupler-head formed with an elongated portion adapted to move in said guideway, and means for securing the coupler-head at the desired position, substantially as described.

2. The combination of clips adapted to embrace the axle, lugs carried by said clips, a rod supported by said lugs, a bar adapted to be positioned beneath the axle, said bar having perforated lugs formed on its ends through which the lugs of the clips extend and are secured, a coupler-head movable upon the rod and having a projecting portion adapted to move in the guideway formed between the bar and the under surface of the axle, and means for securing the head at the desired position upon the rod, substantially as described.

3. In a thill-coupler, the combination with a coupler-head having a transverse passage formed therein with a central vertical recess communicating with the transverse passage, one of the walls formed by the vertical recess having a cut-out portion communicating with the transverse passage, whereby the thill-iron may be inserted in the coupler-head with its trunnion engaging the transverse passage, a pivoted latch adapted to close said opening, a spring engaging said latch for holding it in an open or closed position, the bottom wall of the head being slotted, and a slide controlling said slot, whereby when said slide is drawn out the dirt may be removed from the coupler-head and also the spring, substantially as described.

4. A thill-coupling comprising a coupler-head having a transverse passage formed therein with a central vertical passage communicating therewith, one of the side walls formed by said passage being cut out above the transverse passage and communicating therewith, whereby the thill-iron may be inserted with its trunnion taking the transverse passage, a latch pivoted to the head and closing said opening formed by the cut-out portion, a U-shaped spring engaging the latch at its upper end and having its double portion bearing against the back wall of the coupler-head, said head being formed with an opening in its bottom wall beneath said spring, and a slide closing said opening, said slide being perforated, the parts operating substantially as described.



604,495. SELF OPENING OR CLOSING UMBRELLA. EMIL KLEMM, Berlin, Germany, assignor to Edmund Scherff and Gustav Recober, same place. Filed June 24, 1896. Serial No. 596,703. (No model.) Patented in Germany Dec. 6, 1894, No. 85,351.

Claim.—In a self-opening and self-closing umbrella or parasol having a tube *a*, another tube *b*, arranged to slide within the former tube *a*; a third tube *h*, arranged upon the tube *a*; a catch *c* adapted to couple the tube *h* to the tube *a*, and a spring *c* adapted to move the tube *b* out of the tube *a*, the combination of auxiliary stretchers *i* hinged to the tube *h* and connected displaceably with the ribs *d*; the braces *k* hinged to the auxiliary stretchers *i*, as well as the tube *b*; the runner *m* arranged displaceably upon the tube *h*; the stretchers *p* hinged to said slide as well as to the auxiliary stretchers *i*; and the catch *n* secured to the runner *m*, and adapted to fix the latter in its normal position, all operating in the manner and for the purpose as described.

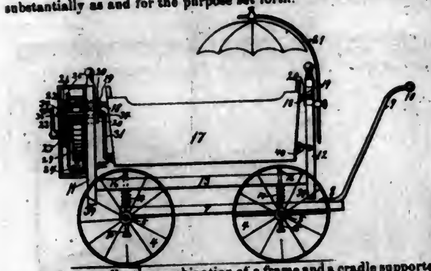
604,496. STRAM-GENERATOR. EDWARD MAHR, Jr., Manchester, England. Filed May 20, 1897. Serial No. 637,204. (No model.) Patented in England Aug. 6, 1896, No. 17,206.

Claim.—In combination with the tube, a series of hollow-walled cones therein with their smaller ends directed into the larger ends of the adjacent cones with spaces through, around and between the cones for the circulation of the hot products and the independent pipe connections *f*, *i*, between the hollow-walled cones and the water-space of the boiler.

604,497. NON-REFILLABLE BOTTLE. JOSEPH H. MCDONALD, New York, N. Y. Filed Feb. 8, 1897. Serial No. 622,422. (No model.)

Claim.—1. The combination with a bottle, of a valve device comprising a lower conical section secured within the neck of the bottle by engagement with its inner walls, a separate upper conical section also supported within the neck by engagement with its inner walls, and having at its upper end a flat cap 15, and a buoyant and a ponderable ball within such sections, and a separate retaining element confined within the bottle-neck by engagement with the inner walls thereof, and having a flat bottom which rests upon the cap of the upper section of the valve device, substantially as set forth.

2. The combination with a bottle, its neck and valve mechanism, of a member confined within the neck above the valve mechanism, passages through said member, enlarged portions in the lower end thereof, and constricted openings from the enlarged portions into the neck, substantially as set forth.



3. The combination with a bottle, its neck, and the valve mechanism, of a tortuous-passage-defining member 17 confined within the neck of the bottle above the valve mechanism, and provided with two passages through it, such passages being separated by a septum 22, and enlarging toward their lower ends, and constricted openings from the said enlarged portions of the passages into the neck of the bottle, substantially as set forth.

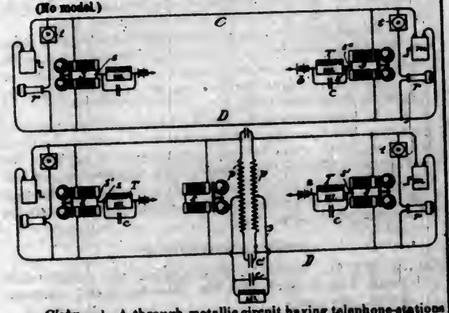
604,498. COMBINED MOTOR-CRADLE AND CHILD'S CARRIAGE. CARL F. HUBERT, Giles, Wis. Filed Mar. 12, 1897. Serial No. 627,146. (No model.)

Claim.—1. The combination with a wheeled skeleton truck having the handle 9 10 of a frame detachably supported on springs upon the truck; a cradle suspended within the frame and being adapted to rock in the frame whether the latter is on the truck or not, substantially as and for the purpose set forth.

2. The combination with a wheeled truck having handhold for pushing it by, of a cradle suspended and rocking or swinging in a frame having legs adapted to stand on the floor and a motor secured to said frame for swinging the cradle and means for yieldingly and

detachably supporting said motor cradle and frame upon the truck, substantially as and for the purpose set forth.

3. In a cradle, the combination of a frame and a cradle supported on trunnions to rock or swing therein, of a clockwork-motor secured to one end of the frame and operatively connected with the cradle and a parasol secured to the opposite end of the cradle over the head of the child, substantially as and for the purpose set forth.



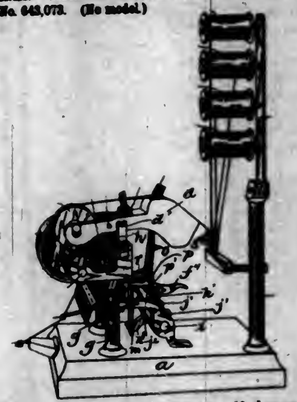
4. In a cradle, the combination with a supporting-frame of a cradle swinging therein on trunnions or journals, a motor secured to one end of the frame and operating the cradle, said motor having the escapement-wheel 29, and the anchor 30, rock-shaft 34, and pendulum-arm 31, and flexible connection between said arm and the cradle proper, substantially as and for the purpose set forth.

5. In a cradle, the combination with a supporting-frame, of a cradle swinging therein on trunnions or journals, a motor secured to one end of the frame and operating the cradle, said motor having the escapement-wheel 29, and the anchor 30, rock-shaft 34, and pendulum-arm 31, and flexible connection between said arm and the cradle proper, said escapement-wheel being made of rubber or other sound-deadening materials, substantially as and for the purpose set forth.

6. In a cradle, the combination with a supporting-frame, of a cradle swinging therein on trunnions or journals, a motor secured to one end of the frame and operating the cradle, said motor having the escapement-wheel 29, and the anchor 30, rock-shaft 34, and pendulum-arm 31, and flexible connection between said arm and the cradle proper, said trunnions and rock-shaft having their journal-boxes inserted in rubber secured in the framework, substantially as and for the purpose set forth.

7. In a cradle, the combination with a supporting-frame, of a cradle swinging therein on trunnions or journals, a motor secured to one end of the frame and operating the cradle, said motor having the escapement-wheel 29, and the anchor 30, rock-shaft 34, and pendulum-arm 31, and flexible connection between said arm and the cradle proper, said trunnions and rock-shaft having their journal-boxes inserted in rubber secured in the framework, and the case containing said motor being secured to the cradle-supporting frame with an intervening dead-air space, substantially as and for the purpose set forth.

604,499. MULTIPLE TELEPHONY AND TELEGRAPHY. RICHARD PUSH, New York, N. Y. Filed Oct. 22, 1897. Serial No. 656,007. (No model.)



Claim.—1. A through metallic circuit having telephone-stations included therein or connected therewith, signaling-magnets for said stations bridged across the two wires of the circuit, an extra circuit uniting the middle points of the signal-magnets whereby an independent circuit is obtained between the stations, and instruments for communication, located in said extra circuit, substantially as described.

2. A through metallic circuit having terminal and way stations, the terminal stations including a self-inductive resistance bridged across the mains, communicating instruments located in or connected with the metallic circuit at said stations, the two sides of the metallic circuit being opened at the way-stations and closed through condensers, self-inductive resistances connecting the two sides of the metallic circuit on each side of the condensers at the way-stations, in the manner described, extra conductors connecting the middle points of the two resistances at the way-stations and including communicating instruments, and an extra circuit connecting the middle points of the resistances at the terminal stations and including communicating instruments, as described.

3. A through metallic circuit having terminal and way stations, the terminal stations including a signaling-magnet bridged across the mains, communicating instruments located in or connected with the metallic circuit at said stations, the two sides of the metallic circuit being opened at the way-stations and closed through condensers, self-inductive resistances connecting the two sides of the metallic circuit on each side of the condensers at the way-stations, in the manner described, extra conductors connecting the middle points of the two resistances at the way-stations and including communicating instruments and an extra circuit connecting the middle points of the coils of the signaling-magnets at the terminal stations and including communicating instruments, as described.

4. A metallic circuit having terminal and way stations, the terminal stations including self-inductive resistances bridged across the mains, communicating instruments located in or connected with the metallic circuit at said stations, the two sides of the metallic circuit being opened at the way-stations, self-inductive transformer or repeating coils connected across the mains, one-half on each side of the opening in the mains in the manner described, extra conductors connecting the middle points of each half of the transformer and including communicating instruments and an extra circuit connecting the middle points of the resistances at the terminal stations and including communicating instruments, substantially as described.

604,500. STOP MECHANISM FOR DOUBLING AND TWISTING MACHINES. ANDREW M. PRESS, Lincolnton, N. C. Filed July 1, 1897. Serial No. 643,073. (No model.)

Claim.—1. A device of the character specified comprising means for progressively actuating two or more yarn-threads, a knife, a normally-stationary knife-actuating member, a feeler having a reciprocating motion toward and away from said member, detectors engaged with the several yarn-threads, and members connected with the several detectors, each of said members being adapted, upon the breaking of a thread and the release of the corresponding detector to fall into the space between the feeler and the knife actuating member, causing engagement of the two and causing the knife to be operated to cut all of the threads.

2. A device of the character specified comprising means for progressively actuating two or more yarn-threads, a knife having a normally-inoperative position in proximity to said threads, means for moving said knife from this position to cut the threads upon the breaking of one or more of them, and means for automatically returning the knife to its inoperative position immediately after the cutting operation.

3. A device of the character specified comprising means for progressively actuating two or more yarn-threads, a knife, a knife-operating member, a vibratory feeler, detectors adapted to effect engagement between said member and said feeler so as to operate the knife and cause it to cut the threads when one or more of said threads break, and means for automatically effecting disengagement of the said member and said feeler immediately after the cutting operation, thereby permitting the knife to return to an inoperative position.

4. A device of the character specified comprising drawing-rollers for progressively actuating two or more yarn-threads, a tilting member carrying one of said rollers, means for locking said tilting member with the rollers in contact, a knife, and thread-controlled devices for causing said knife to sever the threads and simultaneously therewith releasing the locking means to allow of the separation of the rollers upon the breaking of one or more of the threads.

5. A device of the character specified comprising drawing-rollers for progressively actuating two or more yarn-threads, a knife, a knife-operating lever, a vibratory feeler, detectors normally suspended by the threads, a tilting table carrying one of the drawing-rollers, a latch depending from said tilting table and adapted to lock the same with the rollers in contact, and latch-fingers connected with said latch and with the detectors, the arrangement being such that a latch-finger will fall and effect engagement between the vibratory feeler and the knife-operating lever, upon the breaking of its suspending thread, thereby causing the knife to cut the threads, and at the same time pulling the latch so as to unlock the tilting table and allow of the separation of the drawing-rollers.

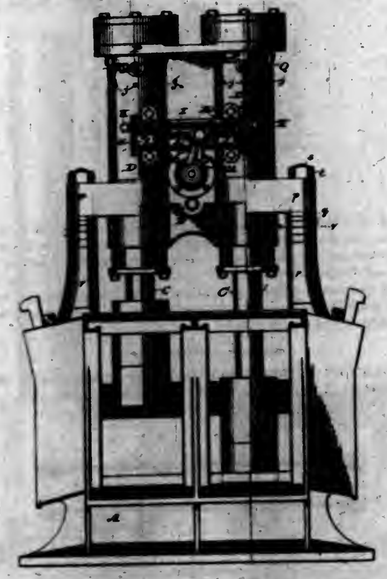
6. A device of the character specified, comprising means for progressively actuating two or more yarn-threads, an oscillating shaft, a knife-actuating member loosely mounted thereon, a knife, a feeler secured to and vibrated by the oscillating shaft, detectors engaged with the several yarn-threads, and members connected with the several detectors and each adapted, upon the breaking of the thread supporting its detector, to fall between the feeler and the knife-actuating member, thereby causing the latter to oscillate and operate the knife to sever the threads.

7. A device of the character specified, comprising a tilting table formed with detector-channels, a series of detectors occupying said channels and normally supported by the yarn-threads at or near the orifices of the channels, and means for automatically tilting the table upon the breaking of one or more of the yarn-threads so as to depress its channeled portion and cause the detectors to project from their orifices for the purpose of rethreading.

604,501. MOTOR-WATTMETER. CARL D. RAAB, Kaiserslautern, Germany. Filed Dec. 27, 1897. Serial No. 663,782. (No model.) Patented in Belgium June 30, 1897, No. 126,966, and in Spain July 10, 1897, No. 21,922.

Claim.—1. A motor-wattmeter having a disk armature, two horseshoe electromagnets placed near each other at one side of the disk armature and a main-current solenoid at the other side thereof, substantially as described.

2. A motor-wattmeter having a disk armature, two horseshoe electromagnets placed near each other at one side of the disk armature and provided with shunt-coils, and a main-current solenoid at the other side of the disk armature, substantially as described.



3. A motor-wattmeter having a rotary armature and two shunt horseshoe electromagnets with their poles closely adjacent thereto and on one side thereof, in combination with a main-current solenoid located on the other side thereof, substantially as described.

4. A motor-wattmeter having a disk armature, two shunt horseshoe electromagnets of different size placed near each other at one side of the armature, in combination with a main-current solenoid located on the other side of said armature, substantially as described.

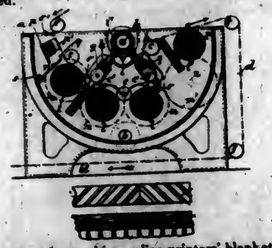
604,502. STAMP-MILL. ERWIN RITTINGER, Milwaukee, Wis. Filed Mar. 13, 1897. Serial No. 627,201. (No model.)

Claim.—1. In a stamp-mill, a pair of main cylinders containing reciprocative stamp-pistons and provided with ports communicating with free atmosphere, these ports being opened and closed by the pistons, a pair of auxiliary cylinders having pipe connection with the main cylinders, pistons in the auxiliary cylinders connected by a sliding rod, a lever in connection with the rod, a steam-chest intermediate of said main cylinders, and an oscillative valve in the steam-chest provided with a stem having rigid connection with said lever, the valve being operative to control passages that establish communication between said steam-chest and steam-spaces at the lower ends of the aforesaid main cylinders.

2. In a stamp-mill, a pair of main cylinders containing reciprocative stamp-pistons, a pair of auxiliary cylinders communicating with the main cylinders, pistons in the auxiliary cylinders connected by a sliding rod, a lever in connection with the rod, a steam-chest intermediate of said main cylinders, and an oscillative valve in the steam-chest provided with a stem having rigid connection with said lever, the valve being operative to control passages that establish communication between said chest and main cylinders.

3. In a stamp-mill, a pair of main cylinders containing reciprocative stamp-pistons having automatic intermittent rotary movement, a pair of auxiliary cylinders communicating with the main cylinders, pistons in the auxiliary cylinders connected by a sliding rod, a lever in connection with the rod, a steam-chest intermediate of said main cylinders, and an oscillative valve in the steam-chest provided with a stem having rigid connection with said lever, the valve being operative to control passages that establish communication between said chest and main cylinders.

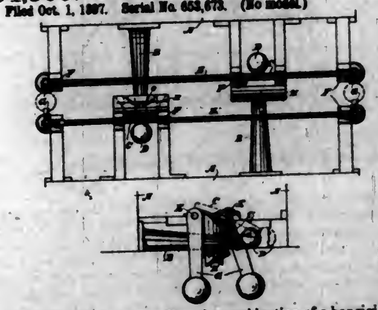
4. In a stamp-mill, a pair of main cylinders containing reciprocative stamp-pistons having automatic intermittent rotary movement in one direction only, a pair of auxiliary cylinders communicating with the main cylinder, pistons in the auxiliary cylinders connected by a sliding rod, a lever in connection with the rod, a steam-chest intermediate of said main cylinders, and an oscillative valve in the steam-chest provided with a stem having rigid connection with said lever, the valve being operative to control passages that establish communication between said chest and main cylinders.



604,503. PROCESS OF MAKING ORTHOSULFAMIN-BENZOIC-ACID ALKYL ESTERS. BRUNO R. SEIFERT, Radebeul, Germany, assignor to the Chemische Fabrik von Heyden, Gesellschaft mit Beschränkter Haftung, same place. Filed Jan. 27, 1897. Serial No. 620,864. (No specimens.)

Claim.—The process of manufacturing orthosulfamin-benzoic-acid alkyl esters which consists in converting orthosulfamin-benzoic acid into an alkyl ester by heating it in an alcoholic solution with a small quantity of a water-absorbing substance, substantially as described.

604,504. MACHINE FOR WASHING PRINTERS' BLANKETS. DANIEL H. SEIFERT and JOHN WALKER, Cheadle Heath, JOSEPH STRAPP, Entwistle, and FRANK FARNWORTH, Ramsbottom, England. Filed Apr. 28, 1897. Serial No. 634,376. (No model.)

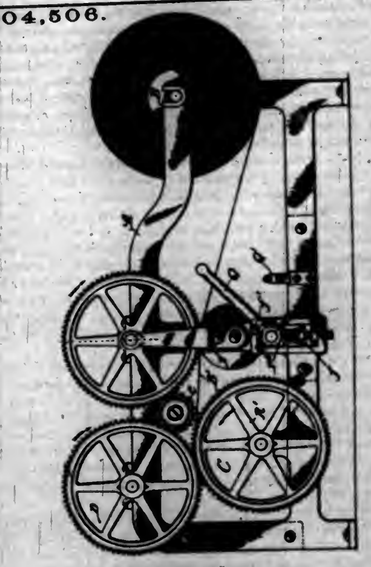


Claim.—1. In a machine for washing calico-printers' blankets, a radially-adjustable guide-roller mounted between two stationary guide-rollers adapted to operate upon back of the blanket, in combination with a brush mounted between the said adjustable and one of the said stationary guide-rollers adapted to act upon the face of the blanket, all substantially as and for the purpose set forth.

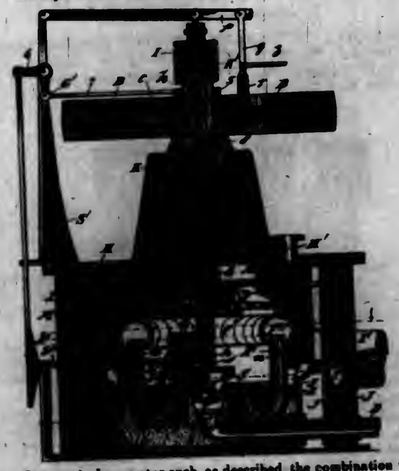
2. In a machine for washing calico-printers' blankets, in combination with guide-rollers and brushes between which the blanket runs, a stationary brush *p* supplied with liquid and a trough *r*, *s*, below the same, said trough being adapted to receive the material from the basket independent of the main wash-box and to convey the same away without entering said wash-box, substantially as and for the purpose specified.

3. In a machine for washing calico-printers' blankets, in combination with the wash-box and guide-rollers over which the blanket runs, stationary brushes *l* and *p* made in two lengths placed end to end and having right and left hand fashioned rows of bristles or strips, said brush extending parallel with the rollers, the said two brush parts abutting against each other and being reversible, all substantially as and for the purpose set forth.

604,505. CAR-COUPLING. CHARLES H. SMITH, Coulterville, Cal.
Filed Oct. 1, 1897. Serial No. 653,673. (No model.)



Claim.—1. In a car-coupling, the combination of a bar rigid with and projecting from one car in the line of travel thereof, and having a knob upon its outer end, an outwardly-diverging guide fixed to the opposing car and having a passage or opening made entirely through it, and a shaft exterior to and journaled behind the inner end of the guide, having a plate depending from it and adapted to seat itself against the rear exterior surface of the guide, so as to partially close the opening in the inner end thereof, said plate having its under surface grooved and said shaft having weighted arms upon its outer ends.



2. An improved car-coupling consisting of bars rigid with and projecting from opposite cars, said bars being on opposite sides of the longitudinal central line of the cars, diverging guides projecting from said cars one in line with each of the said bars, said guides having openings made entirely through them and said bars having knobs to pass through said openings to a point exterior to the inner ends of the guides, shafts journaled on each car at a point behind the inner end of each guide, weighted arms on the ends of said shafts and plates on said shafts and lying just behind the vertical plane of the inner ends of the guides, whereby the passage of the knobs beyond the inner ends of the guides lifts the plates until the grooved portions thereof pass the knobs when the plates seat themselves against the open inner ends of the guides and partially close the same, and secure the knobs.

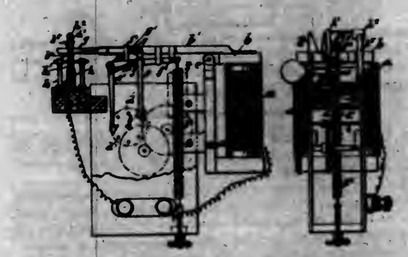
604,506. ROTARY STENCILING-MACHINE. ADDISON C. THOMAS and CASSIUS M. HAMILTON, Chicago, Ill., assignors to George W. Cummings, New York, N. Y. Filed Aug. 14, 1897. Serial No. 648,200. (No model.)

Claim.—In a rotary stenciling-machine, the combination with the frame, of a stencil-cylinder journaled therein, means for supplying ink to the inner side of said stencil while on the cylinder, a paper-drum, and feed and severing rolls journaled in the frame, substantially as and for the purpose set forth.

604,507. STEAM-TURBINE. OTTO THOMEN, Hamburg, Germany.
Filed Sept. 23, 1896. Serial No. 606,763. (No model.)

Claim.—1. In a motor such as described, the combination with a vessel adapted to contain a liquid, an ejector device partly immersed in said vessel and having radial fluid ejecting channels whose inlets open into said vessel, and a turbine wheel into which the outlets of said channels open, and means for periodically admitting steam under pressure to said channels to drive the liquid therefrom into contact with said wheel, of means for preventing the displacement of the liquid in the vessel beyond a normal level, and a power-transmitting shaft on which the turbine wheel is secured, for the purpose set forth.

2. In a motor such as described, the combination with a vessel adapted to contain a liquid, a revoluble power-transmitting shaft extending into said vessel, a turbine wheel secured to said shaft, and an ejector device partly immersed in the liquid in said vessel and provided with radially-arranged liquid-ejecting channels whose inlets and outlets open into the vessel and turbine wheel respectively; of a valve-controlled steam-supply passage in communication with said channels, means for unseating and seating the valve, and means for admitting liquid from the vessel to the valve when on its seat, for the purpose set forth.



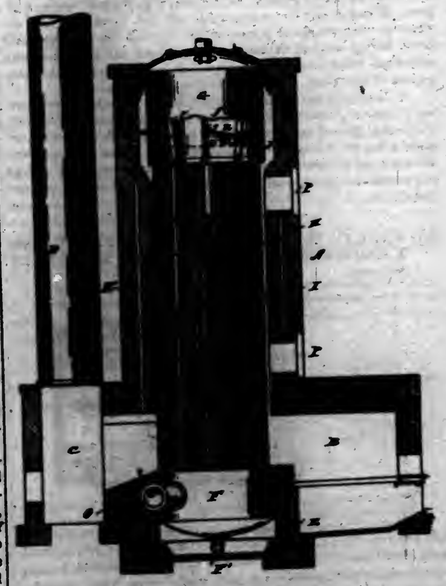
3. In a motor such as described, the combination with a vessel adapted to contain a liquid, a revoluble power-transmitting shaft extending into said vessel, a turbine wheel secured to said shaft, and an ejector device partly immersed in the liquid in the vessel and provided with radially-arranged liquid-ejecting channels whose inlets and outlets open into said vessel and turbine wheel respectively; of a valve-controlled steam-supply passage in communication with said channels, means for alternately unseating and seating the valve controlled by the rotation of the turbine, and similarly-controlled means for admitting liquid from the vessel to the steam-passage on the inlet side of the valve-seat to seal the same.

4. In a motor such as described, the combination with a vessel divided into two chambers by a partition provided with normally open ports or openings, one of said chambers containing a liquid, a revoluble power-transmitting shaft extending into the other chamber, a turbine wheel secured to said shaft and an ejector device partly immersed in the liquid in one of said chambers and provided with radially-arranged liquid-ejecting channels having their inlets and outlets opening into the liquid-containing chamber and the turbine wheel respectively; of means for periodically admitting steam under pressure to the ejecting-channels, and a float-valve in the liquid in one of the chambers adapted to close the ports leading to the other chamber when the level of said liquid is displaced by the pressure of the steam, for the purpose set forth.

5. In a steam-turbine in which superheated steam acts upon molten lead, the combination of a suitably-heated vessel, a body arranged in said vessel and provided with a steam-chest and conducting-channels, the latter and the vessel being partially filled with molten lead, and intermittingly-operated stop-valve for regulating the admission of the superheated steam into the said conducting-channels, a suitable valve for preventing backflow of the molten metal under the pressure of the superheated steam; of a turbine wheel adapted to be rotated by the molten lead thrown out through the conducting-channels, and a fly-wheel or pulley connected with the turbine wheel and adapted to transmit the rotation imparted to the turbine wheel, substantially as described.

6. In a steam-turbine in which superheated steam acts upon molten lead, the combination of a suitably-heated vessel, a body arranged in said vessel and provided with a steam-chest and conducting-channels, the latter and the vessel being partially filled with molten lead, an intermittingly-operated stop-valve for regulating the admission of the superheated steam into the said conducting-channels, a suitable valve for preventing backflow of the molten metal under the pressure of the superheated steam, of a turbine wheel adapted to be rotated by the molten lead thrown out through the conducting-channels, a fly-wheel or pulley connected with the turbine wheel, a box in communication with the interior of the vessel and the steam chest, a cock for changing the said communications alternately and means for actuating the said cock from one position into the other, substantially as specified.

604,508. ELECTRIC CLOCK. WILLIAM WESTENRAD, Manchester, England. Filed June 7, 1897. Serial No. 639,734. (No model.)



Claim.—1. In an electric clock, the combination of an armature-arm *b'* under the influence of a spring *b²* with a switch consisting of a lever *h'* having at its upper end a contact *h²* adapted to make and break contact with an insulated contact-piece *h³* and its lower end being alternately engaged and released by a pawl *h⁴*, all substantially as and for the purpose set forth.

2. In an electric clock, the combination with a pin-wheel *d*, *d'*, and the armature-arm *b'* of a rocking lever *f* pivoted to the armature-arm *b'* and placed under the influence of a spring *b³* and two pawls *e*, *e'*, the "thrust-pawl" *e* of which is pivoted to the armature-arm *b'* and the "pull pawl" *e'* to the rocking lever *f*, which pawls are adapted to engage the pins *d'* and rotate the respective wheel *d'*, all substantially as and for the purpose set forth.

3. In an electric clock, the combination with the armature-arm *b'* of a two-armed lever *g* pivoted to the free end of the said arm, the inner end of which lever is controlled by a lip *f⁴* on the rocking lever *f* and the outer end adapted to operate a switch, all substantially as and for the purpose set forth.

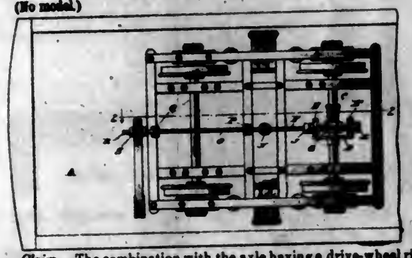
604,509. UPRIGHT WATER-TUBE BOILER. WILLIAM J. WICKES and LEWIS BAKER, Saginaw, Mich. Filed Oct. 4, 1897. Serial No. 654,008. (No model.)

Claim.—1. An upright water-tube boiler comprising a suitable setting or casing having a transverse partition therein, a fire-chamber communicating with the heating-space on one side of said partition and an outlet for the spent gases on the opposite side of said partition, front and rear sets of tubes arranged respectively on opposite sides of said partition, a drum connecting the lower ends of said sets, a steam-drum connecting the upper ends of said sets, and a baffle-plate in the steam-drum extending over the front set of tubes only, substantially as described.

2. An upright water-tube boiler comprising a suitable setting or casing having a transverse partition therein, a fire-chamber communicating with the heating-space on one side of said partition and an outlet for the spent gases on the opposite side of said partition, front and rear sets of tubes arranged respectively on opposite sides of said partition, a drum connecting the lower ends of said sets, a steam-drum connecting the upper ends of said sets, and a baffle-plate in the steam-drum extending over the front set of tubes only and hinged to permit access to said tubes, substantially as described.

3. An upright water-tube boiler comprising a suitable setting or casing having a transverse partition therein, a fire-chamber communicating with the heating-space on one side of said partition and an outlet for the spent gases on the opposite side of said partition, front and rear sets of tubes arranged respectively on opposite sides of said partition, a drum connecting the lower ends of said sets, a steam-drum connecting the upper ends of said sets, and a baffle-plate in the steam-drum extending from the wall of the drum inward in an upwardly-inclined direction over the front set of tubes only, substantially as described.

4. An upright water-tube boiler comprising a suitable setting or casing having a transverse partition therein, a fire-chamber communicating with the heating-space on one side of said partition and an outlet for the spent gases on the opposite side of said partition, front and rear sets of tubes arranged respectively on opposite sides of said partition, a drum connecting the lower ends of said sets, a steam-drum connecting the upper ends of said sets, and a baffle-plate arranged in the steam-drum extending over the front set of tubes and comprising a fixed section adjacent to the wall of the drum and a hinged section located above the fixed section and extending therefrom inward to the central line of the drum, substantially as described.



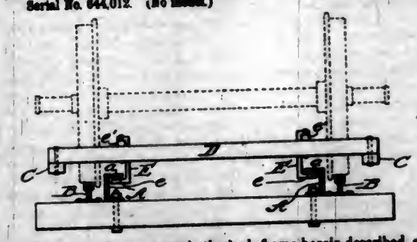
604,510. HANDLE-FASTENER OR SHANK-LOCK. THOMAS E. WILSON, Farmland, Ind. Filed Nov. 18, 1897. Serial No. 658,947. (No model.)

Claim.—1. In combination, a tool-handle having a hole therein, a split nut having internal screw-threads, a tool-shank having a tapered threaded end for engagement with the threads of the nut whereby when the shank is rotated the nut will be expanded, said shank having longitudinal corrugations thereon, and a ferrule having extensions which are corrugated at their ends to engage the corrugations of the shank, as and for the purpose described.

2. In combination with a threaded split nut of a tool-shank having a tapered threaded end adapted to engage the threads of the nut, a shoulder formed upon said shank having notched or corrugated sides, a ferrule secured upon the handle, said ferrule having extensions formed therewith, the ends thereof being serrated to engage the notches or corrugations of the shoulder, as and for the purpose described.

604,511. DRIVING MECHANISM FOR DYNAMOS. PHILEMON W. ALEXANDER, Allapaha, Ga. Filed Sept. 21, 1897. Serial No. 652,414. (No model.)

Claim.—The combination with the axle having a drive-wheel rigidly secured thereto, with a slidable bearing upon the axle normally held toward the drive-wheel, a shaft mounted in said slidable bearing, clutch-collars rigidly secured to said shaft having teeth pointed in opposite directions, drive-wheels mounted loosely upon said shaft engaging said drive-wheel on opposite sides of the axle and having teeth to engage the clutch-collars respectively, and springs coiled around the shaft between the slidable bearing and the wheels thereon, normally holding the wheels in contact with the clutch-collars, substantially as described.



604,512. TUBULAR-FABRIC-TURNING MACHINE. ROBERT BARRIE, Philadelphia, Pa. Filed Aug. 31, 1897. Serial No. 650,174. (No model.)

Claim.—1. In a circular-fabric-turning machine the combination of a base having openings for the fabric to pass through, a tube resting upon said base and registering with one of said openings, and rollers suitably journaled and surrounding the tube substantially as shown and described.

2. In a circular-fabric-turning machine, the combination of a stretching-frame over which the fabric is intended to pass, a base having openings for the fabric to pass through, a tube registering with one of said openings and to which the aforesaid stretcher is secured with rollers surrounding the tube and serving to receive and draw the fabric down as and for the purpose herein shown and described.

604,513. MEANS FOR PREVENTING DERAILMENT OF RAILROAD-CARS. MARIA R. BRADLEY, Chicago, Ill. Filed July 9, 1897. Serial No. 644,012. (No model.)

Claim.—1. In a car-truck, the lock-frame herein described, consisting of the side bars C C, the cross-bars D D, and the longitudinal bars E E; substantially as and for the purpose described.

2. In a car-truck, a lock-frame independent of the action of the car-springs and having longitudinal members E E extending below the level of the guard-rail flanges and in the immediate vicinity thereof, for the purpose of supporting the detent or locking device in proper relation thereto; substantially as described.

3. The combination of the flanged guard-rails A A with a car-truck provided with the lock-frame herein described, and with a detent or locking device projecting outward laterally from the side of the inner longitudinal member of said lock-frame and normally running under the flange of the guard-rail; substantially as and for the purpose described.

604,514. VESSEL FOR HOLDING LIQUIDS. ROBERT H. BALDOM, Horton, Mich., assignor of one-half to William F. Cowham, Jackson City, Mich. Filed May 12, 1897. Serial No. 636,194. (No model.)

Claim.—A drinking-glass or tumbler, provided at the top with a broad swelling enlargement forming a comparatively shallow bowl-shaped receptacle surmounting the brim of the tumbler proper for the purposes herein described and set forth.

604,515. PROCESS OF DEODORIZING AND PURIFYING PETROLEUM-OIL. JOHN BRAGG, Cleveland, Ohio. Filed Aug. 12, 1896. Serial No. 602,042. (No specimens.)

Claim.—1. The process of deodorizing and purifying petroleum-oil, which consists in first dissolving in the oil a metallic compound soluble in the oil and whose metallic constituent is combinable with the sulfur element of the oil, such for instance as an oleate or colophonate, subsequently breaking up the compound or emulsion then formed by the addition thereto of a substance capable of reacting with the metallic element of the compound added, whereby the metallic constituents of the mass are caused to separate from the oil, and finally removing from the oil the separated impurities and precipitates, without distillation, substantially as described.

2. The process of deodorizing and purifying petroleum-oil which consists in effecting the solution in the liquid oil of a metallic soap or emulsion, subsequently decomposing the metallic soap by the addition of acid to the oil under treatment, whereby the skunk is driven off and a precipitation of the impurities is caused, separating the purified oil from such precipitate, and then neutralizing the acid remaining in the oil and washing the oil, substantially as described.

3. The process of deodorizing and purifying petroleum-oil which consists in forming a solution in the liquid oil of a metallic soap or

emulsion and agitating the same to diffuse the same thoroughly throughout, then adding sulfuric acid to precipitate the metallic elements of the solution and separate the impurities from the oil, separating the oil from such precipitate, and then washing the oil with alkaline and chlorin solution, substantially as described.

4. The process of deodorizing and purifying petroleum-oil which consists in dissolving in the liquid oil with agitation a metallic soap or emulsion, then adding sulfuric acid to precipitate the metallic elements of the solution and separate the impurities from the oil, separating the oil from the precipitate and subsequently treating the oil, first with alkali and then with chlorin liquor, alternating each treatment with water-washing, and finally steaming the oil, substantially as described.

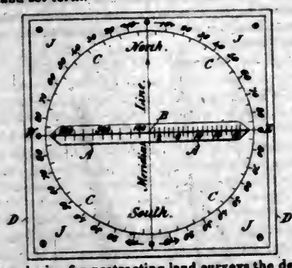
5. The process of deodorizing and purifying petroleum-oil which consists in effecting the solution in the oil of a metallic soap or emulsion formed of the oxids of lead or manganese or both oxids mixed saponified with a mixture of cotton-seed oil and petroleum, subsequently adding acid to decompose the soap and precipitate the metallic elements thereof and drive off the skunky element as a vapor, separating the oil from the precipitate, and afterward treating the oil, first with alkali and then with chlorin liquor, alternating each treatment with water-washing, and finally steaming the oil, substantially as described.

6. The process of deodorizing and purifying petroleum-oil which consists in effecting the solution in the liquid oil of a metallic soap or emulsion, and thoroughly diffusing the same in the oil by agitation, whereby a reaction takes place between the oil and the metallic elements added, then breaking up the combination thus formed by the addition of acids and alkali, whereby the impurities originally present and those added to the oil precipitate, separating the oil from such precipitated impurities, and subsequently washing the oil with alkaline and chlorin solutions, substantially as described.

7. The process of deodorizing and purifying petroleum-oil which consists in effecting the diffusion or solution in the oil of a metallic soap or emulsion, subsequently adding acid to break up the soap or emulsion and precipitate the metallic elements thereof and drive off the skunky element, separating the oil from the precipitate and afterward treating the oil with alkali, chlorin liquor, water and steam, substantially as described.

8. The process of deodorizing and purifying petroleum-oil which consists in effecting the diffusion or solution in the oil of a metallic soap or emulsion, formed of the oxids of lead or manganese or both oxids mixed saponified by a mixture of cotton-seed oil water and petroleum, subsequently adding acid to break up the soap or emulsion and precipitate the metallic elements thereof and drive off the skunky element, separating the oil from the precipitate and afterward treating the oil with alkali, chlorin liquor, water and steam, substantially as described.

604,516. LATCH MECHANISM. CHARLES H. BRIGGS, Canton, Mass., assignor to S. M. Hewes, Jr., Yonkers, N. Y. Filed Feb. 15, 1897. Serial No. 623,249. (No model.)

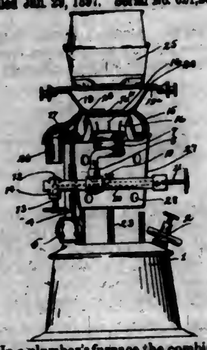


Claim.—1. A latch mechanism having a longitudinally-movable latch-bar, a key-operated revoluble bushing, and a tumbler directly engaged and operated by the key, and arranged to normally lock the bushing against movement.

2. A latch mechanism having a longitudinally-movable latch-bar, a key-actuated revoluble bushing formed to lock the latch-bar against movement, and a longitudinally-sliding tumbler normally locking the bushing, and unlocked therefrom directly by the engagement of the key therewith.

3. A latch mechanism having a casing with opposing keyholes, a key-actuated oscillatory bushing formed to close either of said keyholes, and a tumbler arranged in the path of the key so as to be directly engaged thereby, said tumbler normally locking the bushing against movement.

604,517. DEVICE FOR PROTRACTING LAND SURVEYS. JOHN D. BROWN, Richmond, N. Y. Filed June 26, 1897. Serial No. 642,313. (No model.)



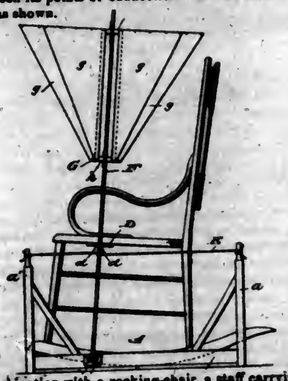
Claim.—1. In a device for protracting land surveys the degreed circle C as herein described provided with a flat rotary indicator plate A, of a length equal to the diameter of the circle C; such plate having a line drawn through the center of its length and made rotatable at the point B by means of a rod, spindle or shaft F attached thereto and passing through the material on which such circle is drawn or fastened substantially as and for the uses and purposes herein fully described and set forth.

2. In a device for protracting land surveys the degreed circle C as herein described provided with a flat rotary indicator-plate A having a scale of measurements drawn thereon commencing to number from the point of rotation B and a length equal to the diameter of the circle C; such plate having a line drawn through the center of its length and made rotatable at the point B by means of a rod, spindle or shaft F attached thereto and passing through the material on which such circle is drawn or fastened substantially as and for the uses and purposes herein fully described.

3. In a device for protracting land surveys the degreed circle C—indicator-plate A—rod, spindle or shaft F in combination with the wheel or pulley E substantially as and for the uses and purposes herein fully described and set forth.

604,518. PLUMBER'S FURNACE. EDWARD T. BURDSEN, Columbus, Ohio. Filed Jan. 29, 1897. Serial No. 621,309. (No model.)

Claim.—1. In a plumber's furnace the combination with a burner 15 having burner-openings therein, of a generating pipe-coil 7 having connection with a tank and a valve-tube 9 connected with said coil, said valve-tube being provided with valve-openings 10 and 12 adapted to discharge respectively through said coil and into said burner, substantially as and for the purpose specified.



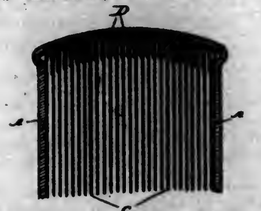
2. In a plumber's furnace the combination with a hollow circular burner body or ring having burner-openings on its inner side and means for discharging gas into said burner, of a flaring flame-protecting ring rising from said burner-top and an interned flange portion 20 formed on the lower end of said protector-plate and adapted to form a protecting-hood for the burner-openings, substantially as and for the purpose specified.

3. In a plumber's furnace the combination with a hollow circular burner-body having a gas-receiving neck 17 and having a continuous horizontal burner-opening 18 in its inner wall, and substantially vertical burner-openings 16 below said burner-opening 18, of a tank 1, a generating-coil burner encircled by said burner-body and connected with said tank, a valve-tube connected with said coil and supported therefrom and valve-controlled openings in said valve-tubes adapted to discharge respectively through said coil and into said burner-neck, substantially as and for the purpose specified.

604,519. FAN ATTACHMENT FOR ROCKING-CHAIRS. ROBERT M. CRITTENDEN, Black Rock, Ark. Filed Oct. 21, 1897. Serial No. 656,260. (No model.)

Claim.—1. In a fan attachment for rocking-chairs, the combination with the chair having attached thereto a clamp with outwardly-projecting arms, a staff with which the outer ends of the arms en-

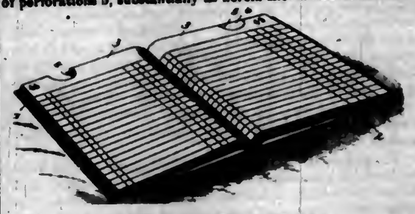
gage, of a trough for the reception of the rocker, a bearing or fixture carried by the trough with which the lower end of the staff engages, and posts having a flexible connection which engages with the staff between its points of connection with the chair and frame, substantially as shown.



2. In combination with a rocking-chair, a staff carrying a fan, a frame with which the rocker is adapted to engage, said frame having a bearing in which the lower end of the staff is loosely fulcrumed, a clamp carried by the chair and provided with outwardly-projecting spring-arms; together with a cord or flexible connection carried by the frame for engagement with the staff, substantially as shown and for the purpose set forth.

604,520. CASTER. ROBERT L. DORSEY, Indianapolis, Ind., assignor to the Tucker & Dorsey Manufacturing Company, same place. Filed Nov. 13, 1897. Serial No. 658,037. (No model.)

Claim.—The combination, in a wheel, of the part A having a hub and projections *p* integral therewith, a rim or tire part B, and a side part C having a central opening to receive said hub, and openings corresponding to the projections *p* to receive said projections, said projections being adapted to be headed down and secure the parts together when said parts are assembled, substantially as and for the purposes set forth.

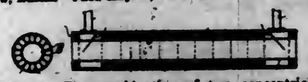


604,521. ACCOUNT-BOOK. JOHN RIEHEMY, Pittsburg, Pa. Filed Mar. 30, 1897. Serial No. 628,469. (No specimens.)

Claim.—In an account-book, the leaves B arranged in sections, combined with the dividing-sheets C which have their inner edges turned inwardly so as to form the strips D, and which sheet C and strip D inclose the inner edge of each section of the leaves B, substantially as shown.

604,522. BLANK-BOOK. THOMAS ELLIOTT, Rexburg, Idaho, assignor of two-thirds to George B. Rogers and Lorenzo B. Thomas, Blackfoot, Idaho. Filed Apr. 20, 1897. Serial No. 634,431. (No specimens.)

Claim.—As an improved article of manufacture, a consecutive-entry book comprising the solid back cover 2, the front cover 1 provided in its top edge with a recess 4 formed as described and arranged between the center and outer side edge thereof, and the leaves 3 having the alined detachable portions 6 formed at the upper edges of their head marginal portions 5, each detachable portion being arranged between the center and outer side edge of said marginal portion and separated from the body of the same by an intervening row of perforations 5, substantially as herein shown and described.



604,523. COMBINED PACK AND SLED. JOHN J. ESS, Livingston, Mont. Filed Jan. 26, 1898. Serial No. 668,242. (No model.)

Claim.—1. A combined pack and sled comprising a rectangular-shaped box having a runner-shaped bottom, two chambers therein, water and insect proof openings into said chambers, prospecting-pans fitting snugly over and forming secure covers over said openings, bails secured to the sides of the top of said device, locks to secure said bails to superstructures on top of said pans, and adjustable harness for securing the pack on the back of a person or to a draft-animal, substantially as described and set forth.

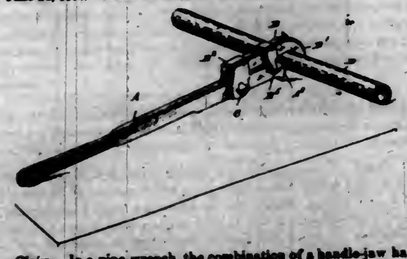
2. The combination in a pack and sled for miners, of a rectangular-shaped device, having a toboggan-shaped bottom, compartments in the same having openings through the top of the same, gasketed, perforated and water-tight covers over the same, prospectors' pans securely fitting on top of said covers, and means to lock said pans in place, as and for the purposes set forth.

604,524. APPARATUS FOR VAPORIZING AND SUPERHEATING WATER CONTAINED IN STEAM. WOLDEMAR FERREMANN, Moscow, Russia. Filed May 27, 1897. Serial No. 638,412. (No model.)

Claim.—1. The combination of two concentrically-arranged tubes, annular plates to close the ends of the annular space between said tubes, an outlet and inlet steam-pipe at opposite ends of said exterior tube, baffle-plates across the outlet and inlet openings, and a series of plates arranged in the annular space formed between the tubes, so as to cause the steam to take a zigzag course through the same and to impart heat direct to the steam substantially as described.

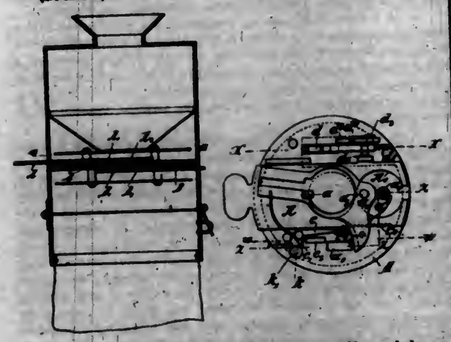
2. The combination of a series of members, each member consisting of two concentrically-arranged tubes, having the ends of the annular space formed between the same closed by annular plates, a steam-inlet extending upwardly from each of the members, and a steam-outlet also extending upwardly at the opposite end of each member, baffle-plates within each member, and a series of plates arranged within each member to cause the steam to take a zigzag course through the said member as specified, the said outlet and inlet pipes having flanges and being so arranged that their flanges extend out of the heating-flue which incloses the members, in two groups at each end of the same, a main inlet for the steam having branches to connect with each of the individual inlet-pipes and a main outlet similarly constructed substantially as described.

3. The combination of an exterior and an interior tube concentrically arranged, plates to close the annular space between the two tubes, an inlet-pipe at one end and an outlet-pipe at the other end of the exterior tube, a slantingly-arranged baffle-plate within the space between the two tubes and across the inlet and outlet, a series of corrugated rings arranged between the outlet and inlet, said rings fitting tightly between and contacting with each of the adjacent walls of the tubes alternately, substantially as described.



604,525. DIE FOR MAKING METALLIC LATHING. CHARLES FORST, Newark, N. J., assignor, by mesne assignments, to the American Metal Lath Proof Construction and Manufacturing Company, same place. Filed Mar. 10, 1897. Serial No. 626,699. (No model.)

Claim.—1. In a die for making expanded metallic lathing, the combination of a holder, teeth for slitting the metal and separate teeth for expanding the metal after it is slitted mounted in said holder.



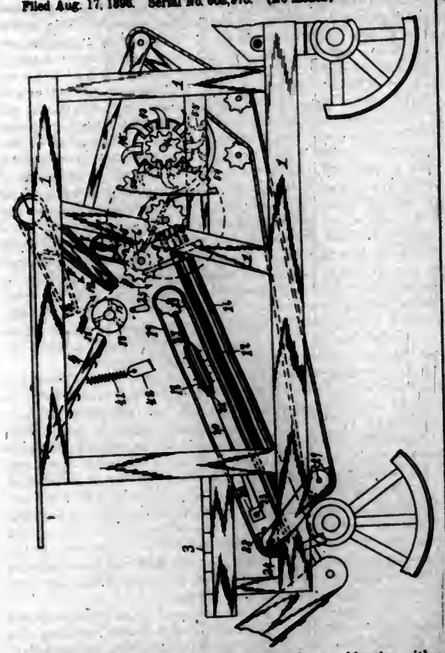
2. In a die for making expanded metallic lathing, the combination of a holder, teeth for slitting the metal and teeth for expanding the metal after it is slitted mounted in said holder and arranged therein in groups, and means for holding said teeth in said holder.

604,526. PIPE-WRENCH. THOMAS J. POWLEN, Tupas, Cal. Filed June 26, 1897. Serial No. 642,499. (No model.)

Claim.—In a pipe-wrench, the combination of a handle-jaw having a series of perforations and a curved or cam-shaped outer end provided with teeth, a movable jaw having its outer end curved or bent to one side, the inside of said jaw being V-shaped and provided with teeth on both sides of the V, two parallel arms projecting from the movable jaw on the same side as its curved end, embracing the handle-jaw and having perforations to register with those of the handle-jaw the perforations of one arm being of less diameter than the other and screw-threaded, a pivot-screw passing through the perforation of one arm of the movable jaw and one of the perforations of the handle-jaw and threaded into the perforation of the other arm of the movable jaw, and a second pair of parallel guide arms projecting from the movable jaw on the same side as the curved end, between the curved end and the pivot-arms, all substantially as and for the purpose set forth.

604,527. DEVICE FOR COLLECTING CONTENTS OF CONTRIBUTION-BOXES. GOTLAV PUSER, Vienna, Austria-Hungary, assignor to Martin Koblenzer, same place. Filed Mar. 20, 1897. Serial No. 628,403. (No model.)

Claim.—1. The combination of a box having orifice and closure-slide as specified and a bag having a head-plate with corresponding orifice and closing-slide, a series of tumblers in connection with both said slides, to retain the same locked, a slide-bolt *f'* mounted beneath said head-plate and having a circular orifice therein with lineal slotted elongation, a vertically-guided pin *f*[3] to fit said circular orifice and having flattened sides at a point in its length, to fit said elongation, means for retaining said bolt with its circular part in the circular orifice, when the box and bag are apart and means in connection with the box-bottom for depressing said bolt as specified when the box and bag are united, a hooked bolt *f* on said slide-bolt, extending through the head-plate and adapted to engage over the bottom of the box when the slide-bolt is operated, and to free the tumblers of the box-slide as specified, a sliding hooked bolt *d* mounted on the bottom of the box and means in connection with the slide of the box to impart to said bolt a downward and then a horizontal motion when the said slide is opened, an orifice in the head plate through which the bolt *d* extends, said bolt constituting the means for operating the tumblers of the bag-slide on the movement of the box-slide, a pawl-and-ratchet device to lock the box-slide in its open position, a pawl operated by the bag-slide to lock the slide-bolt *f'* in its operative position when the bag-slide is opened and a tumbler-lever mechanism in the bag-head plate, adapted to be operated by the bag-slide and to extend into the box-bottom and release the box-slider-retaining pawl when the bag-slide has been opened, substantially as described.



2. The combination of a box having an orifice in the bottom and a slide to close said orifice, a bag having corresponding head-plate and orifice and closing-slide as specified, an operating-bolt slide to lock the box and bag together and release the lock of the box-slide as specified, a series of tumblers to lock the bag-slide, an orifice in the bag-head in proximity to said tumblers, a sliding bolt *d* mounted in the box-bottom, a guide-plate d^5 for the same having slot d^6 with upwardly-extending semicircular arm d^7, pins on the bolt *d* to travel in said slot, a slanting slot in the said bolt *d* and a pin on the slide of the box to engage said slot, a returning-spring to said bolt and means for locking and releasing the slides and the operating-bolt in the order specified and for locking the box to the bag-head while the slides are open and releasing the parts when the slides have been closed and locked substantially as described.

3. The combination of a box having orifice and closing-slide and means for normally keeping said closing-slide locked consisting of a series of tumblers, a bag having corresponding orifice and head-plate in which said orifice is formed and a closing-slide and lock to the same and having an operating-bolt normally locked by means of a pin as specified, means in connection with the box-bottom to release said pin when the box and bag are united and a hooked bolt on said slide-bolt to engage the tumblers of the box-slide, a rearwardly-extending projection on one of said tumblers and an orifice a^4 in the box-bottom in proximity to said tumbler projection and adapted to be partially closed by said projection when the tumblers are in the position to release the slide, a pin on the bag-plate to extend into said orifice a^4 and having lateral recess into which the tumbler projection passes to retain the bag and box together when the slide of the box has been released, and means for locking and unlocking the parts in the order specified, substantially as described.

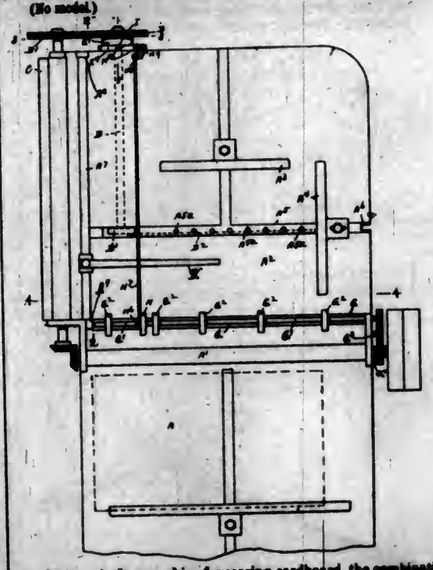
4. The combination of a box having orifice in the bottom and having slide to close same with locking mechanism as specified, a bag having corresponding orifice in its head-plate and locking means in connection with its closure-slide all as specified, an operating slide-bolt and means in connection therewith to release the tumblers of the box-slide, a vertically and horizontally movable bolt *d* mounted in the box-bottom and means in connection with the box-slide for projecting the same into the bag-head as specified, a row of ratchet-teeth formed in the side of the slide *A* of the box within the box and a pawl *c* having spring c^2 and rearwardly-extending arm c^3 to engage said ratchet-teeth and retain the slide in its outward position, an orifice in the box-bottom in proximity to said pawl, a tumbler-lever mounted beneath the bag-head plate and an orifice in said bag-head above said tumbler-lever and means in connection with the bag-slide to project said tumbler-lever through the box-bottom and release the pawl of the slide of the box substantially as described.

5. The combination of a box having orifice in the bottom and closing-slide with locking means and a bag having head-plate with corresponding orifice and locking means for the closing-slide beneath said head-plate as specified an operating slide-bolt *f''* and means in connection therewith for locking together the box and bag and for releasing the lock of the slide of the box, means in connection with the box-slide to release the bag-slide, a pivoted pawl *g* mounted beneath the bag-head and below the operating slide-bolt, and orifice in said slide-bolt adapted to be brought over the pawl-hook when the operating slide-bolt is pushed in as specified, a cam-surface beneath the slide of the bag and fast on the same adapted to contact with the pawl end and operate the pawl to engage the said slide-bolt orifice when the bag-slide is drawn out and means for locking and unlocking the parts in the order specified for the purpose substantially as described.

604,528. CORN-HUSKER, GILBERT S. GUDGEREEN, Dayton, Ohio. Filed Aug. 17, 1896. Serial No. 602,975. (No model.)

Claim.—1. In a corn-husking machine, the combination with a continuous snapping-roll having grooves and rings throughout its length, of two short rolls of similar construction mounted parallel therewith in positions to bring the grooves of one roll in line with the rings of the other, the said short rolls being provided with yielding bearings, substantially as shown and described.

2. The combination with snapping-rollers, of a rotating beater to advance the stalks to the snapping-rollers, and apply pressure thereto; a butting-apron mounted above said snapping-rollers, and beater, and having its lower end, essentially free, and projected between the snapping-rollers and beater, so that a yielding pressure is immediately applied to the stalks to crowd them into the snapping-rollers as said stalks are directed past the beater; whereby the necessity of applying manual pressure to said stalks at a point adjacent to said snapping-rollers, is dispensed with, substantially as described.



3. In a corn-husking machine having side feed-tables and a feeder's footboard, the combination with snapping-rollers, and a shredding-cylinder, of a rotating beater to advance the stalks to the snapping-rollers and to apply pressure thereto, and a butting-apron mounted above said snapping-rollers and beater, the said butting-apron having its lower end essentially free and disconnected from other supports so as to apply variable pressure at all times to the stalks to crowd them into the snapping-rollers as said stalks are advanced by the rotating beater, substantially as shown and described.

604,529. WHEEL-TIRE. WILLIAM H. HEYNER, Rock Hill, S. C. Filed Dec. 1, 1897. Serial No. 660,262. (No model.)

Claim.—A wheel-tire consisting of a pneumatic tube or sack mounted on the rim, a cushion-tire with a central perforation mounted on said pneumatic tube or sack, and a solid non-expansible metal ring mounted in said perforation in said cushion, whereby it is prevented from expanding under the pressure from the pneumatic tube, when pumped up, said pneumatic tube or sack being adapted to partially embrace said cushion-tire, and thus hold it in place, substantially as set forth.

604,530. MACHINE FOR SCORING CARDBOARD. CLARENCE W. HOBBS, Worcester, Mass. Filed Aug. 19, 1896. Serial No. 603,066. (No model.)

Claim.—1. In a machine for scoring cardboard, the combination of a scoring mechanism, a table from which a sheet of cardboard is fed to said scoring mechanism, an automatic feeding mechanism by which the cardboard is fed to said scoring mechanism, a clutching mechanism by which said feeding mechanism is connected with the driving power, a clutch-controlling mechanism arranged in the path of the cardboard and adapted to be actuated thereby, and a table upon which the cardboard is supported as it is presented to said clutch-controlling mechanism, substantially as described.

2. In a machine for scoring cardboard, the combination of two tables for successively supporting the sheet of cardboard, a scoring mechanism, a feeding mechanism by which the sheet of cardboard is fed from the second of said tables to said scoring mechanism, a clutching mechanism by which said feeding mechanism is operatively connected with the driving power, and a clutch-controlling mechanism located between said tables and arranged to be actuated by the sheet of cardboard as it passes from the first to the second table, substantially as described.

3. In a machine for scoring cardboard, the combination of two tables for successively supporting the sheet of cardboard, a feeding mechanism for feeding the sheet of cardboard from the second of said tables, a clutching mechanism by which said feeding mechanism is operatively connected with the driving power, a clutch-controlling mechanism located between said tables and arranged to be actuated by the sheet of cardboard as it passes from the first to the second of said tables, and comprising a tripping member capable of being carried out of the path of the cardboard, substantially as described.

4. In a machine for scoring cardboard, the combination with a feeding mechanism and a clutching mechanism by which said feeding mechanism is operatively connected with the driving power, of a clutch-controlling mechanism arranged to be actuated by the sheet of cardboard and comprising a tripping member and rolls for engaging the cardboard as it strikes said tripping member, substantially as described.

5. In a machine for scoring cardboard, the combination with the scoring mechanism, a feeding mechanism by which a sheet of cardboard is fed to said scoring mechanism, a clutching mechanism by which said feeding mechanism is operatively connected with the driving power, means for automatically disengaging said clutching mechanism at the end of the feeding movement, means for engaging said clutching mechanism with the driving power, consisting of a tripping member adapted to be moved in one direction by the advancing edge of the cardboard and be held from reverse movement by the contact of the cardboard, means for reversing the motion of said tripping member after the cardboard has passed and means for operatively connecting said tripping member with said clutching mechanism whereby said feeding mechanism is set in motion upon the reverse movement of said tripping member, substantially as described.

6. In a machine for scoring cardboard the combination of a scoring mechanism, a table upon which a cardboard is fed to said scoring mechanism, a feeding mechanism, a clutching mechanism by which said feeding mechanism is operatively connected with the driving power, means for automatically disengaging said clutching mechanism at the end of the feeding movement, means for engaging said clutching mechanism with the driving power, consisting of a tripping member pivoted above the surface of the table and arranged to be rocked about an axis parallel with the surface of the table by the advancing edge of the cardboard and arranged to be held from reverse movement by the contact of the cardboard, means for reversing the motion of said tripping member and connected mechanism by which the reverse motion of said tripping member is made to engage said clutching mechanism immediately after the cardboard has passed beneath said tripping member, and means for moving the cardboard beneath said tripping member, substantially as described.

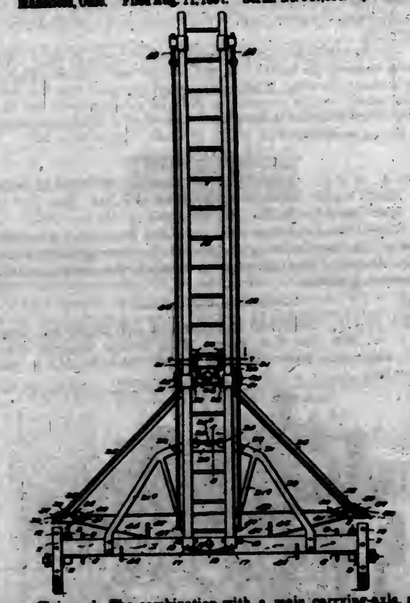
7. In a machine for scoring cardboard, the combination with a scoring mechanism, a table upon which a sheet of cardboard is fed to said scoring mechanism, rolls by which the cardboard is carried upon said table, a feeding mechanism by which the cardboard is fed to said scoring mechanism, a clutching mechanism by which said feeding mechanism is operatively connected with the driving power, means for automatically disengaging said clutching mechanism at the end of the feeding movement and means for engaging said clutching mechanism with the driving power consisting of a tripping member which is moved in one direction by the advancing edge of the cardboard, a spring by which the motion of said tripping member is reversed, means for operatively connecting said tripping member with said clutching mechanism whereby said clutching mechanism is thrown into action by the reverse movement of said tripping member, substantially as described.

8. In a machine for scoring cardboard, the combination with a feeding mechanism and a clutching mechanism by which said feeding mechanism is operatively connected with the driving power, of a clutch-controlling mechanism arranged to be actuated by the sheet of cardboard and comprising a tripping member, and means for holding the cardboard against said tripping member, substantially as described.

9. In a machine for scoring cardboard, the combination with mechanism for scoring a sheet of cardboard, of a tripping-wheel H arranged to be actuated by the passage of a sheet of cardboard beneath it, and feeding mechanism for pushing the cardboard toward the scoring mechanism, clutching mechanism by which said feeding mechanism is connected with the driving power, said clutching mechanism being operatively connected with said tripping-wheel, substantially as described.

10. In a machine for scoring cardboard, the combination with mechanism for scoring the sheet of cardboard, feeding mechanism for pushing the sheet toward the scoring mechanism, and clutching mechanism by which said feeding mechanism is connected with the driving power, of a tripping-wheel provided with a projecting segment placed in the path of the sheet of cardboard, by which said tripping-wheel is oscillated, said tripping-wheel and said clutching mechanism being operatively connected, whereby the oscillation of said tripping-wheel will bring said clutching mechanism into action, substantially as described.

11. In a machine for scoring cardboard, the combination with a pair of scoring mechanisms placed at right angles to each other and with an intervening table, of a feeding mechanism sliding upon the surface of said table and clutching mechanism by which said feeding mechanism is connected with the driving power, of a roll G, shaft G', tripping-wheel H, turning loosely on said shaft and provided with a projecting segment, arranged to be engaged by a passing sheet of cardboard, said tripping-wheel and said clutching mechanism being operatively connected, substantially as described.



12. The combination with the table A^2, and scoring mechanism comprising the roll C and knives C, of a roll G, shaft G', tripping-wheel H, turning loosely on said shaft, spring-actuated segment acting conjointly with said roll to engage a passing sheet of cardboard, a pushing-plate, a rotating crank connected with said pushing-plate, and a clutching device by which said crank is connected with the driving power, said clutching device being operatively connected with said tripping-wheel H, whereby the passage of a sheet of cardboard will cause said tripping wheel to oscillate and bring said clutching device into action, substantially as described.

13. In a machine for scoring cardboard, the combination with scoring mechanism and feeding mechanism for feeding a sheet of cardboard thereto, of an oscillating tripping-wheel H operatively connected with said feeding mechanism, said tripping-wheel having a recess H', a radially-sliding segment H^3 held in said recess, guide-plates H^5 and a spring H^6 by which said plate is pressed outward, substantially as described.

14. In a machine for scoring cardboard, the combination with a table A^2, and scoring mechanism placed at one side of said table, of a bar A^7 held in a fixed position slightly above the surface of said table and parallel with and adjacent to said scoring mechanism with a clear space beneath said bar to receive a sheet of cardboard, feeding mechanism by which a sheet of cardboard is fed upon said table A^2 in a line parallel with, and beneath said bar, and a pusher-plate capable of a reciprocating motion at right angles to said bar, by which the sheet of cardboard is moved transversely to said bar and toward said scoring mechanism.

15. In a machine for scoring cardboard, the combination with a scoring mechanism of a receiving-table A' upon which the sheet of cardboard is fed to said scoring mechanism, a table A^2 upon which the scored sheet is delivered from said scoring mechanism, a feeding mechanism consisting of the roll G, shaft G' and disks G^2 attached to said shaft placed behind the scoring mechanism by which the sheet of cardboard is fed upon the table A^2, after it has left the scoring mechanism, a second scoring mechanism by which the sheet of cardboard is cross-scored, a reciprocating pushing-plate by which the sheet of cardboard is moved on table A^2 toward said second scoring mechanism, means for actuating said reciprocating pushing-plate comprising a clutching mechanism and a tripping-wheel H mounted upon said shaft G' operatively connected with said clutching mechanism, substantially as described.

604,581. PORTABLE ADJUSTABLE LADDER. HENRY HUBER, Mansfield, Ohio. Filed Aug. 11, 1897. Serial No. 647,863. (No model.)

Claim.—1. The combination with a main carrying-axle, and a ladder thereon, of the cranked axle pivoted to the main axle and provided with a hanger-arm, a wheel journaled on the spindle of said cranked axle and provided with a perforated ring or annulus disposed adjacent to the hanger-arm, a locking-pin for holding the ring of the wheel in rigid relation to the hanger-arm of the cranked axle, and means for locking the cranked axle at different points of its adjustment on the main axle, as and for the purposes described.

2. The combination with a main carrying-axle, and a ladder thereon, of a cranked axle having means for locking it at different points of adjustment on said main axle, a wheel journaled on the spindle of the cranked axle and provided with perforations in its rim situated at suitable intervals and in alternate relation to the spokes, and an anchoring-rod which passes through the perforation in the rim of the wheel, as and for the purposes described.

3. The combination with a main carrying-axle, of the supporting-frame rigidly attached thereto and provided with a perforated segment, a ladder, a pivoted carrier in which the ladder is stepped, a block arranged between the ladder-rails and against the segment of the supporting-frame, the connected clips fitted to the block and the segment and embracing one of the rounds of the ladder, and a locking-pin engaging with the block and the segment of said supporting-frame, as and for the purposes described.

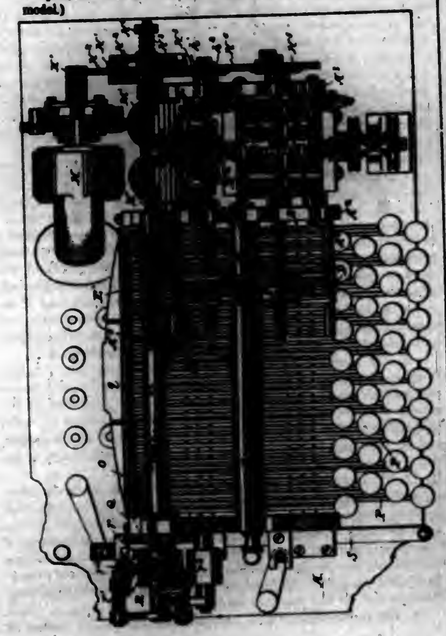
4. The combination with a wheeled main axle, and a ladder, of

the inclined braces, a hinge-rod on which the braces are swiveled, and clip-bearings fitted to the ladder-rails and connected to one of the ladder-rounds, as and for the purposes described.

5. The combination with a ladder, of the clip-bearings fitted against the ladder-rails and provided with the elongated plates arranged to engage with adjacent rounds of the ladder, sleeves arranged between the clip-bearings, a hinge rod or bolt, and braces attached to the sleeves, as and for the purposes described.

6. The combination with a ladder, of the clip-bearings, sleeves fitted between the clip-bearings, a hinge rod or bolt passing through the clip-bearings and the sleeves, braces pivoted to the sleeves, and suitable anchoring devices for the braces, as and for the purposes described.

7. The combination with a wheeled axle, and a ladder, of the clip-bearings connected to the ladder, a hinge bolt or rod, carried by said clip-bearings, sleeves fitted to said rod to be confined between the clip-bearings, braces pivoted to the sleeves and provided with ground-plates, an anchoring-chain connecting the ground-plates, and other chains connecting the ground-plates to the axle, as and for the purposes described.



8. The combination with an axle, and a ladder, of braces having loose connections with the ladder, perforated ground-plates having pivoted connections with the braces, the hooks rigid with the ground-plates and the axle, anchoring-chains attached to said hooks of the ground-plates and the axle, and rods or stakes passing through the ground-plates to anchor them to the ground, as and for the purposes described.

9. The combination with a ladder and its truss, of the keepers which embrace the ladder-rails and are provided with the sleeves, the tension-bolts fitted in said sleeves and provided with the channeled saddles for the reception of the truss cables or rods, and nuts fitted on the bolts and bearing against the ends of the sleeves, as and for the purposes described.

604,582. COMPOUND FOR HEALING PUNCTURES IN PNEUMATIC TIRES. ISRAEL D. JEWETT, Greensburg, Ind. Filed June 15, 1896. Serial No. 695,705. (No specimens.)

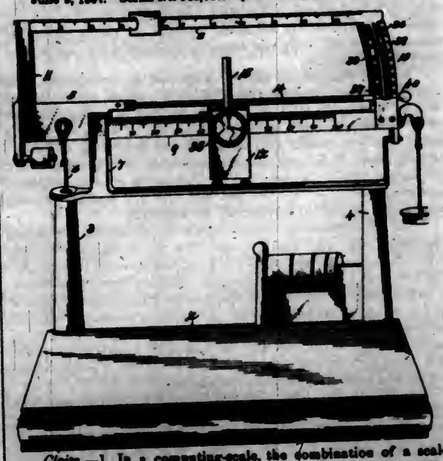
Claim.—The herein-described compound for healing punctures in pneumatic tires consisting of glycerin, a farinaceous powdery substance, a metallic oxid and graphite combined in substantially the proportions specified.

604,583. COMBINED TRANSMITTER AND RECEIVER. JOHN M. JOY, New York, N. Y., assignor to the Printing Telegraph News Company, same place. Filed June 21, 1897. Serial No. 641,619. (No model.)

Claim.—1. In a printing-telegraph apparatus, a type-wheel carried rotatively by a shaft, a carriage to move the type-wheel longitudinally on the shaft, a transmitter having a circuit-controlling shaft, a motor connected to operate the type-wheel, the carriage and the circuit-controlling shaft and arranged to exert a constant stress upon the same, and escapements controlling the operation of the type-wheel, carriage and transmitter-shaft, substantially as described.

2. In a printing-telegraph apparatus, a type-wheel carried rotatively by a shaft, a carriage to move the type-wheel longitudinally on the shaft, a transmitter having a circuit-controlling shaft, and a single motor connected to operate the type-wheel, the carriage and the circuit-controlling shaft and arranged to exert a constant stress upon the same, substantially as described.

3. In a printing-telegraph apparatus, a type-wheel carried rotatively by a shaft, controlling mechanism for determining the movements of the type wheel, a carriage connected to move the type-wheel longitudinally on the shaft, a shaft for moving the carriage, controlling mechanism for determining the movements of said shaft, a transmitter having a circuit-controlling shaft, means for controlling the movements of the shaft, a motor, and connections between the motor and said shafts whereby they are put under constant stress tending to propel the same, substantially as described.



604,584. GEARING. HENRY B. KEIPER, Lancaster, Pa. Filed Oct. 8, 1897. Serial No. 654,563. (No model.)

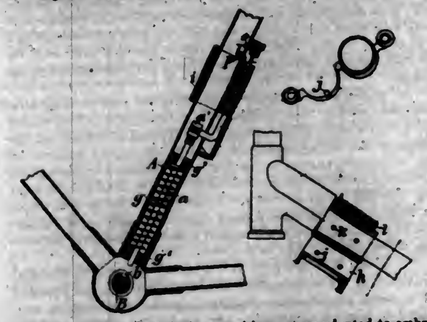
Claim.—1. A gear-wheel comprising a body having sockets in its acting face and screw-threads on opposite sides of the sockets, balls seated in the sockets, and ball-retaining rings interiorly screw-threaded and engaged with the screw-threads on the body.

2. A gear-wheel comprising a body having a series of sockets in its acting face and screw-threaded in said acting face on opposite sides of the sockets, balls seated in the sockets, ball-retaining rings interiorly screw-threaded and engaged with the body on opposite sides of the balls, and securing-rings engaged with the body and with the retaining-rings, substantially as described.

604,585. COMPUTING-SCALE. THOMAS A. KELLMAN and HERSCHEL A. BRATTEN, Liberty, Texas, assignors, by mesne assignments, to the American Computing Scale Company, New York, N. Y. Filed June 9, 1897. Serial No. 640,019. (No model.)

Claim.—1. In a computing-scale, the combination of a scale-beam, an adjustable bar arranged at an angle to the same, a sliding poise mounted on the scale-beam, a rack-bar mounted on the poise and connected with the adjustable bar, an indicator geared with and operated by the rack-bar, upper rollers journaled on the poise and resting upon the upper edge of the scale-beam, the lower rollers 22, engaging the lower edge of the scale-beam, screws mounted on the

poise, sleeves adjustably connected with the screws, rods arranged in the sleeves and carrying the lower rollers, and springs interposed between the sleeves and the lower rollers, substantially as described.



2. In a computing-scale, the combination of a scale-beam, a sliding poise mounted on the same, and upper and lower rollers carried by the poise and bearing against the upper and lower edges of the scale-beam, one set of rollers being spring-actuated and yieldingly engaging the beam, substantially as and for the purpose described.

3. In a computing-scale, the combination of a scale-beam, a sliding poise mounted on the same and provided at its top with a vertical post having a longitudinal slot, an adjustable bar disposed longitudinally of the scale-beam, arranged within the slot of the post and adapted to be moved to and from the beam to vary the angle between the same, a vertically-movable rack-bar mounted on the poise, extending into the post and connected with the adjustable bar and adapted to be actuated by the same when the poise slides along the scale-beam, and an indicating mechanism mounted on the poise and geared with and actuated by the rack-bar, substantially as described.

4. In a computing-scale, the combination of a scale-beam, a sliding poise mounted thereon, an adjustable bar arranged at an angle to the scale-beam and adapted to be moved to and from the same to vary the angle, registering mechanism mounted on the poise and operated by the adjustable bar, an arm extending upward from the front or outer end of the scale-beam, arranged in the path of the adjustable bar and being rigid with the said scale-beam, said arm being provided with graduations, and means for securing the adjustable bar at any point on the arm, substantially as described.

5. In a computing-scale, the combination of a scale-beam provided with graduations, an arm rigid with the scale beam and extending upward from the outer or front end thereof, said arm being provided with a longitudinal slot 36, and having graduations at opposite sides of the same, an adjustable bar arranged at an angle to the scale-beam and adapted to be moved to and from the same to vary the angle thereof, said adjustable bar having its outer end arranged at and moving along said arm, a pointer carried by the adjustable bar, operating in the slot 36 and extending from the same in opposite directions, a sliding poise mounted on the beam, and a registering mechanism carried by the poise and actuated by the adjustable bar, substantially as described.

604,586. BICYCLE-LOCK. ALEXIS KÖHL, Copenhagen, Denmark. Filed Aug. 15, 1896. Serial No. 602,876. (No model.) Patented in England July 24, 1896, No. 16,451.

Claim.—1. A cycle-lock comprising a strap adapted to embrace a frame bar of the cycle, the free ends overlapping, bearings formed therein, and a bolt adapted to lock said ends together and to lock a movable element of the cycle, for the purpose set forth.

2. A cycle-lock comprising two parts hinged together and adapted to embrace a frame member of the cycle, and a bolt adapted to lock said parts together and to lock a movable element of the cycle against motion, for the purpose set forth.

3. The combination with a movable element and a frame member of a cycle, of a lock composed of two parts hinged together and adapted to embrace the frame member, and a bolt adapted to lock said parts to the frame member and to lock the movable element against motion, for the purpose set forth.

4. A bicycle-lock comprising a hinged strap adapted to fit around a frame member of a cycle, a permutation-lock on one of the strap parts, the other provided with lugs or ears having boltways fitting against opposite ends of the lock, and a bolt for said lock extending through and beyond said boltways, for the purpose set forth.

5. The combination with a frame member and a movable element of a cycle, of a permutation-lock and its bolt, said lock constructed to be locked to said frame member by its bolt and the latter adapted to lock the movable element, and a stop connected with the bolt and extending into a slot in the frame member to limit the endwise motion of the bolt, for the purpose set forth.

6. A lock for cycles comprising a substantially cylindrical strap formed of two parts hinged together, a permutation-lock secured to one of the strap parts, the other provided with lugs or ears having a boltway, and with pins projecting from its inner face, and a bolt of a length to project from opposite faces of the lock and adapted to be locked therein against unauthorized removal, said bolt having bearings in the aforesaid ways in the strap-lugs, for the purpose set forth.

7. In a bicycle-lock, a hinged strap surrounding the cycle-frame, pins on said strap engaging holes in the frame, and a lock mechanism on one section of the strap, ears on the other section adapted to register with the said lock mechanism, and a bolt adapted to lock both lock-sections together, pass through the cycle-frame, and engage and lock a moving element, substantially as described.

8. A cycle-lock comprising a strap composed of two parts hinged together, each of said parts provided with two ears having boltways, a permutation-lock detachably secured between the ears of one of said parts, and a bolt projecting through the aligned boltways when the strap is closed, for the purpose set forth.

9. A cycle-lock comprising a strap composed of two parts hinged together, each of said parts provided with two ears having boltways, a permutation-lock secured between the ears of one of the strap parts, a bolt for said lock adapted to pass through the aligned ways in the ears of both parts when the strap is closed, and a spring-actuated auxiliary bolt adapted to engage a movable element of a cycle, said bolt moved into such engagement by the lock-bolt, substantially as set forth.

604,587. SASH-HOLDER. OLE P. KVERNEN, Weaton, Iowa. Filed June 28, 1897. Serial No. 641,921. (No model.)

Claim.—A sash-lock comprising a casing to be secured in the window-sash provided with wedge-shaped slots in each side near the edges, the large ends of the slots being downward and having a rounded corner, rollers mounted on pins or shafts journaled in said slots, an eccentric block in the casing near its rear edge journaled in the sides thereof, and a flat spring interposed between the eccentric block and the spring bearing forward and downward on each roller, substantially as described.

604,588. ROCK-DRILL ENGINE. JOHN G. LEVERE, Denver, Colo. Filed Apr. 26, 1897. Serial No. 633,955. (No model.)

Claim.—1. In a rock-drilling engine, the combination with the cylinder and the piston, of a front cylinder-head comprising an integral, cylindrical member adapted to be threaded to the end of said cylinder, an axial bore through said head, a counterbore at its inner end, a sleeve rotatably seated in said bore, buffer-rings in the bottom of said counterbore and a collar or head portion on said sleeve extending into said counterbore and resting between the buffer-rings and the end of said cylinder, substantially as described.

2. In a rock-drilling engine, the combination with the cylinder, the piston and the cylinder-head, of a rotatable sleeve axially supported in said cylinder-head, having an axial bore, a portion of which is of polygonal cross-section, with a drill-bit loosely supported in said sleeve and having a polygonal-shaped shank adapted to fit the polygonal bore of said sleeve and having its shank extending normally beyond the sleeve into said cylinder of the drill, and having a hole, passage or conduit extending through or along the drill-bit from end to end and adapted to convey a portion of the actuating expansive fluid from the cylinder to the cutting-point of the drill and to the bottom of the hole being drilled, substantially as described.

3. The combination in a rock-drilling engine, of the cylinder, the piston, and the front cylinder-head having an axial bore, a counterbore adjacent to its cylinder end of larger diameter than the bore of said cylinder, a sleeve rotatably seated in said cylinder-head having a collar portion on its inner end extending into said counterbore and of larger diameter than the bore of said cylinder, a rubber buffer-ring and a steel buffer-ring surrounding said sleeve between the collar portion and the bottom of said counterbore and having two

or more rods secured at diametrically opposite points in the collar portion, with said piston-head having holes therein adapted to fit freely said rods and adapted to reciprocate on said rods, substantially as described.

4. The combination with the cylinder and the piston, of the front cylinder-head, the sleeve, the rods, the free holes in the piston in which the rods extend and a bushing at the entrance of said holes adapted to fit slidably the said rods, substantially as described.

5. The combination with the cylinder and the piston, of the front cylinder-head, the sleeve, the buffer-rings, the rods secured to said sleeve, the holes in said piston head, the bushings at the entrance of said holes and the drill-bit adapted to be operatively supported by said sleeve and having a passage or conduit from end to end adapted to convey a portion of the actuating expansive fluid from the cylinder to the cutting-point of the drill and to the bottom of the hole being drilled, substantially as described.

6. The combination with the cylinder and the piston, of the front cylinder-head, a sleeve rotatably supported axially therein, a drill-bit operatively supported by said sleeve and means connected with the said piston for rotating or turning said sleeve and drill-bit step by step, substantially as described.

7. The combination with the cylinder, the piston and the front cylinder-head, of a drill-bit adapted to be operatively held and supported loosely in said cylinder-head so as to be withdrawn therefrom and inserted therein instantly at will, and adapted to extend into the reciprocal path of said piston and be impinged by it in its reciprocal movements in the said cylinder and having a passage extending through it, from one end to the other adapted to convey a portion of the actuating expansive fluid used to operate the piston from the front end of the cylinder to the cutting-point of the said drill-bit and means for rotating or turning said drill-bit step by step at each full stroke of said piston, substantially as described.

8. The combination with the cylinder, the piston, the front cylinder-head and the sleeve freely supported by said cylinder-head and having an axial perforation round in cross-section for a portion of its length and of polygon shape for the rest of its length, with a drill-bit having a shank adapted to fit both portions of the hole in said sleeve loosely, and extending through said sleeve into said cylinder into the reciprocal path of said piston, a counterbore in the outer end of said cylinder-head, a collar or projection on said drill-bit normally resting in said counterbore and adapted to define the inward movement and the position of the end of the drill-bit's shank relative to the said piston, means for rotating said drill-bit and sleeve step by step, and an axially-arranged hole extending through said drill-bit from end to end and adapted to convey a portion of the actuating expansive fluid from the cylinder to the cutting-point of said drill-bit, substantially as described.

9. The combination with the cylinder, the piston, the front cylinder-head and the sleeve, and having a pentagon-shaped shank and a round portion adjacent to said pentagon end, a collar or projection adjacent to said round portion and an axial perforation through said drill-bit and means for rotating said drill-bit step by step, substantially as described.

10. The combination with the cylinder, the piston, the front cylinder-head and the sleeve, of a drill-bit constructed of ribbed steel and operatively supported by said sleeve and front cylinder-head and having a hole drilled axially into each end of it for a short distance, a tube soldered over its central portion and closed at its ends and perforations extending from the axial holes at each end into the spaces between the ribs of the drill-bit and into the tube, whereby a continuous passage is formed from one end of the drill-bit to the other, as and for the purpose herein set forth and described.

11. The combination with the cylinder, the piston, the front cylinder-head and the sleeve adapted to be operatively supported by said sleeve, of a drill-bit having an axial hole in each end, a hole drilled at an angle from the side of the bit into the axial hole in the shank end of the bit, a slot along the bit from said inclined hole to near the cutting end of the bit and a tube soldered in said slot having one end inserted into said inclined hole and its opposite end closed, a hole leading from each end of the tube into the holes at the end of the bit and means for rotating said bit step by step, substantially as described.

12. The combination with the cylinder, the piston, the front cylinder-head and a sleeve having a polygonal-shaped hole formed axially through its center, of a drill-bit adapted to fit freely in said sleeve and projecting beyond it into the reciprocal part of said piston, a collar on said drill-bit adapted to normally rest in contact with the outer end of said cylinder-head, an axially-formed hole in each end of said drill-bit, and a tube or passage either in or attached to said drill-bit adapted to connect with the holes in its ends, whereby a continuous passage is made throughout the entire length of said drill-bit, substantially as described.

13. The combination with the cylinder, the piston, the cylinder-head and the sleeve, having a square or polygonal-shaped axially-arranged aperture, with a drill-bit of any form of cross-section, having a square or polygonal shaped striking end adapted to fit freely the polygonal aperture in said sleeve and arranged to be operatively impinged and intermittently rotated by said piston, a collar or projecting portion adjacent to said drill-point's striking end adapted to normally rest against the outer end of said cylinder-head, and a passage from the striking end of said drill-bit to its cutting-point adapted to convey a portion of the piston's actuating fluid from said cylinder to the cutting-point of said drill-bit and to the bottom of the hole being drilled, substantially as described.

14. In a rock-drill bit, a drill-shank of any merchantable form of cross section having a cutting point of any desired common form, a polygonal-shaped striking end, a collar adjacent to said end and an axial hole from end to end throughout its length, or a closed passage attached to or arranged to form a part of said drill-bit extending from its striking end to its cutting-point, substantially as described.

15. The combination with the cylinder, the piston and the front cylinder-head, of a drill-bit resting freely and loosely and not in any way clampingly secured or fastened to the cylinder-head but operatively supported in a substantially fixed position relative to the reciprocal movements of said piston and arranged and adapted to be struck intermittently and successively by said piston, means for rotating said drill-bit step by step and means for conveying a portion of the piston's actuating fluid from the cylinder to the drill-bit's cutting-point, substantially as described.

16. A rock-cutting drill for rock-drilling engines, comprising a bar of drilled steel of any form of cross-section containing an axial hole through it from end to end and a collar or projection or shoulder adjacent to or at a short distance from its striking end, substantially as described.

17. A rock-drilling engine having a rock-cutting drill loosely positioned and supported in and to the drilling-engine and arranged to be impinged upon one end by a reciprocal movement of the piston, and arranged and adapted to convey a portion of the piston's actuating fluid directly from the cylinder into and through said cutting-drill to its cutting-point and to the bottom of the hole being drilled, whereby said actuating fluid is used to expel the rock-cuttings from the hole being drilled, substantially as described.

18. A rock-drilling engine having a rock-cutting drill loosely positioned and supported in the drilling-engine and arranged to be impinged upon one end by a reciprocal movement of the piston, an axial hole through said rock-cutting drill from end to end arranged and adapted to convey a portion of the piston's actuating fluid directly from the cylinder to its cutting-point to blow out from the hole being drilled the rock-cuttings, and said drill arranged and adapted to be moved by the expansive fluid against the rock after each recoil from the rock, after each blow of the piston, substantially as described.

19. A rock-drilling engine for expelling the rock-cuttings from holes while drilling them, consisting of an operative drilling-engine having rock-cutting drills arranged and adapted to extend into the cylinder of the drilling engine and to be struck and actuated to cut rock by the reciprocative movements of the piston impinging against its inner end and in which the cutting-drills have an axial hole through them from end to end, and the piston's actuating fluid has at all times, free, direct and unobstructed passage from the cylinder to the cutting-point of the drill and to the atmosphere and to the bottom of the hole being drilled, substantially as described.

20. A rock-drilling engine having a rock-cutting drill arranged to be struck by the reciprocal movements of the piston, and provided with a collar, projection, or shoulder adjacent to its striking end, adapted to form an abutment or rest, against the front part of the drilling-engine and define the cutting-drill's operative position relative to the engine's piston and a passage axially through said cutting-drill arranged to conduct a portion of the piston's actuating fluid directly from the cylinder to the cutting-point of said rock-cutting drill, substantially as described.

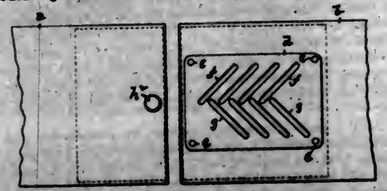
604,539. JOURNAL-BOX FOR RAILROAD-CARS. WESLEY H. MAREN, Braddock, Pa. Filed Dec. 7, 1897. Serial No. 661,097. (No model.)

Claim.—A journal-box, a lid hinged thereto, a staple secured to the inner face of said lid, a shaft journaled in the box, and a spring-actuated catch secured to one end of the shaft, said spring forcing the catch into engagement with the staple when the lid is closed, substantially as shown and described.

604,540. SPOOL. SIDNEY MATHER, Bridgeport, Conn. Filed Apr. 5, 1897. Serial No. 630,604. (No model.)

Claim.—A spool or bobbin having its barrel provided with a slot or recess lying wholly at one side of the usual longitudinal opening, said slot or recess extending into one of the heads of the spool, and the sides of the recess in the head converging at one end and leading into an opening c, through which the contents of the recess may be removed before the thread is used.

604,541. PNEUMATIC TIRE. CHARLES A. MAYNARD, Springfield, Mass. Filed Jan. 22, 1898. Serial No. 668,262. (No model.)

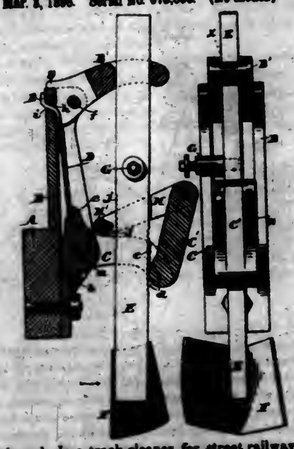


Claim.—1. A single-tube pneumatic tire, a retaining-band embedded in the wall thereof in contact with the felly, and comprising one or more metal sections, segments of a circle in cross-section joined with overlapping ends to form a complete hoop, and anchored on both sides to the tube between its free ends, corresponding elongated holes in the band ends, and bolts through said holes for binding the tube to the felly.

2. A single-tube pneumatic tire, a retaining-band comprising one or more metal sheets bent to form a segment of a circle in cross-section with ends joined to form a complete circle in the plane of the wheel and combined with the wall of the tube seated in the felly by being embedded therein and vulcanized or cemented fast to the tube between the free ends of the band, a felly seating said tube and band—and bolts bearing the band and tube to the felly.

3. A single-tube pneumatic rubber tire, a clamp-band comprising a metal sheet a segment of a circle in cross-section with ends joined to complete a hoop, embedded in the tire-wall and provided at intervals of its length with a covering of fabric united to it by being laced through holes therein, whereby a vulcanizing or cementing surface is formed for the union of the band and inclosing rubber—and a felly bolted to the tire through the band.

4. A single-tube pneumatic rubber tire, a clamp-band comprising a hoop of sheet metal a segment of a circle in cross-section, with ends provided with joints to permit a movement one upon the other, and embedded in the wall of the tire, a covering to the band of woven fabric in the form of a tape laced through perforations in the band, substantially as set forth, and forming a vulcanizing surface—and a felly bolted to the tire through the band.



604,542. FASTENER. ERASTUS H. PARKER, Springfield, Mass. Filed Aug. 21, 1896. Serial No. 603,504. (No model.)

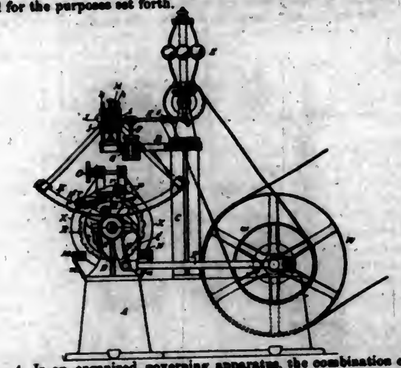
Claim.—1. A fastener for bolts, &c., composed of two members, one of said members being composed of a backing-plate and a superimposed plate secured to said backing-plate, said superimposed plate containing two series of slots, the slots of each series being parallel with each other and at substantially a right angle to those of the other series and all of said slots terminating at their front end at the transverse center line of the plate and at their rear end at points within the side edges of the plate, and the other of said members comprising a hook or stud adapted to make a locking engagement with the slots in said plate, each of said members being provided with means whereby it can be secured to one of the meeting ends of a bolt or similar article, substantially as described.

2. A fastener for bolts, &c., one member of which consists of the plate *d* having therein the slots *f* and *g* arranged as described, and the other member of which consists of the notched stud *h* having its head h^2 provided with the annular shoulder h^3 and annular flange h^4, and ring h^5, substantially as set forth.

604,543. TRACK-CLEANER FOR STREET-RAILWAY CARS. GEORGE A. FARRENTER and STEPHEN H. PERRY, Cambridge, Mass. Filed Mar. 3, 1896. Serial No. 672,063. (No model.)

Claim.—1. In a track-cleaner for street railway cars, the combination with the truck-frame of a stand carried by said frame and provided with a slotted arm at its upper end; a radius-arm pivoted at one end to said stand and provided with a vertical slot through the same, and with a rearwardly and upwardly projecting extension-arm at its rear end; a forked or ⌊-shaped arm or link pivoted by the ends of its forks to the upper end of said oblique extension-arm; a scraper or plowshare to contact with the track-rail and provided with a shank or bar which projects upward through the slots in the radius-arm, the forked link, and the arm at the upper end of said stand; a series of teeth formed upon both the front and rear edges of the shank of said plowshare; a toothed surface at the rear end of the slot through said radius-arm to engage the teeth on the rear edge of said plowshare-shank; and a toothed surface in said forked link arranged to engage the teeth on the front edge of said plowshare-shank substantially as described.

2. In a track-cleaner for street-railway cars the combination with the pilot-board of a truck-frame, the stand B secured to said pilot-board; the slotted arm B' secured to said stand by a single pin or bolt; the radius-arm C C pivoted to said stand B and provided with the shoulders *b* and *c* and having a vertical slot through the same having in its rear end a toothed surface; a spring engaging the shoulder *c* of said radius-arm; the forked link H pivoted at one end to the upper end of the radius-arm C C, and provided at its other end with the tie H' having a toothed inner surface; the bar E provided with the two series of teeth *e* and *j*; and the plowshare F carried by said bar substantially as described.



604,544. ELECTRICAL GOVERNOR. MARK A. REYNOLDS, Akron, Ohio. Filed Feb. 19, 1897. Serial No. 624,371. (No model.)

Claim.—1. In combination with an electrical governor having a pair of electromagnets, a pair of insulated electrical contact-points by means of which electrical circuits may be completed through the said magnets, the said insulating contact-points being separately adjustable and jointly movable substantially as described and for the purpose set forth.

2. In a governor the main or motor-controlling shaft having a pinion keyed thereto engaging with the toothed partial circumference of a sector or quadrant, the said sector or quadrant operating a cam adapted to change the basis of governing, to correspond with the different loads of work thrown on or off the machinery or plant to be governed substantially as specified.

3. The herein-described governing apparatus consisting of a main

or motor-controlling device built upon a base plate or frame, having a pedestal erected thereon and the said pedestal surmounted with a common centrifugal governor and also provided with a horizontal arm supporting guide-posts or sliding rods, the said sliding rods being provided with a sliding bracket carrying electrical contact-points with the end of a tilting lever disposed between them, the said tilting lever being fulcrumed intermediate of the common speed-governor and the contact-points aforesaid, and being adapted to be operated by the action of the centrifugal balls of the governor, for the purpose of setting into and out of operation the main or motor-controlling device and means by which the main or motor-controlling device may change the location of the contact-points aforesaid substantially as specified and for the purposes set forth.

4. In an organized governing apparatus, the combination of a motor-controlling device adapted to be set into and out of operation by means of electromagnets and electrical circuits adapted to charge the said magnets, with a common speed-governor operating a tilting lever adapted to make the required electrical connections and means whereby the motor-controlling device may shift the points, through which the electrical connections are thus made for the purpose of adapting the apparatus to light or heavy work substantially as specified.

5. In a governing apparatus having a main or motor-controlling shaft, a pair of sliding rods or guide-posts disposed over and above said motor-controlling shaft, the said rods having a bracket sliding thereon, a projection of the said bracket engaging with the curved surface of a cam attached to a shaft and the said shaft also provided with a sector or quadrant geared to a revolving pinion on the said motor-controlling shaft so as to move the sliding bracket upward when the motor-controlling shaft is turned in one direction and to allow it to drop downward when the motor-controlling shaft is turned in the opposite direction substantially as specified and for the purposes set forth.

6. In an organized governing apparatus consisting of a motor or gate controlling device, the said motor or gate controlling device being composed of a main shaft S to which is keyed a double ratchet-wheel R by means of which, the said shaft is adapted to be turned, the oscillating arm v carrying oppositely-disposed pawls adapted to engage with the said ratchet-wheel, the said arm adapted to be continuously vibrated by means of a pitman P and crank V driven by a belt-wheel W for the purpose of operating the motor-controlling shaft; in combination with a common speed-governor E adapted to operate a tilting lever F for the purpose of setting into or out of operation one or the other of the pawls aforesaid and means for shifting the field for operation of the said tilting lever to correspond with the load or degree of work imposed upon the plant or machinery to be governed substantially as specified.

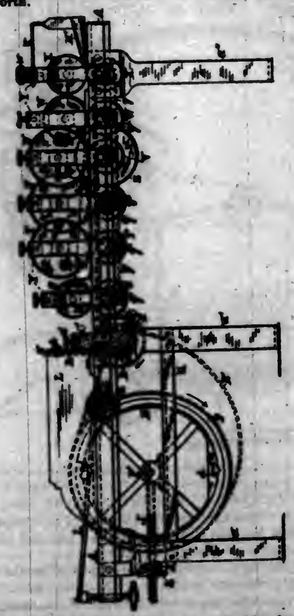
7. In a governing apparatus of the kind described, a motor-controlling shaft having a pinion keyed thereto and the said pinion geared to a sector or quadrant adapted to turn a shaft parallel and over the motor-controlling shaft, which last-mentioned shaft is provided with a cam adapted to raise and lower a bracket sliding on vertical rods and carrying electrical contact-points, adapted to make connections setting into and out of operation mechanisms for turning the motor-shaft aforesaid all arranged for joint operation in the manner specified and for the purposes set forth.

8. In an organized governing apparatus of the kind described, a pair of electrical circuits and corresponding electromagnets for the purpose of setting into and out of operation mechanisms for turning on or off the supply of power, the herein-described cut-out consisting of flexible strips connected with the wires of the said electrical circuits, so that the said circuits are completed through the said strips and the said strips adapted to be pressed out of contact so as to break the circuits aforesaid, in combination with a pair of arms disposed on a revolving shaft and placed over such strips in such relation, that if the said shaft is revolved in one way one of said circuits will be broken by one of the arms pressing its corresponding flexible strip out of contact, and if the shaft be revolved the other way the other of said arms will press out of contact its corresponding flexible strip for the purpose of cutting out the action of the governor substantially as specified.

604,545. DEVICE FOR PREVENTING FRAUDULENT REFILLING OF BOTTLES. MEYER ROSENBERG, Brooklyn, N. Y. Filed June 28, 1897. Serial No. 642,622. (No model.)

Claim.—1. In a bottle, the combination with a neck having indentations on its inner surface adjacent to the upper end of the neck, a stopper provided with spring-plugs adapted to engage the said indentations, said stopper being hollow and provided at its inner central portion with a bushing or casing, the lower end of which terminates in a circular valve-seat, a hinged valve-cup comprising a metal thimble, normally engaging said valve-seat, said valve-cup being provided at its upper edge with an annular flexible collar adapted to engage the upper portion of the valve-seat, a bucket-wheel revolubly mounted in the central portion of the bushing, substantially as described and for the purpose set forth.

2. In a bottle, the combination of a flexible hollow stopper permanently secured to the neck of a bottle, and provided at its upper end with an annular flange overlapping the upper circular edge of the neck of the bottle, a bushing mounted in the interior hollow portion of the stopper, the lower portion of said bushing terminating in a circular valve-seat, a hinged valve-cup normally engaging said valve-seat, said valve-cup being provided at its upper edge with an annular flexible collar adapted to engage the upper portion of the valve-seat, a bucket-wheel revolubly mounted in the central portion of the bushing, substantially as described and for the purpose set forth.



3. In a bottle the combination with a neck having indentations on its inner surface adjacent to the upper end of the neck, a hollow stopper provided with spring-plugs adapted to engage the said indentations, the lower portion of said stopper being provided with a circular valve-seat a hinged valve-cup comprising a metal thimble normally engaging said valve-seat, said valve-cup being provided at its upper edge with an annular flexible collar adapted to engage the upper portion of the valve-seat, a bucket-wheel revolubly mounted in the central portion of the stopper, substantially as described.

604,546. PAPER-BOX-MAKING MACHINE. JOHN H. RUSSELL, Amsterdam, N. Y., assignor of one-half to John H. Glen, same place. Filed July 26, 1897. Serial No. 645,904. (No model.)

Claim.—1. In a paper-box-making machine, the combination with the table and the guides, L, L, of horizontal feed-rollers between which the sheet is passed, large rolls, catches on the peripheries of the rolls to engage the edge of the sheet, said catches consisting of ribs having inclined surfaces forward of the catches and supported to yield and conform to the inclination of the sheet to be fed, as set forth.

2. In a paper-box-making machine, the combination with the table and the guides, L, L, of horizontal feed-rollers between which the sheet is passed, large rolls on a shaft parallel with the said feed-rollers, said large rolls having recesses in their peripheries, a block having a transverse rib and an inclined surface forward of said rib in said recess, a spindle extending through the block and entering recesses in the rolls, and a spring on the spindle to hold the said block and spindle in place, as set forth.

3. In a paper-box-making machine, the combination with devices for feeding a sheet of paper and simultaneously folding the side edges, of means for confining a pile of sheets in an inclined position, rolls beneath the pile, and catches on the peripheries of the rolls to engage the edge of the lower sheet to push it from the pile to the feed-rollers, as set forth.

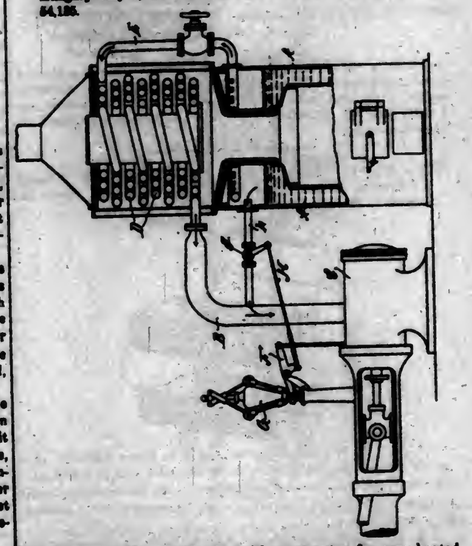
4. In a paper-box-making machine, the combination with means for confining a pile of sheets, and rolls having catches on their peripheries to engage the edge of the lower sheet to push it from the pile, of pairs of feed-rolls to convey the sheet, folding-guides to turn over the said edges of the sheet during transit, and feet to hold the sheet down upon the table while the edges are turned, substantially as described and shown.

5. In a paper-box-making machine, the combination with the table, means for confining a pile of sheets, and rolls having catches on their peripheries to engage the edge of the lower sheet to push it from the pile, of a plurality of pairs of feed-rolls to convey the sheet lengthwise of the table, adjustable folding-guides to turn over the side edges of the sheet during transit, and feet mounted on the folding-guides to hold the sheet down while the edges are turned, substantially as described.

6. In a paper-box-making machine, the combination with the table, means for confining a pile of sheets, rolls having catches on their peripheries to engage the edge of the lower sheet to push it from the pile, of pairs of feed-rolls to convey the sheet over the table, a driving-pulley on one of the shafts of the feed-rolls, gearing connecting the lower feed-roll shafts together, folding-guides to turn over the side edges of the sheet during transit, and feet to hold the sheet down upon the table while the edges are turned, substantially as described and shown.

7. In a paper-box-making machine, the combination with the table, means for confining a pile of sheets, rolls having catches on their peripheries to engage the edge of the lower sheet to push it from the pile, of pairs of feed-rolls to convey the sheet over the table, a driving-pulley on one of the shafts of the feed-rolls, sprocket-wheels on the shafts of the lower feed-rolls, chains connecting the sprocket-wheels together, folding-guides to turn over the side edges of the sheet during transit, and feet mounted on the folding-guides to hold the sheet down while the edges are turned, substantially as described and shown.

8. In a paper-box-making machine, the combination with the table, means for holding a pile of sheets, rolls having catches on their peripheries to engage the edge of the lower sheet to push it from the pile, of pairs of feed-rolls to convey the sheet over the table, gearing between the lower-feed-roll shafts, folding-guides to turn over the side edges of the sheet upon itself during transit, feet mounted on the folding-guides to hold the sheet down while the edges are turned, and horns adapted to raise the said edges of the sheet after it passes from the folding-guides, as set forth.



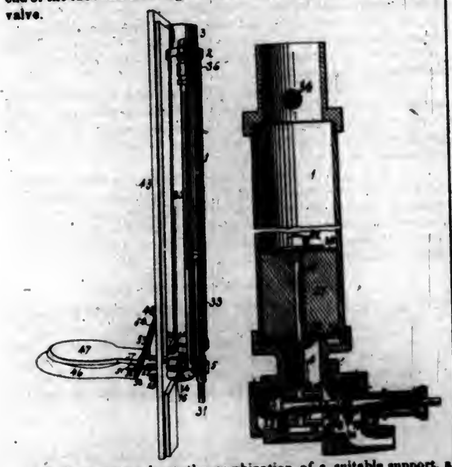
9. In a paper-box-making machine, the combination with the table, means for holding a pile of sheets, rolls having catches on their peripheries to engage the edge of the lower sheet to push it from the pile, of pairs of feed-rolls to convey the sheet over the table, gearing between the lower-feed-roll shafts, folding-guides to turn over the side edges of the sheet upon itself during transit, feet mounted on the folding-guides to hold the sheet down while the edges are turned, and adjustable horns having their points extending toward the folded edges of the sheet to pass between the sheet and the edge, substantially as and for the purpose described.

10. In a paper feeding and folding machine, a table, feeding devices to convey the sheet, folding-guides to turn over the side edges of the sheet, and wedge-shaped horns suitably mounted to open the folded edges, as set forth.

11. In a paper feeding and folding machine, a table, feed-rolls to convey the sheet, folding-guides to turn over the side edges of the sheet, a cross-bar with brackets mounted adjustably thereon, and cone-shaped horns mounted on the brackets to raise the folded edges, substantially as described and shown.

12. In a paper feeding and folding machine, a table, feed-rolls to convey the sheet, folding-guides to turn over the side edges of the sheet upon itself, a slotted cross-bar above the table, angular brackets mounted adjustably on said bar, and horns secured to the said brackets and adapted to open the folded side edges of the sheet, substantially as described and shown.

604,547. APPARATUS FOR REGULATING SUPERHEATED STEAM. WILHELM SCHMIDT, Ballenstedt, Germany. Filed July 17, 1896. Serial No. 599,549. (No model.) Patented in Switzerland June 3, 1896, No. 12,894; in France June 23, 1896, No. 257,482; in Belgium July 2, 1896, No. 122,307; in Italy July 6, 1896, LXXXII, 294; in Hungary July 4, 1896, No. 7,415, and in Canada Nov. 27, 1896, No. 54,125.



Claim.—1. The combination with a generator for superheated steam, and with an engine adapted to be driven by such steam, of a regulator for the temperature of that steam; said regulator being adapted to be automatically adjusted according to the degree of filling of the cylinder of said engine, for the purpose as described.

2. The combination with a generator for superheated steam, and with an engine adapted to be driven by such steam, of a regulator for the temperature of said steam; said regulator being connected to the means that determine the degree of filling of the cylinder of said engine, for the purpose as described.

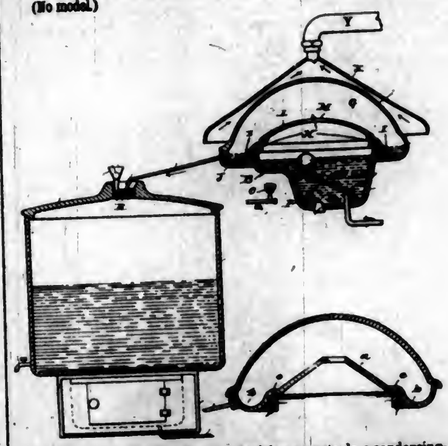
3. The combination with a steam-generator, a superheater for the steam, an engine adapted to be driven by the superheated steam and a connection between said superheater and said engine, of a connection between the latter and said generator so as to allow of the admixing of non-superheated steam to the superheated one, and a steam-distributing device adapted to control said admixing and connected to the means that determine the degree of filling of the cylinder of the said engine, for the purpose as described.

604,548. WATER-CLOSET. DAVID H. SHERMAN, Rockford, Ill. Filed Jan. 16, 1897. Serial No. 618,487. (No model.)

Claim.—1. In a water-closet, the combination of a tube having an open contracted upper end, a movable weight located within the tube, a discharge-chamber, a valve arrangement for admitting water into the tube below the weight and allowing water to escape into the discharge-chamber and a stand-pipe connection between the upper end of the tube and discharge-chamber, said pipe supporting a check-valve.

2. In a water-closet, the combination of a suitable support, a valve arrangement, a bracket secured to the support, a seat, a bracket secured to the seat, links pivotally connecting the two brackets, and a cover pivotally connected to the seat, the seat resting against the valve arrangement.

604,549. PAINT-POT HOOK AND BRUSH-HOLDER. CHARLIE F. SPENCER, Alexandria Bay, N. Y. Filed Oct. 15, 1897. Serial No. 655,257. (No model.)



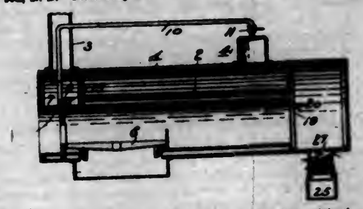
Claim.—1. In a hanger for paint-pails, a frame consisting of a pair of ladder-rung hooks from which depend a pair of bail-receiving hooks, the frame on the opposite side of the bail-receiving hooks carrying a trough which serves as a paint-brush receptacle, substantially as shown.

2. In a hanger for paint-pails a frame made up of a single bar bent to provide portions or hooks for engagement with a ladder-rung and a pair of bail-receiving hooks, a cross-bar connecting the side pieces of the frame to each other, a handle carried by the cross-bar, and a brush-receiving receptacle carried by the opposite side of the frame from the bail-receiving hooks substantially as shown and for the purpose set forth.

3. A combined paint-pail hanger and brush-receptacle comprising a frame made up of a single bar, bent to receive a brush-receptacle and provide eyes, bends forming hooks for a ladder-rung and depending portions which are bent to provide bail-receiving hooks substantially as shown, in combination with a second receptacle having members which are adapted to engage with the eyes *a a'* so that the second receptacle will be suspended below the one carried by the frame, substantially as shown.

4. In a paint-pot hanger and brush-receptacle, a main supporting-frame made up of a single bar bent to provide a pair of hooks above which are bends which provide means for suspending the device from the ladder-round, a brush-receptacle having a vertical wall at one end said receptacle being attached to the frame, and a cross-bar carried by the frame above and adjacent to the open end of the receptacle, substantially as shown and for the purpose set forth.

604,550. APPARATUS FOR DISTILLING WATER. JOSEPH STRETON, East Orange, N. J. Filed June 29, 1897. Serial No. 643,574. (No model.)

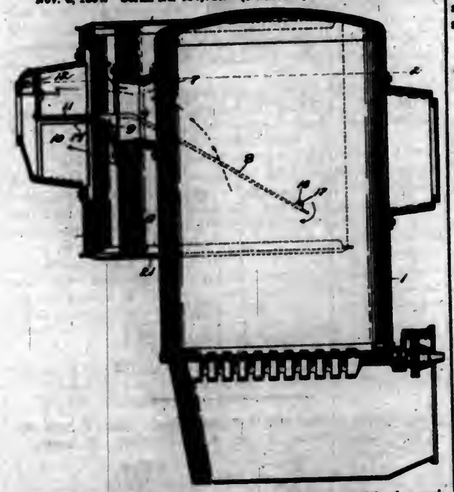


Claim.—1. In combination, a vaporizing-receptacle, a condensing-dome having a hemispherical top, an annular catch-basin around the inside of the top, a flange or ledge surrounding the basin, a crown-plate having a central opening, said plate being so arranged that a space is formed between it and the top, said top and plate being separable, as and for the purpose set forth.

2. In combination, a hemispherical dome of earthenware, an annular catch-basin formed around the inside of the base of the dome, a flange or ledge projecting around the edge of the basin, a crown-plate having a central opening, said plate resting on the edge of the catch-basin and a vaporizing-receptacle on the upper edge of which the flange or ledge of the catch-basin is adapted to rest, substantially as set forth.

3. In combination, a vaporizing-receptacle oval in cross-section, a hemispherical dome of earthenware, an annular catch-basin formed with said dome around the inside lower edge thereof, a downwardly-projecting flange or ledge around the edge of the catch-basin which is adapted to rest on the upper edge of said receptacle, a crown-plate having a central opening, said crown-plate being adapted to rest on the edge of the catch-basin, a draft-hood arranged to inclose the dome so that a space is left therebetween and the dome, and means for automatically supplying water to said receptacle, as and for the purpose set forth.

604,551. STEAM FLUE-CLEANER. JOSEPH T. THOMPSON, Hatton, N. D. Filed July 27, 1897. Serial No. 646,126. (No model.)



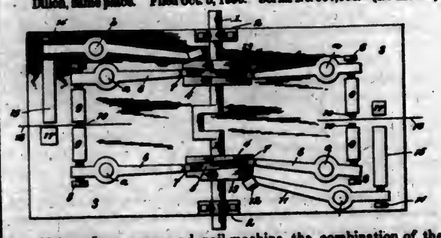
Claim.—1. In a steam-boiler, the combination with the vertical and transverse pipes located in the smoke-box, and connected with the boiler, of the short pipes connected with said pipes, the perforated heads, the tubes connected therewith and the funnels, substantially as described.

2. In a steam-boiler, the combination with the vertical and transverse pipes, and the pipe connected with the boiler and transverse pipe, of the short pipes connected with the said vertical and transverse pipes, the perforated heads, the tubes, the funnels, and the pipes extending through the flues and provided with perforated heads, substantially as described.

3. The combination with a steam boiler, of the ash-discharge consisting of the casing secured to the lower part of the boiler, provided with a slide-valve and having perforations in its sides, the vertically-movable extension and means for raising and lowering the same, substantially as described.

604,552. HOT-AIR FURNACE. HOWARD A. TIBBETS, Norton, Mass., assignor to the White Warner Company, Taunton, Mass. Filed Nov. 4, 1897. Serial No. 657,703. (No model.)

Claim.—1. In a hot-air furnace, in combination with the main radiator, an auxiliary radiator outside of the main radiator, an air-space between the outside wall of the main radiator and the inside wall of the auxiliary radiator, a diaphragm dividing the auxiliary radiator into an upper and a lower chamber, with a passage between said chambers at each end thereof, a single cross-flue connecting the main radiator with said upper chamber midway of the ends of said chamber, a single outlet-flue for both chambers midway of the ends thereof, a plate extending from the diaphragm part way into said outlet-flue, and a damper for the portion of the flue above said extension-plate, substantially as described.



2. In a hot-air furnace, in combination with the main radiator, an auxiliary radiator outside of the main radiator, an air-space between the outside wall of the main radiator and the inside wall of the auxiliary radiator, a single cross-flue connecting the main radiator with said auxiliary radiator midway of the ends thereof, a single outlet-flue for the auxiliary radiator opposite the inlet-flue and of larger sectional area, a bevel-plate extending crosswise of the auxiliary radiator from the lower edge of the inlet-flue to about midway of the outlet-opening, diaphragm-plates extending from both sides of said bevel-plate toward the ends of the auxiliary radiator dividing said radiator into an upper and a lower chamber with a passage between them at each outer end thereof, a plate extending from the bevel-plate into the outlet-flue and a damper for the portion of the flue above said extension-plate, substantially as described.

3. In a hot-air furnace, in combination with the main radiator, an auxiliary radiator outside of the main radiator, an air-space between the outside wall of the main radiator and the inside wall of the auxiliary radiator, a single cross-flue connecting the two radiators midway of the ends of the auxiliary radiator, an outlet-flue from the auxiliary radiator, a bevel-plate with side walls extending crosswise of the auxiliary radiator the full width thereof from the lower edge of the inlet-flue to about the middle of the outlet-opening, diaphragm-plates extending from the upper edge of both side walls of said bevel-plate toward the ends of the auxiliary radiator dividing it into an upper and a lower chamber with end passages, and a damper for that portion of the outlet-flue above the bevel-plate, substantially as described.

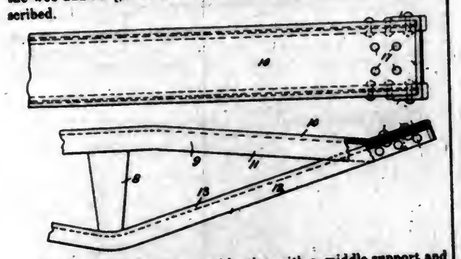
4. In a hot-air furnace, an auxiliary radiator, an inlet-flue intermediate the ends thereof, an outlet draft-opening and collar connection, a diaphragm which divides the said radiator into an upper and a lower chamber with passage-ways between the chambers at the ends thereof, said diaphragm comprising a bevel-bottomed plate which forms the middle piece and two deflecting-plates detachably secured to the middle piece and extending toward the ends of said radiator, a plate detachably secured to said bevel-plate and projecting into the draft-opening dividing it crosswise, a damper above said plate for the upper portion of the draft-collar, and a support for the diaphragm and plates, substantially as described.

5. A top and bottom plate for a segmental radiator consisting of a segmental plate, an upwardly-projecting lip around the inner periphery, an outwardly-extending flange around the outer periphery and around the ends, and an upwardly-projecting lip around inside of said flange, said second lip extending around the ends inside of the flange and past the ends of the inner lip, the two lips being spaced apart at their passing-points to admit the wall of the radiator, substantially as described.

604,553. NAIL-MAKING MACHINE. ROBERT WALTON and FRED MAGEE, Sterling, Ill., assignors of one-third to Washington M. Dillon, same place. Filed Oct. 5, 1896. Serial No. 607,981. (No model.)

Claim.—In a compound nail-machine, the combination of the driving-shaft 1 carrying the cams 4 provided with tracks 5 and projections 13, and levers 11 actuated by said cam projections 5 and carrying pinch-bars 15, and levers 6 actuated by said cam-tracks 5, and carrying rocker-bars 9 to which are secured the wire-cutting knives 10, substantially as set forth.

604,554. HOSE-NOZZLE. ROBERT WISE, New York, N. Y. Filed Nov. 18, 1895. Serial No. 569,290. (No model.)

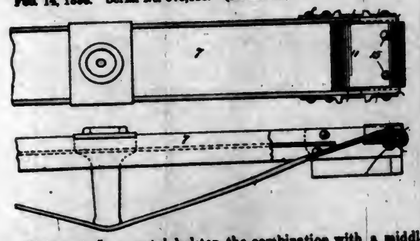


Claim.—1. The hose-pipe nozzle having a body with a shut-off cock and a coupling portion at its rear end screw-threaded at its forward end, a jet-nozzle extending forward of the body and having a flange around it, the body, shut-off cock, coupling portion, jet-nozzle and flange being permanently and rigidly connected, in combination with a bell screw-threaded at its rear end to fit the screw-thread upon the body and adapted to vary the annular opening between its front end and the flange by screwing it forward or backward, substantially as set forth.

2. The hose-pipe nozzle having a body with a shut-off cock and a coupling portion at its rear end screw-threaded at its forward end, a jet-nozzle extending forward of the body and having a flange around it, the body, shut-off cock, coupling portion, jet-nozzle and flange being permanently and rigidly connected, in combination with a bell screw-threaded at its rear end to fit the screw-thread upon the body and adapted to vary the annular opening between its front end and the flange by screwing it forward or backward, a lock-nut and washer adjacent to the rear end of the adjustable bell, substantially as set forth.

604,555. CAR-BOLSTER. CARL E. RAMM, Chicago, Ill., assignor to the Simplex Railway Appliance Company, same place. Filed Feb. 14, 1898. Serial No. 670,128. (No model.)

Claim.—1. In a car-bolster, the combination with a middle sup-



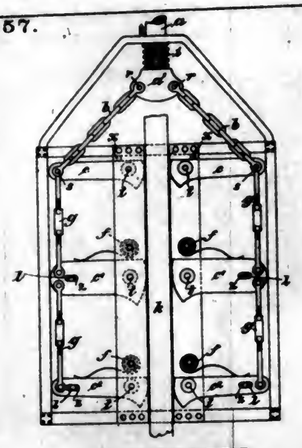
port and a compression member having a web and flanges, of a tension member also provided with web and flange portions, the web and flange portions of the tension member being separated or split at the ends and formed into hook shape, and engaging respectively the web and flanges of the compression member, substantially as described.

2. In a car-bolster, the combination with a middle support and a compression member having a web and flanges, of a tension member also provided with web and flange portions, the flanges of the tension member at the ends being split or separated from the web and formed into hook shape engaging the flanges of the compression member.

3. In a car-bolster, the combination with a channel-iron compression member and a middle support, of a channel-iron tension member embraced within the flanges of said compression member at the ends of the same, the flanges of the tension member being split or separated from the web portion of the tension member, and formed into hook shape and engaging the compression member, substantially as shown and described.

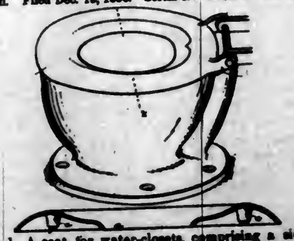
604,556. METAL BOLSTER. CARL H. BAUER, Chicago, Ill., assignor to the Simplex Railway Appliance Company, same place. Filed Feb. 14, 1898. Serial No. 670,183. (No model.)

Claim.—1. In a metal bolster, the combination with a middle support and a tension member formed of a plate or strap, of a compression member having an opening through its horizontal portion or web at or near its end, and the tension member passing through said opening and engaging said horizontal portion, substantially as shown and described.



2. In a metal bolster, the combination with a middle support and a tension member, of a compression member having a web and flanges, the web of the same having a hole formed near the end thereof, and the tension member passing through said hole and engaging said web.

3. In a metal bolster, the combination with a middle support and a plate tension member, of a compression member having a web and flanges, the web of the same having a hole formed near the end thereof, the tension member passing through said hole and engaging said web, and a filling-piece embraced between the ends of said compression and tension members and engaging the flanges of said compression member.

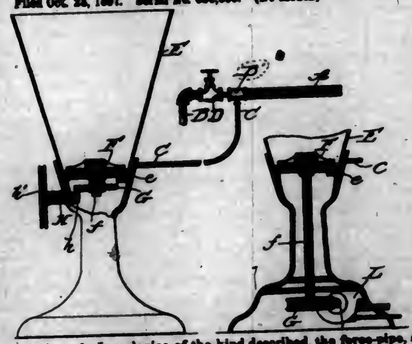


604,557. SAFETY DEVICE FOR ELEVATORS. HERMANN RAUH, Dudweiler, Germany. Filed Jan. 4, 1898. Serial No. 665,540. (No model.)

Claim.—A safety device for elevators comprising levers pivotally mounted on the cage and provided with serrated eccentric ends adapted to engage the guides in the elevator-shaft, connection between the outer ends of said levers and the cables supporting said cage to hold said levers normally out of engagement with said guides of said shaft, and connection between said outer ends of said levers and the load-carrying devices of said cage whereby the strain is adapted to be transferred from said cables to said levers when said cables part to throw said eccentric ends of said levers into engagement with said guides of said shaft, substantially as described.

604,557.

604,558. SEAT FOR WATER-CLOSETS. HENRY P. COPE, Detroit, Mich. Filed Dec. 19, 1896. Serial No. 616,257. (No model.)



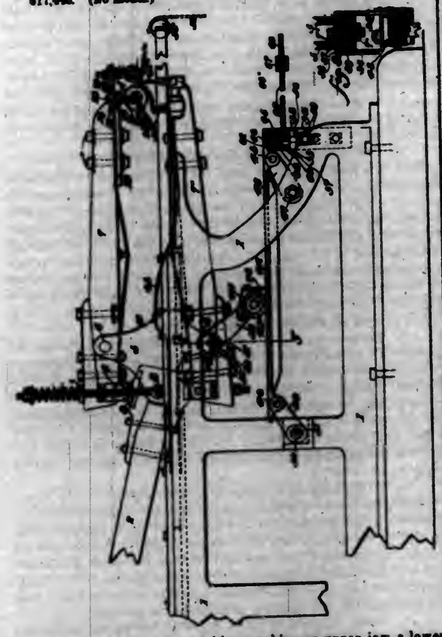
Claim.—1. A seat for water-closets, comprising a single-piece ring of concavo-convex cross-section and of the same general shape as the rim of the bowl to which it is to be applied, and provided with cushion-seats on the concave side thereof for supporting said ring from the bowl.

2. In combination with the bowl of a water-closet, a seat therefor comprising a jointless ring of concavo-convex cross-section and of the same general shape as the rim of the bowl, cushion-seats on the concave side thereof, and hinge-lugs.

3. A seat for water-closets, consisting of a ring of homogeneous material of the same general shape as the bowl of the closet to which it is to be applied, and of concavo-convex cross-section, and having formed on its concave side cushion-seats, for supporting it from the bowl.

604,559. SAND-BLAST. KENDALL H. COTTLE and ROBERT C. DAILY, Chicago, Ill., assignors to Frank B. Redington, same place. Filed Oct. 28, 1897. Serial No. 656,633. (No model.)

Claim.—1. In a device of the kind described, the force-pipe, arranged to direct a blast upon the work to be treated, in combination with a sand-receptacle, an agitator arranged therein, means for operating the agitator, and means for conducting the sand from the receptacle and delivering it to the force-pipe, substantially as described.



2. In a device of the kind described, a pipe adapted to direct a blast on a given object, and a force-pipe extending into the pipe to produce a siphon action, in combination with a sand-receptacle, an agitator arranged therein, means for operating the agitator, and a sand-pipe extending from the receptacle to the siphon, substantially as described.

3. In a device of the kind described, the siphon-blast, in combination with the receptacle E, agitator, F, gear-wheel, G, mechanism for driving the gear-wheel, and sand-pipe C, connecting the receptacle with the siphon, substantially as described.

4. In a device of the kind described, a sand-receptacle, a blast-pipe, a sand-supply pipe connecting with said blast-pipe and with said receptacle at or near its bottom, an agitator within the sand-receptacle adjacent said sand-supply pipe, means for operating the same, and a force-pipe, substantially as described.

5. In a device of the kind described, a sand-receptacle having an outlet-opening in one of its side walls, a horizontally-rotating agitator within the receptacle adjacent said opening, means for operating said agitator, a blast-pipe, a sand-supply pipe leading from said outlet-opening to said blast-pipe, and a force-pipe, substantially as described.

604,560. LEATHER-STAKING MACHINE. JAMES CRAIG and FRANK P. SLOCUM, Wilmington, Del. Filed Dec. 30, 1896. Serial No. 617,446. (No model.)

Claim.—1. In a leather staking machine, an upper jaw, a lower jaw, a blade carried by said lower jaw, a roller mounted in bearings attached to said upper jaw, adjustable arms carried by said upper jaw, stems adjustably supported in said arms, means for securing said stems in their adjusted positions and a roller having bearings in said stems.

2. In a leather-staking machine, an upper jaw, a fixed roller mounted in suitable bearings attached to said jaw, adjustable arms carried by the latter, said arms supporting adjustable threaded stems, and a roller having bearings in said stems.

3. In a leather-staking machine, an upper jaw, a roller journaled thereupon, arms adjustably mounted on said jaw, adjustable stems supported by said arms, and a roller journaled in said stems.

4. In a leather-staking machine, an upper jaw having a plate attached thereto, a roller journaled in bearings depending from said plate, slotted arms having a cross-piece attached thereto, means for securing said arms to said plate, bearings capable of vertical adjustment depending from said arms, and a roller journaled in said bearings.

5. In a leather-staking machine, a cross-head having upper and lower jaws pivotally mounted therein, means for reciprocating and for opening and closing said jaws, a plurality of arms having hubs journaled in said cross-head, openings in said arms located eccentrically in said hubs, a rod passing through said openings, means for holding said rod in position, and means for raising and lowering said arms.

6. In a leather staking machine, a bed or table, arms pivotally attached thereto and supported from the housing of the machine, an inclined or cam-faced projection depending from said table and adapted to contact with a hub having corresponding inclines thereon, and means for actuating said hub, in combination with connections from said bed for adjusting the lower jaw of the machine.

7. In a leather-staking machine, a bed or plate movably supported, arms common to said bed and to the housing of the machine, one of said arms having a shaft passing therethrough, said shaft being provided with bearings eccentric thereto, means for raising and lowering said bed, and connections from the latter to the lower jaw of the machine for adjusting said jaw.

8. In a leather-staking machine, a cross-piece, a hub supported thereupon, said hub having an opening therethrough and a shoulder therein, a threaded stem passing through said opening, and having a head adapted to engage said shoulder, a plurality of cam-faces on said hub, a table having a plurality of cam-faces thereon, arms extending from said hub and having a plate attached thereto, and pins projecting from said plate, in combination with connections common to said plate and to the lower jaw of the machine for adjusting said jaw without stopping the operation of the machine.

9. In a leather-staking machine, upper and lower jaws, a table, suitably supported, means for raising and lowering said table, a roller supported upon the latter, arms common to said roller and to one of said jaws, a scraper adapted to contact with said table, said scraper being located in advance of said roller, and suitably attached to said arms, and means for reciprocating and opening and closing said jaws.

10. In a leather-staking machine, an upper and lower jaw, a cross-head therefor, a plurality of arms having hubs mounted in said cross-head, openings in said hubs eccentrically located, a rod passing through said openings and the lower jaw of the machine, and means for raising and lowering said arms.

11. In a leather-staking machine, an upper and lower jaw, a roller mounted in suitable bearings attached to said upper jaw, adjustable arms carried by the latter, stems adjustably supported in said arms, and a roller having bearings in said stems, in combination with a plurality of upright blades attached to said lower jaw, one of said blades occupying the space between said rollers when said jaws are in their forward position.

12. In a leather-staking machine, a bed, arms pivotally attached thereto and supported from the housing of the machine, an inclined or cam-faced projection on said bed, adapted to contact with a hub having corresponding inclines thereon, and means for supporting and actuating said hub.

13. In a leather-staking machine, a hub suitably supported and having an opening therethrough, and a shoulder therein, a stem passing through said opening and provided with a head adapted to engage said shoulder, and hold said hub in position, a plurality of cam-faces on said hub, a table suitably supported and also provided with a plurality of cam-faces, and devices attached to said hub whereby the latter can be rotated by the knee of the attendant.

14. In a leather-staking machine, pivoted jaws, suitably supported, a movable bed, a roller carried by the lower of said jaws and bearing on said bed, a cam-face carried by said bed, and a rotatable hub having a cam-face adapted to register with the cam-face carried by the bed.

15. In a leather-staking machine, an upper and lower jaw pivotally supported, a movable bed, means for supporting the latter, a roller carried by said lower jaw and bearing on said bed, a cam-face on the latter, a rotatable hub having a cam-face adapted to coact with said first-mentioned cam-face, and means for actuating said hub, said means being controlled and actuated by the knee of the operator.

16. In a leather-staking machine, a pivoted jaw, the pivoted arms, a bed supported by said arms, a roller carried by said jaw and bearing on said bed, a cam-face carried by said bed, and a rotatable hub bearing a cam-face adapted to contact with the cam-face carried by said bed.

17. In a leather-staking machine, upper and lower jaws pivotally supported, a blade carried by said lower jaw, a roller mounted in bearings attached to said upper jaw, arms carried by the latter, stems adjustably supported in said arms, means for locking said stems in position and a second roller having bearings in said stems.

18. In a leather-staking machine, an upper and lower jaw pivotally supported, a movable bed, means for sustaining the latter, connections common to said bed and jaw for operating the latter, a cam-face on said bed, a rotatable element having a cam-face thereon adapted to coact with the first-mentioned cam-face, and means for actuating said element, said means being controlled and actuated by the knee of the operator.

604,561. TEMPORARY BINDER AND LOCK. HARRY B. DAPE, New York, N. Y. Filed Jan. 20, 1897. Serial No. 621,100. (No model.)

Claim.—1. In a binder, the combination with two binding-pieces designed to be fastened together, with sheets of paper or other material between them, of a post attached to one binding-piece, a locking-piece adjustable up and down lengthwise the post and arranged to be locked with the other binding-piece to secure the said pieces together, and means whereby the said locking-piece is at such time secured against upward adjustment lengthwise the post, substantially as described.

2. In a binder, the combination with two binding-pieces designed to be fastened together, with sheets of paper or other material between them, of a threaded post attached to one binding-piece, a member adjustable up and down lengthwise the post and carrying a locking-piece arranged to be locked with the other binding-piece to secure the said pieces together, and means whereby the said locking-piece is at such time secured against upward adjustment lengthwise the post, substantially as set forth.

3. In a binder, the combination with upper and lower binding-pieces designed to be fastened together with sheets of paper or other material between them, a locking device carried by the upper binding-piece, a post attached to the lower binding-piece, a locking-piece adjustable up and down lengthwise the post and arranged to be engaged with the locking device of the upper binding-piece and means whereby at such time the said adjustable locking-piece is secured against upward adjustment lengthwise the post, substantially as set forth.

4. A lock adapted to fasten two pieces together, comprising a post designed to be secured to one of the pieces, a locking-head adjustable up and down lengthwise the post and adapted to be locked to the other of said pieces, and means to secure the adjustable locking head against upward adjustment lengthwise the post when it is locked to the piece engaged thereby, substantially as set forth.

5. A lock adapted to fasten two pieces together, comprising a post designed to be secured to one of the pieces, a member adjustable up and down lengthwise the post and dependent upon rotation for its adjustment, a locking-head carried by said member and adapted to be locked to the other of said pieces, and means to secure the locking-head against adjustment when it is locked to the piece engaged thereby, substantially as set forth.

6. A lock adapted to fasten together two pieces, comprising two or more posts designed to be secured to one of the pieces and each having a member adjustable up and down along it, said members being connected so as to move together, one or more locking-heads moving with said members and adapted to be locked to the other of said pieces, and means to secure the adjustable locking-heads against upward adjustment along the posts when the locking head or heads are locked to the piece engaged thereby, substantially as set forth.

7. A lock adapted to fasten together two pieces, comprising two or more posts designed to be secured to one of the pieces and each having a member adjustable up and down lengthwise it, said members being connected so as to move together and dependent for their adjustment upon rotation of one of them, one or more locking-heads moving with said members and adapted to be locked to the other of said pieces, and means to secure the rotatable adjustable member against rotation when the locking head or heads are locked to the piece engaged thereby, substantially as set forth.

8. A lock adapted to fasten two pieces together, comprising a post designed to be secured to one of said pieces having a locking-head adjustable up and down lengthwise the post, and a locking-piece designed to be carried by the other of said pieces adapted to engage the said locking-head, and means to prevent the upward adjustment of the locking-head when in engagement, substantially as set forth.

9. A lock adapted to fasten two pieces together, comprising two or more posts designed to be secured to one of said pieces, each of said posts carrying a member adjustable up and down along it, said members being connected so as to move together, one or more locking-heads moving with said members and adapted to be locked to the other of said pieces, substantially as set forth.

10. In a binder, the combination with two binding-pieces designed to be fastened together with sheets of paper or other material between them, of a post attached to one of said pieces, a locking-head adjustable up and down lengthwise the post, the other of said binding-pieces being provided on its under side with a recess adapted to receive the locking-head, said recess being provided with means adapted to engage the locking head and fasten the binding-pieces together, and means to prevent the upward adjustment of the locking-head when in engagement, substantially as set forth.

11. In a binder, the combination with two binding-pieces designed to be fastened together with sheets of paper or other material between them, of a post attached to one of said pieces, a locking-head adjustable up and down lengthwise the post, the other of said binding-pieces being provided on its under side with a recess adapted to receive the locking head, said recess being provided with means adapted to engage the locking-head and fasten the binding-pieces together and means to secure the locking-head at such time against upward adjustment, substantially as set forth.

12. In a binder, the combination with two binding-pieces designed to be fastened together with sheets of paper or other material between them, the upper of said binding-pieces being provided with a recess and a locking-piece therein, of three posts fixed to the lower binding-piece, one of said posts being threaded and provided with a threaded member adjustable thereon by rotation and carrying two or more locking-heads connected so as to move together, the other two of said posts having adjustable members connected with and moving with the locking-heads, said locking-heads adapted to be received in the recess of the upper binding-piece and be locked therein and means to prevent the rotation of the said threaded member when the locking-heads are locked with the upper binding-piece whereby at this time the adjustment of the locking-heads is prevented, substantially as set forth.

13. The combination with two pieces designed to be fastened together, of a lock adapted to fasten the pieces together, comprising a threaded post, a threaded member adjustable up and down along said post and carrying a head, two posts in proximity to the threaded post, a yoke carried by the threaded member and adjustably connected with said two posts, locking-heads carried with the yoke, all of said posts being secured to one of the said two pieces to be fastened together, the other of said pieces being provided with an opening to receive the head of the threaded adjustable member and prevent its rotation and having means to engage the locking-heads, substantially as set forth.

14. The combination with two pieces designed to be fastened together, of a lock adapted to fasten the pieces together, comprising a threaded post and two plain posts secured to one of said pieces, the threaded post being disposed between the plain posts, a threaded member adjustable on the threaded post, a yoke carried by the threaded member and sleeved at its ends on the plain posts, two locking-heads carried by the yoke, one at each end thereof, the other of said two pieces to be fastened together being provided with means adapted to engage the locking-heads and also adapted to engage the threaded member so as to prevent its rotation and thereby secure the locking-heads against adjustment, substantially as set forth.

15. The combination with two pieces designed to be fastened together, of a lock adapted to fasten the pieces together comprising a threaded post secured to one of said pieces, an adjustable threaded member sleeved on the post and carrying a locking-head, the post having a stop to limit the upward adjustment of the threaded member, the other of said two pieces to be fastened together being provided with means for engaging the locking-head and at such time prevent the adjustment of the threaded adjustable member, substantially as set forth.

16. A lock adapted to fasten two pieces together, comprising a threaded post secured to one of said pieces, a threaded member adjustable on the post and having a shouldered head, a locking-head carried by the threaded member, the post having a stop to limit the upward adjustment of the threaded member, the other of said two pieces to be fastened together having an opening to receive the shouldered head and prevent its rotation, and also provided with means for engaging the locking-head, substantially as set forth.

17. A lock adapted to fasten together two pieces, comprising two or more posts designed to be secured to one of the pieces and each having a member adjustable up and down lengthwise it, said members being connected so as to move together, one or more locking-heads moving with said members and adapted to be locked to the other of said pieces, one or more of the posts having a stop or stops to limit the upward adjustment of the locking-head or locking-heads, and means to secure the adjustable members against upward adjustment lengthwise the posts when the locking head or heads are locked to the piece engaged thereby, substantially as set forth.

18. The combination with two pieces designed to be fastened together, of a lock adapted to fasten the pieces together, comprising a threaded post and two plain posts secured to one of said pieces, the threaded post being disposed between the plain posts, a threaded member adjustable on the threaded post, a yoke carried by the threaded member and sleeved at its ends on the plain posts, two locking-heads carried by the yoke, one at each end thereof, one or more of the posts having a stop or stops to limit the upward adjustment of the locking-head or locking-heads, the other of said two pieces to be fastened together being provided with means adapted to engage the locking-heads and also adapted to engage the threaded member so as to prevent its rotation and thereby secure the locking-heads against adjustment, substantially as set forth.

19. In combination with two pieces designed to be fastened together, a lock comprising a post secured to one of said pieces and having an adjustable locking-head, the other of said pieces having an opening to receive the locking-head, and a sliding bolt adapted to engage the locking-head, and means to prevent the upward adjustment of the locking-head at such time, substantially as set forth.

20. In combination with two pieces designed to be fastened together, a lock comprising a post secured to one of said pieces, a member adjustable on the post and dependent upon rotation for its adjustment, a locking-head carried by said member, the other of said two pieces having a sliding bolt to engage the locking-head, and provided with means to prevent the rotation of the said adjustable member when the locking-head is engaged by the bolt, substantially as set forth.

21. In a binder, the combination with two binding-pieces designed to be fastened together with sheets of paper or other material between them, of a post secured to one of said binding-pieces, a member adjustable up and down along the post and dependent upon rotation for its adjustment, a locking-head carried by said member, means carried by the other binding-piece to engage the locking-head and including means arranged to prevent the rotation of the adjustable member when the locking-head is so engaged, substantially as set forth.

22. In a binder, the combination with two binding-pieces designed to be fastened together with sheets of paper or other material between them, of two posts secured to one of the binding-pieces, locking-heads adjustable on the posts and connected so as to move together, means for adjusting the locking-heads, and locking means carried by the other binding-piece arranged to engage the locking-heads and at such time secure them against upward adjustment, substantially as set forth.

23. In a binder, the combination with two binding-pieces designed to be fastened together, of a locking-piece carried by one of the binding pieces and adjustable to and from the same, a locking device carried by the other binding-piece and arranged to engage the adjustable locking-piece and means to secure the adjustable locking-piece at such time against upward adjustment, substantially as set forth.

24. In a binder, the combination with two binding-pieces permanently connected together but movable to and from each other, one or more extensible fixed posts and one or more removable posts to receive and secure sheets in the binder, a locking-piece carried by one of the binding-pieces and adjustable to and from the same, and locking means carried by the other binding-piece arranged to engage the adjustable locking-piece and at such time secure it against upward adjustment, substantially as set forth.

25. In a binder, the combination with two covers, having hinged strips at their rear ends, extensible posts and removable posts to receive and secure sheets in the binder, the extensible posts being fixed to the hinged strip of the lower cover and connected together by a rigid strip at their tops, a flexible piece or flap connecting the said rigid strip with the upper cover at its rear end in front of its hinged strip, and means for locking the covers together, substantially as set forth.

26. In a binder, the combination with a lower cover provided with a post having an adjustable locking-head, of an upper cover provided with an opening as a^2 in one end adapted to receive the locking-head, a sliding bolt in a recess in the end of said cover to engage the locking-head and having a key-receiving opening as l^2 whereby the bolt may be operated, the upper cover having a key-hole to give access to a key to the said opening l^2, and means for preventing adjustment of the locking-head when in engagement with the sliding bolt, substantially as set forth.

27. In a binder, the combination with a lower cover provided with a post having an adjustable locking head, of an upper cover provided with an opening as a^2 in one end adapted to receive the locking-head, a sliding spring-bolt in a recess in the end of said cover to engage the locking-head and having a key-receiving opening as l^2 whereby the bolt may be operated, the upper cover having a key-hole to give access to a key to the said opening l^2, and means for preventing adjustment of the locking-head when in engagement with the sliding bolt, substantially as set forth.

604,562. DISINFECTING APPARATUS. JAMES EVERTS, Chicago, Ill., assignor to the Red Cross Hygienic Company, same place. Filed Apr. 24, 1897. Serial No. 633,963. (No model.)

Claim.—1. In a disinfecting apparatus, the combination of a normally-sealed reservoir adapted to contain liquid disinfectant, an auxiliary chamber located within and communicating with said reservoir, a wick-tube leading from below the reservoir and into the upper portion of the chamber and extraneous thereof, a wick arranged in such tube and leading to the lower end of the chamber, the said chamber being closed at its upper end but open at its lower end below the level of liquid in the reservoir whereby air passes through the tube and into the auxiliary chamber only as the liquid is withdrawn by the wick so that the liquid therein remains at a practically constant level which is near the bottom of the chamber and of the reservoir regardless of the level of the liquid in the reservoir, thereby assuring a uniform feed by the wick.

2. In a disinfecting apparatus, the combination with a reservoir adapted to contain liquid disinfectant, of an auxiliary chamber to which access of air is permitted, and located within the reservoir, an avenue of communication between said reservoir and said auxiliary chamber, a wick adapted to withdraw the liquid from said auxiliary chamber to the point of application, said reservoir having holes for the admission of air to said reservoir, and means for normally maintaining said holes sealed against the passage of air, whereby the atmospheric pressure causes the liquid in said auxiliary chamber to remain at a practically constant level, regardless of the height of the liquid within the reservoir, substantially as described.

3. In a disinfecting apparatus, the combination with the reservoir *a*, of an auxiliary chamber *c*, within said reservoir and in communication therewith at the bottom, access of air being permitted to said auxiliary chamber *c*, a wick *h* adapted to withdraw liquid from said chamber *c* to the point of application, said reservoir having holes *e e* for the admission of air, and a cap *d* normally sealing said holes against the passage of air, substantially as described.

4. In a disinfecting apparatus, the combination with the reservoir *a*, of the chamber *c* communicating therewith and with the external air, wick *h*, said reservoir having holes *e e* for the admission of air, cap *d* normally covering the chamber *c*, and a washer *f* carried upon said cap and normally sealing said holes *e e*, substantially as described.

5. In a disinfecting apparatus, the combination of a normally-closed reservoir adapted to contain liquid disinfectant, an auxiliary chamber located within the reservoir and communicating substantially at the bottom with the reservoir, and a wick extending from below the reservoir and into the auxiliary chamber for withdrawing the disinfectant, substantially as described.

6. In a disinfecting apparatus, the combination of a normally-closed reservoir adapted to contain liquid disinfectant, an auxiliary chamber located within the reservoir and to which air has access and whose lower end communicates with the reservoir near the bottom thereof, and a wick extending into the auxiliary chamber to its lower end and leading from a point extraneous of such chamber for withdrawing the disinfectant from the reservoir, substantially as described.

7. In a disinfecting apparatus, the combination of a normally-closed reservoir adapted to contain liquid disinfectant, an auxiliary chamber open only at its lower end and depending into the liquid, a wick-tube leading outside the chamber from its upper portion and a wick extending from the lower end of the chamber upward through the chamber and thence through the wick-tube.

8. In a disinfecting apparatus, the combination of a reservoir adapted to contain liquid disinfectant, an auxiliary chamber located therein and communicating substantially at its lower end with the reservoir, a tube leading from near the top of the chamber downward and a wick in the chamber and tube for withdrawing the disinfectant from the reservoir.

9. In a disinfecting apparatus, the combination of a reservoir adapted to contain liquid disinfectant, an auxiliary chamber depending therein and having communication through its lower end, an ex-

posing surface located adjacent to the reservoir, a tube extending from near the top of the auxiliary chamber and passing downwardly through the reservoir to the exposing-surface and a wick in the auxiliary chamber and tube for conducting the disinfectant.

10. In a disinfecting apparatus, the combination of a reservoir to contain liquid disinfectant, an auxiliary chamber communicating therewith substantially at its lower end and a wick leading from the lower end of the chamber upward therethrough and thence downward extraneous of the chamber and below the bottom of the reservoir.

604,563. DASH-POT FOR STEADYING MULE-CARRIAGES. SAMUEL GREEN, Mossley, England. Filed May 22, 1897. Serial No. 637,784. (No model.) Patented in England May 24, 1896, No. 10,259.

Claim.—1. A carriage-steadier for mules for spinning, consisting of an iron box *a* containing fluid and a plate *b* formed with perforations *k* and an arm *c* hinged to the outside of the said box, the mule-carriage having projections *i* fixed thereto, the said arm being adapted to catch the mule-carriage projections *i* at the end of the inward travel and the said fluid to check the rise of the said plate and thus control the speed of the mule-carriage at the commencement of its outward travel, all substantially as and for the purpose set forth.

2. In combination with an iron box *a* containing fluid and a movable plate therein formed with an arm *c*, a lever *f* hinged to the said arm and supported by a spring, which lever is adapted to be depressed by and catch a projection *i* on the mule-carriage at the end of its inward travel, all substantially as and for the purpose set forth.

604,564. PUNCH. AUGUST KRAEUTER, Newark, N. J. Filed Sept. 17, 1897. Serial No. 651,964. (No model.)

Claim.—1. In a punch, a pair of piercing-jaws, one of said jaws having an opening, and a movable receptacle held in said opening by frictional contact, forming a box or chamber to receive the piercings and to be automatically opened when filled with such piercings, substantially as and for the purposes set forth.

2. In a punch, a pair of piercing-jaws, one of said jaws having an opening, and a receptacle pivotally connected with one of said jaws and held therein by frictional contact, forming a box or chamber to receive the piercings and to be automatically opened when filled with such piercings, substantially as and for the purposes set forth.

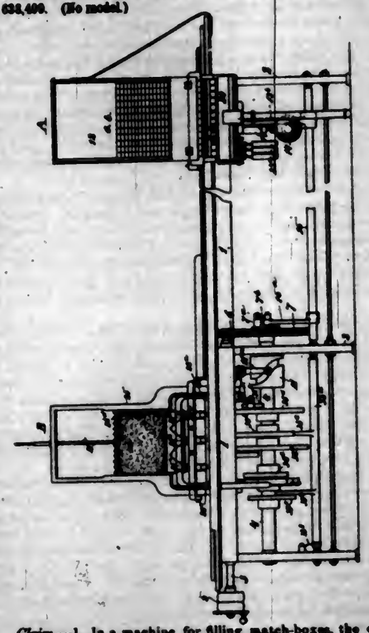
3. In a punch, a pair of piercing-jaws, one of said jaws having an opening, and a receptacle pivotally connected with said jaw and adapted to fit in said opening and held therein by frictional contact, forming a box or chamber to receive the piercings and to be automatically opened when filled with such piercings, substantially as and for the purposes set forth.

4. In a punch, a pair of piercing-jaws, one of said jaws having an opening, a receptacle in said opening, forming a box or chamber to receive the piercings, and a spring-plate connected with said receptacle by frictional contact for removably retaining said receptacle in said opening and to be automatically opened when filled with such piercings, substantially as and for the purposes set forth.

5. In a punch, a pair of piercing-jaws, one of said jaws having an opening, a receptacle pivotally connected with said jaw and adapted to fit in said opening, forming a box or chamber to receive the piercings, and a spring-plate connected with said receptacle for removably retaining said receptacle by frictional contact in said opening and to be automatically opened when filled with such piercings, substantially as and for the purposes set forth.

6. In a punch, a pair of piercing-jaws, one of said jaws having an opening, and a receptacle in said opening, forming a box or chamber to receive the piercings, consisting, essentially, of a base-plate c', side c^2, a top plate c^3, and a lip c^4 on said top plate, substantially as and for the purposes set forth.

7. In a punch, a pair of piercing-jaws, one of said jaws having an opening, and a receptacle in said opening, forming a box or chamber to receive the piercings, consisting, essentially, of a base-plate c', side c^2; a top plate c^3, and a lip c^4 on said top plate, and means connected with said receptacle for removably retaining it in said opening, substantially as and for the purposes set forth.



8. In a punch, a pair of piercing-jaws, one of said jaws having an opening, and a receptacle in said opening, forming a box or chamber to receive the piercings, consisting, essentially, of a base-plate c', side c^2, a top plate c^3, and a lip c^4 on said top plate, and a spring-plate c^5 connected with said receptacle for removably retaining it in said opening, substantially as and for the purposes set forth.

9. In a punch, a pair of piercing-jaws, one of said jaws having an opening, and a receptacle in said opening, forming a box or chamber to receive the piercings, consisting, essentially, of a base-plate c', side c^2, a top plate c^3, a lip on said top plate, and lugs c^7 for pivotally attaching said receptacle to a pin on one of the said jaws, substantially as and for the purposes set forth.

10. In a punch, a pair of piercing-jaws, one of said jaws having an opening, and a receptacle in said opening, forming a box or chamber to receive the piercings, consisting, essentially, of a base-plate c', side c^2, a top plate c^3, a lip on said top plate, and lugs c^7 for pivotally attaching said receptacle to a pin on one of the said jaws, and means connected with said receptacle for removably retaining it in said opening, substantially as and for the purposes set forth.

11. In a punch, a pair of piercing-jaws, one of said jaws having an opening, and a receptacle in said opening, forming a box or chamber to receive the piercings, consisting, essentially, of a base-plate c', side c^2, a top plate c^3, a lip on said top plate, and lugs c^7 for pivotally attaching said receptacle to a pin on one of said jaws, and a spring-plate c^5 connected with said receptacle for removably retaining it in said opening, substantially as and for the purposes set forth.

604,565. MACHINE FOR FILLING MATCH-BOXES. ALEXANDER LAGERMAN, Jönköping, Sweden, assignor to Jönköpings Tändsticks-Fabriks Aktiebolag, same place. Filed May 28, 1897. Serial No. 638,469. (No model.)

Claim.—1. In a machine for filling match-boxes, the combination with a table or main frame to support the mechanism, an endless carrier on said frame, and mechanism for moving said carrier intermittently, of an upright match-box magazine mounted on the main frame over said carrier and adapted to contain the empty boxes arranged in tiers, a plunger adapted to push out the lower tier of boxes onto the carrier, mechanism for operating said plunger, mechanism for pushing the drawers of the boxes on the carrier from their cases, mechanism for placing the matches in the drawers of the boxes, and mechanism for drawing the cases of the boxes over the filled drawers, said mechanisms being situated adjacent to the carrier, and at different points therealong, substantially as set forth.

2. In a machine for filling match-boxes, the combination with the main frame or table to support the mechanism, and a box-filling mechanism for the matches, of the endless carrier for the boxes mounted thereon and comprising the flanged plates 8, hinged together and each having a beveled stud 8^9, and the polygonal, horizontally-arranged, rotatable disks 9 and 9^8, of the slidable rod 10, mounted in the main frame and having laterally-projecting lugs 10^2, adapted to engage the studs on the plates 8 for intermittently advancing the carrier, and mechanism substantially as described for imparting a reciprocating movement to the rod 10, substantially as set forth.

3. In a machine for filling match-boxes, the combination with the main frame or table supporting the mechanism, and an intermittently-moving carrier mounted on said main frame, of the upright magazine 12, for the reception of the empty boxes *a*, *b*, in tiers, the pusher 13, adapted to push out the lowermost tier of boxes from the magazine, said pusher being mounted to slide to and fro on the machine-frame, a weight 14, adapted to move the pusher forward in expelling the boxes, positive mechanism, substantially as described for withdrawing the pusher, and a stop to regulate the forward movements of the pusher, said stop comprising the intermittently-rotating disk 9, of the carrier provided with raised segments 17 on its surface, and a stud 13^2, carried by the pusher, said segments being adapted for interposition into the path of the stud 13^2 during certain parts of the rotation of said disk 9, substantially as set forth.

4. In a machine for filling match-boxes, the combination with the main table or frame supporting the mechanism, and an intermittently-moving carrier, mounted on said frame, for carrying the boxes, of the mechanism for pushing the drawers of the empty boxes from their cases, said mechanism comprising a movable bar 21^2, which rests upon and holds down the box-case, a weight carried by said bar, means for raising said bar to release the case, a slidable plunger 22, which pushes out the drawer of the box from its case while the latter is held stationary, a weight 23^2, which imparts the operative, forward movement to said plunger, and mechanism, substantially as described, for withdrawing said plunger, substantially as set forth.

5. In a machine for filling match-boxes, the combination with the main frame, the carrier mounted thereon for supplying empty boxes to the filler, and an upright magazine for the matches, said magazine having a chute or chutes at its bottom to load the matches to the box to be filled, of an intermittently-operating vibrating brush 26^2, situated in front of the match-magazine and adapted to bear on the uncoated ends of the matches and by shaking them cause them to descend freely to the box-filling point, substantially as set forth.

6. In a machine for filling match-boxes, the combination with the upright match-magazine having a chute at its bottom for the delivery of the matches, of a cut-off in said chute consisting of a pair of shutters 27, hinged on vertically-arranged pins so as to swing in a curved path into the chute, entering the same first near the heads of the matches therein, and mechanism for closing and opening said shutters simultaneously, substantially as set forth.

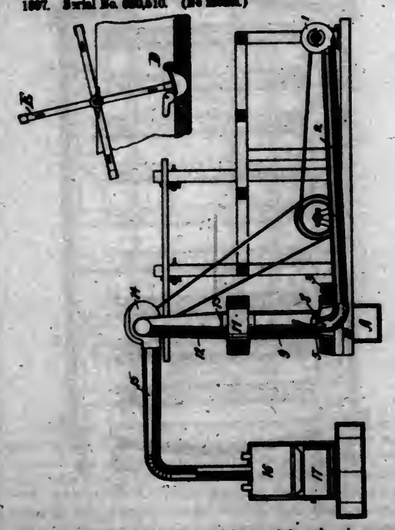
7. In a machine for filling match-boxes, the combination with the upright match-magazine having a chute at its bottom for the delivery of the matches to the filling-point, of a cut-off in said chute consisting of a pair of shutters 27, adapted to move in and out simultaneously with a tremulous motion, a cam with an undulating or wavy periphery, mechanism between said cam and shutters whereby the cam moves them out in one direction, and springs for holding them against the undulating movement derived from the cam and for moving them in the opposite direction, substantially as set forth.

8. In a machine for filling match-boxes, the combination with an upright match-magazine having a chute at its bottom for the delivery of the matches to the filling-point, of a cut-off in said chute consisting of a pair of shutters 27, hinged on upright axes, mechanism substantially as described for opening said shutters, and springs which close the shutters with a yielding force or pressure, substantially as set forth.

9. In a machine for filling match-boxes, the combination with an upright match-magazine having a chute at its bottom for the delivery of the matches to the filling-point, of a cut-off in said chute, consisting of a pair of swinging shutters 27 hung on upright hinge-axes, whereby they are adapted to close and to open simultaneously, mechanism substantially as described for operating the shutters, a movable, inclined bottom 30 in the chute which receives the matches cut off by the shutters, mechanism which moves said bottom and a reciprocating plunger 32, arranged under the chute, which pushes the matches so separated into the box, substantially as set forth.

10. In a machine for filling match-boxes, the combination with the upright match-magazine having a chute at its bottom and means substantially as described for separating a measured quantity, $m^{\times}$, of matches from said chute to fill a box, of the vertically-movable cell 32, to receive the matches, mechanism for operating said cell, the movable depressor, 34, at the delivery end of said cell, mechanism for operating said depressor, and the reciprocating plunger adapted to push the matches into the cell and from the cell into the box, substantially as set forth.

11. In a machine for filling match-boxes, the combination with the upright match-magazine having a chute at its bottom and means substantially as described for separating a measured quantity, $m^{\times}$, of matches from said chute to fill a box, of the vertically-movable cell 32, to receive the matches, mechanism for operating said cell, the movable depressor, 34, at the delivery end of said cell, mechanism for operating said depressor, 34, and the reciprocating plunger 33, and its operating mechanism, the slidable bottom plate, 31, in the cell and adapted to take over the margin of the box to be filled, and mechanism for operating said sliding bottom, substantially as set forth.



12. In a machine for filling match-boxes, the combination with the vertically-movable cell 32, and the means for moving the same, of the vibrating adjuster 35, adapted to even the matches in the cell by rubbing on their uncoated ends while the cell is elevated, substantially as set forth.

13. In a machine for filling match-boxes, the combination with the carrier for the match-box, and mechanism for placing the matches in the protruding drawer thereof, of the slidable hook 36, with a beveled under side, adapted to engage the margin of the box-case at its end and guide the matches into the drawer, and mechanism for operating said hook, substantially as set forth.

14. In a machine for filling match-boxes, the combination with the endless carrier, composed of flanged plates 8, and polygonal disks 9 and 9^8, mechanism for advancing said carrier intermittently, mechanism for placing the empty boxes on said carrier at one point and mechanism for pushing out the drawers of the boxes at another point, of a stationary, curved guide, 9^9, arranged over the carrier at the point set forth, and adapted to insure the boxes being pressed up to the flange on the main frame when they reach the point where the drawers are pushed out, substantially as set forth.

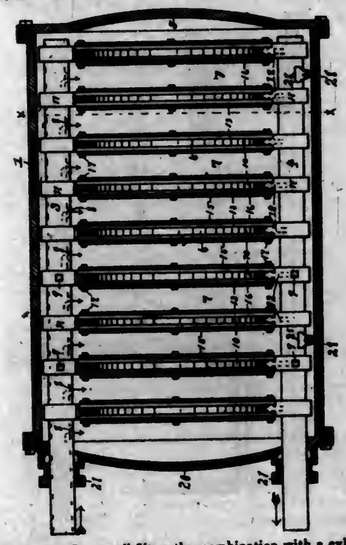
15. In a machine for filling match-boxes, the combination with the main frame, the intermittently-moving, endless carrier for the boxes, mounted on said frame, the upright box-magazine 12, on the main frame and at the inner side of the path of the carrier, the pusher for pushing out the lower tier of boxes onto the plates of the carrier, whereby the filled boxes are pushed off from the carrier, and mechanism for operating said pusher, of the inclined plate 18 on the frame down which the filled boxes slide, the tray 20, situated to receive the filled boxes, the slide 16, adapted for pushing the filled boxes into the tray, and mechanism for operating said slide, substantially as set forth.

604,566. MACHINE FOR SEPARATING FINE GOLD FLAKES FROM SAND. JONATHAN H. MARION, Louisville, Ky. Filed Jan. 25, 1897. Serial No. 620,510. (No model.)

Claim.—1. The combination, with a receiving-chamber: a supply-hopper; and a nozzle, for depositing centrally within the receiving-chamber the mass of material fed from said hopper to the machine, of means for supplying an air-blast which operates to force upwardly within said chamber the finer portions of the sand and also all the

finest particles, of the gold; a screen, located at the upper end of said chamber, and adapted to permit the passage through it of only the dust and flour gold; and a pipe extending upwardly from said screen and provided with an exhaust-fan, operating to enforce the ascent of said flour gold, and fine particles of dust, and discharge them into a suitable receiver, or receptacle.

2. In combination with a vertical, tubular, receiving-chamber, provided with a supply-hopper and nozzle as specified, a centrally-located receiving-pan, 6, arranged within the open, upper, end of a blast-pipe, located within the lower end of said receiving-chamber; the frustum-shaped cape, or deflector, 8, arranged and operating as specified; a force-fan, 1; and a flume, A, located beneath the sand-receiving blast devices as shown; the whole arranged and operating so that the overflowing mass of material fed into the pan, 6, will be acted upon by the blast which forces upwardly its finer particles, and disintegrates the overflowing mass, while at the same time the coarser sand and the bulk of the entire mass will finally descend into the flume; substantially as and for the purpose hereinbefore set forth.

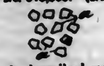


3. The combination, with the vertical, tubular chamber 9, into which the mass of material is centrally discharged and within which the flour gold and dust are separated by a blast operation; and the flume A, into which the coarser sand and gold particles descend from said chamber, of a series of quicksilver-receptacles, or amalgamating-boxes D, each of which is let into the flume-bottom, each of which is provided with a hinged lid and is made as specified; and a series of wheels each arranged relatively to one of said boxes in the manner specified and revolved by the action of the water in the flume; the whole constructed and operating substantially as and for the purposes hereinbefore set forth.

604,567. HARNESS-PAD. EDWARD L. MCCLAIN, Greenfield, Ohio. Filed June 25, 1896. Serial No. 596,871. (No model.)

Claim.—A pad for application to animals, which pad contains a flexible waterproof diaphragm; an absorbent filling on one side of the latter; and a dissimilar filling on its opposite side, for the purpose described.

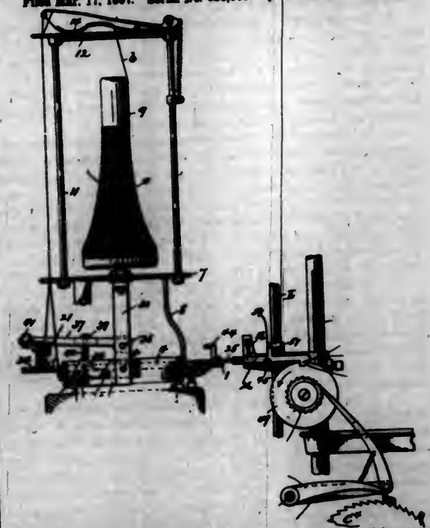
604,568. OIL-FILTER. JOHN B. RAAB, Dayton, Ohio, assignor to W. P. Callahan & Co., same place. Filed Nov. 22, 1897. Serial No. 659,439. (No model.)



Claim.—1. In an oil-filter, the combination with a cylinder, of inlet and outlet pipes located in opposite sides of said cylinder and throughout the length thereof, the inlet-pipe being provided with a series of oil-orifices throughout its length, a series of filter-buckets mounted on said pipes with intervening spaces into which the oil enters from said inlet-pipe and from whence it enters the filter-buckets, and an oil-channel leading from the interior of each of said buckets to the outlet-pipe, the said pipes and buckets being removable from the cylinder in a body, substantially as and for the purposes specified.

2. A filtering apparatus comprising in combination with a cylinder from and into which it may be freely moved, an inlet and outlet pipe, a series of filter-buckets rigidly mounted on said pipes with space between each pair into which oil is forced through a series of orifices in the inlet-pipe, and openings leading from the interior of said buckets to the outlet-pipe, and a cylinder-head mounted on said pipes, substantially as described.

3. In an oil-filter, the combination with a cylinder having pipe-channels in opposite sides, and inlet and outlet pipes having oil-orifices throughout their inner sides, of a series of filter-buckets rigidly mounted on said pipes, each of said buckets consisting of plates 13 and cloths 15, a ring 10 against which said plates and cloths are firmly held, the said rings being placed on the pipes at uniform distances apart, and having oil-orifices on one side through which the oil enters the outlet-pipe from the interior of the buckets, as herein shown and described.



604,569. GRINDING, ABRADING, OR CUTTING MATERIAL AND MODE OF PREPARING SAME. ANDERS V. RINMANSÖ, Örebro, Sweden, assignor to Nils Ryvin Frykholm, Stockholm, Sweden. Filed Dec. 26, 1896. Serial No. 573,265. (No model.)

Claim.—1. The herein-described method of preparing abrading materials which consists in first applying to the separate, fine grains of a hard, abrading material, as corundum, a coating of metal, then mixing said coated grains with molten metal, and then shaping said mixture into suitable forms for use.

2. As an improved article of manufacture, an abrading or cutting tool having its surface composed of a mass of fine particles or granules of hard abrading material, each coated with a film or metal, and an embedding or binding metal about and among said granules, the binding metal having a lower melting-point than that of the metal with which the granules are coated, substantially as set forth.

604,570. KNITTING-MACHINE. JAMES E. ROWE, Pawtucket, R. I., assignor to the E. Jonston Manufacturing Company, same place. Filed Mar. 17, 1897. Serial No. 628,005. (No model.)

Claim.—1. In a knitting-machine, the combination with a traveling main thread-guide, of a thread-guide traveling therewith, means for reciprocating said guide in a path which does not cross the plane of the needles, a clamp inside the needles and means for severing the thread, substantially as described.

2. In a knitting-machine the combination with a traveling main thread-guide, of a pivoted thread-guide traveling therewith and arranged to oscillate in a path which does not cross the plane of the

needles, means for oscillating said thread-guide, and means for severing the thread, substantially as described.

3. In a knitting machine the combination with a rotary cam cylinder, of a thread-carrier carried therewith, a stationary cam for reciprocating said carrier, and means inside the needles for severing and holding the thread, substantially as described.

4. In a knitting-machine the combination with a rotary cam-cylinder, of a thread-carrier carried therewith, a cam for reciprocating said carrier, a support for said cam moving with the cam-cylinder, and means for automatically stopping and releasing said cam, substantially as described.

5. In a knitting-machine the combination with a rotary cam-cylinder, of a thread-carrier carried therewith for carrying the thread into engagement with the needles, a stationary cam for operating said carrier, means for automatically throwing said cam into and out of operative position, and means inside the needles for severing the thread, substantially as described.

6. In a knitting-machine, a thread-carrier, means for operating said carrier to carry the thread into and out of engagement with the needles, and a thread-holder inside the needles, and means for operating said holder from said carrier, substantially as described.

7. In a knitting-machine, a thread-carrier, a cam for operating said carrier to carry the thread to and from the needles, a support for said cam moving with the cam-cylinder, means for holding said cam stationary during one or more revolutions of the cam-cylinder, and means for throwing said holding means into and out of operation, substantially as described.

8. In a knitting-machine, a thread-carrier for carrying the thread into engagement with the needles, a cam for operating said carrier, a clamp inside the needles for the thread also operated from said cam, substantially as described.

9. In a knitting-machine, the combination of a thread-guide, means for operating said guide to carry the thread to and from the needles at each revolution of the cam-cylinder, a support for said operating means traveling with the cam-cylinder, and means for automatically stopping and releasing said operating means, substantially as described.

10. In a knitting-machine, a thread-carrier, a ring carrying a cam for operating said carrier to carry the thread to and from the needles, a support for said cam-ring moving with the cam-cylinder, a stop for engaging said cam-ring, and means for moving said stop into and out of operative position, substantially as described.

11. In a knitting-machine, an annular ring secured to the cam-cylinder, a cam-ring mounted in said ring, means for holding said cam-ring stationary during one or more revolutions of the cam-cylinder, a thread-guide operated by said cam-ring, substantially as described.

12. In a knitting-machine, a cam-ring, a support therefor carried by the cam-cylinder, a pivoted thread-carrier operated by said cam-ring at each revolution of the cam-cylinder, substantially as described.

13. In a knitting-machine, a stationary cam, a traveling thread-carrier for carrying the thread into engagement with the needles operated by said cam, a thread-holder operated by said cam, and a cam for operating said holder independent of said carrier, substantially as described.

14. In a knitting-machine, a cam partially surrounding the needles and provided with a swell at its forward end, a thread-carrier riding over said cam, a thread-holder operated from said carrier, and a cam for operating said holder substantially as described.

15. In a knitting-machine, a support traveling with the cam-cylinder, a thread-carrier supported by said support, a ring also supported by said support and carrying a cam for operating said thread-carrier, substantially as described.

16. In a knitting-machine, a support traveling with the cam-cylinder, a thread-carrier and a thread-holder supported by said support, a ring also supported by said support and carrying a cam for operating said carrier, substantially as described.

17. In a knitting-machine, a thread-carrier, a ring carrying a cam for operating said carrier, a main-thread guide, a latch-guard, and a support secured to the cam-cylinder for supporting all said devices, substantially as described.

604,571. BISMUTH-OXYIODIN TANNATE. JAKOB SCHMID, Basle, Switzerland, assignor to the Society of Chemical Industry, same place. Filed Aug. 17, 1897. Serial No. 648,800. (Specimens.)

Claim.—1. The process for the production of a bismuth-oxyiodid lake of tannic acid, consisting in bringing one molecule of bismuth oxyiodid into reaction with one molecule of a tannic acid, as described.

2. As a new article of manufacture the described bismuth-oxyiodid lake of tannin consisting of a gray powder which is quite insoluble in water and is dissociated by acids and alkalies, the gray coloration of the compound turning to yellow, with emanation of an acid odor, when it is boiled with water.

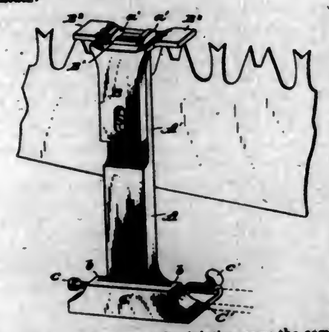
604,572. GUIDE-FRAME FOR LOOSE ROLLS IN JOURNAL-BEARINGS. THEODORE J. TELLEPSEN, Newark, N. J., assignor to the Hyatt Roller Bearing Company, of New Jersey. Filed Apr. 1, 1897. Serial No. 630,230. (No model.)

Claim.—1. In a roller-bearing, the combination, with the journal, the casing, and a considerable series of rolls C arranged in groups around the journal within the casing, of two similar guide-frames consisting each of the semicircular yokes *a* connected by the guide-bars *b* and *b'* arranged as shown and described, the lateral guide-bars *b* being each set at a short distance from the end of the yoke for the purpose set forth, and a group of the rolls in contact with one another being fitted between the guide-bar *b'* and each of the lateral bars *b* and other rolls being fitted between the adjacent guide-bars *b* upon the two guide-frames, substantially as herein set forth.

2. In a roller-bearing guide-frame having semicircular yokes connected by guide bars with groups of rolls in contact between each bars, the combination, with the three yokes *a*, *a*, *a'*, of the guide-bars *b*, *b* and *b'* arranged as shown and described, with the guide-bar *b'* connecting the centers of the yokes, and the lateral guide-bars *b* connected to the yokes at a suitable distance from the ends of the same, to admit one of the rolls between the opposite yokes, beyond each lateral guide-bar, substantially as herein set forth.

604,573. FILTER. WILLIAM W. WILSON, Holyoke, Mass. Filed Feb. 3, 1896. Serial No. 578,594. (No model.)

Claim.—1. In a filter, a collecting-tube for conducting filtered water from and washing-water to the filtering-chamber, said tube having connected thereto within said chamber, a hollow head provided with a plurality of laterally-projecting, tubular arms, each of which arms is provided with a plurality of longitudinal slits adapted to permit the passage of water therethrough while preventing the passage of the particles composing the filtering material, substantially as described.



2. In a filter, the combination with the filtering-chamber thereof of a tube for conducting filtered water from and washing-water to said chamber, said tube having connected to its end within the chamber a hollow head provided with a plurality of radially-disposed tubes,

each of which tubes is longitudinally slitted to permit water to pass therethrough while preventing the passage of sand or similar filtering material, substantially as described.

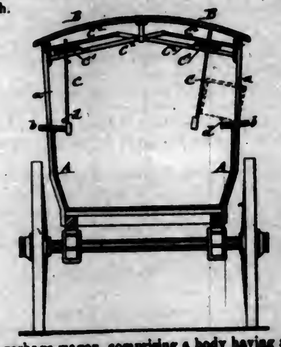
3. In a filter, the combination with a discharging device located within the filtering-chamber and forming the outlet therefrom for filtered water consisting of a globular head provided with a plurality of radially-disposed and longitudinally-slitted members, of an imperforate guard adapted to rest upon the bottom of said chamber and to cover said head and its members, said guard having an open waterway between its bottom and the bottom of said chamber, substantially as set forth.

4. The discharging device for filters composed of the globular head *f* having projecting radially therefrom the tubular members *g* provided with the dividing-slits 6, substantially as described.

604,574. DEVICE FOR JOINTING, GAGING, AND SETTING SAWS. ITHAMAR ARNOLD, La Fargeville, N. Y., assignor of one-half to Parley K. Foote, same place. Filed Sept. 1, 1897. Serial No. 650,268. (No model.)

Claim.—1. In an implement for jointing saws the combination with the body portion A, one end of which is bent to provide an overlying member or portion *c* which is cut away centrally to provide an aperture for the passage of the teeth of a saw, and a gage which is adjustably secured to the body portion and provided with laterally-extending members substantially as shown and for the purpose set forth.

2. In an implement for jointing and setting saws the combination with a body portion A, having one end beveled, the opposite end being bent upon itself and centrally cut away; together with a saw-filing gage adjustably secured to one end of the body portion, said gage having an aperture and laterally-extending members and a file-holding frame adjustably mounted on the opposite end of the body portion, substantially as shown and for the purpose set forth.



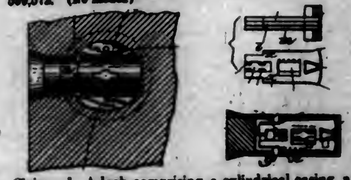
3. In a saw-sharpening implement or tool, the combination with the body portion A, the ends thereof being reduced in thickness, of a saw-filing gage adjustably secured to one end of the body portion and a file-holding frame adjustably secured to the opposite end of the body portion for the purpose set forth.

4. In a saw-jointer, the combination of a frame or body portion A, bent upon itself so as to provide an overlying portion *a* having connecting portions *a'* and an aperture between said portions through which the saw-teeth may pass, in combination with a saw-filing gage which is adjustably secured to the body portion and provided with an aperture through which the body portion passes, said gage having laterally-projecting portions B^2, substantially as shown and for the purpose set forth.

604,575. GARBAGE-WAGON. PETER BAUER, Cologne-Ehrenfeld, Germany, assignor to Lobach & Company, Gesellschaft mit Beschränkter Haftung, Cologne, Germany. Filed Dec. 30, 1897. Serial No. 664,696. (No model.) Patented in Belgium June 7, 1895, No. 115,986; in Switzerland July 30, 1895, Nos. 10,963 and 10,976; in Germany Aug. 22, 1895, No. 91,447; in France Mar. 6, 1897, No. 256,615; in Hungary July 9, 1897, No. 295, and in Austria July 17, 1897, No. 47/3,320.

Claim.—1. A garbage-wagon, comprising a body having a side opening, a laterally-projecting ledge at the lower part of the side opening, a swinging gate abutting against said ledge and displaceable at its upper end, and means for guiding said upper end inwardly in its movement, substantially as set forth.

2. A garbage-wagon, comprising a body having a side opening, a laterally-projecting ledge at the lower part of the side opening, a swinging gate abutting against said ledge and displaceable at its upper end, means for guiding the said upper end inwardly in its movement, and a transverse rod arranged above said ledge, substantially as set forth.



3. A garbage-wagon, comprising a body having a side opening, a swinging gate hinged adjacent to the upper part of said side opening and adapted to be opened automatically inward when the receptacle to be emptied is brought in contact therewith, and a transverse rod above the lower part of said opening, substantially as set forth.

4. A garbage-wagon comprising a covered body having an opening or openings in the side walls, a ledge at the lower edge of each side opening, a swinging gate or shutter, abutting against the inner edge of said ledge, guide-rollers applied to the upper parts of the swinging gate or shutter, and rails for guiding said rollers and shutter when moved in inward direction, substantially as described.

5. A garbage-wagon, comprising a closed body, having an opening or openings in the side walls, a ledge at the lower part of each side opening, a swinging gate or shutter for each opening, means for guiding the upper part of the swinging gate or shutter on inclined rails in inward direction, a chain connected at the ends of the swinging gate or shutter, and conducted over a stationary pulley to the outside of the body, and means for attaching said chain to the outside shutter, so as to support the swinging gate or shutter in inward-raised position, substantially as set forth.

604,576. LOCK. CHARLES H. BURROWS, Canton, Mass., assignor to S. M. Hawes, Jr., Yonkers, N. Y. Filed July 17, 1896. Serial No. 599,573. (No model.)

Claim.—1. A lock comprising a cylindrical casing, a bolt movable longitudinally in said casing, and two or more flat key-actuated tumblers placed longitudinally of the casing, and a stop for said tumblers, said tumblers having laterally-extended rear ends to loosely engage the opposing inner walls of the casing, whereby the said rear ends are held against edgewise movement, and their forward ends are free to move edgewise to permit the bolt to be shot.

2. A lock comprising a casing, two or more flat tumblers arranged side by side to engage and hold the locking member against movement, said tumblers having laterally-extended ends to engage the opposing inner walls of the casing, a stop for said tumblers and a V-shaped spring inserted in notches in the said laterally-extended ends of the tumblers for holding them in locking position.

3. A lock comprising a seamless casing having a cylindrical aperture with unobstructed sides for the insertion of the operative parts, two or more flat tumblers arranged side by side independently of the bolt and having stops to limit the movements of the bolt, a stop for said tumblers, and a bolt normally held against movement by the tumblers, said tumblers being free from positive connection with the casing but having rear corners resting upon a wall of the casing whereon they may oscillate and having means with which a key may be engaged in such way that the stops thereon will permit the bolt to be moved by the key.

604,577. PADLOCK. CHARLES H. BURROWS, Canton, Mass., assignor to S. M. Hawes, Jr., Yonkers, N. Y. Filed Sept. 8, 1897. Serial No. 650,904. (No model.)

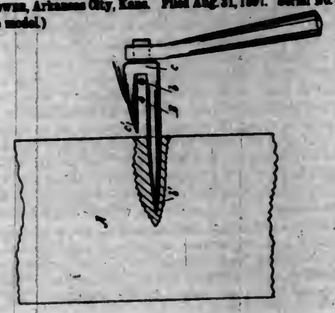
Claim.—1. In a lock, the combination with a casing, of two or more flat apertured tumblers arranged side by side and movable edgewise and longitudinally, and a locking member movable into and out of an aperture in the casing, and adapted to enter the aperture in said tumblers whereby it may be locked in place.

2. In a lock, the combination with a casing having a transverse aperture in the end adapted to receive a locking member, and also having a keyhole, a plug or block inserted in the said casing to close the end of the same and formed with a slot or recess, two or more flat tumblers arranged in the recess, said tumblers having apertures normally out of alinement with each other and adapted to be moved to bring the apertures into alinement with the apertures in the casing.

3. In a lock, the combination with a tubular casing, a block closing one end thereof, and a plug or frame closing the other end thereof, of a locking member arranged to have its free locking end enter an aperture in the casing and block, and locking devices in the casing adapted to engage the said locking members when it is so inserted.

4. A lock comprising in its construction a cylindrical casing, one or more flat tumblers arranged side by side in said casing and having stops to normally prevent movement of the locking member, a locking member adapted to be engaged by the tumblers, and means on the said tumblers whereby they may be engaged by a key and moved thereby longitudinally and edgewise to liberate the end of said locking member.

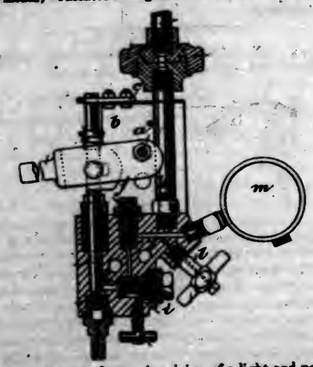
5. In a lock, the combination with a tubular casing, and locking-tumblers in said casing, of a frame or plug closing one end of the casing, and a locking member hinged in said frame or plug and swinging about the axis transverse thereto and adapted to have its locking end engaged by the tumblers at the other end of the casing.



6. In a lock, the combination with a cylindrical casing, locking-tumblers in the casing, and a locking member, of a removable plug or frame inserted in the end of the casing in which the said locking member is hinged, and a spring bearing against said locking member to hold it normally in its unlocked position.

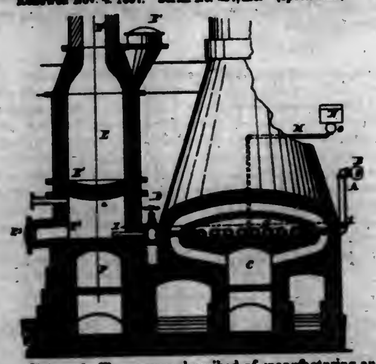
7. In a lock, the combination with a casing having a straight cylindrical aperture and locking-tumblers in said aperture adapted to be moved both longitudinally and transversely edgewise, of a locking member hinged at one end of said casing and adapted to be engaged by the tumblers at the other end of the casing.

8. A lock comprising in its construction an open-ended casing and tumblers in said casing free from connection therewith, a block closing one end of the casing and held therein by frictional contact with the walls of said casing, said block and casing having bolt-receiving apertures, a plug or frame closing the other end of the casing and held therein by frictional contact with the walls of said casing and a locking member hinged in said frame and adapted to engage the said tumblers and the said apertures, whereby all of said parts are securely locked in and with the casing.



9. A lock comprising in its construction a seamless open-ended casing, tumblers in said casing, frictionally-retained plugs or blocks closing both ends of said casing, and a locking member adapted for engagement with the tumblers, plug, and casing, whereby all of said parts may be securely locked in and with each other.

604,578. WIRE-TIGHTENER. DANIEL DONNELL and ASHER A. BROWER, Arkansas City, Kans. Filed Aug. 31, 1897. Serial No. 650,063. (No model.)



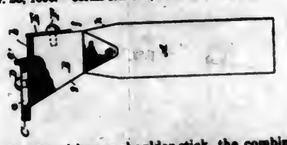
Claim.—A fence-wire tightener, comprising a revolvable straight pog pointed at one end and provided with a hooked portion at its other end, said hooked portion being provided with a projection *d* suitable for a wrench to engage with and having a straight and pointed portion shorter than the pog and arranged parallel with it, substantially as described and shown.

604,579. PORTABLE PUMP. WILLIAM G. GAM and JAMES TOWER, Bolton, England. Filed Aug. 12, 1897. Serial No. 648,776. (No model.) Patented in England Mar. 23, 1897, No. 7,441.

Claim.—A pump for use in mining of a light and portable character adapted for use in confined limits, comprising the piston and cylinder, the duplicate check-valves, the standard, the reservoir, both the pump-cylinder and the reservoir being adjustable vertically of the standard, means for operating the pump by a downward thrust in the direction of the standard, and a connection extending from the pump to the cartridge from the upper part of the pump, substantially as described.

604,580. PROCESS OF AND APPARATUS FOR ALLOYING IRON AND HYDROGEN. GEORGE W. GESNER, New York, N. Y., assignor to Harriston Corbett Gesner, Brooklyn, N. Y. Filed Dec. 10, 1895. Renewed Nov. 4, 1897. Serial No. 657,626. (Specimens.)

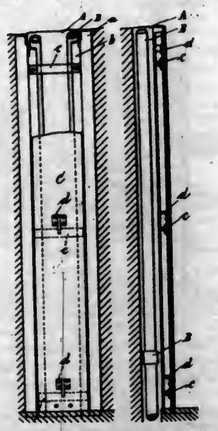
Claim.—1. The process described of manufacturing an alloy of iron and hydrogen, the same consisting in first passing jets of hydrogen through a mass of melted metal and thereafter similarly circulating hydrogen and hydrocarbon vapor combined, substantially as herein specified.



2. The process described of manufacturing an alloy of iron and hydrogen, the same consisting in first passing jets of hydrogen through a mass of melted metal, subsequently similarly circulating hydrogen and hydrocarbon vapor combined, and thereafter resuming the introduction of hydrogen alone until the flame at the top of the mass indicates a yellowish hue, substantially as herein specified.

3. In apparatus for the production of an alloy of iron and hydrogen, the combination with a furnace inclosing an iron coil communicating with a source of steam-supply and capable of decomposing the steam to form hydrogen under pressure, of a converter having a chamber for a mass of melted metal provided with a perforated bed, and a communication between the coil and converter below the bed

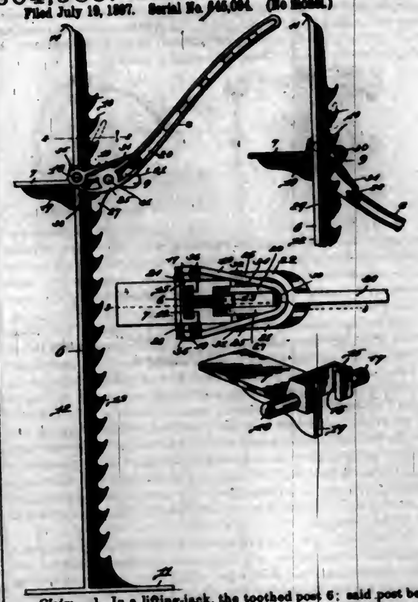
of the latter, the connections at both sides of said coil having suitable controlling-valves, substantially as herein specified.



4. In apparatus for the production of an alloy of iron and hydrogen, the combination with a furnace inclosing an iron coil communicating with a source of steam-supply and capable of decomposing the steam to form hydrogen under pressure, of a converter having a chamber for a mass of melted metal, provided with a perforated bed, a communication between the coil and converter below the bed of the latter, and a hydrocarbon-supply connecting with the coil, the several connections of the coil with the steam and hydrocarbon supply and with the converter having suitable controlling-valves, substantially as specified.

604,581. SHOULDER-STICK. GEORGE W. SHEER, Concord, N. H. Filed Nov. 23, 1896. Serial No. 613,091. (No model.)

Claim.—In a burnisher or shoulder-stick, the combination with a handle provided with an inclined end, of a head having its side walls parallel, its front and rear walls rearwardly inclined in different degrees, the front wall being in substantial alinement with the adjacent inclined face of the handle and the end or burnishing-face of the head being transversely curved throughout its length, an adjustable stop-piece consisting of a plate C substantially longitudinally coextensive with the burnishing-face of the head, correspondingly transversely curved throughout its length and provided with a longitudinal slot and with a flanged upwardly-inclined and longitudinally-curved face, a retaining-screw passed through the slot in the plate C and screwed into the head at a point adjacent to its rear edge, and a bead-plate E of somewhat less width than and adjustably secured to the front face of the head, the upper edge of said bead-plate being carved in degree corresponding to the curvature of the burnishing-face of the head, and a screw extending into the front face of the head and passing through a longitudinal slot in the bead-plate, substantially as and for the purpose specified.



604,582. COVERING-PLATE FOR CHANNELS FOR PIPES, &c. DAVID GROVE, Berlin, Germany. Filed Oct. 6, 1897. Serial No. 654,288. (No model.) Patented in Germany June 2, 1891, No. 59,660, and Mar. 3, 1894, No. 79,383.

Claim.—1. In combination, the channel for pipes, the angle-irons extending along the edges thereof and having engaging surfaces and the cover having the hooks or lugs to engage said surfaces, substantially as described.

2. In covering-plates of channels for pipes and the like the combination with angular pieces or rails *a* on the side walls of the channel A with angular pieces or rails *b* of connecting pieces or strips *c* between such rails and of hooks or lugs *d* on the covering-plate C, such hooks being provided with inclined surfaces substantially as and for the purpose described.

604,588. LIFTING-JACK. JOHN C. HACKETT, St. Louis, Mo. Filed July 19, 1897. Serial No. 645,094. (No model.)

Claim.—1. In a lifting-jack, the toothed post 6; said post being T-shaped in cross-section, its first and second flanges forming the flat front face 12 and its third flange projecting backwardly from the junction of said first and second flanges, the rear edge of said third flange being notched to form the upwardly-projecting teeth 13, the sliding block 15 having the T-slot 16 formed from its rear face, said toothed post 6 being mounted in said slot, the lifting-plate 7 projecting forwardly from said sliding block, the trunnions 17 and 18 extending from opposite sides of said block 15 in alinement with each other, the bracket-shaped web 19 extending downwardly from the center of said plate 7 with its rear edge engaging the face 12 of the toothed post, a hand-lever having bearings to receive said trunnions and a fulcrum carried by said hand-lever to engage said teeth, substantially as specified.

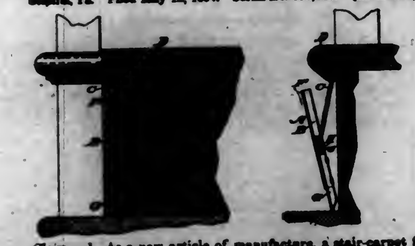
2. In a lifting-jack, the toothed post 6; said toothed post being T-shaped in cross-section, its first and second flanges forming the flat front face 12 and its third flange projecting backwardly from the junction of the first and second flanges and the rear edge of said third flange being notched to form the upwardly-projecting teeth 13, the projection 14 formed integral with the toothed post 6 and designed to be bent forwardly after the parts of the jack have been assembled, the block 15 having the T-slot 16 in its rear face, said toothed post being mounted in said T-slot, said block being provided with the lifting-plate 7, the trunnions 17 and 18 and the bracket-shaped web 19 for strengthening the plate 7, a hand-lever having bearings in which said trunnions operate, a fulcrum attached to said hand-lever and engaging said teeth, and a locking-link having bearings to receive said trunnions and extending upwardly and backwardly in position to engage said teeth, substantially as specified.

3. In a lifting-jack, a T-shaped toothed post having upwardly-projecting teeth formed upon the edge of its third flange, a sliding block having a T-slot to receive said toothed post as required to form a sliding connection between the block and the post, a lifting-plate projecting forwardly from said block, trunnions projecting from opposite sides of said sliding block, the hand-lever 8 having bearings in which said trunnions operate; said hand-lever consisting of the bar 20 and the arms 21 and 22 formed integral with the forward end of said bar, said arms 21 and 22 having bearings in their forward ends to receive said trunnions and the forward ends of said arms being spread apart to allow of the insertion of said trunnions and then bent toward each other to hold the trunnions in position and the bearings 25 and 26 formed in said arms 21 and 22 a short distance back of the bearings in which said trunnions operate; the overbalanced pivoted fulcrum 9 mounted between said arms 21 and 22 and engaging the teeth of said post; said overbalanced pivoted fulcrum consisting of the curved plates 27 and 28 in parallel positions and connected by the fulcrum-bar 29 and the weight 30, the trunnions 31 and 32 extending in a horizontal line outwardly from said plates 27 and 28 and approximately at the centers of the plates and engaging in said bearings 25 and 26, substantially as specified.

4. In a lifting-jack, a toothed post, said toothed post being T-shaped in cross-section and having upwardly-projecting teeth formed upon the edge of its third flange, a sliding block having a T-slot in its rear face in which said toothed post operates, a lifting-plate projecting forwardly from said block, trunnions projecting from said sliding block, a hand-lever having its forward end bifurcated and having bearings in the forward ends of the arms forming the bifurcated portion to receive said trunnions, the overbalanced pivoted fulcrum 9 mounted between the arms of said hand-lever and in position to engage said teeth; said fulcrum 9 consisting of the curved plates 27 and 28 in parallel positions and connected by the fulcrum-bar 29 and the weight 30, the trunnions 31 and 32 extending outwardly from the centers of said plates 27 and 28 into bearings in said arms of said hand-lever and the leg 33 extending outwardly from near the lower end of one of said curved plates and in position to be engaged by the end of one of said arms of said hand-lever, substantially as specified.

604,584. ADHESIVE COMPOUND AND PROCESS OF PRODUCING SAME. CHARLES M. HIGGINS, Brooklyn, N. Y. Filed Oct. 6, 1897. Serial No. 654,205. (No specimens.)

Claim.—1. The described process of making an adhesive compound, viz., dissolving or combining dextrine with an alkaline solvent and then adding boracic acid until neutrality is nearly or actually reached or exceeded, substantially as herein set forth.



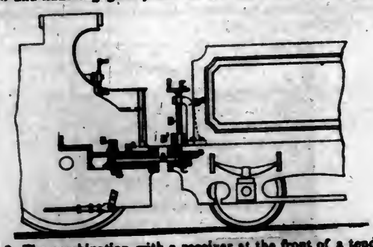
2. The described process of making an adhesive compound, viz., dissolving dextrine in a cold alkaline solution and then adding boracic acid until neutrality is nearly or actually reached or exceeded, substantially as herein set forth.

3. A dextrine paste or mucilage formed by the combination with a dilute caustic alkali and with dextrine dissolved therein, of boracic acid added thereto till neutrality is nearly or actually reached or exceeded, substantially as set forth.

4. A dextrine paste or mucilage formed by the combination with solvent water and dextrine dissolved therein, of the ingredients of borax combined therewith in proportion of about five or more per cent. of the weight of the dextrine and having the acid and alkali in such proportions that some of the boracic acid remains in excess, giving an alkalinity to the compound less than borax, substantially as and for the purpose set forth.

5. A dextrine paste or mucilage formed by the combination with a dilute alkali and dextrine dissolved therein, with boracic acid added thereto in such proportions as to give an alkaline reaction less than borax, substantially as herein set forth.

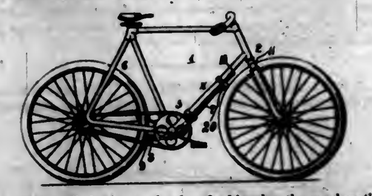
604,585. STAIR-CARPET FASTENER. JOHN S. JARDINE, Philadelphia, Pa. Filed May 12, 1897. Serial No. 634,143. (No model.)



Claim.—1. As a new article of manufacture, a stair-carpet fastener consisting of a bar formed of sections longitudinally movable and adjustable on each other, a rod pointed at its outer end and pivoted at its inner end to one of said sections intermediate of the ends thereof, the outer end of the other section being pointed, and means on the back of said bar and rod adjustably coupling said sections, said bar inclosing said rod and the coupling means and concealing the same.

2. A bar formed of sections adjustably connected, a rod pivoted to one section of said bar, a dog on the pivotal end of said rod, and a ratchet on the other section of said bar, adapted to be engaged by said dog, the outer end of said rod, and the end of the section opposite to said rod having spurs thereon.

604,586. CAR-COUPLING. MARY A. KNOWLES, Bolden, England. Filed Nov. 1, 1897. Serial No. 657,060. (No model.) Patented in England Dec. 17, 1896, No. 26,926.



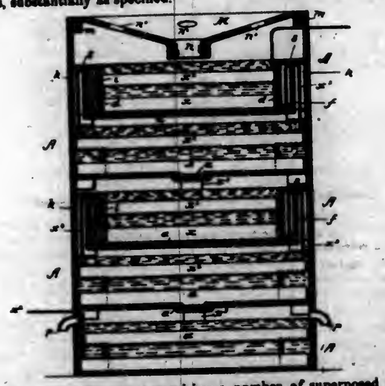
Claim.—1. The combination, with a stationary bracket, a vertically-slidable bracket, and guides for the said slidable bracket; of a revolvable screw engaging with both the said brackets, coupling-pins carried by the said slidable bracket and screw respectively, and a receiver and links engaged by the said pins, substantially as set forth.

2. The combination, with a receiver at the front of a tender, of a rod extending under the tender and connected to the carriage behind it, a retractable pin coupling the said rod and receiver, and a support on said carriage preventing the said rod from striking the ground when no longer supported from the tender, substantially as set forth.

3. The combination, with receivers attached to two adjacent carriages, and a coupling-bar connecting the two receivers; of a rod N supported by the receiver on the front carriage, means for disengaging the said bar and rod at one operation from the receiver to which they are connected, a block carried by the said rod, and flexible connections attached to the said block and to the rear carriage, whereby the block falls in front of the wheels of the rear carriage when the said rod and bar are disengaged from the receiver on the front carriage, substantially as set forth.

604,587. BICYCLE-BRAKE. PETER KERN, Shawnee, Ohio. Filed May 26, 1897. Serial No. 638,302. (No model.)

Claim.—In brake mechanism for bicycles, the combination with the bicycle-frame, of a pivot-clamp engaging the reach-bar thereof adjoining the crank-hanger; a guide-clamp also engaging the reach-bar at a point adjoining the front fork thereof and provided with guide-arms, a brake-lever fulcrumed to the said pivot-clamp and moving between the guide-arms of the guide-clamp and provided at one end with a heel-rest having position adjoining the front fork of the bicycle and at the other end thereof with a horizontal extremity provided with a brake-shoe adapted to bear against the rear-wheel tire, and a spring connecting between the guide-clamp and the brake-lever and serving normally to press the upper or operative end of the lever upward and thereby throw the brake-shoe out of engagement with rear-wheel tire, substantially as described.



604,588. STORAGE BATTERY. HERBERT S. LLOYD, Philadelphia, Pa. Filed Dec. 28, 1896. Serial No. 616,711. (No model.)

Claim.—1. A battery-cell comprising a vessel having vertically-disposed passages *k k'* formed by partitions, *c*, *c'*, *c²*, *c³*, *d*, *f*, arranged at the sides of the vessel for the escape of any excess of electrolyte and for the passage of the connecting wires or strips.

2. The combination in a battery-cell of the open-top vessel of non-conducting material, electrode-supports and overflow-partitions in said cell forming passages arranged to allow of the flow of excess of electrolyte into the cell immediately below, and lugs or ribs on the lower surface of said vessel adapted to act as guides in superposing a number of said vessels.

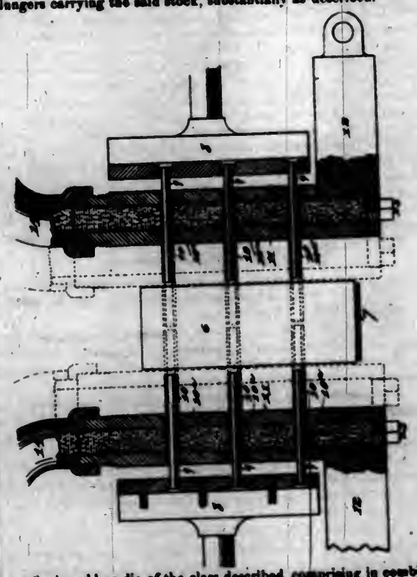
3. The combination in a battery-cell, of the open-top vessel of non-conducting material, vertically-disposed passages formed by partitions, *c*, *c'*, *c²*, *c³*, *d* arranged on each side of the same, a central mercury-trough in the bottom of said vessel, partitions, *f*, extending between the partitions, *c'*, *c³*, said partitions, *f*, having their tops on a level below the tops of the remaining partitions, electrode-supports within the vessel, and guiding lugs or blocks on the bottom of said vessel, substantially as specified.

4. A series battery comprising a number of superposed cells, overflow-partitions in each cell communicating with an opening in the bottom of said cell, and arranged to form passages for the overflow of the excess of electrolyte into the cell below, electrode-supports in said cells, and connecting wires or strips extending between adjacent cells, substantially as specified.

5. A series battery comprising a number of superposed cells, forming passages arranged to allow of the flow of excess of electrolyte from said cell, overflow-partitions in each cell and connecting-strips extending from opposite sides of the upper electrode of one cell through one of said passages and over one of said partitions to the lower electrode of the cell immediately above it, substantially as specified.

6. A series battery comprising a number of superposed and connected cells, troughs containing mercury in the bottom of each cell in contact with the lower electrode, the conducting wires or strips extending from the upper electrode of one cell to the mercury of the cell immediately above it.

604,589. EYELET-HOLE-FINISHING DEVICE. JAMES R. MORAN, New Haven, Conn. Filed Jan. 31, 1896. Serial No. 577,516. (No model.)



Claim.—In an eyelet-finishing device, the combination with the handle member *a*, carrying at its front end the tubular socket *b* that extends below the handle member *a* and provided with the downwardly and forwardly projecting bracket *d*, upon which is secured the convex and centrally-recessed die *f*, of the stem *c* loosely mounted in said tubular socket and carrying at its lower end the concave die *h* and punch *k*, the handle member *c* having a pivotal bearing upon said bracket and carrying at its front end a fork which engages a reduced portion of the stem *c*, below the socket *b*, and spring *m*, arranged and operating substantially as described, whereby sufficient space is provided between the fork and the female die, for the purpose set forth.

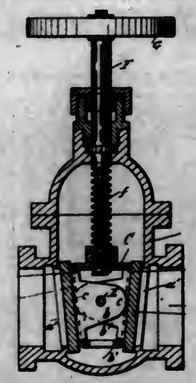
604,590. MOLD OR DIE FOR PLASTIC SUBSTANCES. PEARSON P. MCCOLL, Brooklyn, N. Y. Filed May 3, 1897. Serial No. 634,602. (No model.)

Claim.—1. The herein-described apparatus for impregnating a solid or semisolid body with material having a distinguishing characteristic comprising in combination a reservoir to contain the impregnating material, a hollow needle in communication with the reservoir and receiving impregnating material therefrom, means for imparting relative movement of the needle and the solid or semisolid body, whereby to cause the needle to penetrate the body, and a plunger contained and reciprocating within the needle whereby the impregnating material is ejected and caused to enter the openings in the body produced by the penetration of the needle, substantially as described.

2. The herein-described apparatus for impregnating a solid or semisolid body with material having a distinguishing characteristic comprising in combination a reservoir adapted to contain the impregnating material under pressure and having a series of needles affixed thereto and communicating therewith, the reservoir and needles and the body to be impregnated having relative movement to cause the needles to penetrate the body, a reciprocating stock and a series of plungers carrying the said stock, substantially as described.

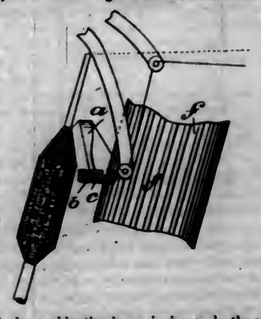
3. A mold or die of the class described, comprising in combination a movable reservoir, hollow needles connected thereto, and plungers reciprocating within said needles, and said reservoir being adapted for pressure connection, substantially as described.

4. An apparatus of the class described, comprising in combination oppositely-movable reservoirs or holders adapted to hold a fluid or semifluid material under pressure, hollow needles carried by said holders and extending across the interiors thereof with apertures communicating with said interiors, reciprocating stocks having plungers slidably mounted within said needles and means for reciprocating said holders or reservoirs with their needles and said stocks with their plungers both simultaneously and independently, substantially as described.



604,591. APPARATUS FOR MANUFACTURING RAILROAD-SPIKES. HERMANN C. ROMPF, Dahlhausen, Germany. Filed Oct. 1, 1896. Serial No. 607,541. (No model.) Patented in Hungary Aug. 13, 1896, No. 7,123; in England Aug. 14, 1896, No. 18,004; in France Aug. 14, 1896, No. 256,899; in Belgium Aug. 14, 1896, No. 123,031, and in Austria Sept. 18, 1896, No. 45/3,603.

Claim.—In a machine for severing a blank into nails or spikes, the combination with a fixed and a movable die having alternate projections and depressions adapted to register with each other, the surfaces of the projections and depressions of one of said dies being serrated to impart their contour to the nails or spikes while being severed, substantially as set forth



604,592. VALVE. HENRY J. SCHMITT, Hoboken, and RUSSELL BOSELL, Elizabeth, N. J. Filed Dec. 27, 1897. Serial No. 663,607. (No model.)

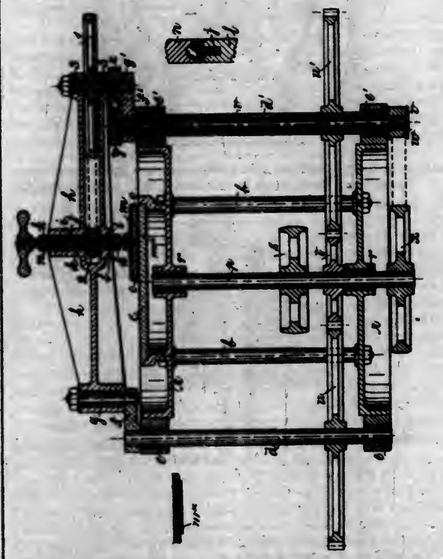
Claim.—1. The combination, with a valve-casing provided with seats, of a hollow carrier, and disks provided with lugs which have shoulders arranged near the peripheries of the disks and engaging pivotally with the carrier, the lugs on each disk being arranged to overlap the lugs on the other disk and to bear against its central portion, whereby both disks are pressed uniformly upon the said seats, substantially as set forth

2. The combination, with a valve casing provided with seats, of a hollow carrier, disks provided with lugs which have shoulders arranged near the peripheries of the disks and engaging pivotally with the carrier, the lugs on each disk being arranged to overlap the lugs on the other disk and to bear against its central portion, and a pin passing loosely through holes in two of the said lugs and the side of the carrier and preventing the disks from falling apart from the carrier when the carrier is removed from the valve-casing, substantially as set forth.

604,593. YARN-GUIDE FOR SPINNING-MULES. JOHN D. WHITE, Urmston, England, assignor of one-fourth to Henry Stafford Golland, Worsley, England. Filed Aug. 27, 1897. Serial No. 649,706. (No model.) Patented in England Oct. 17, 1896, No. 23,060.

Claim.—1. In combination in a spinning-mule, the spindle for the bobbin, the winding-faller wire and means between the winding-faller wire and the spindle engaging the yarn with means for giving the same a vibrating motion to produce cross-winding, substantially as described.

2. In combination in a spinning-mule, the spindle for the bobbin, the winding-faller, and a double incline between the winding-faller and the spindle with means for traversing the said incline across the path of the yarn whereby said yarn will be raised and lowered to produce cross-winding, substantially as described



3. In combination, the spindle, the winding-faller and a series of double inclines between the spindle and winding-faller with means for traversing the double inclines across the path of the yarn and in contact therewith to produce cross-winding, substantially as described.

4. In combination, the spindle, the winding-faller, the device between the faller and the spindle with means for moving the same across the path of the yarn and in contact therewith, said device comprising inclines and means for moving the device up and down, substantially as described.

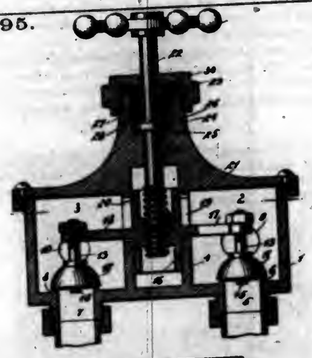
5. In combination, the spindle, the winding-faller, the double inclines between the winding-faller and the spindle, means for traversing said inclines, the reciprocating carrier for the inclines, the slideway in which the carrier moves and means for reciprocating said carrier, substantially as described.

6. In combination, the spindle, the winding-faller, the double inclines between the same and the spindle, the carrier *b* for said inclines having gear-teeth thereon, and the pinion *f* for moving the carrier, means for actuating said pinion *f*, substantially as described.

604,594. MACHINERY FOR GRINDING AND POLISHING STEEL BALLS. WILLIAM WOOLF, Birmingham, and ALBERT BROWN and JAMES R. RICHARD, London, England. Filed Mar. 4, 1898. Serial No. 672,597. (No model.)

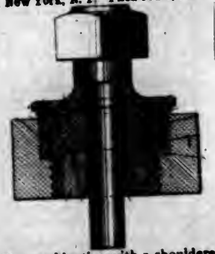
Claim.—1. The combination, in a ball grinding and polishing machine, of a frame A and lower grinding-plate *c*, central driving-shaft *p*, side shaft *d*, hollow side shaft *d'*, and driving-gear *t*, *u*, *w*, cranks *f*, *f'*, connecting-rod *h*, bracket *i*, bearings *k* and spindle *l* carrying grinding-disk *m* with rim *o*, inner shaft *r*, pulley *w*, and driving-pulley *x*, pulley *y*, spindle *g'* turning in crank *f'* and in bearings 3, 3, pulley *z* driven by pulley *y*, and pulley 1 driving pulley 2 on spindle *l*, all substantially as set forth.

2. In combination, the table *c*, the disk *m*, the spindle *l* carrying the disk, the supporting means carrying bearings in which the spindle *l* is journaled and means for adjusting the disk *m* toward and from the disk *c* comprising a screw *n* arranged in line with the spindle and the pin having a spherical head forming the connection between the end of the spindle and the screw, substantially as described.



3. In combination with the table *c*, the grinding-disk *m* having a projecting rim *o* and arranged with a space between its plain face and a similar face on the table *c* and the frame having arms with a pin connecting it to the disk *m*, said frame being located between the plain face of the table and disk and within the space bounded by the projecting rim, substantially as described.

4. In combination, the table, the grinding-disk carrying the same, the movable bar *h* carrying the shaft of the grinding-disk, the cranks connected to the bar for operating the same and means for rotating the disk carried by the movable bar and having connection with one of the crank-shafts, said rotating means comprising the pulleys 1 and 2, the crank-pin *g'* and the pulleys *z*, *y*, with connections between the pulleys 1 and 2 and between the pulleys *z*, *y*, substantially as described.

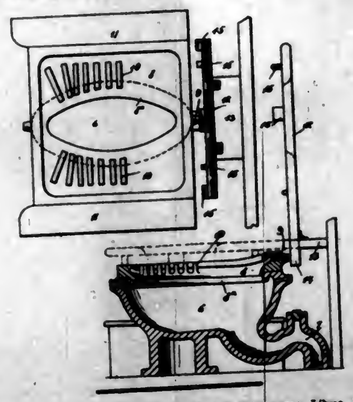


604,595. VALVE. MATHEW ABT, New York, N. Y. Filed Sept. 3, 1897. Serial No. 650,477. (No model.)

Claim.—A valve comprising a casing having two chambers, a tubular guide separating the chambers and having opposite slots, a nut movable in the guide and forming a closure for the slots, arms integral with the nut and extended through the slots of the guide, valves adjustably connected to said arms for controlling inlet and outlet openings, a screw-rod engaging with the nut and means for holding said rod from longitudinal movement, substantially as specified.

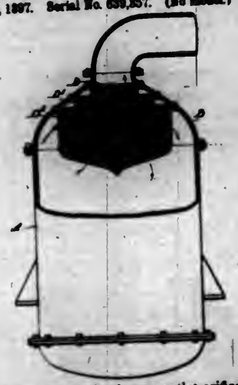
604,595.

604,596. TAPPING APPARATUS. ANDREW BERGER and HENRY HILDENBRAND, New York, N. Y. Filed Oct. 7, 1897. Serial No. 654,463. (No model.)



Claim.—1. The combination with a shouldered bushing screwed in the head of the barrel and provided with cam-shaped projections in its outer enlarged portion, a webbed wooden plug driven into the inner smaller part of the bushing, a faucet-piece provided with a circumferential flange, a cylindrical portion adjacent thereto, provided with cam-shaped projections adapted to engage the projections in the bushing, a tapering portion adjacent to said cylindrical portion and an enlarged head at the outer end of the faucet-piece, an elastic washer or gasket interposed between the outer edge of the bushing and the circumferential flange of the faucet-piece, a stuffing-box at the outer end of the faucet-piece, and a discharge-pipe guided in said stuffing-box and provided with a stop-cock, substantially as set forth.

2. The combination with a bushing located in the head of the barrel, said bushing being provided with a shoulder so as to form an outer larger and inner smaller portion, cam-shaped projections in the outer larger portion, a webbed wooden plug driven into the inner portion of the bushing, a faucet-piece provided with a circumferential flange, a cylindrical portion adjacent to said flange provided with cam-shaped projections corresponding in size to the space between the cam-shaped projections in the bushing, a conically-tapering portion adjacent to the cylindrical portion of the faucet-piece, and a head at the outer end of the faucet-piece, a stuffing-box at the outer end of the faucet-piece, a gasket interposed between the outer edge of the bushing and the circumferential flange on the faucet-piece, a short tubular portion on the outer end of the faucet-piece for connection with the air-pump, and a discharge-pipe passing through the bore of the faucet-piece and provided with a stop-cock at its outer end, said discharge-pipe being of slightly less diameter than the interior bore of the faucet-piece so as to provide an annular space for the ingress of air to the interior of the barrel, substantially as set forth.



604,597. PRIVY-STOOL. WILLIAM G. BLISS, Constantinople, Turkey. Filed Dec. 29, 1897. Serial No. 664,290. (No model.)

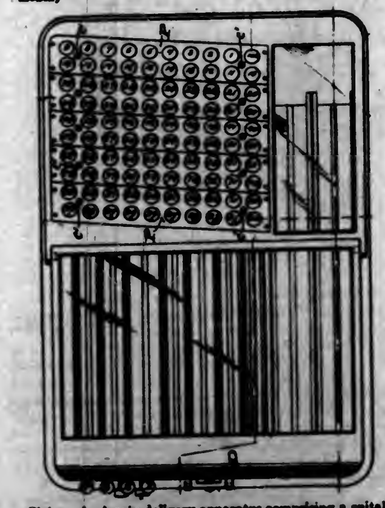
Claim.—1. A privy-stool having a basin, a pan or tray mounted on the basin and having an opening registering with the basin, the pan or tray being extended horizontally beyond the sides of the basin and having a smooth top surface inclined gradually toward the opening in the pan or tray, two series of parallel ribs formed on the top surface of the pan or tray at the horizontally-extended portions thereof and located one series at each side of the opening therein, such ribs forming raised gratings on which the feet of a person may rest, and a weighted seat horizontally mounted adjacent to the basin and normally extending perpendicularly to expose the pan or tray, the seat being capable of swinging downward to cover the pan or tray.

2. A privy-stool having a basin, a pan or tray mounted on the basin and having an opening registering with the basin, the pan or tray being extended horizontally beyond the sides of the basin and having a smooth top surface inclined gradually toward the opening in the pan or tray, and two series of parallel ribs formed on the top surface of the pan or tray and at the horizontally-extended portions thereof and located one series at each side of the opening therein, such ribs forming raised gratings on which the foot of a person may rest.

604,598. VACUUM-PAN. HENRY G. BOWELL, Lihue, Hawaii. Filed June 8, 1897. Serial No. 639,857. (No model.)

Claim.—A vacuum-pan having an outlet-orifice, and a plurality of depending cup-shaped screens fitting one within the other and spaced apart from each other, the screens being foraminous at the bottom and sides and arranged under the said orifice and within the vacuum-pan, whereby vapors passing from the pan will be separated from the liquids that may be suspended therein.

604,599. THREAD OR YARN GUIDE. HOWARD W. BRACKETT, Hopedale, Mass., assignor to the Draper Company, same place and Portland, Me. Filed Dec. 31, 1897. Serial No. 664,810. (No model.)



Claim.—1. A thread or yarn guide comprising a jaw having two separated parallel clearing-faces, an opposed jaw having its clearing-face between the planes of the said separated faces, and means to vary the distance laterally between the parallel faces.

2. A thread or yarn guide comprising an open jaw having a plurality of separated, parallel clearing-faces, means to vary the distance laterally between said clearing-faces, and an opposed jaw having a cooperating clearing-face.

3. A yarn or thread guide comprising a jaw having a plurality of independent, adjustable clearing portions and provided with an attaching-foot, means to adjust said clearing portions toward and away from each other, an opposed jaw having an arm to cooperate with said foot, and means to secure said arm and foot together and to vary the space between the acting faces of the jaws.

604,600. COIN-DELIVERY APPARATUS. EDWARD J. BRANDT, Watertown, Wis. Filed July 26, 1897. Serial No. 645,967. (No model.)

Claim.—1. A coin-delivery apparatus comprising a suitable casing, a series of inclined coin-chutes in the casing, a notched plate at the lower ends of the chutes constituting a temporary stop for the coin, a coin follower in each of said chutes, suitably-arranged permanently-located spring-controlled drums in flexible strap connection with the coin-followers, and pusher mechanism operative to lift coin from the chutes into register with notches of the aforesaid plate, these notches being of such contour and dimension as will permit escape of the lifted coin.

2. A coin-delivery apparatus comprising a suitable casing, a series of inclined coin-chutes in the casing, a notched plate at the lower ends of the chutes constituting a temporary stop for the coin, a coin follower in each of said chutes, suitably-arranged permanently-located spring-controlled drums in flexible strap connection with the coin-followers, a pusher mechanism operative to lift coin from the chutes into register with notches of the aforesaid plate, and deflectors for the lifted coin, said notches being of such contour and dimensions as will permit escape of said lifted coin.

3. A coin-delivery apparatus comprising a suitable casing, a series of inclined coin-chutes in the casing, a suitably-notched plate at the lower ends of the chutes constituting a temporary coin-stop, a coin-follower in each of said chutes, suitably-arranged permanently-located spring-controlled drums in flexible strap connection with the coin-followers, a series of lever-controlled pushers operative to eject coin from the aforesaid chutes, and lever-actuating mechanism comprising a series of rockers and a series of reciprocative edgewise plates having foot operative on the rockers.

4. A coin-delivery apparatus comprising a suitable casing, a series of inclined coin-chutes in the casing, a suitably-notched plate at the lower ends of the chutes constituting a temporary coin-stop, a delivery-chute in front of the plate, a coin-follower in each of said chutes, suitably-arranged permanently-located spring-controlled drums in flexible strap connection with the coin-followers, a series of lever-controlled pushers operative to eject coin from the aforesaid chutes, and lever-actuating mechanism comprising a series of rockers and a series of reciprocative edgewise plates having foot operative on the rockers.

5. A coin-delivery apparatus comprising a suitable casing, a series of inclined coin-chutes in the casing, a suitably-notched plate at the lower ends of the chutes, constituting a temporary coin-stop, a coin-follower in each of said chutes, suitably-arranged permanently-located spring-controlled drums in flexible strap connection with the coin followers, a series of lever-controlled pushers operative to eject coin from certain of the chutes, lever-actuating mechanism comprising a series of rockers and a series of reciprocative edgewise plates having foot operative on the rockers, other lever-controlled pushers operative to eject coin from the remaining chutes of the series, and a multiple lever-and-trip mechanism operative in conjunction with the latter pushers.

6. A coin-delivery apparatus comprising a series of inclined coin-chutes, a suitably-notched plate at the lower ends of the chutes constituting a temporary coin-stop, an automatic pressure-exerting coin-follower in each of said chutes, a series of lever-controlled pushers operative to eject coin from the aforesaid chutes, lever-actuating mechanism comprising a series of rockers and a series of reciprocative edgewise plates having foot operative on the rockers, and a longitudinally-reciprocative crank-controlled plate provided with stop-lugs arranged to be brought in opposition to pusher-levers.

7. A coin-delivery apparatus comprising a series of inclined coin-chutes, a suitably-notched plate at the lower ends of the chutes constituting a temporary coin-stop, an automatic pressure-exerting coin-follower in each of said chutes, a series of lever-controlled coin-pushers operative to eject coin from certain of the chutes, lever-actuating mechanism comprising a series of rockers and a series of reciprocative edgewise plates having foot operative on the rockers, other lever-controlled pushers operative to eject coin from the remaining chutes of the series, a multiple lever-and-trip mechanism operative in conjunction with the latter pushers, and a longitudinally-reciprocative crank-controlled lock-plate for all the pusher-levers.

8. A coin-delivery apparatus comprising a series of inclined coin-chutes, a suitably notched and slotted plate at the lower ends of the chutes constituting a temporary coin-stop, an automatic pressure-exerting coin-follower in each of said chutes, a series of adjustable lever-controlled pivotal coin-pushers engaging the plate-slots, and suitable mechanism for operating single levers and combinations of levers.

9. A coin-delivery apparatus comprising a series of inclined coin-chutes, a suitably notched and slotted plate at the lower ends of the chutes constituting a temporary coin stop, an automatic pressure-exerting coin-follower in each of said chutes, a system of levers, coin-pushers having pivotal spring-controlled connection with the levers and engaged with the plate-slots, a spring-plate secured at one end to each coin-pusher and provided with lateral ears opposing the plate aforesaid, a set-screw adjustable in the spring-plate to bear against the corresponding coin-pusher, and suitable mechanism for operating single levers and combinations of levers.

10. A coin-delivery apparatus comprising a series of inclined coin-chutes, a suitably notched and slotted plate at the lower ends of the chutes constituting a temporary coin-stop, an automatic pressure-exerting coin-follower in each of said chutes, a series of lever-controlled pivotally-adjustable coin-pushers engaging the plate-slots, suitable mechanism for operating single levers and combinations of levers, and a longitudinally-reciprocative crank-controlled lock-plate for said levers.

11. A coin-delivery apparatus comprising a series of inclined chutes, a temporary coin-stop in each of said chutes, a series of lever-controlled coin-pushers, suitable mechanism for operating single levers and combinations of levers, and other suitable mechanism operative to throw one or more coin-pushers of a combination out of working position.

12. A coin-delivery apparatus comprising a series of inclined coin-chutes, a temporary coin-stop at the lower end of each chute, an automatic power-exerting coin-follower in each of said chutes, a series of spring controlled pivotally-adjustable coin-pushers, suitable mechanism for operating single coin-pushers and combinations of the same, and other suitable mechanism operative in conjunction with certain of said coin-pushers to throw the same out of working position.

13. A coin-delivery apparatus comprising a series of inclined coin-chutes, a temporary coin-stop at the lower end of each chute, an automatic power-exerting coin-follower in each of said chutes, a series of spring-controlled pivotal coin-pushers, suitable mechanism for operating single coin-pushers and combinations of the same, and spring-controlled push-pins operative in conjunction with certain of said coin-pushers to throw the same out of working position.

14. A coin-delivery apparatus comprising a series of inclined coin-chutes, a temporary coin-stop at the lower end of each chute, chute-engaging coin-followers, flexible straps connected to the coin-followers and trained on pulleys through apertures in the chute-bottoms, spindles journaled in bearings under said chutes, loose drums on the spindles in connection with the straps, spiral springs on said spindles connecting the latter with said drums, and suitable means for dislodging coin from the lower ends of the aforesaid chutes.

15. A coin delivery apparatus comprising a series of inclined coin-chutes, a temporary coin-stop at the lower end of each chute, chute-engaging coin-followers, spindles journaled in bearings under the chutes, loose drums on the spindles in flexible strap connection with the coin-followers, spiral springs on the spindles connecting the

latter with said drums, stops for retaining said spindles in rotary adjusted position to vary spring tension, and suitable means for dislodging coin from the lower ends of the aforesaid chutes.

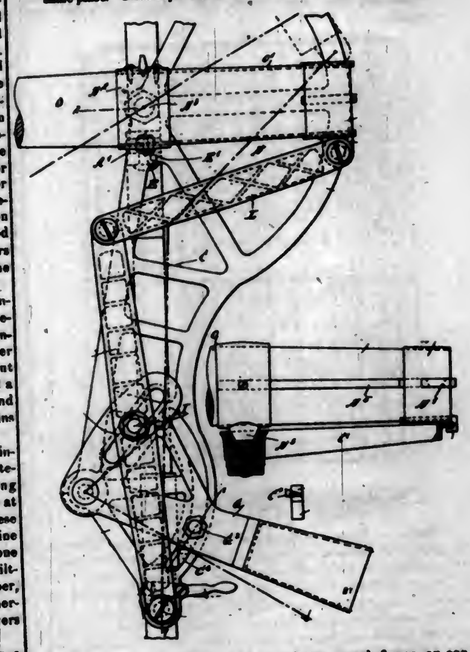
16. A coin-delivery apparatus comprising a series of inclined coin-chutes, a temporary coin-stop at the lower end of each chute, chute engaging power-exerting coin-followers, a fulcrum-rod, a series of levers supported on the rod and provided with rear crank-rod extensions, a series of rockers operative on the said lever extensions, reciprocative edgewise plates having feet operative on the rockers, and pushers having pivotal spring-controlled connection with forward ends of the levers under coin in the lower ends of the aforesaid chutes.

17. A coin-delivery apparatus comprising a series of inclined coin-chutes, a temporary coin-stop at the lower end of each chute chute-engaging power-exerting coin-followers, a series of levers having a common fulcrum, crank-rods extended rearward from certain of the levers, rockers operative on the crank-rods, reciprocative edgewise plates having feet operative on the rockers, the remainder of the levers provided with spring-controlled rear rod extensions, a pusher having spring-controlled pivotal connection with each lever under coin in the lower ends of the aforesaid chutes, a coin-pusher trip device on the fulcrum-rod, and a system of multiple levers operative in conjunction with the trip and those of the aforesaid levers provided with spring-controlled rod extensions, the working faces of the pushers in connection with the latter levers being of width approximating the thickness of a plurality of coin.

18. A coin-delivery apparatus comprising a pair of inclined coin-chutes, a temporary coin-stop at the lower end of each chute, chute-engaging power-exerting coin-followers, levers carrying spring-controlled pivotal pushers each of which opposes two coins at the lower end of a chute, a tripper operative to bring one of the pushers out of opposition to the innermost coin normally in line therewith, and a series of four tilt-levers operative in conjunction with the tripper and aforesaid levers to effect an ejection of one, two, three or four coins from the aforesaid chutes.

19. A coin-delivery apparatus comprising a pair of inclined coin-chutes, a temporary coin stop at the lower end of each chute, chute-engaging power-exerting coin-followers, a pair of levers carrying spring-controlled pivotal pushers arranged to oppose two coins at the lower end of a chute, a tripper operative to bring one of these pushers out of opposition to the innermost coin normally in line therewith, a tilt-lever operative to actuate the tripper and that one of the pusher-levers carrying the tripped coin-pusher, a second tilt-lever operative to actuate said pusher-lever independent of the tripper, a third tilt-lever operative to actuate said tripper and both pusher-levers, and a fourth tilt-lever operative to actuate both pusher-levers independent of the tripper.

20. A coin-delivery apparatus comprising a suitable casing, a series of inclined chutes in the casing, a temporary coin-stop, at the lower end of each chute, chute-engaging power-exerting coin-followers, a system of levers carrying pushers operative to eject coin from said chutes, a series of lever-actuating rockers, edgewise plates having feet operative on the rockers, spring-controlled push-pins connected to the plates in successive series, and a pair of suitably spaced and connected horizontal guide-plates for each series of pins, the upper guide plate in each pair constituting a top section of said casing.



21. A coin-delivery apparatus comprising a series of inclined chutes, a temporary coin-stop at the lower end of each chute, chute-engaging power-exerting coin-followers, ejector mechanisms operative on single coin and combinations of coins, and stop-ears extending inward from walls of each chute in opposition to the coin next in rear of a predetermined number in position to be acted upon by ejector mechanism.

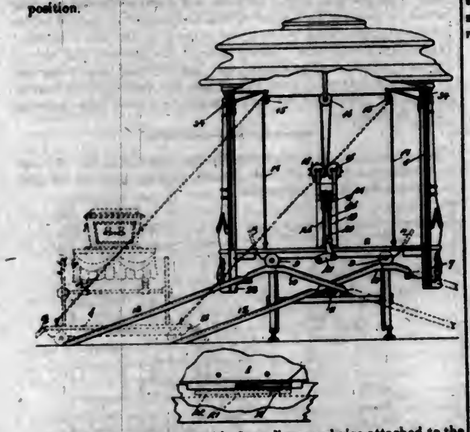
22. A coin-delivery apparatus comprising a series of inclined chutes, a temporary coin-stop at the lower end of each chute, chute-engaging power-exerting coin-followers, ejector mechanisms operative on single coin and combinations of coins, and chute-wall noses arranged to oppose foremost coin of each column and skew the same as it clears the temporary stop incidental to action of ejector mechanism.

23. A coin-delivery apparatus comprising a series of inclined chutes, a temporary coin-stop at the lower end of each chute, chute-engaging power-exerting coin-followers, ejector mechanisms operative on single coin and combinations of coins, stop-ears extending inward from chute-walls in opposition to the coin next in rear of a predetermined number in position to be acted upon by ejector mechanism, and chute-wall noses arranged to oppose foremost coin of each column and skew the same as it clears the temporary stop incidental to action of ejector mechanism.

24. A coin-delivery apparatus comprising an inclined coin-chute, a temporary coin-stop at the lower end of the chute, a chute-engaging power-exerting coin-follower, a pivotal pusher in normal opposition to two coins in the lower end of the chute, a tripper operative to bring the pusher out of opposition to the innermost coin normally in line therewith, a spring-controlled finger arranged to resist frictional lift of the latter coin, suitable mechanism for effecting joint action of the tripper and pusher, and other suitable mechanism for actuating the pusher independent of the tripper.

604,601. BOW-FACING OAR. THOMAS H. BROSNIHAN, Livermore Falls, Me., assignor to Frank A. Millett and Thomas H. Brosnihan, same place. Filed Sept. 14, 1897. Serial No. 651,644. (No model.)

Claim.—1. A bow-facing oar, comprising a rock-frame, an oar-holder pivoted on the said frame, a handle pivoted on the frame a distance from the oar-holder, and a connection between the said handle and oar-holder, to impart a swinging motion to the oar-holder, the said connection comprising a lever fulcrumed on the rock-frame, and engaged by the said handle, and a link for connecting the free end of the lever with the said oar-holder, substantially as shown and described.



2. A bow-facing oar, comprising a rock-frame, an oar-holder mounted to swing on the said rock-frame, a link pivotally connected with the inner end of the said oar-holder, a lever fulcrumed on the said rock-frame, and connected at its free end with the said link, and a handle fulcrumed on the rock-frame, and provided with an angular slot engaged by a bolt carried by the said lever at or near the middle thereof, substantially as shown and described.

3. A bow-facing oar, comprising a rock-frame, an oar-holder mounted to swing on the said rock-frame, a link pivotally connected with the inner end of the said oar-holder, a lever fulcrumed on the said rock-frame, and connected at its free end with the said link, a handle fulcrumed on the rock-frame, and provided with an angular slot engaged by a bolt carried by the said lever at or near the middle thereof, and a bolt carried by the said handle, to engage a segmental guideway on the said frame, substantially as shown and described.

4. A bow-facing oar, provided with a rock-frame, brackets on which the rock-frame is mounted to swing, one of the brackets carrying for this purpose a fixed pivot-pin engaging a bearing on the rock-frame, and the other bracket carrying a removable pivot-pin engaging an eyebolt on the rock-frame, the bearing on the said rock-frame comprising a half bearing or pin fitted to slide vertically, and a lever fulcrumed on the frame, for lifting the said pin, as set forth.

604,602. FUNERAL-CAR. JAMES BURNS, Cincinnati, Ohio. Filed Sept. 18, 1897. Serial No. 652,140. (No model.)

Claim.—1. A car having a movable floor, and rails on which said floor may be moved from its position in the car to a position in proximity to the ground, the rails maintaining the floor in a horizontal position.

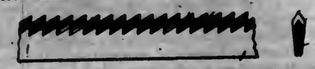
2. A car having a movable floor, lines or chains attached to the floor for raising the same, and rails on which the floor may move.

3. A railway-car having a movable floor, stationary rail-sections on which the floor normally rests, and movable rail-sections capable of connection with the stationary rail-sections and of extending outwardly and downwardly to the ground.

4. A car having a movable floor, lines or chains attached to the floor by which to raise the same, stationary rail-sections on which the floor is normally supported, and removable rail-sections capable of connection with the stationary sections and of extending outwardly and downwardly to the ground.

5. A railway-car having a panel sliding in one side thereof, and a removable sill whereon said panel bears.

6. A railway-car having a floor, a portion of which is capable of lateral movement in and out of the car, means whereon said portion of the floor is supported, and a panel forming part of the side of the car and slidable on the car to permit the displacement of said portion of the floor of the car.

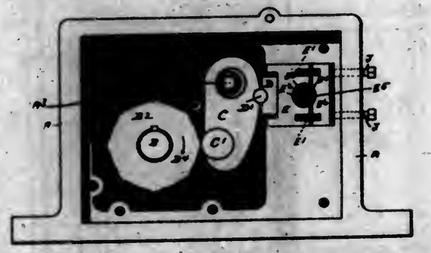


7. A railway-car having rails, a removable floor portion carried on said rails and movable in and out of the car, a removable sill held on the car, and a sliding panel normally sustained on the sill and capable of moving on and off the same to permit the displacement of said floor portion.

8. A railway-car having a removable floor portion, a series of stationary rail-sections whereon said portion may roll, and removable rail-sections capable respectively of attachment to the stationary rail-sections to form continuations thereof.

9. A railway-car having a removable floor portion, rails whereon said portion may roll to move in and out the car, and lines attached to the floor portion and supported on the car whereby to move the floor portion on said rails.

10. A railway-car having a removable floor portion, means whereon said portion is carried to roll in and out of the car, and a lever swinging on the stationary portion of the car and engaging the floor portion to start the same laterally.



604,608. SAW. JOHN I. CARUTHERS, Ingleside, Tex. Filed Aug. 13, 1897. Serial No. 647,979. (No model.)

Claim.—A saw having the front sides of its teeth arranged at a slight incline relatively to the blade and the rear sides arranged at a greater incline, the said teeth being beveled outward from their longitudinal centers, the inner end of a tooth engaging with and terminating at a point between the inner and outer ends of the front portion of an adjacent tooth, substantially as specified.

604,604. WIRE-SWAGING MACHINE. LEMUEL OSGOOD, Worcester, Mass., assignor to the Washburn & Moen Manufacturing Company, same place. Filed July 6, 1896. Serial No. 598,093. (No model.)

Claim.—1. The combination with a pair of swaging-dies, of a sliding block arranged behind one of said dies, a pivoted lever operatively connected with said sliding block, a cam-wheel by which said lever is actuated to compress said dies, means for shifting the fulcrum of said lever and a stop-pin against which said lever is moved by the shifting of its fulcrum, whereby said lever is carried out of engagement with said cam-wheel, substantially as described.

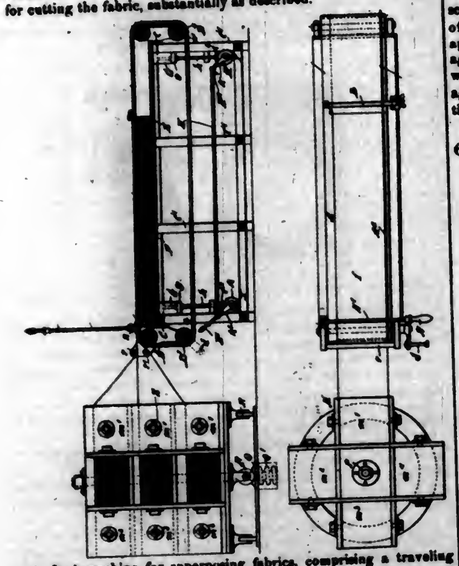
2. The combination with a pair of swaging-dies of a lever pivoted at its upper end and hanging by gravity in a vertical plane between said dies and an actuating cam-wheel, a cam-wheel arranged to act against the lower end of said lever, means for operatively connecting said lever with one of said dies on the side opposite said cam-wheel and between the cam-wheel and the pivoted end of the lever, and means for moving the pivoted end of said lever away from said dies, substantially as described.

3. The combination with a fixed and movable swaging-die, of a pivoted lever operatively connected with said movable die, a cam-wheel by which said lever is actuated, means for shifting the fulcrum of said lever and a stop-pin against which said lever is moved by the shifting of said fulcrum, substantially as described.

4. The combination with a fixed and a movable die, of a sliding block bearing against said movable die and a pressure-plate capable of a sliding movement at right angles to the movement of said sliding block, a pivoted lever operatively connected with said pressure-plate, and a rotating cam-wheel by which said lever is actuated, substantially as described.

5. The combination with a pair of swaging-dies of a sliding block bearing against one of said dies, a pressure-plate bearing against the side of said sliding block and capable of a slight sliding movement thereon at right angles to the movement of said sliding block and provided with a semicircular recess, a pivoted lever having a semicircular recess opposite the recess in said pressure-plate, a cylindrical pin fitting said recess whereby said lever is operatively connected with said pressure-plate and a rotating cam-wheel by which said lever is actuated, substantially as described.

6. The combination of a pair of swaging-dies, a sliding block bearing against said dies to compress the same, a lever operatively connected with said sliding block and pivoted at one end upon a rotating spindle, a rotating spindle carrying said lever and journaled eccentrically in the frame of the machine, a cam-wheel arranged to act against the free end of said lever, a handle attached to said eccentric spindle, and means for determining the angular movement of said handle, substantially as described.



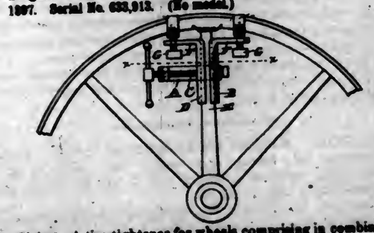
7. The combination with a pair of swaging-dies, of a lever pivoted at one end and operatively connected with one of said dies, a rotating cam-wheel for actuating said lever to close said dies, means for simultaneously moving the pivoted end of said lever away from said dies and its opposite end away from said cam-wheel, whereby said lever is rendered inoperative on said dies and at the same time moved out of engagement with said cam-wheel, substantially as described.

8. The combination with a pair of swaging-dies, of a sliding block, E, a pressure-plate D bearing against said sliding block and capable of a slight movement thereon, and provided with a semicircular recess, a lever C pivoted at its upper end upon a rotatable eccentric spindle journaled in the frame of the machine, said lever having a semicircular recess opposite the recess in said pressure-plate, a pin engaging both of said recesses, a cam-wheel having a series of radial projections acting against the free end of said lever, and a stop-pin H by which the free end of said lever is thrown out of engagement with said cam-wheel by the rotation of said eccentric spindle, substantially as described.

604,605. MACHINE FOR SUPERPOSING CLOTHS. HENRI E. COMMERAN, Lille, France. Filed May 21, 1897. Serial No. 637,640. (No model.) Patented in Belgium Feb. 15, 1897, No. 126,008, and in France May 3, 1897, No. 268,490.

Claim.—1. A machine for superposing fabrics, comprising a traveling apron having a solid or supporting portion and an open portion to allow the fabric to pass therethrough, a holder carried by the apron and adapted to engage the fabric, means for opening the

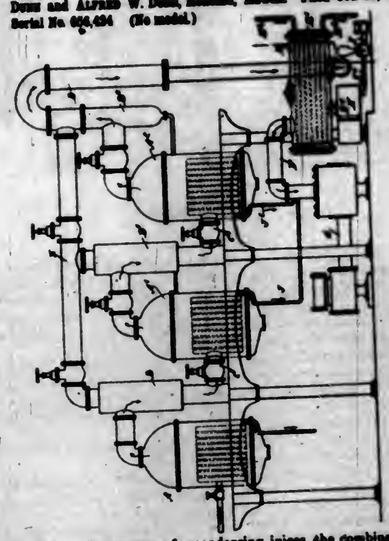
holder to release the fabric, means for operating the apron and means for cutting the fabric, substantially as described.



2. A machine for superposing fabrics, comprising a traveling apron having a solid or supporting portion and an open portion to allow the fabric to pass therethrough, a holder carried by the apron and adapted to engage the fabric, a stationary abutment adapted to collide with the holder for the purpose of opening the same and releasing the fabric, means for operating the apron, and means for cutting the fabric, substantially as described.

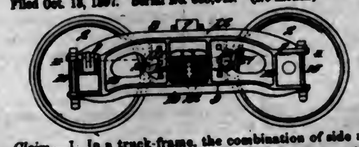
3. A machine for superposing fabrics, comprising a traveling apron having a solid or supporting portion and an open portion to allow the fabric to pass therethrough, a holder carried by the apron and adapted to engage the fabric, a normally stationary abutment adjustable longitudinally of the apron and adapted to collide with the holder for the purpose of opening the same and releasing the fabric, means for operating the apron, and means for cutting the fabric, substantially as described.

4. A machine for superposing fabrics, comprising a traveling apron having a solid or supporting portion and an open portion to allow the fabric to pass therethrough, a holder carried by the apron and adapted to engage the fabric, means for opening the holder to release the fabric, means for operating the apron, means for cutting the fabric, a table serving as a support for the fabric, and arranged adjacent to the apron, said table and apron being movable relatively to one another, and means for varying the distance between the table and the apron, substantially as described.



5. The herein-described stand for fabrics, the said stand being mounted to turn and having a series of circumferential compartments adapted to receive the fabrics, in combination with a movable spring-pressed stop or locking plate having a depression adapted to receive a projection on the stand proper, substantially as described.

604,606. TIRE-TIGHTENER. GEORGE M. DOERSCH, Antigo, Wis., assignor of one-half to Richard Koehler, same place. Filed Apr. 26, 1897. Serial No. 633,913. (No model.)



Claim.—A tire-tightener for wheels comprising in combination a clamp having two arms with concave inner surfaces to embrace a spoke of the wheel, each of said arms bent at its top at a right angle and there provided with a set-screw and a swiveled saddle on said screw, an open bar having curved ends and secured at one end to one of said clamping-arms, and provided at the other end with a threaded aperture, a threaded bolt passing through said aperture and bearing against the other clamping-arm, said bolt provided on its outer end with means to turn the same and to move the clamping-arms from or against the spokes and the saddles to and from each other, substantially as described.

604,607. VAPOR-CONDENSER FOR VACUUM-PANS. WILLIAM DUNN and ALFRED W. DUNN, Honiton, Devon. Filed Oct. 26, 1897. Serial No. 656,634. (No model.)

Claim.—In apparatus for condensing juices, the combination of a vacuum-pan, a pipe leading from the vacuum-pan downwardly, a surface condenser located beneath the vacuum-pan and having said pipe in communication with the bottom of the surface condenser, a pump located adjacent to the surface condenser and in communication therewith by means of a pipe running from the top of the surface condenser, a reservoir beneath the surface condenser and communicating with the bottom thereof, and a second pump, said second pump having communication with the reservoir.

604,608. TRUCK-FRAME. THOMAS M. GALLAGHER, St. Louis, Mo., assignor to the Shickle, Harrison & Howard Iron Company, same place. Filed Oct. 18, 1897. Serial No. 655,648. (No model.)

Claim.—1. In a truck-frame, the combination of side members, a transom secured to the side members, and a bolster carried by the transom; each side member consisting of a vertical web having upper and lower horizontal flanges and vertical flanges 14 connecting said horizontal flanges at the middle portion of the member, substantially as set forth.

2. In a truck-frame, the combination of side members, a transom secured to the side members, and a bolster carried by the transom; said side members each consisting of a web having upper and lower horizontal flanges and vertical flanges 13 and 14 connecting said horizontal flanges, substantially as set forth.

3. In a truck-frame, the combination of side members, a transom secured to the side members and provided with spring-seats, and a bolster carried by the transom; said side members consisting each of a web having upper and lower flanges connected by vertical flanges; said webs being cut away between said vertical flanges to permit the removal and renewal of the truck-springs, substantially as set forth.

4. In a truck-frame, the combination of side members an open-top transom, and a bolster fitting in the transom; said transom having sides, and ends adapted to fit against and be secured to said side members; said sides and ends being made in one integral casting, substantially as set forth.

5. In a truck-frame, the combination of side members, a transom secured to the side members, and a bolster carried by the transom; said transom having sides joined at the bottom by shelves to form seats to receive the bolster-springs, and said transom also having ends adapted to fit against and be secured to said side members, said sides, ends and shelves being formed in one integral casting, substantially as set forth.

6. In a truck-frame, the combination of side members, a transom, and a bolster carried by the transom: said transom having sides, open at bottom to permit the bolster to be raised from beneath, and said transom having ends adapted to fit against and be secured to the side members, said sides and ends being formed in one integral casting, substantially as set forth.

7. In a truck-frame, a transom having sides, and bottom shelves to form spring-seats, and having ends adapted to fit against the side members of the truck-frame: said sides, ends and shelves being formed in one integral casting, substantially as set forth.

8. In a truck-frame, a transom having sides, bottom shelves to form spring-seats, and end flanges adapted to fit against and be secured to the side members of the truck-frame: said sides, shelves and flanges being formed in one integral casting, substantially as set forth.

9. In a truck-frame, the combination of side members, having horizontal flanges and vertical ribs on the inner faces of their webs, and a transom having end flanges and adapted to fit between said flanges and ribs on the side members and occupying the entire space surrounded by said flanges and ribs, substantially as set forth.

10. In a truck-frame, the combination of side members, a transom secured to the side members, and a bolster carried by the transom; said transom having open ends, and said side members having vertical webs provided with openings registering with the open ends of the transom, whereby the bolster-springs may be removed and replaced through said openings, substantially as set forth.

11. In a truck-frame, the combination of side members, a transom secured to the side members, and a bolster carried by the transom said transom being formed with sides having horizontal flanges, an open top and spring-seats at the ends of its bottom, all made integral, substantially as set forth.

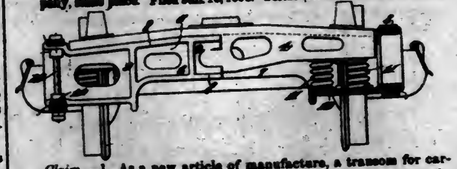
12. In a truck-frame, the combination of side members, a transom secured to the side members, and a bolster carried by the transom; said transom being formed with sides having horizontal and vertical flanges, an open top, and spring-seats at the bottom of each end of the transom, all made integral, substantially as set forth.

13. In a truck-frame, the combination of side members, a transom secured to the side members, and a bolster carried by the transom; said transom having sides, and open at the top to receive the bolster and having spring-seats, and said side members consisting of vertical webs and flanges, and having pockets over the journal-boxes to embrace the springs, substantially as set forth.

14. In a truck-frame, the combination of side members, a transom secured to the side members, and a bolster carried by the transom, said transom having lateral flanges at the ends, and said side members having vertical ribs on their inner faces against which said lateral flanges abut, substantially as set forth

---

604,609. CAR-BOLSTER. THOMAS M. GALLAGHER, St. Louis, Mo., assignor to the Shickle, Harrison & Howard Iron Company. Filed Jan. 3, 1898. Serial No. 665,454. (No model.)



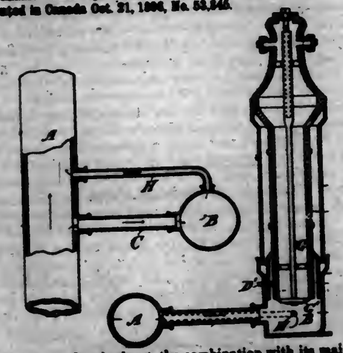
Claim.—1. A metallic bolster for railway-cars made in hollow box form with a top, sides and bottom, all made integral, the top being shaped to receive the center plate and side bearings, and the bottom being extended out and adapted to provide spring-seats, substantially as set forth.

2. A metallic bolster for railway-cars made in hollow box form with a top, sides and bottom all made integral, the top having a horizontal central part and sloping ends, and the bottom having sloping central portions and horizontal ends providing spring-seats, substantially as set forth.

3. A metallic bolster for railway-cars made in hollow box form with a top, sides and bottom all made integral, the sides being formed with grooves to receive hangers, and the bottom being extended out to provide spring-seats, substantially as set forth.

4. A metallic bolster for railway-cars made in hollow box form with a top, sides and bottom, formed flush with each other, all made integral, and the bottom being extended out to provide spring-seats, substantially as set forth.

604,610. TRANSOM FOR CAR-TRUCKS. THOMAS M. GALLAGHER, St. Louis, Mo., assignor to the Shickle, Harrison & Howard Iron Company, same place. Filed Jan. 10, 1898. Serial No. 666,174. (No model.)

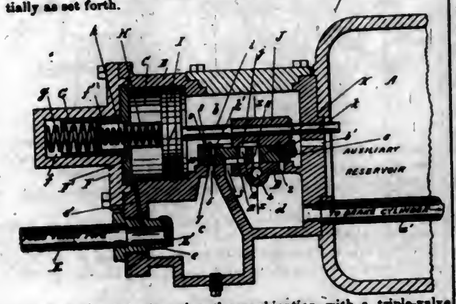


Claim.—1. As a new article of manufacture, a transom for car-trucks composed of sides having ends formed to receive the arch-bars of a truck-frame, and spring-seats located at the bottom of the sides near the ends all made in one integral casting, substantially as set forth.

2. As a new article of manufacture, a transom for car-trucks composed of sides having ends provided with grooves to receive the arch-bars of a truck-frame, and spring-seats located at the bottom of the sides near the ends all made in one integral casting, substantially as set forth.

3. As a new article of manufacture, a transom for car-trucks composed of sides having ends formed to receive the arch-bars of a truck-frame, perforated lugs or ears to receive the frame-bolts, and spring-seats located at the bottom of the sides near the ends, all made in one integral casting, substantially as set forth.

604,611. HYDRANT AND STAND-PIPE. LUDGER GRENIER, Hull, Canada. Filed Apr. 14, 1897. Serial No. 633,168. (No model.) Patented in Canada Oct. 21, 1896, No. 53,545.

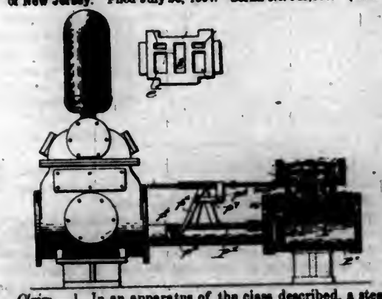


Claim.—1. In a hydrant, the combination with its main body, of a jacket at its lower end forming a space around said lower end and adapted to be secured to the base, a base into which said jacket is secured, a service-pipe connecting said base with the main and a circulating-pipe connecting said base with the main a little distance from said service-pipe, independently of the latter, substantially as set forth.

2. In a hydrant, the combination with the main body and the base of a jacket at the lower end of said main body closed at the top and open below and adapted to form an air-space around said lower end and said jacket forming the connection with said base or valve-chamber, substantially as set forth.

604,612. AIR-BRAKE VALVE. WINFIELD O. GORDON, Terre Haute, Ind., assignor of one-fifth to George W. Faris, same place. Filed Sept. 3, 1897. Serial No. 650,514. (No model.)

Claim.—1. In an air-brake valve, the combination, with a triple-valve casing provided with a faced plate; of an intermediate valve, said intermediate valve and faced plate being provided with ports 6 and 2 of different area for admitting air from the reservoir to the brake-cylinder and effecting two service steps of different suddenness, and a passage 12 and ports 5 and 3 for admitting air from the train-pipe to the brake-cylinder in an emergency stop, said passage 12 being formed separate from the port 6 and not communicating with it; and a separate valve for admitting air through the said port 6, substantially as set forth.

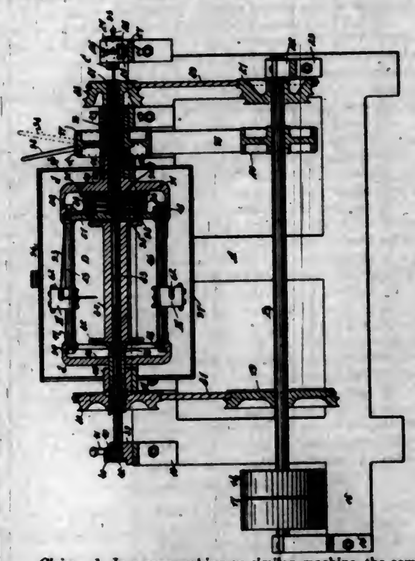


2. In an air-brake valve, the combination, with a triple-valve casing provided with a faced plate having a port 5 leading to the train-pipe, and ports 2 and 3 leading to the brake-cylinder; of an intermediate valve provided with a port 6 of less area than the said port 2, a passage 12 for connecting the ports 5 and 3, and a port 7 communicating with the port 5; a reservoir check-valve carried by the intermediate valve and normally covering the said port 7; and a separate valve for admitting air through the said port 6, the said ports 6 and 2 and the passage 12 operating respectively to effect two service stops of different suddenness and an emergency stop, substantially as set forth.

3. In an air-brake valve, the combination, with a triple-valve casing provided with a faced plate having ports 5 and 3 at one end, an admission-port 2 at its other end, and an exhaust-passage 4 between the ports 2 and 3; of an intermediate valve provided at one end with a port 6 smaller than said port 2 and communicating with it, said ports 2 and 6 effecting two stops of different suddenness, a passage 12 in its under face at its other end for connecting the said ports 5 and 3, said passage 12 having no connection with the port 2, a port 13 extending between its upper face and the passage 12, and an exhaust-port 11 extending through it between the ports 6 and 13; and a separate valve operating to uncover the port 6 and provided with an exhaust-cavity for connecting the said port 11 with the port 13 and passage 12, substantially as set forth.

4. In an air-brake valve, the combination, with a triple-valve casing provided with a faced plate having three ports, one of which is an inlet-port leading from the reservoir to the brake-cylinder; of an intermediate valve provided with an air-inlet port of less area than the said inlet-port, and having a passage for connecting the remaining two of the said ports which lead to the train-pipe and brake-cylinder respectively; and a valve for uncovering the said inlet-port of the intermediate valve and effecting an ordinary service stop, the three said ports of the faced plate and the said passage being arranged at such relative distances apart that the intermediate valve upon being moved in one direction operates first to uncover the said inlet-port of the faced plate and effects a more sudden service stop without connecting the brake-cylinder direct with the train-pipe, and subsequently connects the remaining two ports of the faced plate by means of the said passage thereby effecting an emergency stop, substantially as set forth.

604,618. DIRECT-ACTING STEAM-PUMP. ALBERT F. HALL, Boston, Mass., assignor to the Geo. F. Blake Manufacturing Company, of New Jersey. Filed July 26, 1897. Serial No. 645,885. (No model.)



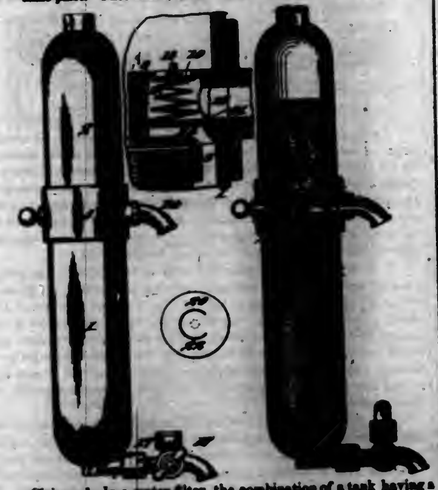
Claim.—1. In an apparatus of the class described, a steam-cylinder having large main steam-ports, a piston reciprocable in the cylinder, a movable valve-seat, a main valve, and small auxiliary steam-ports opening into the cylinder near the end thereof, adapted and arranged to admit a small quantity of steam at the beginning of the stroke to impart a gradual initial movement to the piston, substantially as described.

2. In an apparatus of the class described, a steam-cylinder, a reciprocating piston therein, and means including a movable valve-seat and a main valve, to admit a small quantity of steam to the cylinder at the beginning of the stroke and thereafter an independent larger quantity, and to cushion the piston at the end of the stroke, substantially as described.

3. In an apparatus of the class described, a steam-cylinder having main and auxiliary steam-ports, a reciprocating piston in the cylinder, a movable valve-seat and a cooperating main valve for said ports, whereby steam is admitted through both, and exhausted through the main port, and manually-controlled means to at times effect communication between said ports to permit a limited exhaust from the auxiliary into the main port, to regulate the amount of cushion, substantially as described.

4. In an apparatus of the class described, a steam-cylinder having main and auxiliary steam-ports, a reciprocating piston in the cylinder, a combined movable valve-seat and auxiliary valve, said seat having ports corresponding to the said main and auxiliary steam-ports, a main valve, whereby steam is admitted through both of said main and auxiliary steam-ports but exhausted through the main port only, an auxiliary steam-cylinder having steam and exhaust ports, and a plunger-piston therein to move the main valve, said ports being controlled by said auxiliary valve, substantially as described.

604,614. ROPE-MAKING MACHINE. HARRY I. HARRIS, Boston, Mass. Filed June 9, 1897. Serial No. 640,004. (No model.)



Claim.—1. In a rope-making or similar machine, the combination, with a flier, a bar whereof is provided with a longitudinal slot in one face and a wider longitudinal slot in its opposite face, together with a longitudinal rib extending along the wider slot and stopping short of its ends, the walls of the wider slot being provided with teeth, of a traverse mounted to travel on the bar of the flier, having a guide-wheel arranged to enter the annular slot in said bar, a driving-wheel held in engagement with the toothed wall of the wider slot, a pulley over which the yarn or rope is to be carried, and a driving connection between said pulley and the driving-wheel of the traverse.

2. The combination, with the bar of a flier having a longitudinal slot in one face and a wider slot in the opposite face, a rib dividing the wider slot for a portion of its length, the walls of the wider slot having teeth or projections, of a traverse held to travel on said bar, provided with a guide-wheel which enters the narrower slot, the said traverse being provided with a shaft having lateral movement, a driving-wheel carried by the shaft and arranged for engagement with the projections from the wall of the wider slot, a pulley adapted for engagement with the yarn or rope passed to the traverse, and means for driving said shaft from said pulley.

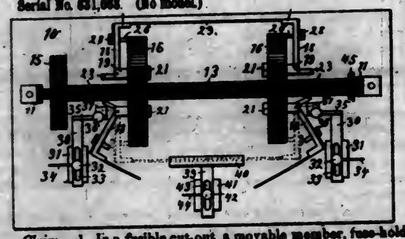
3. In rope-making machines or machines of like type, a flier provided with a guide-bar, in combination with a traverse consisting of a casing having an opening to receive the bar of a flier, a shaft above the opening, extending within the same and mounted to have rotary and lateral movement, a driving-wheel carried by the lower end of said shaft, a pulley adapted for frictional engagement with the rope or yarn, and a driving connection between said shaft and said pulley.

604,615. WATER-FILTER. CHARLES F. HITCHCOCK, St. Louis, Mo., assignor of two-thirds to Orville D. Tibbetts and Philip J. Conroy, same place. Filed Jan. 5, 1898. Serial No. 666,667. (No model.)

Claim.—1. In a water-filter, the combination of a tank having a filtering medium, a clear-water tank to receive the water after it passes through the filtering medium, a supply-pipe, a valve controlling the flow of water from the supply-pipe to the filtering-tank and from the latter to a waste pipe or nozzle, a discharge-nozzle and an automatic valve located in the discharge from the clear-water chamber, substantially as set forth.

2. In a water-filter, the combination of a tank or chamber for receiving the filtering medium, a tank or chamber for receiving the filtered water, a valve for controlling the passage of water to the filtering-chamber and from the chamber to a waste, and an automatic valve located in the discharge from the clear-water chamber; said last-mentioned valve being arranged to open under the pressure of water in the clear-water chamber and to close on the opening of a communication between the filtering-chamber and the waste, substantially as set forth.

3. In a water-filter, the combination of a filtering-chamber, a valve controlling the flow of water into the filtering-chamber, a clear-water chamber and an automatic valve located in the discharge from the clear-water chamber, substantially as set forth.



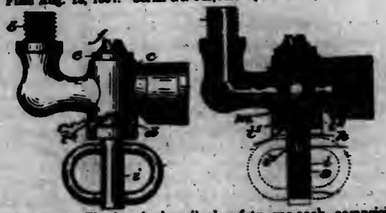
4. In a water-filter, the combination of a filtering-chamber with which supply and waste pipes connect, a single valve for controlling the flow of water from the supply-pipe to the filtering-chamber and from the filtering-chamber to the waste-pipe, a clear-water chamber and an automatic valve located in the discharge from the clear-water chamber, substantially as set forth.

5. In a water-filter, the combination of a filtering-chamber, a valve controlling the flow of water to and from the chamber, a clear-water chamber and an automatic valve located in the discharge from the clear-water chamber; said automatic valve being arranged to open under the pressure created in the clear-water chamber and being arranged to close when water wastes from the filtering-chamber, and said automatic valve being provided with a vent to permit air to pass into the filtering-chamber, substantially as set forth.

6. In a water-filter, the combination of a filtering-tank, a clear-water tank, a ring connecting the tanks together and which is provided with a perforated diaphragm, an automatic spring-valve connected to said ring, and adapted to open up a communication between the clear-water tank and a discharge-nozzle, a supply-pipe, a discharge pipe or nozzle, and a valve controlling the flow of water from the supply-pipe into the filtering-tank and from the latter to the discharge-nozzle, substantially as set forth.

7. In a water-filter, the combination of a filtering-tank, a supply-pipe and a discharge pipe or nozzle communicating with the filtering-tank, a valve controlling the flow of water from the supply-pipe to the filtering-tank and from the filtering-tank to the waste-nozzle, a clear-water tank, a ring connecting the filtering-tank and the clear-water tank, and which is provided with a perforated diaphragm and a raised flange, a plug fitting in said flange and a spring-actuated valve located within the plug, substantially as set forth.

604,616. AUTOMATIC RESETTING FUSIBLE CUT-OUT. JOHN D. HOLMES and WEBSTER L. HEATH, St. Louis, Mo. Filed Apr. 12, 1897. Serial No. 631,663. (No model.)



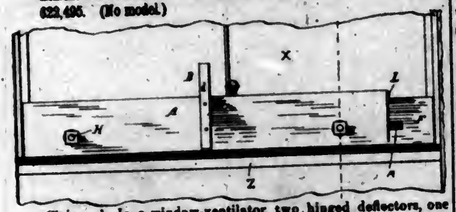
Claim.—1. In a fusible cut-out, a movable member, fuse-holding devices carried by said movable member and normally locking the same, said fuse-holding devices being arranged in pairs and insulated from each other, means for releasing said movable member when a fuse is burned out, and line-wire terminals adapted to be put in electrical communication with one pair only of said fuse-holding devices at a time.

2. In a fusible cut-out, a rotary member, radial fuse-holding arms pivotally mounted thereon to swing in radial planes, said rotary member being normally locked against rotation, and means for releasing said rotary member when a fuse is burned out.

3. In a fusible cut-out, a rotary member, fuse-holding arms pivotally mounted on said rotary member to swing in radial planes, each of said fuse-holding arms being insulated from the others, and stops at each end of said rotary member adapted to come in contact with said fuse-holding arms when they are held in position by a fuse and thereby lock said rotary member.

4. In a fusible cut-out, a rotatable sleeve, disks of insulating material carried by said sleeve, radial fuse-carrying arms pivotally mounted on said disks, projections on said radial arms, and line-wire terminals with which said projections come in contact when said arms are held in position by a fuse.

604,617. SAFETY GAS-FIXTURE. ALBERT H. HOXIE, Boston, Mass., assignor of two-thirds to Nathaniel C. Merrill, New York, N. Y. Filed Aug. 13, 1897. Serial No. 648,643. (No model.)



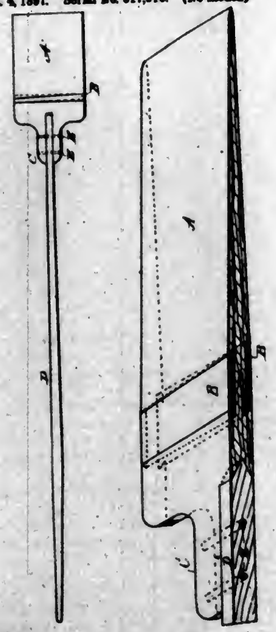
Claim.—1. The herein-described safety gas-cock, comprising a usual socket and plug, the latter having usual securing means at its upper smaller conical end, and at its lower portion an extension interiorly threaded, a screw secured in said extension, a barrel inclosing said screw and extension and non-rotatably secured to said block, said barrel having an interior shoulder adjacent said extension and a laterally-extended head at its upper end provided with opposite projections, notches being formed adjacent said socket to receive said projections when the cock is in closed position, a spring within said barrel between said shoulder and the head of said screw, and turning portions projecting laterally from said barrel, substantially as described.

2. The herein-described safety gas-cock, comprising a usual socket and tapered plug, the latter, when snugly seated in the socket, depending at its base slightly below said socket, a laterally-extended head inclosing said depending portion of the plug, said head having one or more locking projections 3^3, and the socket having notches therefor, means holding said head against rotation relatively to the plug and permitting it to move to and from the plug, a spring normally holding said head against the plug with its said projections in said notches, and turning portions for pulling said head down from

locked engagement with the socket and turning the plug, substantially as described.

604,618. WINDOW-VENTILATOR. WILLIAM L. JOHNSON and ERNEST G. JOHNSON, Buffalo, N. Y. Filed Feb. 3, 1897. Serial No. 622,495. (No model.)

Claim.—1. In a window-ventilator, two hinged deflectors, one carried by the main supporting-piece, A, of the device, and the other by an extensible portion of the device, the two deflectors being substantially parallel, and one superposed on the other, substantially as set forth.



2. In a window-ventilator, a hinged deflector, B, and two hinged deflectors, E, the latter being each about half as long as the deflector, B, the deflectors E being arranged to lie above and close to the deflector B, substantially as set forth.

3. In a window-ventilator, the supporting-piece, A, a deflector hinged thereto, two extension-pieces at the ends of the piece, A, and independent deflectors hinged to such extension-pieces, substantially as set forth.

4. In a window-ventilator, the piece, A, a deflector hinged to the upper edge thereof, the extension-pieces, F, the bolts, H, which pass through holes in the piece, A, and through slots in the extension-pieces, the pieces, G, which cover the slots in the extension-pieces, and the deflectors hinged to the said extension-pieces, substantially as set forth.

5. The combination, in a window-ventilator, of the main supporting-piece, a deflector hinged thereto, and a spring-catch for holding the deflector in a more or less open position, having a main portion, *d*, secured to the supporting-piece, and a curved portion, *d'*, under which the deflector moves, and which is adapted to engage with the edge thereof, substantially as set forth.

604,619. BAKER'S PEEL. CHRISTIAN KNEBEL, St. Louis, Mo. Filed Jan. 4, 1897. Serial No. 617,916. (No model.)

Claim.—A baker's peel consisting of the blade, having tapering dovetailed grooves formed on opposite sides, combined with tapering wedge-shaped strips which are forced into the grooves, the taper of the grooves and the strips being made to extend in opposite directions, upon opposite sides of the blade, whereby should the blade split, the two parts may be secured rigidly together by driving in the strips from opposite directions, substantially as shown and described.

604,620. WINDOW-SCREEN. ROBERT J. KOLB, Florence, and MICHAEL KOLB, Newport, Ky. Filed Sept. 25, 1897. Serial No. 653,696. (No model.)

Claim.—1. A window-screen, comprising a netting or screen proper, a screen-roller on which winds the screen, a casing containing the said roller and formed with a slot for the passage of the said screen, a removable cap on the end of the casing, a rod secured to the said cap and extending into the said roller, a spring coiled on the said rod and secured at one end to the rod and at its other end to the said roller, and a bearing on the said cap for the end of the said roller to turn on, substantially as shown and described.

2. A window-screen, provided with a screen-roller, on which winds a screen-netting, a casing containing said roller and formed with a slot for the passage of the netting, a cap on the end of the casing and formed with a bearing for the roller to turn on, a rod secured to the cap and extending into the said roller, the inner end of the rod being formed with a collar for the roller to turn on as a bearing, and a spring coiled on the said rod and secured at one end to said rod and at the other end to the said roller, substantially as shown and described.

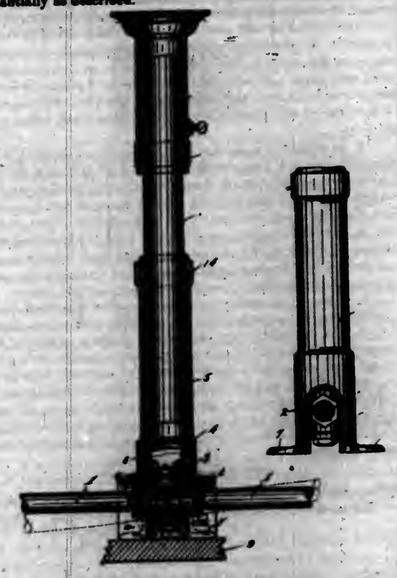
3. A window-screen, provided with a fixed casing, a spring-roller mounted to turn therein, a netting winding on the said roller, a sliding casing to which the outer end of the netting is secured and which is formed with a shoulder, a spring-catch on the window-sash and adapted to engage the said shoulder to lock the slidable casing to the sash, a plate having a finger-piece and secured to the sash, the plate carrying the said catch, and a button turnable on the said catch, and provided with an angular flange adapted to pass through a correspondingly-shaped opening in the said plate and adapted to rest against the back of the said plate to hold the catch locked in an inactive position, substantially as shown and described.

604,621. PROCESS OF CLEANING AND DRYING EGGS. JOHN A. KNEBEL, New York, N. Y. Filed Feb. 11, 1896. Serial No. 669,903. (No specimens.)

Claim.—The process of cleaning and drying eggs, which consists in cleaning them in a weak solution of a vegetable acid, as vinegar, and soda, in water having cornmeal stirred therein, and then drying them in cornmeal, as described

604,622. STOP-COCK BOX. JARED C. LOCKELL and ADA TALCOTT, Minneapolis, Minn., assignors of one-third to Henry F. Hodge, same place. Filed July 2, 1897. Serial No. 643,216. (No model.)

Claim.—1. A stop-cock box, securable at its lower end to the stop-cock, by means of a joint which permits angular movement of said parts with respect to each other, substantially as described.



2. A stop-cock box, securable to the stop-cock, by means of a telescopic flexibly-packed joint which permits angular movement of said parts with respect to each other, substantially as described.

3. A stop-cock box formed in sections, the lower of which is applicable to the stop-cock, the upper of which is securable at or near the surface of the ground, and the intermediate section of which telescopes with said upper and lower box-sections, with freedom for endwise sliding movements substantially as described.

4. A stop-cock box formed in sections, the upper of which is securable at or near the surface of the ground, the lower of which is securable to the stop-cock by means of a telescopic flexibly-packed joint, and the intermediate section of which telescopes with said upper and lower box-sections, substantially as described.

5. A stop-cock box, formed in sections, the lower of which is applicable to the stop-cock, the upper of which is securable at or near the surface of the ground, and the intermediate section of which telescopes with said upper and lower box-sections, and is connected therewith by means of flexible gaskets, secured in channeled seats formed, respectively, in said upper and lower box-sections, substantially as described.

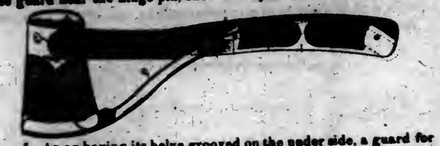
6. The combination with a stop-cock located beneath the surface of the ground, of a stop-cock box, formed with telescopic sections, the lower member of which is connected to said stop-cock, by a telescopic joint and is pronged or bifurcated to form a supporting-base, substantially as described.

604,623. CIGARETTE-FORMER. WILLIAM S. MALLARD, Darien, Ga., assignor of one-half to Robert Manson, same place. Filed Aug. 27, 1897. Serial No. 649,774. (No model.)

Claim.—1. A cigarette-former, consisting of the body portion provided at one end with a trough-shaped portion, and a former removably placed within the said trough-shaped portion, said former consisting of a handle provided with a boss, a finger attached to said boss, said finger having a beveled forward end, and a serrated upper edge adapted to engage with the cigarette-paper.

2. In a cigarette-forming device, the combination with the body 1, having a trough 3 and having its edge 14 in a plane with the body-plate 1, and having bearing portions 6 and 7, at the ends, of the twister comprising the knob 12, the bearing portion 12^b, having a spring-contact 12^a and a single projecting spring member 13 having a friction bearing-face 13^d, and a serrated beveled face 13^c, all being arranged substantially as shown and described.

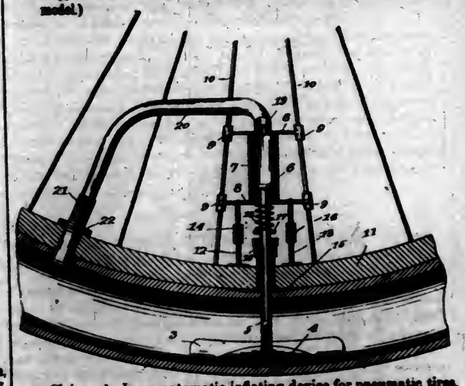
3. In a cigarette-former of the kind described, the combination with the curved trough, of a twister means movable rotatably and endwise in the trough, said twister comprising a finger-holding knob having a bearing member and a single spring-finger projected over the circumferential edge of the bearing portion, said finger having a friction face 13 and a beveled face 13^c, having serrations 13^e, substantially as shown and for the purposes described.



604,624. SAFETY-GUARD FOR AXES. WEBSTER L. MARBLE, Gladstone, Mich., assignor of one-half to Frank H. Van Cleve, Escanaba, Mich. Filed Jan. 28, 1898. Serial No. 667,849. (No model.)

Claim.—1. An ax having a guard hinged to its helve on an axis transverse thereto and adapted to cover and inclose its edge, substantially as described.

2. An ax having a grooved helve, and a guard hinged to said helve and adapted to inclose the edge when open and to lie within the groove when closed, substantially as described.



3. An ax having a guard hinged to its helve about midway of the same, the length of said guard being about half that of the helve so as to inclose the edge when open and to lie parallel with the butt of the helve when closed, substantially as described.

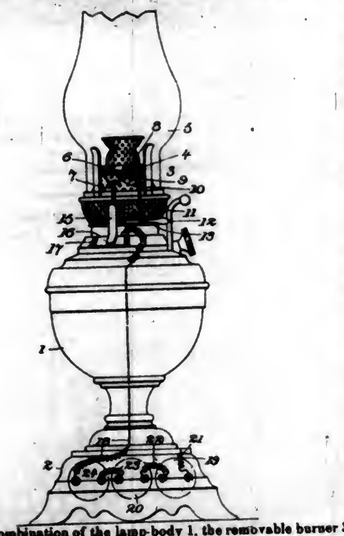
4. An ax having the handle portion of its helve grooved on the under side, a guard for the edge of the head hinged in said groove about midway of the helve, and a spring bearing against the end of the guard near the hinge-pin, substantially as described.

5. An ax having its helve grooved on the under side, a guard for the ax edge hinged in said groove, a roller mounted in the end of the guard near the hinge-pin, and a spring in the groove bearing against said roller, substantially as described.

604,625. AUTOMATIC BICYCLE-PUMP. WARREN METCALF, Skippersville, Ala. Filed Aug. 27, 1897. Serial No. 649,761. (No model.)

Claim.—1. In an automatic inflating device for pneumatic tires, a pump-cylinder provided at its ends with cross-heads having sleeves adapted to slidingly fit upon adjacent spokes, in combination with a flexible tube adapted to be applied to the inflating-valve of the tire, a reciprocating piston in said pump-cylinder, a piston-rod extending into the tire and having a foot or shoe for contact with the outer portion of the tire, a spring for normally pressing said piston outward, and longitudinally-extensible connections between the wheel-rim and the adjacent cross-head of the pump-cylinder, all arranged for joint operation, substantially as described.

2. In an automatic tire-inflater, the combination with wheel-spokes and a tire, of a pump-cylinder fitted to adjacent wheel-spokes for slidable adjustment thereon, adjustable devices between the pump-cylinder and wheel-rim for holding the pump-cylinder in a fixed position and for securing a limited adjustment of the pump-cylinder relatively to the tire, and a piston-rod actuated by the tire on partial deflation thereof, substantially as described.

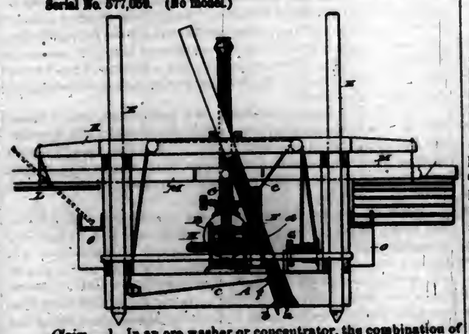


3. In an automatic tire-inflater, the combination with wheel-spokes, a wheel-rim, and a tire, of a pump-cylinder fitted to adjacent wheel-spokes for limited adjustment thereon, means for rigidly connecting the pump-cylinder with the wheel-rim, a tubular connection between the pump-cylinder of the tire, and a piston-rod fitted within the tire to be actuated by the latter on partial deflation thereof, substantially as described.

4. In an automatic tire-inflater, the combination with a wheel-rim and a tire, of a pump-cylinder slidably fitted to the wheel-spokes, the extensible rods attached to the wheel-rim and pump-cylinder for holding said pump-cylinder normally in a fixed position with relation to the rim and spokes, and a piston-rod actuated by the tire, substantially as described.

5. In an automatic tire-inflater, the combination with a wheel-rim, a tire, and wheel-spokes, of the bushing fixed in the wheel-rim, a pump-cylinder having the cross-heads fitted to the spokes, rods fixed to the wheel-rim and the cross-head of the cylinder, a piston-rod passing through the bushing and having a piston-head at one end and a shoe at the other end, a coiled spring acting against a shoulder or stud of the rod, and a tubular connection between the cylinder and the tire, substantially as described.

604,626. ELECTRICAL LIGHTING DEVICE FOR KEROSENE OR OTHER BURNERS. SYDNEY M. MEYER, Brooklyn, N. Y. Filed Jan. 27, 1897. Serial No. 620,909. (No model.)

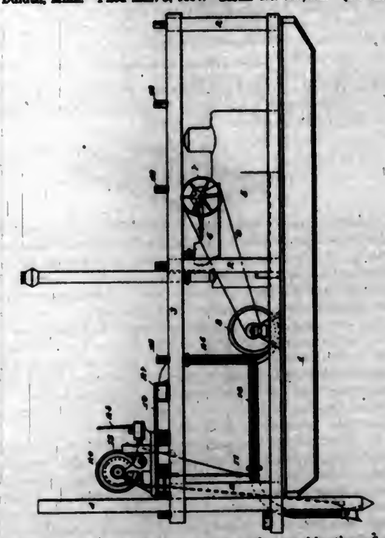


Claim.—1. In combination with a lamp-burner 3 and a suitable source of electricity and conductors, the contact-arm 6 and the contact-spring 9, vibrating in an arc approximately tangential to the wick 4 of the lamp-burner, substantially as and for the purposes set forth.

2. The combination of the lamp-body 1, the removable burner 3, a suitable source of electricity, as 19, 20, 24 and conductor 18, therefrom, in the body of the lamp, an insulated plate 16, on the body of the lamp, in electrical connection with the conductor 18, a circuit-closing device, as 6, 8, 9, 10, mounted on the removable burner, and a spring 15, in electrical connection with the circuit-closer and making connection with the insulated plate 16, when the burner is placed in position, substantially as explained.

3. A device for lighting lamps by electricity comprising a suitable lamp-body, a burner separable therefrom, a source of electricity in the body or base of the lamp grounded by one pole in the lamp-body, an insulated conductor from the other pole, an igniting device mounted on the removable burner grounded by one end in the metal of the burner and connected at the other end with an insulated conductor, insulated contact devices carried by the lamp-body and removable burner respectively and respectively connected to the insulated conductors therein, so as to form electric connection between the insulated conductors when the burner is placed in position; and a suitable device for closing the electric circuit by hand, substantially as set forth.

604,627. APPARATUS FOR CONCENTRATING GOLD-BEARING SAND. ALEXANDER McDOUGALL, Duluth, Minn. Filed Jan. 27, 1896. Serial No. 577,059. (No model.)



Claim.—1. In an ore washer or concentrator, the combination of a scow, a pump carried on the scow, the suction-pipe of said pump being arranged to remove the gold-bearing sand or gravel, an inclined tiltable platform carried on said scow, having a corrugated or roughened surface, and a trough movably mounted above and normally engaging said inclined platform, receiving the discharge of said pump and normally holding the platform with its minor axis horizontal, but adapted to be moved out of its engagement therewith to allow the platform to be tilted, substantially as set forth.

2. In an ore washer or concentrator, the combination of a scow, a pump carried on the scow, the suction-pipe of said pump being arranged to remove the gold-bearing sand or gravel, an inclined tiltable platform carried on said scow at each side thereof and having a corrugated or roughened surface, and a trough pivotally mounted above and normally engaging said inclined platform, receiving the discharge from said pump, and normally holding the said platforms with their minor axes horizontal, but adapted to be swung out of its engagement with either of said platforms to allow it to be tilted, substantially as set forth.

3. In a mining apparatus of the character described, the combination of a scow, a superstructure carried on said scow, an inclined platform suspended from said superstructure by flexible connections whereby the same may be tilted, a chute mounted below one edge of said platform, a trough mounted on said platform above the upper end of said platform but movable away from the same, and a pump carried on the scow, the suction-pipe of said scow being arranged to remove the gold-bearing sand or gravel and discharge the same to said trough, substantially as and for the purposes set forth.

4. In a mining apparatus of the character described, the combination of a scow, a superstructure carried on said scow and extending over the side of the scow, an inclined platform carried by flexible connections on the end of said superstructure outside of the scow, a trough pivoted to said superstructure and normally arranged over the upper ends of said platforms, but movable alternately out of engagement therewith, and a pump carried on the scow, the suction-pipe being arranged to remove the gold-bearing sand or gravel and discharge the same to said trough, substantially as and for the purposes set forth.

604,628. DREDGING APPARATUS. ALEXANDER McDOUGALL, Duluth, Minn. Filed Mar. 5, 1897. Serial No. 626,112. (No model.)

Claim.—1. In a dredging apparatus, the combination of a support, a pump mounted thereon, a suction-pipe flexibly connected to said pump, means for sustaining the forward end of said suction-pipe, a dredge-pipe connected to said suction-pipe and in contact with the material to be removed, a superstructure for said support, a steam-windlass, connections between said windlass and said dredge-pipe for moving the latter back and forth in contact with the material, and a trough or chute secured to said superstructure and connected to the discharge-pipe of the pump, substantially as set forth.

2. In a dredging apparatus, the combination of a support, a pump mounted thereon, a suction-pipe flexibly connected to said pump, means for sustaining the forward end of said suction-pipe, a dredge-pipe connected to said suction-pipe and in contact with the material to be removed, a superstructure for said support, a steam-windlass having a double drum carried on said superstructure and mounted directly over the forward end of said suction-pipe, and two cables wound in opposite directions on said double drum and connected to opposite sides of the dredge-pipe for moving said dredge-pipe back and forth in contact with the material, substantially as set forth.

604,629. BOTTLE-CLOSURE. PATRICK H. McGRATH, Randolph, Mass., assignor of one-half to Michael F. Cunningham, same place. Filed Sept. 23, 1897. Serial No. 652,674. (No model.)

Claim.—1. The combination with a bottle-neck, provided with an internal channel, of a guard having perforations therethrough, one or more of said perforations having transverse apertures therefrom, a pin movable in each of said apertures adapted to be projected into said channel, said perforations being conical with the larger end outermost, and a correspondingly conical plug adapted to be inserted in the perforation behind said pin and hold the latter against removal from said channel, said plug terminating within the perforation short of the upper end thereof, substantially as described.

2. The combination with a bottle-neck, provided with an internal channel, of a guard having a perforation in the shape of an inverted cone extending from its outer end, a transverse aperture from said perforation through the wall of the guard in alinement with said channel, a pin movable in said aperture, and a rigid plug of the same shape as the perforation and slightly less in diameter at its larger end than the outer end of the perforation, whereby when the plug is driven in the perforation behind the pin, the latter is held in said channel and the plug terminates short of the top and is thereby inaccessible, substantially as described.

3. In a non-refillable bottle, a guard, means to secure it in the neck of the bottle, and a contractible ring carried at the lower end of the guard, said ring being made up of rigid sections movably secured together and provided with tortuous passages across it for the flow of the liquid, substantially as described.

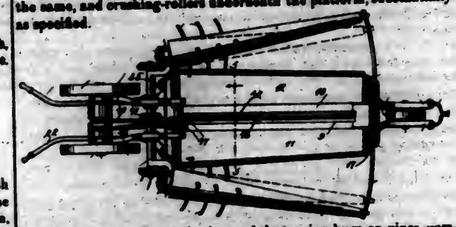
4. In a non-refillable bottle, a guard, means to secure it in the neck of the bottle, and a contractible ring carried at the lower end of the guard, said ring being made up of rigid sections interlocked with each other and each provided with tortuous passages across it, for the flow of the liquid, substantially as described.

5. In a non-refillable bottle, a guard, means to secure it in the neck of the bottle, and a contractible ring carried at the lower end of the guard, said ring being made up of rigid sections movably secured together and provided with tortuous passages across it, and means normally maintaining said ring extended, substantially as described.

6. In a non-refillable bottle, a guard secured in the bottle-neck, said guard comprising a body having a stem at its lower end and outlet-perforations through its upper end, and a sectional ring secured to said stem, the sections thereof being overlapped and having tortuous passages for the escape of the liquid to said outlet-perforations, substantially as described.

7. In a non-refillable bottle, a guard secured in the bottle-neck, said guard comprising a body having a stem at its lower end and outlet-perforations through its upper end, and a sectional ring secured to said stem, the sections thereof being overlapped and having tortuous passages for the escape of the liquid to said outlet-perforations, a chamber being formed between the latter and said ring, substantially as described.

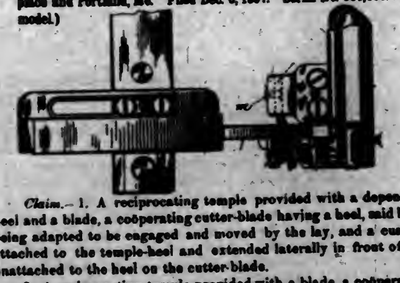
604,630. BANJO-BELL. WILLIAM J. McLEAN, New York, N. Y. Filed Sept. 20, 1897. Serial No. 653,491. (No model.)



Claim.—1. An attachment for banjos, consisting of a shallow bell adapted to fit between the banjo-head and the continuation of the neck, and having a central aperture and a flange surrounding said aperture, said bell being adjustable in height.

2. An attachment for banjos, consisting of a shallow bell having a central aperture therein, a flange surrounding said aperture, and a series of openings above said central aperture, and a flanged ring threaded in the central aperture of said bell, whereby the bell may be adjusted to fit the same between the head of the banjo and the continuation of the neck.

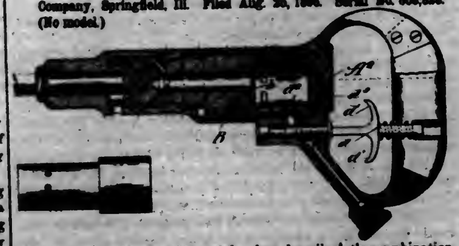
604,631. POTATO-BUG DESTROYER. CHRISTIAN NELSON and HENRY P. S. JOHNSON, Arrowsmith, Ill. Filed Nov. 10, 1897. Serial No. 658,048. (No model.)



Claim.—1. A machine for gathering and destroying bugs on vines, comprising a platform having laterally-movable side sections, pivoted handles for moving said side sections, wheels upon which the platform is mounted, gathering-rollers at the sides of the platform and above the same, and crushing-rollers underneath the platform, substantially as specified.

2. A machine for gathering and destroying bugs on vines, comprising a platform mounted on wheels, laterally-movable sections on said platform, pivoted handles having connection with said movable sections for moving them in one direction, and springs for moving the sections in the other direction, substantially as specified.

3. A machine for gathering and destroying bugs on vines, comprising a platform having laterally-sliding sections curved upward at the outer edge, means for moving said sections in both directions, longitudinally-tapered gathering-rollers at the sides of the platform, laterally-extended arms at the front of the platform and having holes to receive the front trunnions of the gathering-rollers and whereby the front ends of said rollers may be adjusted outward and inward, means for rotating said rollers, crushing-rollers extended along a slot longitudinally formed in the platform, and means for rotating said crushing-rollers, substantially as specified.



604,632. THREAD-CUTTING TEMPLE FOR LOOMS. JAMES H. NORTHROP, Hopedale, Mass., assignor to the Draper Company, same place and Portland, Me. Filed Dec. 6, 1897. Serial No. 660,986. (No model.)

Claim.—1. A reciprocating temple provided with a depending heel and a blade, a cooperating cutter-blade having a heel, said heels being adapted to be engaged and moved by the lay, and a cushion attached to the temple-heel and extended laterally in front of but unattached to the heel on the cutter-blade.

2. A reciprocating temple provided with a blade, a cooperating cutter-blade having a heel adapted to be engaged by the lay, and a flexible cushion attached to the temple and extended in front of and independent of the heel of the cutter-blade, to break the force of the blow of the lay thereupon.

604,633. PNEUMATIC HAMMER. ALFRED PARFITT, Topeka, Kans., assignor, by mesne assignments, to the Johnson-Parfitt Tool Company, Springfield, Ill. Filed Aug. 26, 1896. Serial No. 603,832. (No model.)

Claim.—1. In a machine of the class described, the combination of a shouldered piston, a port adapted to give constant supply of motive agent beneath the shoulder, an exhaust-port, and a passage in the piston leading to its larger end adapted to communicate alternately with the supply and exhaust ports at opposite ends of its stroke, substantially as described.

2. In a machine of the class described, the combination of a cylinder having an enlarged bore at one end, and a correspondingly-shaped piston, a supply-port leading into the inner end of the enlarged bore

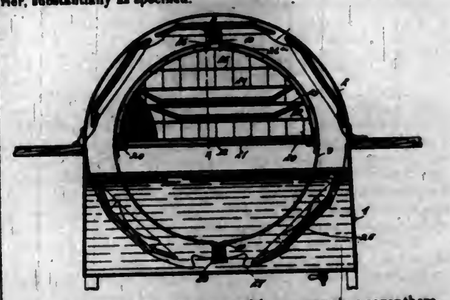
adapted to give a constant supply of motive agent, and a passage in the piston leading to the large end having a port adapted to connect alternately with the supply and an exhaust port at the opposite ends of the stroke and to be closed intermediate thereof, substantially as described.

3. In a pneumatic hammer or drill, the combination of a cylinder provided with a duct for the inlet of the motive fluid and with an annular shoulder between the opening of the duct and the tool end and with an emergency groove or duct arranged along its inner surface, a plunger provided with an annular shoulder arranged at such a distance from its outer end as to enable the outer end of the emergency groove or duct to open into the cylinder beyond the end of the plunger when the tool is out and the plunger fully in, and means for admitting the motive fluid into the cylinder between the shoulder on the cylinder and the annular shoulder on the plunger.

4. In a pneumatic hammer or drill, the combination of a cylinder provided with a duct for the inlet of the motive fluid and with an annular shoulder between the opening of the duct and the tool end, a plunger provided with an annular shoulder and with a head E at its tool end so that as the plunger is moved out the motive fluid is admitted to the outer side of the head, and means for admitting the motive fluid into the cylinder between the annular shoulder on the cylinder and the annular shoulder on the plunger.

5. In a pneumatic hammer or drill, the combination of a cylinder provided with a duct for the inlet of the motive fluid and with an annular shoulder between the opening of the duct and the tool end, a plunger provided with an annular shoulder and with a head E at its tool end and with a diminished portion between the annular shoulder and its head E, so that as the plunger is moved out its diminished portion will come opposite the inner end of the duct for the inlet of the motive fluid, and means for admitting the motive fluid into the cylinder between the annular shoulder on the cylinder and the annular shoulder on the plunger.

6. In a pneumatic hammer or drill, the combination of a cylinder provided with a duct for the inlet of the motive fluid and with an annular ring between the opening of the duct and the tool end, a plunger provided with an annular shoulder and with a head E at its tool end, both of larger diameter than the bore of the ring, and means for admitting the motive fluid into the cylinder between the annular ring and the annular shoulder on the plunger.



7. A valveless portable pneumatic hammer in which there is combined a casing provided with a fluid-pressure chamber and inlet and exhaust openings, an operating-tool in one end thereof, a reciprocating piston-hammer in the casing arranged to contact the operating-tool at one limit of its stroke and divide the pressure-chamber into two chambers, and means whereby fluid-pressure is admitted constantly to one end of the piston and through the piston is alternately admitted to and exhausted from the other end of the piston to reciprocate the same and operate the parts, substantially as described.

8. In a machine of the class described, a casing provided with fluid-pressure and exhaust chambers, an operating-tool in one end of the casing, a reciprocating piston hammer in the chambers of the casing arranged to contact the operating-tool at one limit of its stroke and divide the exhaust from the pressure chamber, a head portion on such piston-hammer dividing the pressure-chamber into two chambers, one a constant-pressure chamber and the other a main intermittent-pressure chamber, so as to present a larger superficial area of the piston in the main chamber over the surface presented in the constant-pressure chamber, means whereby fluid-pressure is admitted constantly to the constant-pressure chamber, a passage in the piston for alternately connecting the main and constant-pressure chamber and the main pressure and exhaust chambers by the movements of the reciprocating piston to supply to and exhaust fluid-pressure from the same, substantially as described.

9. In a machine of the class described, the combination of a casing provided with a pressure and exhaust chamber, an operating-tool in one end thereof, a reciprocating piston-hammer in the casing arranged to contact the operating-tool at one limit of its stroke and divide the pressure from the exhaust chambers, a head portion on the piston dividing the pressure-chamber into two chambers, one an annular pressure-chamber between the body, the piston and the casing and the other a main pressure-chamber between the head and the end of the casing and presenting a larger superficial area of piston surface than in the annular chamber, an inlet-passage connected with the annular chamber whereby fluid-pressure is admitted constantly thereto, and a passage in the piston whereby the main and constant-pressure chamber and the main and exhaust chambers are alternately connected to admit to and exhaust fluid-pressure from the main chamber during the movements of the piston, substantially as described.

604,684. DISH-CLEANER. ROBERT B. PARRY and EDWIN EVANS, Poultney, Vt., assignors of one-third to John Hughes Parry, Utica, N. Y. Filed Apr. 9, 1897. Serial No. 631,568. (No model.)

Claim.—1. A dish-washing machine, comprising a reservoir, a cover therefor, carrier-rings mounted to rotate in the reservoir and cover, means for raising and supporting the carrier-rings above the water in the reservoir, a series of open-work receptacles for containing articles to be washed, said receptacles being arranged to conform to the interior of the carrier-rings, a brush secured to the carrier-rings and means for holding dishes in the reservoir outside the carrier, substantially as specified.

2. A dish-washing machine, comprising a reservoir, a cover thereon, a carrier mounted to rotate in said reservoir, a brush on the carrier, vertically movable rods on the reservoir and having bearings for the shaft of the carrier, guides for the rods and fulcrumed levers having pivotal connection with said rods, substantially as specified.

3. A dish-washing machine, comprising a reservoir, a semicircular cover therefor, a carrier mounted to rotate in the reservoir and cover and adapted to receive dish-receptacles, a brush secured to the carrier, and spring yielding clips in the reservoir for receiving and holding dishes to be operated upon by the brushes, substantially as specified.

4. A dish-washing machine, comprising a reservoir, a semicircular cover therefor, a carrier mounted to rotate in the reservoir and cover and adapted to receive dish-receptacles, a brush secured to the carrier, spring yielding clips in the reservoir for receiving and holding dishes to be operated upon by the brushes, and spring yielding clips in the cover portion for supporting the dishes, substantially as specified.

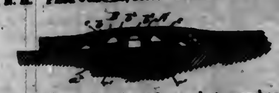
5. A dish-washing machine, comprising a reservoir a carrier mounted to rotate in the reservoir, and means for lifting and supporting the carrier, comprising sliding bearing-blocks, guides therefor and levers, substantially as specified.

604,685. APPARATUS FOR CASTING TYPE. JAMES G. PAYNE, St. Louis, Mo. Filed June 21, 1897. Serial No. 641,603. (No model.)

Claim.—1. An apparatus for casting type comprising a type-mold, a matrix, a nipple having a core extension formed with a jet-opening and whereby a recess or channel is formed in the base of the type, and a choker-valve constructed and arranged to enter and fill the jet-opening and thereby displace the molten metal at the base of the core extension, whereby the necessity of removing the sprue is avoided; substantially as described.

2. An apparatus for casting type comprising a type-mold, a matrix, a nipple-plate having a core-extension formed with a jet-opening and whereby a recess or channel is formed in the base of the type, a nipple adapted to seat in the core extension, and a choker-valve constructed and arranged to enter and fill the jet-opening and thereby displace the molten metal at the base of the nipple and core extension, whereby the necessity of removing the sprue is avoided; substantially as described.

604,686. DEVICE FOR REPAIRING RUBBER TIRES. JAMES F. REYNOLDS, Lynn, Mass., assignor to L. C. Chase & Co., Boston, Mass. Filed Feb. 21, 1898. Serial No. 671,086. (No model.)



Claim.—1. A repair-patch for rubber tires and the like, comprising two layers of unvulcanized rubber, an interposed layer of inelastic material completely inclosed by the layers of rubber, and a backing of resilient material, substantially as described.

2. A repair-patch for rubber tires and the like, comprising two layers of unvulcanized rubber, an interposed layer of inelastic material, and a backing of vulcanized rubber, the edges of the layers of unvulcanized rubber extending beyond the inelastic material to form an annular, hermetic seal around it when the said layers are vulcanized, substantially as described.

3. A repair-patch for rubber tires and the like, comprising two layers of rubber ready for vulcanizing, an interposed smaller layer of strengthening material, a resilient backing, and a thread or string passed through the outer layer of rubber and attached to the strengthening-layer, the layers of rubber extending beyond the edges of said strengthening-layer and adapted to be vulcanized together to hermetically inclose the strengthening-layers, substantially as described.

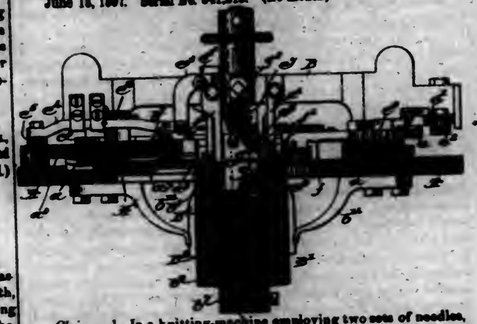
604,687. FASTENER. WILLIAM S. RICHARDSON, Boston, Mass., assignor to the Ball and Socket Fastener Company, same place and Nashua, N. H. Filed June 23, 1896. Serial No. 596,900. (No model.)

Claim.—1. The combination of a socket member having a fastening-flange, a wall surrounded by the flange and integral therewith, which wall forms a cavity open at both ends and provides a yielding socket-entrance, and a flexible fabric to one surface of which the fastening-flange is secured, and which fabric covers the said cavity opposite the socket-entrance and is held from said socket-entrance by the wall, and which fabric and wall forms a bearing, raised from the socket-entrance, for the thumb or finger used in holding or pressing said socket member while it is being engaged by or with its cooperating member.

2. The combination of a socket member of a fastener having a fastening-flange, a wall at an angle to said flange surrounded by and integral with the flange, forming a cavity or chamber open at both ends and a socket-entrance, flexible fabric to which the said member is secured by said flange, and which fabric is held from the socket-entrance by said wall and closes one end of said cavity, with a ball member having a flange by which it is secured to its support or material, and said support or material; the said socket and ball members being secured to the opposing faces of the fabrics or parts which they unite without perforating said fabrics or parts and without interposing any substance between the ball and the fabric with which it is united by the socket member.

3. A socket member of a fastener consisting of a single piece of metal having a fastening-flange adapted to lie against the surface of the fabric or material to which the member is to be attached, a wall integral with said flange and forming a stud-containing cavity open at both ends, and which wall provides, first, a socket-entrance, second, a means for holding the fabric from the socket-entrance, and, third, a pressure-receiving bearing, as and for the purposes set forth.

4. A complete socket member of a fastener consisting of a single piece of metal, having an attaching-flange, a socket-entrance substantially in line with said flange and a wall or raised section surrounding said socket-entrance.



5. A complete socket member of a fastener consisting of only one piece of metal having an attaching-flange, a socket-entrance substantially in line therewith, a raised section about said socket-entrance, and a slit b^4 extending from the socket-entrance through the raised section or wall and flange.

6. A complete socket member of a fastener consisting of only one piece of metal and having the flange b provided with holes b', the continuous socket-entrance b^2 and the interposed raised section or wall b^3, as and for the purposes described.

7. A complete socket member of a fastener consisting of a single piece having an attaching-flange adapted to be united to a surface of the fabric or material with which it is used, an integral continuous wall extending first upward therefrom and then downward, to provide a socket-entrance substantially in line with the flange, said wall serving as a means for holding the fabric or material above or away from the socket-entrance and thereby establishing a ball-receiving cavity above said entrance.

8. A complete socket member of a fastener consisting of a single piece of metal having an attaching-flange and a continuous raised wall or bead within said flange and the inner depending part of which wall or bead extends downward so as to form a socket-entrance substantially in line with the said flange, said wall or bead serving to hold the fabric or material above or away from the socket-entrance, to provide a ball-receiving cavity, combined with a ball member consisting also of a single piece of metal and also having an attaching-flange, one of said members being formed resilient so that they will be elastically and detachably connected when engaged, and the ball of said ball member being of a height approximately equal to the height of said wall so that the top of said ball will not project materially above the top of said wall or bead when the two members of the fastening are engaged.

604,688. KNITTING-MACHINE. JOHN H. RICE, Manchester, N. H., assignor to the Leighton Machine Company, same place. Filed June 18, 1897. Serial No. 641,315. (No model.)

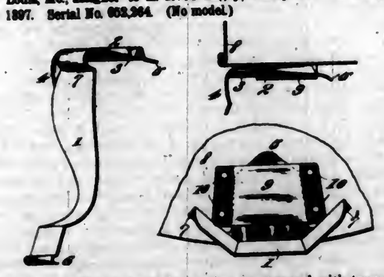
Claim.—1. In a knitting-machine employing two sets of needles, one or more main-thread guides to constantly supply said needles with thread, and means to actuate said needles to knit plain-rib stitch, combined with one or more auxiliary sets of cams and one or more auxiliary-thread guides which are not in action when the machine is operated to knit plain-rib stitch, and with means to put said auxiliary cams into operative position to cause them to also actuate said plate-needles to take said auxiliary threads and enable tuck or royal rib stitch to be knitted at desired times, substantially as described.

2. In a knitting-machine, the following instrumentalities, viz: a cylinder-needle bed to contain cylinder-needles, a cylinder-needle cam to actuate said needles, a dial-needle bed to contain a series of plate-needles, a dial-needle cam-plate having a plurality of main cams to actuate said plate-needles, a plurality of main-thread guides having threads to at all times supply said plate-needles with thread for plain-rib knitting, a plurality of auxiliary cams carried by said dial-needle cam-plate, a plurality of auxiliary-thread guides which occupy their inoperative position when the machine is actuated to knit plain-rib stitch, and means under the control of a pattern-surface to put said auxiliary cams into their operative position to actuate said plate-needles to take thread from said auxiliary-thread guides at points intermediate the said main-thread guide when tuck or royal rib is to be knitted, and means to effect the putting of the said auxiliary cams out of operative position when plain-rib knitting is to be carried on following tuck or royal rib knitting, substantially as described.

3. In a knitting-machine, the following instrumentalities, viz: a cylinder-needle bed to contain cylinder-needles, a cylinder-needle cam to actuate said needles, a dial-needle bed to contain a series of plate-needles, a dial-needle cam-plate having a plurality of main cams to actuate said plate-needles, a plurality of main-thread guides to supply said plate-needles at all times for plain-rib knitting, a plurality of auxiliary-thread guides, a plurality of auxiliary cams, and means under the control of a pattern-surface to put said auxiliary cams into operative position to actuate said plate-needles to take thread from said auxiliary-thread guides at points intermediate the said main-thread guide when tuck or royal rib is to be knitted, and means to effect the putting of the said auxiliary cams out of operative position when plain-rib knitting is to be carried on following tuck or royal rib knitting, and means to cut off said auxiliary threads, substantially as described.

4. In a knitting-machine, the following instrumentalities, viz: a cylinder-needle bed to contain cylinder-needles, a cylinder-needle cam to actuate said needles, a dial-needle bed to contain a series of plate-needles, a dial-needle cam-plate having a plurality of main cams to actuate said plate-needles, a plurality of main-thread guides having threads to at all times supply said plate-needles at all times for rib-knitting, a plurality of auxiliary-thread guides, a plurality of auxiliary cams, and means under the control of a pattern-surface to put said auxiliary cams into operative position to actuate said plate-needles to take thread from said

auxiliary-thread guides at points intermediate the said main-thread guide when tuck or royal rib is to be knitted, and means to effect the putting of the said auxiliary cams out of operative position when plain-rib knitting is to be carried on following tuck or royal rib knitting, and means to clamp and hold the ends of said auxiliary threads, substantially as described.



5. In a knitting-machine, a dial-needle cam-plate, a pair of blades occupying a position within the central opening of the said plate, and a dial or plate needle bed, a cam mounted therein, and a pattern-surface to actuate said cam, combined with means intermediate one of said blades and said cam to actuate the same at the proper time to cut a thread placed between them, substantially as described.

6. The dial needle cam-plate, and the ratchet-toothed ring having spaced cam projections 2 and mounted thereon, a pawl to move said ratchet-toothed ring on said cam-plate, a plurality of sets of auxiliary cams, levers a^{20}, and 16, connected with said cams, and a lever c, said levers a^{20} and c being acted upon by said cam projections and actuating said auxiliary cams, substantially as described.

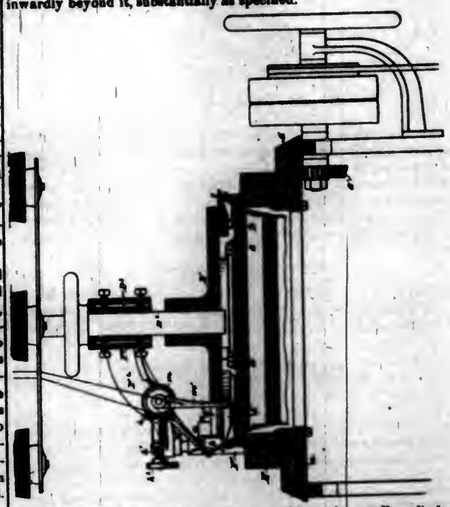
7. The dial-needle cam-plate, its cams a^3 and a^7, two levers a^{20} and c connected with said cams, and a third lever having an adjusting device, combined with a ring having cam projections to actuate said levers a^{20} and c, substantially as described.

8. In a machine for knitting plain-rib stitch and tuck or royal rib stitch, the following instrumentalities, viz: a cylinder-needle bed to contain cylinder-needles, a cam-cylinder to actuate said needles, a dial or plate needle bed, a series of plate-needles therein, a plurality of main-thread guides containing threads to be used in plain-rib knitting, and a plurality of auxiliary-thread guides to contain threads to be used only when tuck or royal rib stitch is being made, a dial-needle cam-plate provided with a plurality of main cams to operate said plate-needles, to take the threads from the main-thread guides for plain-rib knitting, and a plurality of auxiliary cams, and means to automatically put them in operative position to impart to said plate-needles during each rotation of said cam-plate extra knitting movements to engage the threads of said auxiliary-thread guides only when tuck or royal rib stitch is being knitted, substantially as described.

604,689. SHEET-METAL STOVE-LEG. JOHN B. SCHNEIDER, St. Louis, Mo., assignor to H. Given Hagey, same place. Filed Sept. 20, 1897. Serial No. 652,264. (No model.)

Claim.—1. A sheet-metal stove-leg constructed with transverse corrugations 7 for providing an extended bearing-surface to support the stove, and with longitudinal corrugations 3 and 4 for strengthening the leg; substantially as described.

2. A sheet-metal stove-leg, having a horizontal tongue adapted to engage with the keeper of a stove, and a spring-tip on said tongue adapted to serve as a lock, substantially as described.



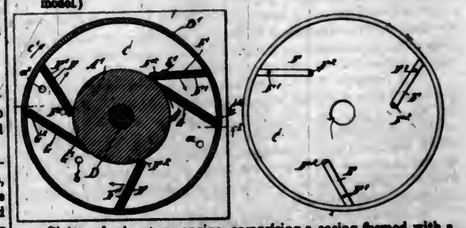
3. A sheet-metal stove-leg, provided at the top thereof with a horizontal corrugated tongue, said corrugations extending down over the front of said leg, a spring-tip on the end of said tongue, and transverse corrugations at the top of said leg which provide an extended bearing-surface to support the stove, substantially as described.

4. The combination of a sheet metal stove-leg, said leg being provided with a horizontal tongue, a spring-tip on said tongue, and a socket secured to the stove-bottom into which said tongue is adapted to fit, and be locked by said spring-tip, substantially as described.

604,640. YARN-CHANGING DEVICE FOR RIB-KNITTING MACHINES. ROBERT W. SCOTT, Philadelphia, Pa., assignor of one-half to Louis H. D. Williams, Ashbourne, Pa. Filed Apr. 16, 1896. Renewed May 8, 1896. Serial No. 590,722. (No model.)

Claim.—1. The combination, in a knitting-machine, of a needle-cylinder and its needles, an annular dial also provided with needles, and having a slot extending through the same from the inner to the outer edge, and means for actuating the needles of the cylinder and dial whereby one or more threads may be passed down on the inner side of the dial, substantially as specified.

2. The combination, in a knitting-machine, of a needle-cylinder and its needles, an annular dial also provided with needles, and having a slot extending through the same from the inner to the outer edge, means for actuating the needles of the cylinder and dial, and a movable thread-guide adapted to carry a thread through the slot of the dial from a position outwardly beyond the same to a position inwardly beyond it, substantially as specified.



3. The combination, in a knitting-machine, of a needle-cylinder and its needles, an annular dial also provided with needles, and having a radial slot, cam-cylinder having cams for actuating the cylinder-needles, a cam-plate having cams for actuating the dial-needles, and brackets on said cam-plate for supporting said dial, substantially as specified.

4. The combination, in a knitting-machine, of a needle-cylinder and its needles, an annular dial also provided with needles and having a radial slot, means for actuating the needles of the cylinder and dial, a series of thread-guides mounted so as to be movable inwardly through the slot of the dial to a position within the limits of said dial and so as to be moved outwardly through said slot to a position for feeding thread to the needles of the cylinder and dial, and means for so moving said thread-guides.

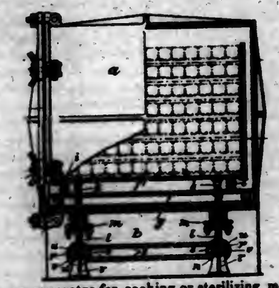
5. The combination in a knitting-machine, of the needle-cylinder and its needles, the cam-cylinder, an annular and radially-slotted dial and its needles, a radially-slotted cam-plate and its spindle, a structure connecting the cam-cylinder and the spindle of the dial cam-plate, and swinging thread-guides mounted upon said connecting structure and adapted to move through the slot of the dial either to an inoperative position within the dial or to an operative position beyond the same.

6. The combination of the swinging thread-guides, the bevel-wheels carrying the same, a bevel-wheel meshing with the wheels which carry the thread-guides, a shaft carrying said meshing bevel-wheel, a tappet on said shaft, and means for actuating said tappet so as to partially turn the shaft first in one direction and then in the opposite direction, substantially as specified.

604,641. ROTARY ENGINE. WILLIAM WILLERTON and THOMAS SHORTLIFF, Kipp, Mont. Filed July 27, 1897. Serial No. 646,094. (No model.)

Claim.—1. A rotary engine, comprising a casing formed with a hub and having pivoted abutments, a revoluble piston in the form of a wheel having a rim concentric to the hub of the casing and forming with the said hub an annular working chamber, the said abutments being pivoted near their inner ends and each having a heel at said end adapted to rest against the inner wall or hub, the outer ends of said abutments being adapted to travel on the inner surface of the said rim, and piston-heads pivoted near their outer ends on the web of the said wheel, the inner ends of the said piston-heads being adapted to travel on the peripheral surface of the hub, substantially as described.

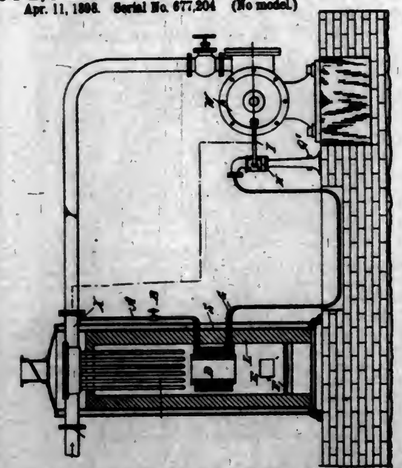
2. A rotary engine, comprising a casing formed on one face with a hub, the said casing having inlet and exhaust ports alternately arranged, a piston mounted to turn and having its central portion engaging the said hub of the casing, the piston having a solid web and a rim concentric to the said hub of the casing and having its outer edge fitted to turn in an annular groove formed on the inner face of the casing, thereby forming with the casing an annular working chamber, the said piston being provided with piston-heads pivoted near their outer ends to the web of the said piston and mounted to swing in the said chamber, the inner ends of the said piston-heads being provided with friction-rollers adapted to travel on the peripheral surface of the hub of the casing, and abutments pivoted near their inner ends to the hub of said casing at opposite points and normally extending tangentially therefrom, the said abutments being provided at their outer ends with friction-rollers arranged to travel on the inner surface of the rim of the piston, the said abutments and piston-heads being so arranged that when the piston rotates the piston-heads swing outwardly while the abutments swing inwardly to allow the piston-heads to pass the abutments, substantially as set forth.



3. A rotary engine, comprising a casing, and a piston mounted to turn and forming with the said casing an annular working chamber and pivoted abutments and pivoted piston-heads within the working chamber and adapted to pass one another, the said abutments being pivoted near their inner ends to the inner fixed wall of said working chamber and provided with friction-rollers at their outer ends adapted to rest against the inner surface of the rim of the piston, and the said piston-heads being pivoted near their outer ends on the movable piston and having their inner ends provided with friction-rollers adapted to engage the inner fixed wall of the said working chamber, the said casing being provided with inlet-ports opening into the said annular chamber forward of said abutments, and outlet-ports leading from said annular chamber and located at the rear of said abutments, the inlet-ports being located near the outer wall of the annular chamber and the outlet-ports near the inner wall thereof, the said ports being alternately arranged, substantially as shown and described.

4. A rotary engine, comprising a casing, a piston mounted to turn and forming with the said casing an annular working chamber, abutments pivoted near their inner ends to the inner fixed wall of the chamber at opposite points and adapted to engage with their outer ends the inner surface of the rim of the piston, piston-heads pivoted near their outer ends to the movable piston and having their inner ends adapted to engage the inner fixed wall of the working chamber, the said casing being provided with oppositely-arranged inlet-ports opening into the said annular working chamber at a point forward of said abutments, the casing being also provided with oppositely-arranged outlet-ports opening into the annular chamber at the rear of the abutments, the said pivoted abutments and pivoted piston-heads being adapted to pass one another and arranged to be returned to their normal positions by pressure of the motive agent, substantially as set forth.

5. A rotary engine, comprising a casing, a revoluble piston forming with the said casing an annular working chamber, two oppositely-arranged abutments pivoted near their inner ends to the casing and resting with their inner ends against the inner wall of the chamber, the said abutments carrying friction-rollers at their outer ends adapted to rest against the rim of the piston, the said abutments normally extending tangentially from the inner wall of the annular working chamber and in opposite directions, piston-heads pivoted near their outer ends on the web of the piston and adapted to rest with their outer ends against the rim of the piston and their inner ends on the inner wall of the chamber, the piston-heads being three in number, the said casing being provided with diametrically-arranged inlet-ports opening into the annular working chamber forward of the said abutments, and outlet-ports opening into said chamber at the rear of said abutments, substantially as set forth.



604,642. APPARATUS FOR TREATING OR STERILIZING CANNED FOOD. FRANK W. SMITH, Portland, Me. Filed Sept. 3, 1897. Serial No. 650,473. (No model.)

Claim.—1. In an apparatus for cooking or sterilizing meats, vegetables and other substances, the combination of a stationary retort, a car, crate or similar device holding such substances, a rod connected with said car and passing through a steam-tight opening in the walls of said retort and means for reciprocating such rod, substantially as described.

2. In an apparatus for cooking or sterilizing meats and other substances, the combination of a stationary retort, a car, crate or similar device mounted upon springs upon a car with trucks and means by which said springs may be alternately depressed and released, substantially as described.

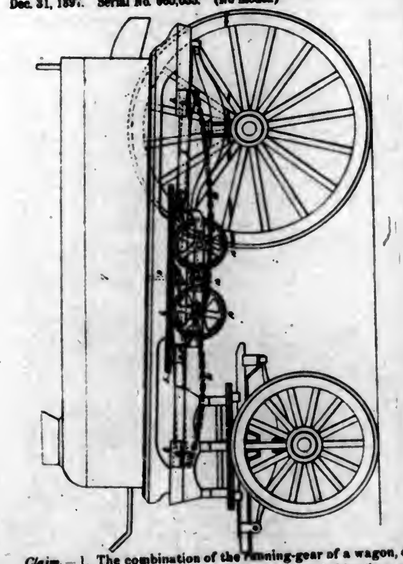
604,643. ENGINE. HENRI STEVEN, San Sebastian, Spain. Filed Apr. 11, 1898. Serial No. 677,204. (No model.)

Claim.—1. The combination with the movable resistance or piston, the cylinder or working chamber, and means for supplying a main motive agent alternately to both ends of the cylinder, of a separate superheater for each end of the cylinder, connections from the superheaters to the cylinder, and a shifting valve for alternately admitting the heating medium from the superheaters to the cylinder.

2. The combination, with movable resistance or piston, the cylinder or working chamber, means for supplying a motive agent to said cylinder, ports or nozzles arranged longitudinally to discharge a fluid in the same direction in which the piston moves, and a superheating arrangement connected with said ports.

3. The combination with the piston or movable resistance, the cylinder or working chamber, and means for supplying a motive agent thereto, of two superheaters, a valve-casing having two passages connected to the ends of the cylinder, and two passages connected to said superheaters, and a shifting valve which in each of its positions closes one of the cylinder-passages and one of the superheater-passages.

4. The combination with the piston or movable resistance, the cylinder or working chamber, and means for supplying a motive agent thereto, of two superheaters, a valve-casing having two passages connected to the ends of the cylinder, and two passages connected to said superheaters, and an oscillating valve which in each of its positions closes one of the cylinder-passages and one of the superheater-passages.



5. The combination with the piston or movable resistance, the cylinder or working chamber, and means for supplying a motive agent thereto, of a valve-casing having two passages connected to the ends of the cylinder, a superheating arrangement connected to the valve-

casing, and an oscillating valve for alternately admitting the superheated medium to the opposite ends of the cylinder.

6. The combination with the piston or movable resistance, the cylinder or working chamber, a furnace, a supply-pipe for the motive agent, a series of pipes connected to said supply-pipe and extending into said furnace to dry the motive agent, a device for distributing the motive agent in the cylinder, a pipe leading from the discharge end of the said series of pipes to the distributing device, a superheating arrangement located in said furnace and having connections to each end of the cylinder, and an oscillating valve for alternately admitting the superheated medium to opposite ends of the cylinder.

7. The combination with the piston or movable resistance, the cylinder or working chamber, a device for distributing the motive agent in the cylinder, and a supply-pipe leading to said device, of a branch pipe connected to said supply-pipe, a superheating arrangement connected to said branch pipe, a throttle-valve controlling the connection of the superheating arrangement with the supply-pipe, connections from the superheating arrangement to each end of the cylinder, and a shifting valve for alternately admitting the superheated medium to opposite ends of the cylinder.

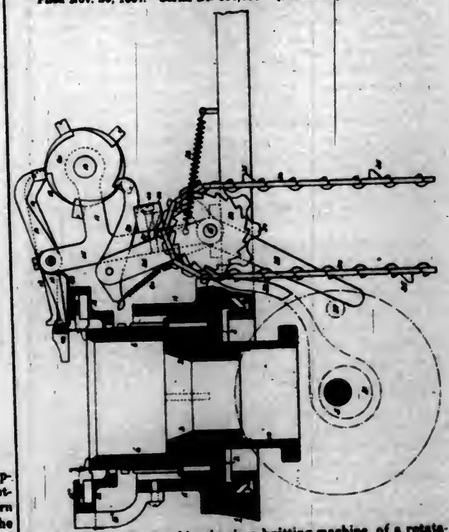
604,644. DUMPING-WAGON. SAMUEL STURGIS, West Manayunk, Pa., assignor to James A. McCullough, Philadelphia, Pa. Filed Dec. 31, 1897. Serial No. 665,033. (No model.)

Claim.—1. The combination of the running-gear of a wagon, opposite pairs of toggle-levers thereon, a turn-table carried by the meeting ends of said toggle-levers, a wagon-body mounted so as to turn on said turn-table, and provision for drawing the lower ends of the toggle-levers toward each other so as to elevate the turn-table and the wagon-body mounted thereon, substantially as specified.

2. The combination of the running-gear of a wagon, opposite pairs of toggle-levers, a turn-table carried by the meeting ends of said levers, a wagon-body mounted upon said turn-table so as to be free to turn thereon, and winding-shafts having draft-chains, those of one shaft operating one pair of toggle-levers and those of the other shaft operating the other pair of toggle-levers, substantially as specified.

3. The combination of the running-gear of a wagon, opposite pairs of toggle-levers, a turn-table carried by the meeting ends of said pairs of levers, a wagon-body free to turn on said turn-table, a pair of winding-shafts, draft-chains whereby each shaft is caused to operate its respective pair of toggle-levers, and slides guided on the sills of the truck and carrying the outer ends of said toggle-levers, substantially as specified.

4. The combination of the truck and its running-gear, opposite pairs of toggle levers, a turn-table carried by the meeting ends of said levers, a wagon-body free to turn on said turn table, winding-shafts each having draft-chains operating its respective pair of toggle-levers, cone-drums on said shafts, and stay-chains leading from said cone-drums to the fore-and-aft portions of the turn-table, substantially as specified.



5. The combination of the truck and its running-gear, opposite pairs of toggle-levers, a turn-table carried by the meeting ends of said levers, a wagon-body free to turn on said turn-table, a pair of winding-shafts each having draft-chains operating its respective pair of toggle-levers, and provision for operating said winding-shafts either simultaneously or separately, substantially as specified.

604,645. SYRINGE. WILLIAM L. WHITTINGTON, St. Joseph, Mo. Filed May 13, 1896. Renewed Dec. 17, 1897. Serial No. 662,341. (No model.)

Claim.—A vaginal syringe having an interiorly-threaded socket at the end of its discharge-tube, the discharge-nozzle having its rear end reduced and threaded to take into said socket and also having the collar flange or shoulder *g*, and the projection *h*, in rear of said flange or shoulder, and the frame comprising the sleeve *i*, placed on the nozzle between the collar-flange thereof and the socket of the discharge-tube and having a notch in its forward end receiving the projection *h*, of the nozzle, the arms *k*, extending radially from the rear end of the sleeve, the forward plate, and the bars connected at their ends to the said plate and the arms *k*, substantially as specified.

604,646. CIRCULAR-KNITTING MACHINE. LOUIS H. D. WILLIAMS, Ashbourne, and HARRY SWINBURNE, Jr., Philadelphia, Pa., assignors to said Williams and Robert W. Scott, Philadelphia, Pa. Filed Nov. 29, 1897. Serial No. 660,060. (No model.)

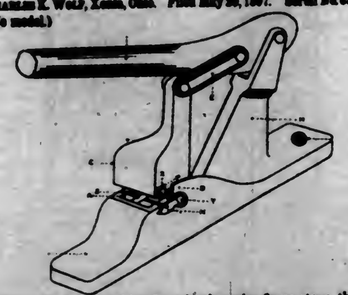
Claim.—1. The combination in a knitting-machine, of a rotatable and removable needle-cylinder, with thread-guides movable into and out of operative relation with the needles, and also movable from and toward the needles so as to permit of the insertion or removal of the needle-cylinder.

2. A knitting-machine in which are combined a rotatable and removable needle-cylinder, thread-guides movable into and out of operative relation with the needles of said cylinder and also movable to and from the needle-cylinder so as to permit of the insertion and removal of the same, and a pattern device acting on said thread-guides and movable toward and from the needle-cylinder with the same.

3. A knitting-machine in which are combined a needle-cylinder, a rotatable carrier therefor having a split and tapered flange engaging with the inner side of the needle-cylinder and an annular wedge rotating with said carrier and acting upon the split and tapered flange of the same.

4. A knitting-machine in which are combined a needle-cylinder, a rotatable carrier having a split and tapered flange adapted to engage with the inner side of said cylinder, an annular wedge engaging with said split and tapered flange, and an annular nut engaging with said annular wedge and bearing upon said rotating carrier.

5. A knitting-machine in which are combined a rotatable and removable needle-cylinder, a series of thread-guides, a pattern-drum for acting thereupon, a pivoted structure carrying said thread-guides and drum, and operating mechanism for said pattern-drum hung upon the same axis as the carrier therefor.

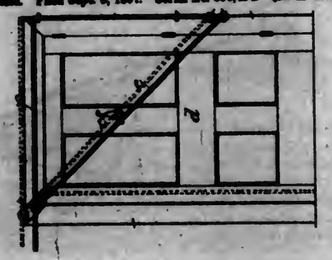


6. The combination in a knitting-machine, of a series of thread-guides, a pattern-drum for acting thereupon, a ratchet-wheel connected to said drum, a swinging arm having a pawl for engaging with said ratchet-wheel, a movable stop lug for arresting the movement of said pawl-carrying arm, a pattern-chain for moving said lug, and means for actuating said pattern-chain and swinging arm.

7. A knitting-machine in which are combined a rotatable needle-cylinder, thread-guides movable vertically into and out of operative relation with the needles, and a needle shield or guard covering and protecting the tops of the needles on each side of the knitting-point, whereby the thread from a raised guide will pass over said shield.

8. A knitting-machine in which are combined a rotatable needle-cylinder, thread-guides movable vertically into and out of operative relation with the needles, and a needle shield or guard covering and protecting the tops of the needles on each side of the knitting-point, whereby the thread from a raised guide will pass over said shield, the latter being cut away so as to escape the needles when the latter rise to receive the thread from the operative guide.

9. A knitting-machine in which are combined a rotatable and removable needle-cylinder, thread-guides movable vertically into and out of operative relation with the needles, a needle shield or guard for preventing the thread from a raised guide from engaging with the needles at the knitting-point, and a carrier for said thread-guides and needle-shield movable so as to carry them away from the cylinder in order to permit of the removal of the same.



604,647. MACHINE FOR CRIMPING WIRE-FENCE STAYS. CHARLES K. WOLF, Xenia, Ohio. Filed May 20, 1897. Serial No. 638,702. (No model.)

Claim.—1. In a machine for crimping wire-fence stays, the combination with the casting or base 1, the projection extending from the upper side of said base forming a boxing in which is placed the female die A, the hammer fastened to the top of said projection and working pivotally thereon and being provided on its under side with a male die F, the link E connecting said hammer with the lever F pivoted to the upright H on the base, substantially as described and shown.

2. In a machine for crimping wire-fence stays, the combination with the base or casting formed with a projection on its upper side, and with a lug at the side, of the hammer having a male die at its lower end, the stud or pivot at the side of the hammer and engaging said lug, the upright formed integral with said casting, the lever pivoted thereto, the link pivotally connecting said lever and hammer, and the guide N, substantially as described and shown.

604,648. PORTIÈRE-ROD. JAMES ATHERSON, Dunedin, New Zealand. Filed Sept. 3, 1897. Serial No. 650,694. (No model.)

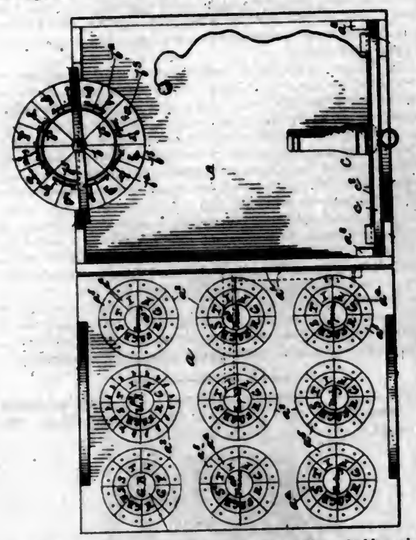
Claim.—1. A curtain or portière support of the character described, comprising a vertical rod; a horizontal rod fixed upon the upper end of said vertical rod; a diagonal rod rigidly fixed at its ends to said vertical and horizontal rods; eyebolts or equivalent devices loosely mounted upon said vertical rod; and an eyebolt or equivalent device loosely mounted upon said diagonal rod, as and for the purposes described.

2. The combination with a swinging door and its hinge-post; of a curtain or portière support comprising a vertical rod, a horizontal rod fixed upon the upper end of said vertical rod, and a diagonal rod rigidly connected to both of said rods; a plurality of eyebolts or equivalent devices loosely inclosing said vertical rod and attached in a vertical line to the hinge-post of said door at some distance to one side of the hinges thereof; and an eyebolt or equivalent device loosely inclosing said diagonal rod and fixed upon said door, substantially as and for the purposes described.

3. The combination with a swinging door and its hinge-post; of a curtain or portière support comprising a vertical rod hinged to the said hinge-post of the door, and at some distance to one side of the hinges of the latter, and having a longitudinal as well as a rotary movement; a horizontal rod fixed upon the upper end of said vertical rod and extending transversely above the doorway; and a diagonal rod rigidly connected at its ends to said vertical and horizontal rods and passing through a guide fixed upon the face of the door, and having a longitudinal movement in said guide, substantially as described.

604,649. PERPETUAL CALENDAR. OCTAVIUS H. ST. GEORGE ARMER, Madison, Wis. Filed May 26, 1897. Serial No. 638,051. (No model.)

Claim.—In a calendar of the character set forth, the combination of a rectangular frame open at the front and having a pivoted back to serve as a rest therefor, and also formed with a longitudinal slot in one of the frame sides, a calendar-card mounted in the said frame and divided into columns representing the days of the month and also formed with a longitudinal slot as well as upper slots, an endless roll movable against the back of the frame containing days of the week and also an upper roll bearing the names of the months of the year, one of the slots at the top of the frame being adapted to expose a roll bearing terminal numerals representing the fraction of a year or portion of a century, and a concealing-slide movable over the card at one side thereof to conceal one or all of the numerals in the last column of the same, and connected to cranks of an actuating-slide, the said cranks projecting through the slot in one side of the frame and the actuating-slide being of greater width than the said slot and located on the exterior of the frame and provided with an operating-knob, the said shanks also providing stops to abut against the upper and lower terminations of the slot in the side of the frame and limit the movement of the concealing-slide.



604,650. GAME APPARATUS. CHARLES R. AMES, Duluth, Minn., assignor of one-half to Edward A. Forsythe, same place. Filed Oct. 7, 1897. Serial No. 654,436. (No model.)

Claim.—1. In a game apparatus, the combination of a suitable casing, a target mounted therein, means for shooting said target, a cover for said casing having an indicod counter thereon consisting of inclosed spaces representing the territories of different nations, each inclosed space having an inner space which is subdivided, each subdivision representing a nation represented in the game, and an outer subdivided space provided with pin-holes adapted to receive and hold markers representing captured flags or prisoners, substantially as described.

2. In a game apparatus, the combination with a suitable target and a shooting means, of a casing for inclosing the same, the said casing being provided with apertures in its ends for accommodating the target and the shooting apparatus, a cover adapted to close the casing when the game is not being used and means on the cover for closing the said apertures in the casing, substantially as described.

3. In a game apparatus, the combination with a suitable casing, of a target adapted to be mounted therein, said target comprising a disk having soldiers or flags removably mounted thereon, a revolv-

ing rim surrounding the said disk and adapted to indicate the flag or soldier captured and a mechanism for throwing a projectile against said target for revolving it, substantially as described.

4. In a game apparatus, the combination with a suitable casing, of a target adapted to be mounted therein comprising a vertical standard, a disk mounted thereon having suitable indicating means upon the same, a revolving rim also mounted on said standard, a target portion mounted on the said rim and an indicator adapted to operate in connection with the indications upon the said disk and means for forcing a projectile against the said target, substantially as described.

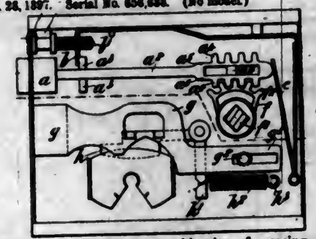
5. In a game apparatus, the combination of a suitable casing having apertures in the sides thereof, a removable target mechanism adapted to be set up in one of said apertures and a gun-carriage adapted to be set up in the other aperture whereby the parts will be held in suitable playing position, substantially as described.

6. In a game apparatus, the combination with a suitable casing of a target mounted therein, a removable gun-carriage, having a plurality of engaging portions, disposed at right angles to each other, a cannon, pivotally and slidably mounted therein, and retaining means in said box for holding the said gun-carriage in position, the construction being such that the carriage may be placed in position upon different edges so that the gun may have a horizontal or vertical sliding movement, substantially as described.

7. In a game apparatus, the combination with a suitable casing of a target having a disk provided with spaces for the representative flags and soldiers of different nations, a counter having spaces representing the territory of different nations, a target provided with an indicator for designating the flag or soldier of the nation which may be captured, the construction being such that the captured flag or soldier may be placed in the prison of the victorious nation upon the counter, substantially as described.

8. In a game apparatus, the combination with a suitable casing of a target mounted therein having a revolving rim portion, a projectile-receiving portion mounted thereon and an indicator secured to the said rim, a disk also mounted on the said target and provided with flags and soldiers of different nations, a removable cannon also mounted in the said casing and adapted to force the projectiles against the said target, the construction being such that the revolving rim portion will indicate when it ceases its movement the flag or soldier captured, substantially as described.

604,651. WELL-STRAINER. JOHN BOOTH, Bellville, Tex. Filed Sept. 23, 1897. Serial No. 652,642. (No model.)

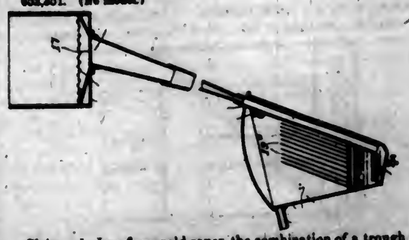


Claim.—1. In a well-strainer, the combination of a hollow shell or casing made up of a plurality of sections fitted together, and provided externally with a plurality of larger openings leading partially therethrough, and internally with a corresponding number of smaller openings leading to said larger external openings; a strainer covering the passage between each larger and corresponding smaller opening; and a strainer covering each larger opening, substantially as described.

2. In a well-strainer, the combination with a hollow shell or casing made of cement molded into the desired shape and provided externally with a plurality of larger openings leading partially therethrough, and internally with a corresponding number of smaller openings leading to said larger external openings; sheets of wire-gauze covering the inner ends of said smaller openings, and other sheets of wire-gauze covering the outer ends of said larger openings, said sheets of gauze being embedded at their edges in said cement, substantially as described.

3. In a well-strainer, the combination with a hollow shell or casing made of cement, molded into the desired shape and provided externally with a plurality of openings leading partially therethrough, and internally with smaller openings leading to said external openings, sheets of wire-gauze covering the outer ends of said smaller openings, and other sheets of wire-gauze covering the outer ends of said larger openings, said sheets of gauze being embedded at their edges in said cement casing, and a porous filtering material filling the space between the parallel layers of wire-gauze, substantially as described.

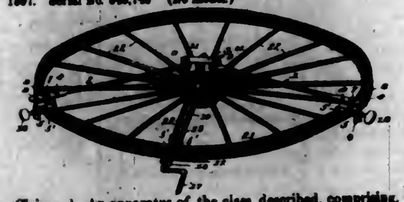
604,652. LOCK. WILLIAM R. BURT, Dunedin, New Zealand. Filed Oct. 28, 1897. Serial No. 656,688. (No model.)



Claim.—1. In a lock, the combination of a casing, a bolt provided with a pin, a spring engaging said bolt, one end of said spring serving as a stop with which said pin engages and an adjusting-screw mounted in said casing and engaging the said stop, substantially as described.

2. In a lock, the combination of a casing, a bolt provided with a rack and a pin, a handle provided with a rack, a spring engaging said bolt, one end of said spring serving as a stop with which said pin engages and an adjusting-screw mounted in said casing and engaging the stop, substantially as described.

3. In a lock, the combination of a casing, a bolt provided with a stop and with two racks, a handle provided with a rack, a spring engaging said bolt near one end and having the other end bent over and provided with a screw-threaded perforation and an adjusting-screw provided with collars and a screw-thread, said casing being provided with a perforated guide-block, substantially as described.



604,653. FLOUR-GOLD SAVER. BURT CHALONER and RICHARD B. LICHTENBERGER, Anaconda, Colo. Filed Sept. 20, 1897. Serial No. 652,351. (No model.)

Claim.—1. In a flour-gold saver, the combination of a trough or receptacle for mercury, a distributer or feed-chute discharging into the trough, and a dividing-plate composed of a series of parallel bars forming narrow, parallel openings arranged within the trough below the surface of the mercury, and a series of parallel, inclined, amalgamated plates in the receptacle above and inclined with relation to the dividing-plate and away from the discharge side, whereby the material passing through the discharge side, whereby the material passing through the amalgamator is forced to take a zigzag or sinuous path between the amalgamated surfaces, substantially as described.

2. The combination of a trough or receptacle having downwardly-converging front and rear walls, a discharge-port in the upper part of the front wall, a feed-chute having a narrow, elliptical mouth or discharge-orifice in the lower part of the rear wall, a dividing-plate composed of a series of bars forming narrow parallel openings arranged in the trough below the surface of the mercury, of a series of amalgamated plates in the receptacle above the mercury, inclined away from the discharge side whereby the material passing through the amalgamator is forced to take a zigzag or sinuous path between the amalgamated surfaces, substantially as described.

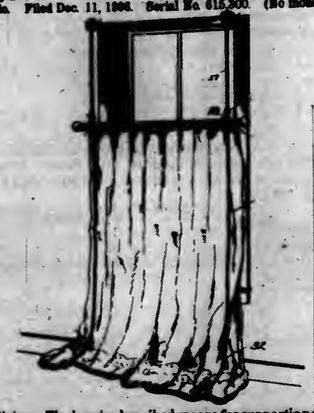
604,654. DEVICE FOR CONTRACTING AND EXPANDING VEHICLE-RIMS. WILLIAM H. CLAWSON, Rob Roy, Ind. Filed Aug. 27, 1897. Serial No. 649,743. (No model.)

Claim.—1. An apparatus of the class described, comprising, in combination, a wedge-block or head, a pair of expanding and contracting arms pivoted thereto, clamps adjustably connected with the free ends of said arms and provided with pendent, parallel arms adapted to straddle a wheel-rim, a clamping-screw operating in one of the parallel arms of each clamp and adapted to bear against the periphery of the wheel-rim, a bearing-clamp also provided with parallel arms and a clamping-screw, and a screw-shaft operating in said bearing-clamp and connected with said wedge-block or head, substantially as described.

2. An apparatus of the class described, comprising, in combination, a wedge-block or head 3, expanding and contracting arms 1 2 pivoted at their inner ends thereto and provided at their outer ends with a series of orifices 4, a pair of clamps 5 each provided with pendent, parallel arms 6 adapted to straddle a wheel-rim, a pivot-bearing adapted to engage either one of the said series of holes 4 in the said arms 1 2 and a clamping-screw, a bearing-clamp 12 provided with similar parallel flanges and a clamping-screw and also with a bearing-leg, and a screw-shaft operating in said bearing-lug and connected with said wedge-block or head, substantially as described.

3. An apparatus of the class described, comprising, in combination, a wedge-block or head, a pair of expanding and contracting arms pivoted thereto and carrying adjustable clamps formed with pendent flanges or arms adapted to straddle and engage the inner and outer faces of a wheel-rim and with lateral lips or ears adapted to bear upon the side of the rim, a bearing-clamp, and a screw-shaft operating in the bearing-clamp and connected with said wedge-block or head, substantially as described.

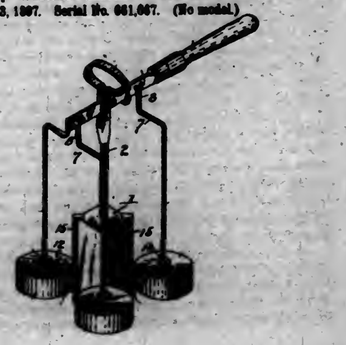
604,655. STOVE. ERNEST C. COLE, Council Bluffs, Iowa. Filed Nov. 9, 1897. Serial No. 657,948. (No model.)



Claim.—1. In a stove substantially as shown and described the combination of the elbow-frame or jamb, the swinging connection pivoted at one end thereto, and the door pivoted to the other end of said connection and having a latching projection or lug arranged to abut the framing and hold the door open substantially as shown and described.

2. In a stove substantially as shown and described the combination of the frame or jamb, the door having a projecting lug arranged to abut said frame or jamb, and the swinging connection pivoted at one end to the elbow or frame and at its other end to the door and provided between its ends with an opening through which the lug on the door plays substantially as shown and described.

3. An improvement in stoves comprising the door, and the door-jamb having coincident surfaces and provided with hinge lugs or projections arranged wholly out of the line of coincidence between said door and its jamb and a double-hinge connection between said lugs or projections substantially as described, whereby the lugs or projections will not interfere with the grinding of the coincident surfaces on a flat wheel and the surfaces when so ground may adjust to a true fit substantially as set forth.



4. The herein-described improvement in stoves consisting of the sheet-metal body having an opening, the cast-metal door-jamb, and the sheet-metal collar extending at its outer end within the cast-metal door-jamb and secured thereto at a point away from the extreme heat, the inner end of the sheet-metal collar being secured to the sheet-metal body whereby the sheet-metal collar is connected at one end directly with the sheet-metal body and its connection at its other end with the cast-metal door-jamb may be located away from the extreme heat substantially as set forth.

604,656. CURTAIN-FIXTURE. ALBERT C. FISCHER, Cincinnati, Ohio. Filed Dec. 11, 1896. Serial No. 615,200. (No model.)

Claim.—The herein-described means for supporting curtains comprising a pair of brackets adapted to be secured to a window-frame, each of which has formed integral therewith one section of a casing, a complemental section of said casing detachably connected thereto, said sections having oppositely and centrally located socketed offsets, an opening in said casing, an axle, revolubly and removably mounted in said offsets, having longitudinal ribs, a pulley having in its bore grooves adapted to receive said ribs and removably fitted on the axle to turn therewith, a spring located within the casing for actuating said pulley, a gravity-latch engaging the axle of said pulley for retarding the rotation thereof, and a tape wound around said pulley and working through the opening in the casing and having at its free end provision for the attachment of a curtain-pole, substantially as described.

604,657. WASHING-MACHINE. SAMUEL FLOWERS, Galion, Ohio. Filed Dec. 13, 1897. Serial No. 661,667. (No model.)

Claim.—In a clothes-washer of the character described, the combination with the central block provided with vertical guides, of the cups provided with loops engaging with and movable upon said guides, the rods connected with said cups formed with central bends, the rod secured to said block provided with a hand-hole, and the lever pivotally connected with the rods secured to the cups, substantially as specified.

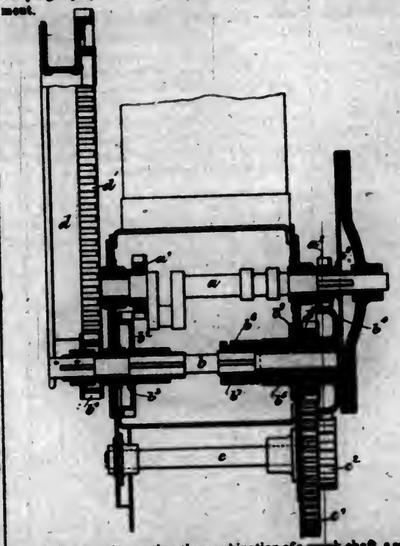
604,658. ARCH-STONE. Otto Förster, Wernigerode, Germany. Filed Dec. 23, 1896. Serial No. 616,780. (No model.) Patented in England Dec. 26, 1896, No. 6,846.

Claim.—The herein-described floor construction, comprising supporting-beams and a series of rows of tiles placed end to end, the tiles of one row breaking joints with those of the adjacent rows and each block being provided upon the two opposite sides which extend transversely to the supporting-beams, with two oppositely-inclined walls, said walls extending toward each other and joined about midway of the sides of the tile by a short inclined intermediate wall to provide a continuous transverse rib upon opposite sides of each row of tiles, and the ribs of one row of tiles interlocking with the ribs of the adjacent rows, substantially as described.

604,659. APPARATUS FOR USING LIQUEFIED OR COMPRESSED GAS. Joseph B. Fournier, Paris, France. Filed Oct. 22, 1896. Serial No. 609,762. (No model.) Patented in France Mar. 30, 1896, No. 255,128.

Claim.—In an apparatus for receiving and discharging liquefied gas, the combination of a closed vessel for containing the gas, a valved filling-tube having an automatic alarm at its inner end, a valved eduction-tube fitted gas-tight in one end of said vessel, a safety-vent formed in the vessel, a valve for closing said vent, and a manometric tube communicating at one end with the interior of the vessel and connected at its other end with said vent-valve, the said manometric tube being adapted to expand and open the vent-valve when pressure in the vessel becomes excessive, substantially as shown and described.

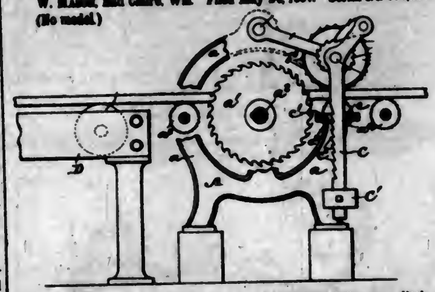
604,660. TRACTION-ENGINE WITH WINDING-DRUM. Robert H. Fowler and George B. Tuer, Leeds, England. Filed Sept. 20, 1897. Serial No. 652,336. (No model.) Patented in England Dec. 6, 1896, No. 23,422.



Claim.—1. In a traction-engine, the combination of a crank-shaft, a second-motion shaft, gearing connecting the road-wheels with the second-motion shaft, means for disconnecting this gearing, a vertical winding-drum at the side of the engine, a ring of teeth on the drum, and a pinion on the second-motion shaft engaging with the ring of teeth.

2. In a traction-engine, the combination of a crank-shaft, a second-motion shaft, a pinion fixed on the crank-shaft gearing with a wheel free to slide on the second-motion shaft, a pinion free to slide on the crank-shaft gearing with a wheel on the second-motion shaft, means for connecting this wheel to the shaft, a pinion revolving with the wheel and driving the road-wheels, and a pinion on the second-motion shaft driving a vertical winding-drum at the side of the engine.

3. In a traction-engine, the combination of a crank-shaft, a second-motion shaft, a pinion fixed on the crank-shaft gearing with a wheel free to slide on the second-motion shaft, a pinion free to slide on the crank-shaft gearing with a wheel fixed to a sleeve on the second-motion shaft, a clutch connecting the sleeve to the shaft, a pinion free to slide on the boss of the wheel and driving the road-wheels, and a pinion on the second-motion shaft driving a vertical winding-drum at the side of the engine.



4. In a traction-engine, the combination of road-wheels, a winding-drum, means for driving the wheels when the drum is stationary and the drum when the wheels are stationary each at two different speeds and means whereby the driver is prevented from putting both traveling speeds or both winding speeds into gear at the same time.

5. In a traction-engine, the combination of road-wheels, a winding-drum, means for driving the wheels and the drum each at two different speeds, four clutch-levers operating the gearing, a locking-bar moved by the first lever and carrying a hook engaging with the second lever, a second locking-bar moved by the third lever and carrying a projection coming between the first bar and a fixed abutment.

6. In a traction-engine, the combination of a crank-shaft, a second-motion shaft, a pinion fixed on the crank-shaft gearing with a wheel on second-motion shaft, a clutch-lever sliding the wheel on the shaft, a pinion on the crank-shaft, a second clutch-lever sliding the pinion on the shaft, a sleeve on the second-motion shaft, a wheel fixed to the sleeve and gearing with the pinion, a clutch connecting the sleeve to the shaft, a third lever operating the clutch, a pinion free to slide on the boss of the wheel and driving the road-wheels, a fourth clutch-lever operating the pinion, a pinion on the second-motion shaft driving a vertical winding-drum on the side of the engine, a locking-bar moved by the first lever and carrying a hook engaging with the second lever, a second locking-bar moved by the third lever and carrying a projection coming between the first bar and a fixed abutment.

604,661. LUMBER-EDGER. Hansen M. Johnson and George W. Mason, Eau Claire, Wis. Filed May 24, 1897. Serial No. 637,997. (No model.)

Claim.—1. An attachment for machines for edging or splitting lumber consisting of a roller for holding the lumber in position in said machine, means secured to the shaft of the said roller for preventing its backward movement comprising a pivoted lever, a pawl on the said lever and a guide upon the frame engaging said lever whereby the said lever is held so that the pawl will always be in operative position, a ratchet-wheel upon the roller-shaft for engaging the said pawl and means upon the periphery of the said roller for engaging the surfaces of the lumber, the construction being such that the lumber cannot be thrown backward in the machine by the action of the saw, substantially as described.

2. An attachment for a machine for edging or splitting lumber comprising a roller for holding the lumber in proper position, a ratchet secured to the shaft of the said roller, a lever pivotally mounted on the said shaft, a pawl pivotally secured to the said lever for engaging the said ratchet whereby the roller is prevented from moving backwardly and the back throw of the lumber under the action of the saw is also prevented, and a guide upon the frame engaging the said lever to limit the movement of the pawl with the ratchet, the said pawl also operating to prevent the rising of the roller, substantially as described.

3. An attachment for a machine for edging or splitting lumber comprising a roller for holding the said lumber in proper position, a ratchet secured to the shaft of the said roller, a lever pivotally mounted on the said shaft and a pawl pivotally secured to said lever for engaging the said ratchet whereby the roller is prevented from turning backwardly and a weight secured to the lower end of the said pivoted lever for holding the roller in engagement with the lumber, substantially as described.

4. In an attachment for lumber-edging machines, the combination of a roller for holding the lumber in proper position, means for pivotally holding said roller in said frame whereby the roller is capable of an up-and-down movement, brads for engaging the lumber secured to the periphery of the roller, a ratchet secured to the shaft of the roller, a pivoted lever carrying a pawl for controlling the ratchet, said lever being provided with a rack or ratchet-teeth adapted to engage a portion of the frame, the construction being such that the roller is prevented from being turned backwardly and is held firmly in contact with the lumber, substantially as described.

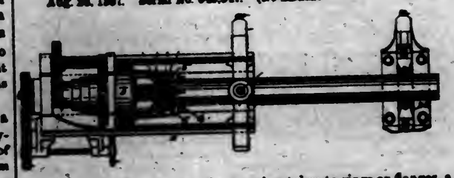
5. In an attachment for lumber-edgers, the combination of a roller for holding the lumber in proper position, a swinging frame for supporting the roller, a lever pivotally mounted on the shaft of said roller, means interposed between the said roller and lever for preventing the backward revolution of the roller, ratchet-teeth formed upon the said lever, a projection upon the frame of the machine having a guide-slot formed therein for receiving and guiding the lower portion of the said lever, one of the walls of the said slot being adapted to engage the teeth upon the lever for preventing its upward movement and a weight secured to the lower end of the lever, substantially as described.

6. In an attachment for lumber-edgers, the combination of a roller for holding the lumber in proper place, brads consisting of cylindrical body portions adapted to be inserted into the periphery of the roller, whereby the roller is adapted to hold the lumber from twisting, the surface of the outer ends of the said cylindrical portions being flush with the peripheral surface of the roller, flattened knife-edges formed upon said body portions for engaging the lumber, the said edges being arranged on lines at right angles to the roller, a ratchet secured to the shaft of the roller, a lever pivotally mounted on the said shaft, a pawl pivotally secured to said lever for engaging the said ratchet whereby the roller is prevented from turning backwardly and thus adapted to prevent the back throw of the lumber under the action of the saw, and means for limiting the movement of the said lever, substantially as described.

604,662. GEARING. Henry B. Keiper, Lancaster, Pa. Filed Oct. 13, 1897. Serial No. 655,070. (No model.)

Claim.—1. A gear-wheel divided transversely, and each section having a series of sockets registering with the corresponding series of sockets in the other section, and each section having an encircling channel registering with that in the other section, each two registering sockets together forming a spheroidal recess opening out of the periphery of the wheel, and the registering encircling channels together forming a groove extending centrally through the recesses and opening out of the periphery of the wheel and being of reduced width as compared with the recesses, balls seated in said recesses and confined therein by reason of the spheroidal form of the latter; and means securing the sections of the wheel together.

2. A gear-wheel divided transversely, and each section having a series of sockets registering with the corresponding series of sockets in the other section, and each section having an encircling channel registering with that in the other section, each two registering sockets together forming a spheroidal recess opening out of the periphery of the wheel, and the registering encircling channels together forming a groove extending centrally through the recesses and opening out of the periphery of the wheel and being of reduced width and depth as compared with the recesses; balls seated in said recesses and confined therein by reason of the spheroidal form of the latter; and means securing the sections of the wheel together.



604,668. CUSHION-TIRE. Wheeler G. Kendall, Providence, R. I., assignor to the Kendall Rubber Tire Company, same place. Filed Dec. 22, 1897. Serial No. 663,126. (No model.)

Claim.—1. A rubber tire, having an interior longitudinal cavity of inverted-T shape, in cross-section, and provided with means opening from the inner periphery into said cavity for the passage of securing-bolts, in combination with a metal clamping-band, provided with a central rib to set into the vertical channel of the cavity, and bolts for securing the tire onto a wheel.

2. A rubber tire, having an interior longitudinal cavity of inverted-T shape, in cross-section, and provided with a channel or slot opening from the inner periphery into said cavity, in combination with a clamping-band, provided with a central rib adapted to set up into the vertical channel of the cavity and with depending ribs on its horizontal portion, and suitable bolts, whereby the tire may be secured onto a wheel.

604,664. MACHINE FOR CUTTING AND EXPANDING PIPES. Carl W. A. Koehnhorst and Joseph K. Smith, Pittsburg, Pa. Filed Aug. 26, 1897. Serial No. 649,847. (No model.)

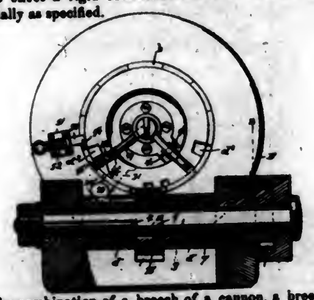
Claim.—1. In apparatus for securing tubes to rings or flanges, a rotatory head provided with a central expanding-chuck, said head having secured thereto and rotatory therewith holders for the ring into which the pipe is expanded.

2. In pipe-expanding apparatus, a rotatory head having radially-movable arms, and rollers in the arms arranged to guide and hold in place the flange into which the pipe is expanded.

3. In a pipe-expanding machine, a rotatory head having a chuck arranged to expand the pipe, and a series of radially-movable holders mounted in frames and having rollers bearing upon the pipe, the planes of the rollers lying longitudinally of the pipe.

4. A pipe cutting and expanding machine having a rotary head, a chuck secured to the head and having means for expanding the pipe, said head having radially-movable grippers arranged to seize and rotate the pipe in cutting the same.

5. In pipe cutting and expanding apparatus, a rotatory head, a chuck secured thereto and having means for expanding the pipe, holders for the ring into which the pipe is expanded, and spindles having rollers arranged to bear upon and guide the pipe.



6. In apparatus for expanding pipe, a head having radially-movable arms, means for moving said arms simultaneously in a radial direction, rollers upon the arms arranged to engage a ring or flange and hold the same in position, a chuck centrally secured to the head and having an inner hollow tapered mandrel rotatable therewith, means for sliding said mandrel longitudinally, and pressing-rollers movably mounted in the chuck and engaged by the tapered mandrel.

7. In pipe-expanding apparatus, a rotary head having radially-adjustable arms, and rollers in said arms arranged to engage and hold a ring or flange in position for pressing the pipe thereinto, one of said rollers being movable to and from the other.

604,665. BREECH MECHANISM FOR ORDNANCE. Michael A. Lynch and William I. Rouse, Washington, D. C., assignors, by direct and mesne assignments, to James J. Sheehy, A. A. Thomas, and R. J. Turner, same place. Filed Oct. 16, 1896. Serial No. 608,819. (Model.)

Claim.—1. The combination of a breech of a cannon, a breech-plug, a rock-shaft supported on the cannon, a breech-plug carrier fixed with respect to the rock-shaft, a gear movable independent of the rock-shaft and engaging the breech-plug, a lever connected with said gear, and mechanism independent of the breech-plug adapted, at in-

tervals, to effect a rigid connection of the lever to the rock-shaft, substantially as specified.

2. The combination of a breech of a cannon, a breech-plug, a rock-shaft supported on the cannon, a breech-plug carrier fixed to the rock-shaft, a gear movable independent of the rock-shaft and engaging the breech-plug, and suitable mechanism for transmitting motion to the gear and rock-shaft.

3. In a breech-loading cannon, the combination with a breech and the breech-plug; of a breech-plug carrier hinged to the breech, the gear-segment engaging the breech-plug to rotate the same axially and also move said breech-plug in a forward and backward direction, and a single lever which is rigid with the gear-segment and is fixedly connected at suitable intervals with the breech-plug carrier by mechanism independent of the breech-plug to cause the carrier to cooperate with the gear-segment in moving the breech-plug toward or from the breech, substantially as specified.

4. In a breech-loading cannon, the combination with a breech and the breech-plug, of a breech-plug carrier hinged to the breech, a gear segment engaging the breech-plug to successively rotate the same and move the same rearward, a single lever rigid with said gear-segment, and a clutch mechanism independent of the breech-plug for rigidly connecting said breech-plug carrier to the lever during a portion of its movement both in a backward and forward direction and operated to release said carrier from the lever as the breech-plug is being locked or unlocked in the breech, substantially as specified.

5. In a breech-loading cannon, the combination with a breech and a mutilated-gear breech-plug adapted to lock with suitable threads in the breech, of a breech-plug carrier hinged to the breech, a gear engaging the breech-plug to successively rotate and impart endwise movement to the breech-plug, a lever normally rigid with said gear, and clutch mechanism independent of the breech-plug for securing a rigid connection between the lever and the breech-plug carrier after the gear has operated the breech-plug to unlock the same from the breech, substantially as described.

6. In a breech-loading cannon, the combination with a breech and a breech-plug, of a breech-plug carrier hinged to the breech, the gear-segment having the separate rack-teeth and worm-teeth to mesh with similar teeth on the breech-plug, and a lever connected, substantially as described, with said gear-segment and the breech-plug carrier to operate said parts conjointly and independently in the manner and for the purpose described.

7. In a breech-loading cannon, the combination with a breech and a breech-plug, of the rock-shaft supported on the breech, the breech-plug carrier rigid with said rock-shaft, the tubular spindle concentric with the rock shaft and carrying the gear-segment, a lever rigid with the tubular spindle, and a clutch mechanism carried by the lever to rigidly connect the rock-shaft to said lever at suitable intervals during the forward and backward motions of the lever, substantially as and for the purpose described.

8. In a breech-loading cannon, the combination with the breech and the breech-plug, of a rock-shaft carrying the breech-plug carrier, a tubular spindle having the gear-segment rigid therewith and engaging the breech-plug, a lever rigid with the tubular spindle and provided with the groove or channel, the locking-key carried by said lever and adapted to engage the rock-shaft, and a trip to release the locking-key from the rock-shaft, for the purpose described, substantially as set forth.

9. In a breech-loading cannon, the combination with the breech and the breech-plug; of a rock-shaft carrying the breech-plug carrier, the tubular spindle having the gear-segment rigid therewith and engaging the breech-plug, the lever rigid with the tubular spindle and having the concentric annular groove provided with an offset, the locking-key carried by the lever, and the sliding trip supported on the breech and riding in the groove of the lever to operate the movable key, substantially as specified.

10. In a breech-loading cannon, the combination with the breech and the breech-plug, of the rock-shaft carrying the breech-plug carrier, the tubular spindle having the rigid lever and provided with the concentric groove which is provided with an offset and has its ends terminating in abutments located near each other, the gear-segment operating in a slot in the breech-plug carrier and rigid with the tubular spindle, the movable key seated in the lever opposite to the offset portion in the groove of the lever and adapted to enter a recess in the rock-shaft, and the trip-piece seated in a groove in the breech and having the angular arm that rides in the groove of the lever to release the movable key at the desired intervals, substantially as specified.

11. In a breech-loading cannon, the combination with the breech and the breech-plug, of the breech-plug carrier hinged to the breech, the segmental gear movable with the carrier, and an extractor-piece seated in the breech and provided with a rack which engages with the segmental gear for the purpose described, substantially as set forth.

12. In a breech-loading cannon, the combination with the breech having the extended groove therein, and the breech-plug; of the breech-plug carrier hinged to the breech, the segmental gear movable with the carrier, and the extractor-piece fitted in the groove of said breech and having its right-angled toe entering the extension of the groove and the rack meshing with the segmental gear, substantially as specified.

13. In a breech-loading cannon, the combination with a breech the breech-plug, and the breech-plug carrier; of the spring-pressed firing-pin supported in said breech-plug and having the rack-teeth, the setting-lever having the segmental toothed surface which meshes with said rack on the firing-pin and which lever is journaled in the breech-plug with its free end extending rearwardly beyond said breech-plug and adapted to strike against the breech-plug carrier on the rearward movement of the breech-plug, the sear arranged to engage with the firing-pin as it is retracted, and the discharge-detent connected to the sear, substantially as specified.

14. In a breech-loading cannon, the combination of the breech the breech-plug, the breech-plug carrier provided with the slot or groove 55', the firing-pin carried by said breech-plug, means for automatically setting the firing-pin for action on a rearward movement of said breech-plug, and a sear also carried by the breech-plug and adapted to take into the recess or slot in the breech-plug carrier as the breech-plug is withdrawn in a rearward direction into said carrier, substantially as and for the purpose set forth.

15. In a breech-loading cannon, the combination with the breech, and the breech-plug, of a breech-plug carrier provided with the slot or groove 55', the firing-pin carried by said breech-plug, the setting-lever engaging with the firing-pin, and the sear also carried by the breech-plug and having its head adapted to take into the recess or slot in the breech-plug carrier as the breech-plug is withdrawn in a rearward direction into said carrier, substantially as described.

16. In a breech-loading cannon, the combination with a breech and a breech-block; of a shell-starter arranged within the breech to have a circumferential contact with a cartridge-shell and movable in a line transverse of the cannon, and operated by the breech-block as the latter is unlocked to release the shell from the breech and give the same its initial movement in extracting it from the breech, substantially as described.

17. In a breech-loading cannon, the combination with a breech and breech-plug, of a shell-starting plate fitted within the breech to have a circumferential contact with a cartridge-shell and movable in a line transverse of the cannon, and means for imparting movement to the plate and starting the cartridge-shell in the breech as the breech-plug is rotated

18. In a breech-loading cannon, the combination with a breech and a breech-plug; of a segmental shell-starting plate fitted in the breech and movable in a line transverse of the cannon, and connected to the breech-plug to be seated and unseated in the breech as said breech-plug is locked and unlocked therein, substantially as specified.

19. In a breech-loading cannon, the combination with a breech; of a breech-plug, the shell-starting plate movable in a line transverse of the cannon and having the cam seated in the breech, and means for connecting the plate to the breech-plug while the latter is locked or unlocked in the breech and which disengages said plate from the breech-plug as the latter is withdrawn in a rearward direction, substantially as specified.

20. In a breech-loading cannon, the combination of a breech having the cam-face recess or seat therein, the grooved breech-plug, and the segmental wedge-shaped shell-starting plate seated in said cam-groove within the breech and having the lug to fit into the groove of the breech-plug, substantially as described.

21. In a breech-loading cannon, the combination with a breech and an endwise-movable and rotary breech-plug having a recess; of a segmental shell-starting plate fitted in the breech and movable in a line transverse of the cannon and having a projection adapted to engage the recess of the breech-plug, substantially as specified.

22. In a breech mechanism of the slotted-screw system, the combination with a breech-block provided with combined rack-teeth and screw-threads thereon for locking the same in the gun and worm-threads in rear of said screw-threads, of a gear-segment provided with teeth to engage in said worm and other teeth to engage in said combined rack-teeth and screw-threads, and a hand-lever connected with said gear-segment, substantially as described.

23. In a breech mechanism of the slotted-screw system, the combination with a breech-plug provided with combined rack-teeth and screw-threads thereon for locking the same in the gun and worm-threads in rear of said screw-threads; of a gear-segment pivoted to the gun and provided with teeth to engage in said worm and other teeth to engage in said combined rack-teeth and screw-threads, and a hand-lever connected with said gear-segment, substantially as specified.

24. In a breech-loading cannon, the combination with a breech and a breech-plug having rack-teeth and worm-gear teeth; of a gear having rack-teeth and worm-gear teeth adapted to engage the rack-teeth and worm-gear teeth respectively of the plug, and a suitable means for rotating or partially rotating the gear.

25. In a breech-loading cannon, the combination with a breech and a mutilated-gear breech-plug adapted to lock with suitable threads in the breech and having rack-teeth and worm-gear teeth; of a gear having rack-teeth and worm-gear teeth adapted to engage the rack-teeth and the worm-gear teeth respectively of the plug, and a suitable means for rotating or partially rotating the gear.

26. In a breech-loading cannon, the combination with a breech-plug having a series of rack-teeth and also having another series of worm-gear teeth; of a gear having a series of rack-teeth and also having another series of worm-gear teeth adapted to engage the series of rack teeth and the series of worm-gear teeth respectively of the plug; the said rack-teeth and the worm-gear teeth being so arranged on the gear and plug that a single partial revolution of the gear will completely unlock and withdraw or replace and lock the breech-plug, substantially as specified.

27. In a breech-loading cannon, the combination with a breech and a mutilated-gear breech-plug adapted to lock with suitable threads in the breech and having a series of rack-teeth and also having another series of worm-gear teeth; of a gear having a series of rack-teeth and also having another series of worm-gear teeth adapted to engage the series of rack-teeth and the series of worm-gear teeth respectively of the plug; the said rack-teeth and worm-gear teeth being so arranged on the gear and plug that a single partial revolution of the gear will completely unlock and withdraw or replace and lock the breech-plug, substantially as and for the purpose set forth.

28. In a breech-loading cannon, the combination with the breech, the breech-plug, and the breech-plug carrier; of the spring-pressed firing-pin carried by said breech-plug, the setting-lever arranged to retract the firing-pin on the backward movement of the plug, the sear to engage the firing-pin as it is retracted and having an angular branch at its outer end, and the discharge detent supported on the breech and having a branch at its inner end adapted to engage that of the sear to release the latter from the firing-pin when the lanyard is pulled, substantially as specified.

29. In a breech mechanism in which a breech-block is rolled or turned to lock it in the breech, the combination of a breech-block, rotating and translating means thereon, and a partially-revoluble gear-segment meshing as described with both said rotating and translating means as set forth.

30. In a breech mechanism in which a breech-block is rolled or turned to lock it in the breech, the combination of a breech-block, a partially-revoluble gear-segment, coacting devices on the block and gear-segment for translating the block, and other, distinct coacting devices on the block and gear-segment for rolling or turning the said block on its axis as described, whereby the block may be placed and locked in the breech or unlocked and removed from the breech by a single, partial revolution of the gear-segment as set forth.

31. In a breech mechanism in which a breech plug or block is rolled or turned to lock it in the breech, the combination of a breech plug or block having the translating-rack and also having worm-teeth thereon, and a partially-revoluble gear-segment having the rack and also having worm-teeth thereon to engage the translating-rack and the worm-teeth, respectively, of the plug or block as set forth.

32. In a breech-loading gun in which a breech plug or block is rolled or turned to lock it in the breech, the combination of a breech plug or block, and a gear-segment; said plug or block and the gear-segment having coacting devices for translating the block and other coacting devices for rolling or turning the said block on its axis, a cartridge-extractor, a handle for operating the gear-segment, and suitable means, operative by the handle, for actuating the extractor.

33. In a breech-loading gun in which a breech plug or block is rolled or turned to lock it in the breech, the combination of a breech-block, a partially-revoluble gear-segment, coacting devices on the block and gear-segment for translating the block, other, distinct coacting devices on the block and gear-segment for rolling or turning the said block on its axis as described, firing mechanism carried by the block, and an actuating device arranged on the breech of the gun in juxtaposition to and adapted to register with the firing mechanism when the plug is turned to lock it in the breech.

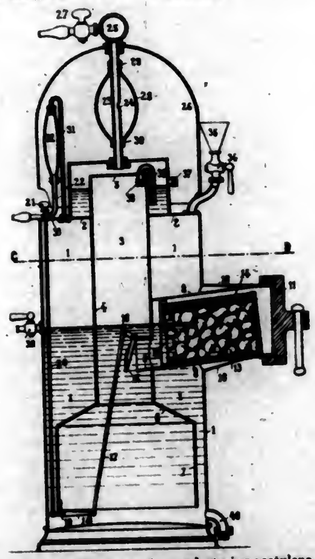
34. In a breech-loading gun in which a breech plug or block is rolled or turned to lock it in the breech, the combination of a breech plug or block, and a partially-revoluble gear-segment; said plug or block and the gear-segment having coacting devices upon them for translating the block, and other coacting devices upon them for rolling or turning the said block on its axis, a firing-hammer carried by the block, a sear also carried by the block, and a trigger arranged on the breech of the gun in juxtaposition to and adapted to be engaged by the sear when the plug is turned to lock it in the breech.

35. In a breech-loading gun in which a breech-block is rolled or turned to lock it in the breech, the combination of a breech-block, and a partially-revoluble gear-segment; said block and gear-segment having coacting devices upon them for translating the block and other coacting devices upon them for rolling or turning the said block on its axis, a spring-pressed firing-hammer carried by the block, a sear also carried by the block, a trigger arranged on the breech in juxtaposition to and adapted to be engaged by the sear when the block is turned, a breech-plug carrier, and a lever, for setting the firing-hammer, arranged to engage the carrier.

36. In a breech-loading gun in which a breech-block is rolled or turned to lock it in the breech, the combination of a breech-block, a spring-pressed firing-hammer carried thereby, a sear also carried by the block, a trigger arranged on the breech in juxtaposition to and adapted to be engaged by the sear when the block is turned to lock it in the breech, a hinged breech-plug carrier having a recess 55' to receive the sear, a device, for setting the firing-hammer, carried by the plug and arranged to engage the carrier, a partially-revoluble gear-segment, coacting devices on the block and gear-segment for translating the block, other, distinct coacting devices on the block and gear-segment for rolling or turning the said block on its axis as described, and suitable means for operating the breech-plug carrier and the gear-segment conjointly and independently, substantially as specified.

37. In a breech mechanism in which a breech-block is rolled or turned to lock it in the breech, the combination of a breech-block, a gear, coacting sets of teeth on the block and gear for translating the block and other distinct coacting sets of teeth on the block and on the gear for rolling or turning the said block on its axis.

604,666. ENVELOP. CHARLES P. MONFORT, Louisiana, Mich. Filed Dec. 8, 1896. Serial No. 614,994. (No model.)

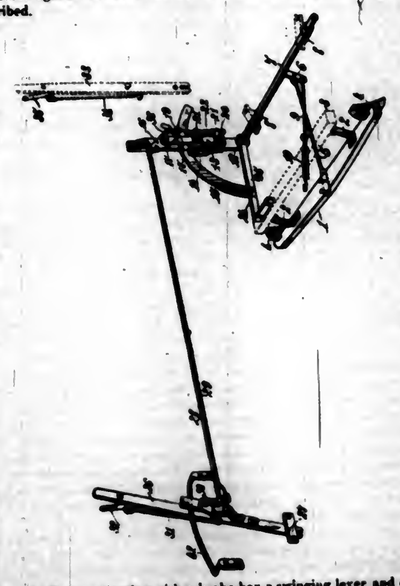


Claim.—An envelop comprising a body having side flaps with transverse slits adapted to coincide when the said flaps are folded over, one of the said side flaps under its transverse slits having a pair of vertically-disposed slits, the said body of the envelop also having opposite end flaps, one of which forms the sealing-flap and has supplemental folds thereon brought over on the inner face thereof, and the said folds and flaps apertured adjacent to the apex, a keeper having its ends inserted in the vertical slits in one of the side flaps and exposed at the rear of the envelop, and a tongue having a triangular head inserted in the sealing-flap and held against the supplemental flaps, and also provided with a bendable prong adapted to engage the said keeper to hold the sealing-flap closed.

604,667. APPARATUS FOR GENERATING ACETYLENE GAS. GEORGES DE ROSNY DE SALES, Lyons, France. Filed Feb. 15, 1897. Serial No. 623,422. (No model.) Patented in France Oct. 24, 1896, No. 260,714; in Belgium Jan. 23, 1897, No. 125,983; in Hungary Jan. 25, 1897, No. 8,389; in Switzerland Jan. 27, 1897, No. 13,991; in England Jan. 26, 1897, No. 2,265; in Austria Feb. 16, 1897, No. 965, and in Italy Apr. 6, 1897, LXXXV, 402.

Claim.—1. An apparatus for generating and storing acetylene gas consisting of a reservoir, a dome rising above the reservoir, a bell arranged within the reservoir, its lower open end lying in water therein, a washer arranged in the dome above the reservoir and in which the upper end of the bell lies, a valved siphon-tube communicating with the bell and having one arm lying in a body of water in the washer, one or more receivers each having a pipe which opens into the bell, a valve to close the open end of said pipe, means for operating said valve from the exterior, a cap to close the receiver

and separate it and the carbid-cartridge from the reservoir and atmosphere, a pipe communicating with the washer and with the exterior, and an elastic bag inclosing a part of said pipe in which is an opening for the gas, substantially as described.



2. An apparatus for generating and storing acetylene gas, consisting of a vessel or reservoir adapted to contain water, a bell whose mouth dips into the water and whose upper part is fitted with a siphon-tube provided internally with a ball-valve and with its exterior end dipping into the water contained in a washer mounted at and surrounding the upper part of said bell and fitted with a gas-outlet tube perforated so as to communicate with an elastic air-tight bag or pocket for storing a small volume of gas for immediate consumption, a receiver, (or receivers,) containing a carbid-cartridge and communicating with the interior of said bell by a tube fitted with a valve adapted to be operated by hand from the exterior of the apparatus so as to start or stop the generation of gas, a cap to inclose the receiver and separate the carbid-cartridge both from the atmosphere and from the vessel or reservoir, a safety device in connection with the upper part of said vessel or reservoir to prevent overpressure therein, and suitable inlet and outlet fittings, substantially as described and shown.

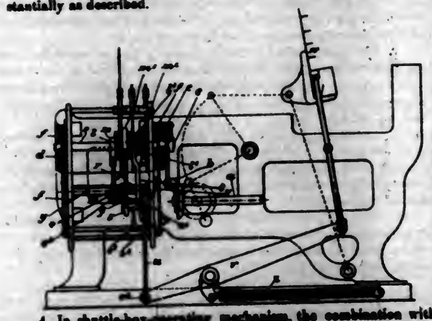
3. An apparatus for generating and storing acetylene gas, consisting of a reservoir containing a body of water, a bell arranged in said reservoir its lower end lying in the water, a dome on the upper end of the reservoir but separated from it by a hermetically-closed cover, a washer in the dome containing a body of water above which the upper, closed end of the bell rises, a siphon-tube having one valved end in the bell and the other open end in the water in the washer, a gas-pipe communicating with the washer and with the exterior, an elastic bag inclosing a part of said pipe in which is an opening permitting the gas to pass from said pipe into the bag, one or more receivers each lying in a socket projecting from the wall of the reservoir and closed by a cap, a valve to close and open a pipe leading from said receiver into the bell, means for operating said valve from outside, a pipe communicating at one end with the top of the reservoir and at the other end with an elastic bag in the dome, and a second pipe communicating with said bag and the exterior, substantially as described.

604,668. VEHICLE-BRAKE. CHARLES SAMPLE, Valley Grove, W. Va. Filed Sept. 29, 1897. Serial No. 653,500. (No model.)

Claim.—1. The combination with a brake-bar, a lever, and intermediate connections between the lever and the brake-bar, of a segmental ratchet-bar having ratchet-teeth on its upper or outer edge, a support to which one end of the ratchet-bar is pivoted, a guide on the lever constructed with an abutment or shoulder against which the lower or inner edge of the ratchet-bar bears, a ratchet-dog pivoted to the lever and constructed to engage or slide over the ratchet-teeth, and a spring connected with the dog and acting to force it in engagement with the ratchet-bar and to bind the inner or lower edge thereof against the said abutment or shoulder, substantially as described.

2. The combination with a brake-bar, a swinging lever, and connections between the lever and the brake-bar, of a segmental ratchet-bar having ratchet-teeth in its upper or outer edge, a support to which one end of the ratchet-bar is pivoted, a plate secured to one side of the lever and constructed with an abutment or shoulder against which the lower or inner edge of the ratchet-bar bears, a dog pivoted to the lever and having a beveled extremity to engage the ratchet-bar, a spring connected with the beveled extremity of the dog to force it in engagement with the teeth of the ratchet-bar and to bind the latter against said abutment or shoulder, a pivoted finger-piece, and a link connection between the finger-piece and the dog for disengaging the latter from the teeth of the ratchet-bar, substantially as described.

3. The combination with a brake-bar, a rock-shaft connected with the brake-bar, and a lever secured to the rock-shaft, of a segmental ratchet-bar having ratchet-teeth in its upper or outer edge, a support to which the lower end of the ratchet-bar is pivoted, an abutment or shoulder on the lever against which the lower or inner edge of the ratchet-bar bears, a ratchet-dog pivoted to the lever and constructed to engage the teeth of the ratchet-bar, a spring acting on the dog to force it in engagement with the teeth of the ratchet-bar and to bind the lower or inner edge of the latter against said abutment or shoulder, a hand-lever connected with the lever of the rock shaft, a tripping wire or rod connected with the ratchet-dog, and a finger-piece mounted on the hand-lever and engaging the tripping wire or rod for disengaging the ratchet-dog from the teeth of the ratchet-bar, substantially as described.

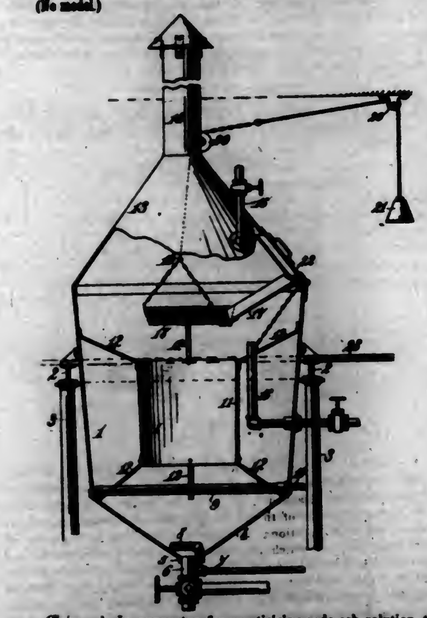


604,669. SHUTTLE-BOX-OPERATING MECHANISM FOR LOOMS. GEORG SCHWARZ, Biela, Austria-Hungary. Filed Apr. 27, 1897. Serial No. 634,125. (No model.) Patented in England Dec. 20, 1894, No. 24,794.

Claim.—1. In shuttle-box-operating mechanism, the combination with the shuttle-boxes, of a lifting and depressing lever connected therewith and pivoted at a fixed point, a second pivoted lever connected to the lifting and depressing lever, and pattern-controlled devices for shifting the pivotal point of said second lever and for swinging it upon its pivot, substantially as described.

2. In shuttle-box-operating mechanism, the combination with the shuttle-boxes and their carrier, of a lever connected with the carrier and pivoted at a fixed point, mechanism for swinging the lever upon its pivot, an eccentric, connections between the eccentric and the pivot of the lever, and pattern-controlled devices for rotating the eccentric and for operating the swinging mechanism of the lever, substantially as described.

3. In shuttle-box-operating mechanism, the combination with the shuttle-boxes and their carrier, of a lever having a pivot adapted



to be moved in different planes, connections between said lever and the shuttle-box carrier, a second lever having a fixed pivotal point, a third lever pivoted to the said second lever and connected to the pivot of the first-mentioned lever, and pattern-controlled devices for swinging any one or more of the three levers upon their pivots, substantially as described.

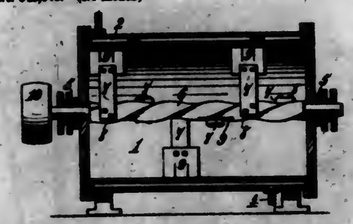
4. In shuttle-box-operating mechanism, the combination with the shuttle-boxes and their carrier, a lever having a pivot adapted to be moved in different planes, connections between said lever and the shuttle-box carrier, a second lever connected with the pivot of the first, said second lever likewise having a pivot adapted to be moved in different planes, means for shifting said pivotal point, and pattern-controlled devices for swinging one or both of the levers upon their pivots, substantially as described

---

604,670. APPARATUS FOR MAKING CAUSTIC SODA. FREDERICK B. STRAUB, Pittsburg, Pa. Filed Aug. 2, 1897. Serial No. 646,817. (No model.)

Claim.—1. In apparatus for causticizing soda-ash solution, the herein-described kettle having downward and inward slanting sides and a conical bottom, in combination with a perforated steam-coil located in said kettle close to the lowest part of the conical kettle-bottom, to cause agitation of the kettle contents and a motion of the same upward and downward in the kettle, and mechanism suspended in the kettle for introducing lime therein, the slanting sides of the kettle-body being adapted to permit a gradual distribution of the force of steam-pressure toward the top of the kettle and thereby prevent a sudden accumulation of lime precipitate at the bottom, substantially as described.

2. In apparatus for causticizing soda-ash solution, the herein-described kettle having downward and inward slanting sides and a conical bottom, in combination with mechanism suspended in said kettle for introducing lime therein, a lower perforated steam-coil located close to the lowest part of the conical kettle-bottom, and an upper perforated steam-coil located in the kettle at about the junction of the kettle-body and its said conical bottom, one of said steam-coils having its perforations directed upward and the other downward to cause agitation and circulation of the kettle contents, and whereby the slanting sides of the kettle-body will permit a gradual distribution of the force of steam-pressure toward the top of the kettle and thereby prevent a sudden accumulation of lime precipitate at the bottom, substantially as described.



3. In apparatus for causticizing soda-ash solution, the herein-described kettle having a conical bottom and provided with the lower perforated steam-coil 8 located close to the bottom and the upper perforated steam-coil 9 located at or near the junction of the kettle-body and its said conical bottom, the perforations of the lower steam-coil being directed upward and the perforations of the upper steam-coil being directed downward, whereby there is caused a movement of the kettle contents upward at the center and downward along the slanting sides of the conical kettle-bottom, in combination with mechanism for introducing and suspending a body of lime within the said kettle, substantially as specified.

4. In apparatus for causticizing soda-ash solution, the herein-described kettle having its sides slanting downward and inward and provided with a conical bottom and a conical cover having a vapor-escape pipe attached, in combination with a perforated steam-coil located in the conical kettle-bottom, and a perforated lime-basket suspended in the kettle substantially as specified.

5. In apparatus for causticizing soda-ash solution, the herein-described kettle having slanting sides and a conical bottom and provided with a cover having an attached vapor-escape pipe, in combination with a flanged cap secured to the lower part of the conical kettle-bottom, a drawing-off pipe and a steam-inlet pipe connected with said cap, a perforated steam-coil located in the conical kettle-bottom, a lime-basket suspended in the kettle and a lime-chute having hinged connection with said basket and kettle, substantially as specified.

6. In apparatus for causticizing soda-ash solution, the combination with the herein-described kettle provided with downward and inward slanting sides and a conical bottom, of a perforated steam-coil located in and close to the lowest part of the conical kettle-bottom, an upper perforated steam-coil located in said kettle at about the junction of the kettle-body and its said conical bottom, an annular shield supported above said steam-coils to serve as a guide for upward and downward currents of the kettle contents caused by injection of steam into the kettle through said coils, and a lime-receptacle suspended in the kettle above said shield or guide, substantially as described.

604,671. SOAP-CRUTCHING MACHINE. FREDERICK B. STRAUB and STEPHEN C. STRAUB, Pittsburg, Pa. Filed Aug. 30, 1897. Serial No. 649,973. (No model.)

Claim.—1. In a soap-crutching machine, the combination with a cylindrical vessel, of a shaft journaled centrally therein and consisting of a torsionally-twisted bar square in cross-section, and a plurality of flat paddles having their inner flat sides seated upon one of the flat faces of said shaft and secured thereto by bolts passing transversely through the shaft and paddles, substantially as described.

2. In a soap-crutching machine, the combination with a cylindrical vessel inclosed by a water-jacket, of a shaft journaled centrally therein, a plurality of flat radial paddles arranged spirally about said shaft and fastened thereto at their inner ends, and resilient scraper-blades fixed on the outer ends of the paddles and resting in intimate contact with the interior of the vessel, the paddles being so arranged that each scraper will travel in a path immediately adjacent to the path traversed by the preceding scraper, whereby the interior of the vessel is thoroughly scraped and the soap prevented from caking, substantially as described.

3. In a soap-crutching machine, the combination with a cylindrical vessel, of a shaft journaled centrally therein and carrying a plurality of paddles, and longitudinally-slitted metallic scraper-blades attached to the outer ends of the paddles and resting in contact with the interior of the vessel, substantially as described.

604,672. LOCK. FRED W. TOBEY, Grand Rapids, Mich. Filed Nov. 6, 1897. Serial No. 657,697. (No model.)

Claim.—1. The combination with the two doors and the recessed lintel, of the latch pivoted at one end to one of said doors and projecting into the path of the other door, and a plate attached to the meeting edge of the last-named door and inwardly beveled at its upper end whereby when both doors are closed said beveled plate raises the free end of the pivoted latch into the recess in the lintel, substantially as described.

2. The combination with the two doors and the recessed lintel, of the latch pivoted at one end to one of said doors, a beveled plate attached to the edge of the other door and operating to lift the free end of the latch into the recess in the lintel, and a notch or recess formed in the upper end of the beveled plate in which the free end of the latch is adapted to rest and hold the doors closed, substantially as described.

3. The combination with the two doors and the recessed lintel, of the latch pivoted at one end in a recess in one of the doors and constructed to overlap the edge of the other door, a beveled plate secured to the edge of the last-named door and operating to lift the free end of the latch into the recess in the lintel and provided at its upper end with a notch in which the free end of the latch is adapted to rest when the doors are closed, and a spring for throwing the latch out of locking position when the doors are open, substantially as described.

604,673. MITER-SAW GUIDE. HAMILTON WEIR, La Porte, Ind. Filed Feb. 7, 1898. Serial No. 669,427. (No model.)

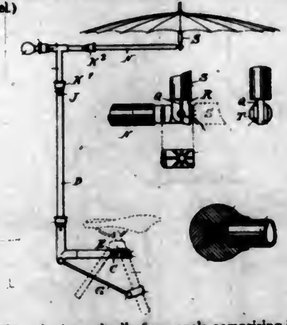
Claim.—1. A saw-guide comprising the clamp-sections hinged together and having below their hinged connection depending plates forming a clamp for the saw-blade, means operating above said hinge connection whereby the depending plates may be forcibly set toward each other and a guide in which the clamp-sections are slidable lengthwise substantially as set forth.

2. In a miter-saw guide the combination of the main plate having guides and the clamp-sections hinged together and held to said main plate by said guides and movable in the direction of their length in said guides substantially as set forth.

3. In a miter-saw guide the combination of the hanger, a cap-plate pivoted or hinged to the swinging end of the hanger, and a main plate provided with the guide devices and movable rotarily on the cap-plate substantially as set forth.

4. The combination of the cap-plate, the hanger supporting said cap-plate, the main plate having the guide devices and pivotally connected with the cap-plate whereby it may be adjusted thereon and means for securing the main plate in any desired adjustment substantially as set forth.

5. In a miter-saw guide the combination of a main plate having at its outer edges securing ribs or rails and the clamp-sections having depending plates spaced apart forming a clamp for the saw-blade, and top plates resting at their outer edges on the ribs or rails substantially as set forth.



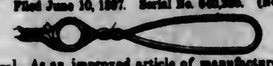
6. In a miter-saw guide the combination of the clamp-sections hinged together, devices for adjusting said sections and a support in which the clamp-sections are movable in the direction of their length substantially as set forth.

7. The combination of the cap-plate, a support therefor the main plate adjustable on the cap-plate, means for securing the main plate in its different adjustments, the clamp-sections hinged together and supported by the main plate and means for adjusting the clamp-sections substantially as set forth.

8. The combination in a miter-saw guide of the guide-sections having depending plates spaced apart forming a clamp for the saw-blade and top plates provided with inwardly-facing shoulders, of a spreading device operating between said shoulders whereby to adjust the clamping plates or arms and a support for the clamp-sections, substantially as set forth.

9. The miter-saw guide herein described comprising the cap-plate having a curved slot, the hanger to which said cap-plate is jointed, the main plate pivoted to the cap-plate and movable thereon to different adjustments, the screw for securing the main plate in its different adjustments, the clamp-sections hinged together, the spreading device by which to adjust the said clamp-sections and the ribs or rails by which the moving clamp sections are held to the main plate substantially as set forth.

604,674. UMBRELLA-HOLDER FOR CYCLES. ARTHUR T. WOODWARD, Bendigo, Victoria. Filed Dec. 1, 1896. Serial No. 614,125. (No model.)



Claim.—1. An umbrella for a cycle comprising in its construction a vertically-adjustable umbrella-support of approximately U shape, which is attached at its lower end to the saddle-supporting rod of a cycle out of the way of the rider, the outer end of the upper horizontal portion being provided with a plug having a forked end, each wall of which is provided with a transverse opening and one wall is provided on its inner face with radial grooves, an umbrella proper having a rod provided with a ridge, which latter is adapted to be inserted into any one of the radial grooves on the fork, and a screw passing through the openings in the fork for tightening the fork upon the umbrella-rod, and holding the umbrella at the desired angle, substantially as described.

2. An umbrella-support for a cycle which is capable of being adjusted to different heights on the frame of the cycle and which is also capable of having a tilting movement backward and forward, means for adjusting the same and securing it in an adjusted position, said support being pivotally attached to the saddle-supporting rod of a cycle by means of a clip vertically adjustable thereon, and a diagonal brace-rod attached at its upper end to the umbrella-support and at its lower end by a pivotal connection to a clip which is also vertically adjustable on the saddle-supporting rod, substantially as described.

3. An umbrella for a cycle comprising in its construction a vertically-adjustable and backward and forward tilting support, means for adjusting the same and securing it in an adjusted position, said support being pivotally attached to the saddle-supporting rod of a cycle by means of a vertically-adjustable clip and a diagonal brace-rod attached at its upper end to the umbrella-support and at its lower end by a pivotal connection to a vertically-adjustable clip on the saddle-supporting rod, and means for tilting the umbrella proper to the desired extent, and holding it in such tilted position, substantially as described.

604,675. SEAM-RIPPING DEVICE. JOHN R. FISHER, Rhodedale, Canada. Filed June 10, 1897. Serial No. 640,256. (No model.)

Claim.—1. As an improved article of manufacture, a seam-ripping device comprising a suitable handle, yielding jaws having flaring ends and opposing knife-edges for grasping and holding the seam, one of said jaws carrying a knife or cutter crossing obliquely the plane of the opposing jaw edges, substantially as and for the purpose specified.

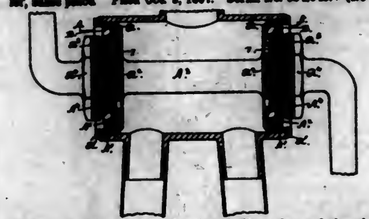
2. In a seam-ripping device, the opposing knife-edged yielding or spring jaws having flaring or diverging receiving ends, separated at their rear ends, said jaws being formed integrally with the arms of wire twisted together in rear thereof, and extended in a loop forming the handle, with a blade or cutter applied to one of the jaws, substantially as described.

3. As an improved article of manufacture, a seam-ripping device comprising knife-edged jaws, a handle formed integral from a single rod or wire, a coil in said wire intermediate said jaws and handle forming an opening in the rear of said jaws, a spring for pressing the jaws together, and a knife or cutter connected to one of said jaws and operated substantially as described.

604,676. WEATHER-STRIP. JOHN FELLABERER, Pittsburg, Pa. Filed Dec. 23, 1897. Serial No. 663,139. (No model.)

Claim.—1. A weather-strip comprising two metallic strips, one of which is formed of a flat base or web, with a longitudinally-raised portion bent upon itself and extending at right angles thereto at each edge of the base, and thereby providing recesses or grooves for the reception of two projecting ribs or flanges formed on each edge of a similar base or web, substantially as shown and described.

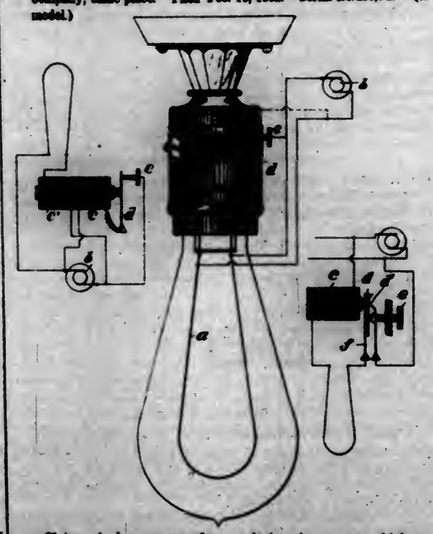
2. A weather-strip comprising two sections, each of which consists of a metallic strip having a flat base provided throughout with apertures, one of said strips being formed at its edge with a longitudinally-raised portion forming a projecting rib, and the other of which is formed at its edge with a similar longitudinally-raised portion that is bent upon itself to receive the projecting rib of the engaging strip, substantially as shown and described.



604,677. CYCLIST'S BRACE AND RACK-SUPPORT. WILLIAM C. HUMPHREY, Jamestown, N. D. Filed Nov. 23, 1897. Serial No. 660,041. (No model.)

Claim.—1. In combination with the body-engaging strap, the link connected thereto, the member secured to the post of the machine, the guide member, the spring for retaining the link on the lug, and the protecting strap or shell secured to the member about the guide member, as shown and described.

2. In combination with the body-strap, the webbing or long strap carried thereby, the elastic strap connecting the ends of the said body-strap, the link, and strap connecting same with a link or ring to which the long strap or webbing is connected, the shoulder-strap, combined with the member clamped to the post of the bicycle handle-bar, the lug on said member over which the said link is designed to engage, the guide member and protecting strap or shell and the retaining-spring, all arranged substantially as shown and described.

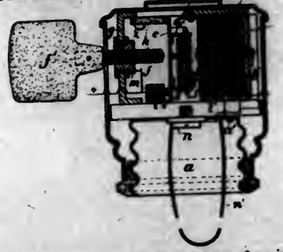


604,678. BALL-RETAINER FOR ANTIFRICTION-BEARINGS. HENRY B. KNIPER, Lancaster, Pa., assignor of one-half to John Hertzler, same place. Filed Oct. 9, 1897. Serial No. 654,649. (No model.)

Claim.—1. The combination in a ball-retainer of the character described, with a funnel-like ring having ball-seating apertures in its body and a tubular ring having one end secured thereto, of a second tubular ring securely seated in said first-mentioned tubular ring, and having an outwardly-projecting ring-flange with its inner edge securely affixed to the forward end thereof, substantially as and for the purpose hereinbefore set forth.

2. The ball-bearing comprising the portion, A', having the ball-race, a, and the ring-flange, a'; the cone, A^4, with the ball-bearing face, a^3, and adapted to be secured onto a central shaft or bolt; the balls, A^2, moving in said race and against said face; and the independent ball-retainer comprising the funnel-shaped ring, B, having the apertures, b, loosely seating said balls, and the tubular ring, b', having one end secured to the inner edge of said funnel-shaped ring, with the tubular ring, b^3, fitted into said fixed ring, b', and having the outwardly-projecting ring-flange, b^4, secured to the forward end thereof, all substantially as described and for the purpose hereinbefore set forth.

604,679. INCANDESCENT-ELECTRIC-LAMP REGULATOR. DANIEL MCF. MOORE, New York, N. Y., assignor to the Moore Electrical Company, same place. Filed Feb. 10, 1892. Serial No. 420,943. (No model.)



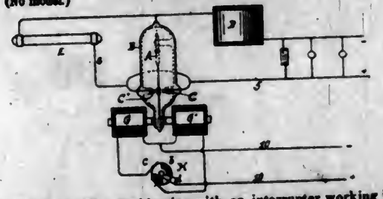
Claim.—1. In a system for regulating the current which operates an incandescent electric lamp, the combination with an incandescent electric lamp of a magnet in circuit therewith, means for auto-

matically and variably opening and closing both the circuit of said magnet and that of said lamp at terminals which are independent of a surrounding rarefied or inert gas.

2. An incandescent-electric-lamp regulator, consisting of the combination with the filament thereof, located within an evacuated bulb, of circuit-breaking terminals outside of the bulb in free air, and means for automatically maintaining vibration of the terminals relatively to and from each other.

3. The combination of an incandescent electric lamp, its filament, and an automatic circuit-breaker in the circuit of said filament arranged to make and break the circuit through said filament, rapidly and continually.

604,680. ELECTRIC-LAMP REGULATOR. DANIEL MCF. MOORE, New York, N. Y., assignor to the Moore Electrical Company, same place. Filed Oct. 13, 1894. Serial No. 525,787. (No model.)

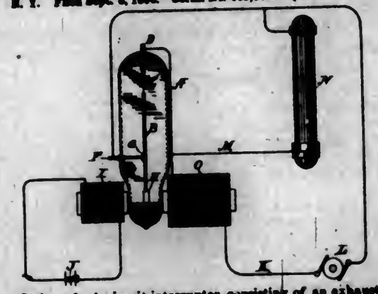


Claim.—1. The combination with the base of an incandescent electric-lamp socket, of an electromagnet, a bulb having a vacuum or inert atmosphere, a vibratory armature within the vacuum within inductive relation to the magnet, a flexible arm carrying the bulb and movable to and from the magnet, an insulating-stop for limiting the movement of the bulb from the magnet, a screw provided with a handle passing through the socket-frame and movable to and from and against the said arm, and electric contacts within the bulb and controlled by the armature, the electric circuit being from one terminal of the lamp to the other and passing through the said screw, the said arm, the said contacts and the said magnet.

2. The combination with the base of an incandescent electric lamp, of an electromagnet, a bulb having a vacuum within inductive relation to the magnet, a flexible arm, carrying the bulb and movable to and from the magnet, an insulating-stop for limiting the movement of the bulb from the magnet, a screw provided with a handle passing through the frame of the socket and movable to and from and against said arm, and electric contacts within the bulb and controlled by the armature, and a short-circuiting electric conductor in the path of the arm *e*, for the purpose as set forth, of short-circuiting the said contacts and the magnet.

3. The combination with an incandescent lamp, of an electromagnet in the socket thereof and in the lamp-circuit, a vacuous chamber within said socket, circuit-interrupting contacts within said chamber and in circuit with the lamp-filament, and an armature attached to one of said contacts and actuated by said magnet.

604,681. INTERRUPTER FOR ELECTRIC-LIGHTING SYSTEMS. DANIEL MCF. MOORE, Newark, N. J., assignor to the Moore Electrical Company, New York, N. Y. Filed Dec. 3, 1895. Serial No. 570,872. (No model.)



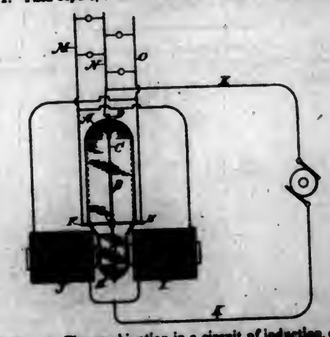
Claim.—1. The combination with an interrupter working in a sealed receptacle, of a pair of actuating-magnet poles arranged at opposite sides of an armature carried by said interrupter, and means for energizing said magnets in alternation, as described, over a circuit independent of the interrupter.

2. The combination with an interrupter loosely pivoted in a sealed receptacle, of an armature borne thereby, and a pair of actuating-magnet poles arranged on opposite sides thereof, said magnet being in a circuit independent of the interrupter-contacts.

3. The combination, substantially as described, of an interrupter working in a sealed receptacle and carrying an armature within said receptacle, a pair of magnet-poles exterior to the same and arranged on opposite sides of said armature, and means for energizing said magnets in alternation as described to cause a positive movement of the interrupter in both directions.

604,682. MAGNETIC CIRCUIT-BREAKER. DANIEL MCF. MOORE, Newark, N. J., assignor to the Moore Electrical Company, New York, N. Y. Filed Sept. 8, 1896. Serial No. 605,109. (No model.)

Claim.—1. A circuit-interrupter consisting of an exhausted receiver, a non-resilient vibrating tongue therein, a fixed contact also in the receiver for engagement with the tongue, a magnet exterior to the receiver tending to hold the contacts in engagement, and the circuit-interrupting magnet also exterior to the receiver but acting on said tongue in opposition to the other magnet.



2. In a circuit-interrupter in vacuo, the combination with the vibrating member, of coöperating contacts located in substitute relation to one another for the purpose set forth.

3. The combination with a series of circuit interrupters, of a magnet normally holding the vibrating part of each interrupter in engagement with its coöperating contact, and a series of circuit-breaking magnets successively energized, as and for the purpose set forth.

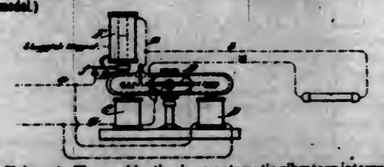
4. The combination with a series of circuit-interrupters, of a magnetic retractor common to all of them, a circuit-breaking magnet for each interrupter, a circuit common to said magnets, and a commutator in said circuit for successively creating a flow of current through said magnets, substantially as and for the purpose set forth.

5. The combination of a series of circuit-interrupters in each of which the vibrating part is normally magnetically held in engagement with its coöperating contact, and magnetic means for successively withdrawing said vibrating parts from their coöperating contacts.

604,683. MAGNETIC CIRCUIT-BREAKER. DANIEL MCF. MOORE, Newark, N. J., assignor to the Moore Electrical Company, New York, N. Y. Filed Sept. 8, 1896. Serial No. 605,110. (No model.)

Claim.—1. The combination in a circuit of induction, of circuit-breaking magnets in said circuit, and a contact-tongue alternately actuated thereby to repeatedly make and break said circuit, and a circuit to receive the discharges of the circuit of induction.

2. A circuit-interrupter having a vibrating contact-tongue, in combination with a circuit of induction, circuit-breaking magnets in said circuit operating alternately upon said tongue and a lighting-circuit controlled by each magnet and forming a branch of said circuit of induction.



3. The combination in a circuit of induction, of circuit-breaking magnets in said circuit, and a contact-tongue alternately actuated thereby to repeatedly make and break said circuit, a circuit to receive the discharges of the circuit of induction, and devices operated directly or indirectly by said discharges.

4. In a circuit-interrupter, the combination of a vibrating contact-tongue centrally pivoted, a contact engaged by each end thereof in alternation, magnets in circuit with said contacts and acting to vibrate said tongue automatically and continuously, a circuit of induction controlled by said interrupter, and a discharge circuit or circuits connected to the circuits of induction, substantially as and for the purpose set forth.

5. The combination with a source of current, of two self-induction coils, circuits or branches, a circuit-interrupter acting alternately on said coils or circuits, and a circuit or circuits forming branches around the contacts of the interrupter into which the coils discharge and containing devices operated by the discharges from said coils.

6. The combination in a circuit of self-induction, of a vibrating circuit-interrupter making contact at each half-vibration, of electromagnets in said circuit for actuating said interrupter, and a lighting-circuit at each contact for receiving the discharge from the circuit of induction.

604,684. AUTOMATIC VIBRATORY INTERRUPTER. DANIEL MCF. MOORE, Newark, N. J., assignor to the Moore Electrical Company, New York, N. Y. Filed Dec. 17, 1896. Serial No. 616,971. (No model.)

Claim.—1. The combination in an automatic vibratory interrupter, of an operating-magnet therefor in the circuit including the interrupter-contacts, and a jarring device for insuring continuous action of the interrupter, as and for the purpose described.

2. The combination with an automatic electromagnetic vibratory interrupter, substantially as described, of a striker for jarring the contacts, and a separate actuating-magnet for said striker in a circuit controlled by the interrupter.

3. The combination with an automatic vibratory interrupter, substantially as set forth, of a striker, and a sluggish magnet controlling it and energized on the cessation of the interrupter, as and for the purpose described.

4. The combination with an automatic vibratory interrupter, of a striker, and a sluggish actuating-magnet therefor having a self-acting circuit-breaker controlled by the flow of current through the interrupter-contacts, as and for the purpose described.

5. The combination with an automatic rapidly-operating vibratory interrupter, substantially as described, of a vibratory striker or knocker independently of the vibratory portion of the interrupter, and a magnet in the circuit of the interrupter-contacts for operating it, as and for the purpose described.

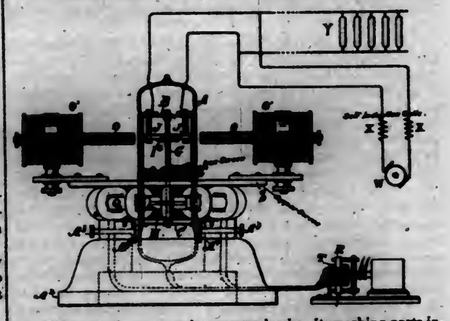
6. The combination with a pivoted vibratory contact, of contacts with which it cooperates to make and break an electric circuit, of a striker for jarring the pivoted contact but without touching it to prevent its sticking to a contact with which it cooperates.

7. The combination with a vacuous receptacle, of a balanced vibrating contact mounted therein, a contact within said receptacle with which the balanced contact cooperates to make and break circuit, magnets for vibrating the balanced contact, and a striker for jarring the receptacle occasionally to insure the continued operation of the balanced contact.

8. The combination with a vibrating contact, of magnets alternately energized to produce the vibration of said contact, a striker for jarring the vibrating contact to insure its continuous action, and a magnet for controlling the actions of the striker, said magnet being connected in the circuit controlled by the interrupter and timed to act when the interrupter comes to rest, as and for the purpose set forth.

9. In a vibratory interrupter, a balanced lever and two magnets operating respectively at opposite sides of the fulcrum of said lever one to close and the other to open the circuit, in combination with a circuit controlled by the interrupter and containing means whereby the interrupter is maintained in continuous operation, as and for the purpose described.

10. The combination with a vacuous receptacle, of a balanced contact mounted therein, a fixed contact sealed in the wall of said receptacle and engaging the balanced contact, and electromagnets arranged exterior to and under opposite ends of the balanced contact for producing a continuous vibration of said contact for the purpose set forth.



11. The combination in an automatic continuously-operating vibratory interrupter having an actuating-magnet in the circuit of the interrupter-contacts, of a retractor-magnet supplied by a branch from the main circuit and acting with a constant retracting power tending to close the circuit to the interrupter.

12. In a vibratory interrupter, a balanced contact-lever, a magnet acting with a constant power upon said lever and tending thereby to maintain it in a certain position, and another magnet in the circuit of the interrupter-contacts and acting intermittently to move said contact-lever from that position for the purpose set forth.

13. The combination with the interrupter, of the circuit of self-induction having two self-inductive coils on opposite sides of the break respectively, and a circuit into which said coils discharge in concert connected to opposite sides of said break.

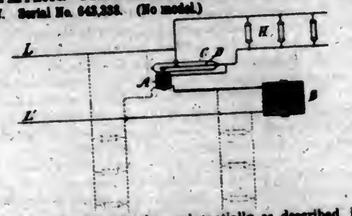
14. In an apparatus for producing electric vibrations or disturbances by discharges from a rapidly-interrupted circuit of induction, the combination with an interrupter, of a circuit having its self-induction equalized at opposite sides of the break.

604,685. ELECTRIC-LIGHTING APPARATUS. DANIEL MCF. MOORE, Newark, N. J., assignor to the Moore Electrical Company, New York, N. Y. Filed Feb. 15, 1897. Serial No. 623,209. (No model.)

Claim.—1. In a rotary interrupter having its working parts inclosed within a sealed receptacle, the combination with an armature secured to the rotator and stationary armature-coil system surrounding said receptacle, of a rotating commutating device to which the said system is connected, and a circuit of self-induction exterior to the sealed receptacle and connected through the walls thereof to the contacts of the interrupter.

2. In a rotary interrupter contained within a sealed receptacle, the combination with the armature in said receptacle, of means for producing a rotating field to rotate said armature, said means comprising a fixed system of windings similar to the armature system of a dynamo-electric machine or motor, a rotating commutating device for said system, and a circuit of self-induction exterior to the sealed receptacle and connected through the walls thereof to the contacts of the interrupter, as and for the purpose described.

3. In a rotary interrupter, the combination with a vacuous chamber, of the armature attached to the interrupter-shaft and mounted within said chamber, a stationary system of closed-circuit windings surrounding said armature and outside of said chamber, a rotating commutating device to which said closed-circuit system is connected in the ordinary way, and a circuit of self-induction exterior to the vacuous chamber and connected through the walls thereof to the contacts of the interrupter.



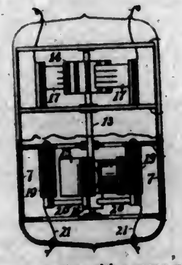
4. In a rotating interrupter, the combination, substantially as described, of a vacuous chamber, an armature secured to the rotator-shaft and both mounted in said chamber, a fixed system of closed-circuit windings, the fixed commutator-cylinder with which said windings are connected after the manner of the windings for the armature of a dynamo-electric machine or motor, rotating brushes moving on said cylinder, and a circuit of self-induction exterior to the vacuous chamber and connected through the walls thereof to the contacts of the interrupter.

5. In a rotary circuit-interrupter, having magnetic devices for holding the parts of the interrupter in contact, and means for producing a rotating magnetic field to rotate the interrupter, of a magnetic screen interposed between the latter devices and the devices which act magnetically upon the interrupter-contacts, as and for the purpose described.

6. In a rotating circuit-interrupter having its parts inclosed in a sealed receptacle, the combination with a commutator-brush carry-

ing a spring, of a lever having an arm bearing on said spring so as to force the brush against its contacts and armature carried by said lever, and an exterior magnet, as and for the purpose described.

604,686. APPARATUS FOR PRODUCING LUMINOUS OR SIMILAR EFFECTS. DANIEL McF. MOORE, Newark, N. J. Filed July 3, 1897. Serial No. 643,233. (No model.)



Claim.—1. The combination, substantially as described, in an apparatus for producing luminous or similar effects by interruptions of a circuit of induction, of a vacuous receptacle, inter upter-contacts located therein, a magnet or coil in the circuit of the interrupter-contacts and constructed solely for the operation of said contacts, and a separate coil or magnet in the circuit of the interrupter constructed to produce inductive effects in said circuit, as and for the purpose described.

2. In an apparatus for producing luminous or similar effects, as described, by interruptions of a circuit of induction supplied from any suitable source of energy, the combination, substantially as described, of a circuit-interrupter in an exhausted receiver, a magnet or magnets for the operation of the interrupter and devoid of inductive effects upon said circuit, and a separate magnet or magnets acting inductively upon said circuit, said operating and inductive magnets being placed in branches of the circuit but both in circuit with a contact or contacts of the interrupter, as and for the purpose described.

3. In an apparatus for producing luminous or similar effects, as described, by interruptions of a circuit of induction, the combination, substantially as described, of an operating magnet or magnets in the circuit of an interrupter inclosed in an exhausted receiver, and a separate inductive magnet or coil in a branch or circuit through a separate interrupter brush or contact in said receiver, as and for the purpose described.

4. The combination, substantially as described, with the rotary interrupter, of a series of operating-magnets arranged on the exterior of the receptacle containing the interrupter and having their poles presented to armatures within said receptacle, said magnets being included in a circuit of the interrupter, and a separate inductive coil B, in a branch of the circuit controlled by said interrupter, as and for the purpose described.

604,687. CIRCUIT-INTERRUPTING MECHANISM. DANIEL McF. MOORE, Newark, N. J. Filed Sept. 9, 1897. Serial No. 651,153. (No model.)

Claim.—1. The combination with a vacuous receptacle, of a circuit-interrupter therein, a motor for driving the interrupter, the rotary part of which motor is within said receptacle and has its coils insulated and thoroughly embedded in a vitreous mass.

2. The combination with a vacuous receptacle, of a circuit-interrupter therein, a motor for driving the interrupter also located in the receptacle and having the coils thereof insulated by and thoroughly embedded in a vitreous mass.

3. A magnetically-operated circuit-interrupter the magnet or magnets of which are inclosed in a vacuous receptacle and the coils of which are insulated by and thoroughly embedded in a vitreous mass.

4. The combination with a vacuous chamber, of a rotary circuit-interrupter located therein, a circuit of induction controlled thereby, an electromagnetic motor located wholly within said chamber for operating the interrupter, and an operating circuit for said motor independent of the circuit of induction.

5. The combination with a vacuous chamber, of a rotary circuit-interrupter located therein, a circuit of induction controlled thereby, a self-starting or induction motor the armature or rotary part of which with its coils is located within said chamber and operates the interrupter, and a power-circuit for said motor independent of the circuit of induction, substantially as set forth.

6. The combination with a vacuous receptacle, of a circuit-interrupter therein, and electromagnetic devices operating the interrupter, said devices being also located in the receptacle and having its coil or coils covered by an inclosing vitreous envelop.

7. A magnetically-operated circuit-interrupter inclosed in a vacuous receptacle, and having the metal portions of the magnet or magnets which operate said interrupter coated with a vitreous envelop.

604,688. CIRCUIT-INTERRUPTER. DANIEL McF. MOORE, Newark, N. J. Filed Sept. 10, 1897. Serial No. 651,178. (Model.)

Claim.—1. A circuit-interrupting device consisting of a metallic foundation and sections of insulation formed from some vitreous substance located therein in suitable quantities and at the desired intervals, and having a fused or fired connection with said foundation.

2. A circuit-interrupting device consisting of a metallic foundation and sections of porcelain which have a fused or fired connection with the metal.

3. A circuit-interrupter consisting of a metallic foundation provided with openings or depressions and successive layers of a vitreous insulating substance deposited therein and having a fused connection with the metal and the surface of the metal and insulation made level and smooth.

4. A circuit-interrupter consisting of a metallic foundation with sections of porcelain deposited therein and having a fused or "fired" connection with the metal, the foundation being then ground or planed down to expose a portion of the porcelain sections.

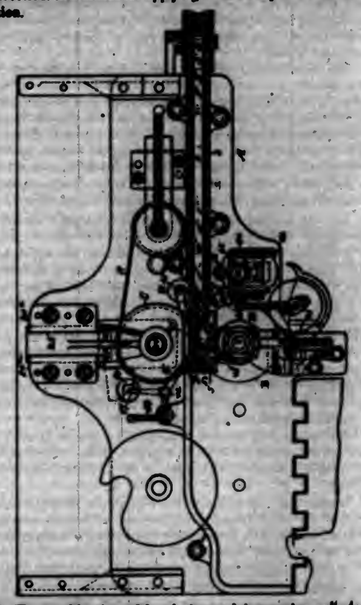
5. A circuit-breaking wheel consisting of a cylinder of metal with plugs of porcelain deposited therein and having a fused or "fired" connection with the metal, the cylinder being turned or ground down to expose a portion of said plugs.

604,689. MAIL-MARKING MACHINE. CHARLES P. OGDEN, New York, N. Y., assignor, by mesne assignments, to the Asmo Supply Company, of New York. Filed June 22, 1897. Renewed May 2, 1898. Serial No. 679,490. (No model.)

Claim.—1. The combination with printing and impression cylinders, a stop and trip, of a sliding spring-actuated foot located above one of the cylinders for moving the article to be marked from the stop and for operating the trip, and means on one of the cylinder-shafts for moving the foot.

2. The combination with printing and impression cylinders, of a rigid stop, a strip, a sliding bifurcated foot located over one of the cylinders, a spring for pulling the foot in one direction and a cam on one of the cylinder-shafts for forcing the foot positively in the other direction.

3. The combination with printing and feeding mechanism, of a stop, a shaft having a cam thereon, a slide having a foot adapted to be forced in one direction by the cam, a tail-bolt extending rearward from the foot through a solid part of the machine and a spring connecting said bolt to a rigid part of the machine.



4. The combination with a printing and impression cylinder, and conveyer-belts, of a trip, a stop, a sliding spring-actuated feed-roller, and a sliding spring-actuated foot for throwing the card or envelop from the stop and operating the trip.

5. The combination with rotary printing and impression cylinders, a feed-roller, and a sliding bracket carrying one of the cylinders, of a trip operated by a passing card or envelop to release the bracket, and means for automatically applying a variable pressure to the bracket and through it to the cylinder carried thereby.

6. The combination with a rotary printing-cylinder, rotary impression-cylinder, a sliding feed-roller, and sliding foot a sliding bracket carrying one of these cylinders, of a trip operated by a passing card or envelop to release the bracket and means for automatically applying a variable pressure to the bracket and through it to the cylinder carried thereby.

7. The combination with two rotary cylinders, one movable and means for applying a variable pressure to the movable cylinder, of a sliding spring-actuated foot-feeding mechanism and trip mechanism.

8. The combination with rotary printing and impression cylinders, one of which is movable, of a sliding spring-actuated feed-roller, a sliding foot, trip mechanism, cam moving the movable cylinder in one direction, and means for applying a variable pressure in the other direction.

9. The combination with printing and impression cylinders one of which is movable, the shaft on which one cylinder is secured having two cams, of a sliding spring-actuated foot operated by one of these cams, a lever operated by the other, a spring extending from this lever and connected with the movable cylinder and adapted to apply a variable pressure thereto, and feed, stop and trip mechanism.

10. The combination with a printing-cylinder having a transverse post therein, of a cancellation-block having a bayonet or L-shaped slot formed therein and adapted to receive this post, and a slide constructed and adapted to lock the block in this post.

11. The combination with a printing-cylinder having a post therein, of a cancellation-block having an L-shaped slot opening into the inner face and adapted to receive and let the post into its innermost end whereby the block is held in place, and a spring-actuated slide having sliding connection with the cylinder in rear of the cancellation-block and adapted to normally extend over the end of the latter whereby to lock it in place on the cylinder.

12. The combination with feed mechanism and a printing-cylinder, of a sliding spring-actuated foot located over the cylinder, a cam on the cylinder-shaft for moving said foot, a stop and trip mechanism.

604,690. FOUNTAIN-PEN. LOUIS H. WAGNEMAN, Brooklyn, N. Y. Filed Aug. 16, 1893. Serial No. 483,094. (No model.)

Claim.—1. An ink and air joint consisting of the fountain of a fountain-pen provided at its front end with an inner surface in the form of a truncated female cone, in which is inserted a nozzle provided at its rear end with an outer surface in the form of a truncated male cone, the front end of the fountain having on its outer surface the form of a truncated male cone which is inserted in the open end of the cap of a fountain-pen provided at its front end with an inner surface in the form of a truncated female cone.

2. An ink and air joint consisting of the fountain of a fountain-pen provided at its front end with an inner surface in the form of a truncated female cone, in which is inserted the nozzle provided at its rear end with an outer surface in the form of a truncated male cone, the front end of the fountain having on its outer surface the form of a truncated male cone which is inserted in the open end of the cap of a fountain pen provided at its front end with an inner surface in the form of a truncated female cone, the outer edge of the open end of the cap being beveled to a thin edge.

3. An air and ink joint consisting of a nozzle provided with a surface in the form of a truncated male cone inserted in a seat in the form of a truncated female cone provided in the forward end of the fountain, in combination with an air-joint consisting of a fountain provided on its front end with a truncated male cone inserted in a seat in the form of a truncated female cone provided in the open end of the cap, the open end of the cap being provided with a short truncated male cone on its exterior end surface.

4. In a fountain-pen, surfaces in the form of two truncated female cones in combination with three surfaces in the form of truncated male cones forming two air and ink joints, one between the nozzle and the fountain and the other between the holder and the cap, substantially as shown and described.

5. In fountain-pens, one or more annular progressive elastic ink and union joints and stops formed by the combination of truncated tubular wedges, without an abutting shoulder, and with an elastic mouth in the outer member of each joint engaging the opposite part of the inner wedge or member with a comparatively slight elastic pressure, the stop being formed at and opposite the inner part of the conical chamber where its wall is thicker, less elastic and more rigid.

6. In fountain-pens, an ink and union joint and stop consisting in the cooperative and supporting union of external and internal conical members, the external member provided with an internal conical surface, seat or chamber and composed of material made progressively thicker and less yielding from the outer to the inner end of its conical surface, and the internal member provided with an external conical surface, in which the external member, at, by and near its mouth, engages the opposite part of the internal member with elastic pressure, and forms a non-capillary joint and stop.

7. In fountain-pens, an automatic and progressive ink joint and stop, consisting in the cooperative and supporting union of external and internal conical members, the external member provided with an internal conical surface, seat or chamber and composed of material made progressively thicker and less yielding from the outer to the inner end of the conical surface, and the internal member provided with an external conical surface, in which the external member, at, by and near to its mouth, engages the opposite part of the internal member with elastic pressure and forms a non capillary joint and variable stop, and the internal conical member projects beyond the external conical member and thereby provides for the automatic maintenance of a progressive ink and union stop and joint during both use and wear.

8. In fountain-pens, an ink and union joint and stop consisting in the cooperative and supporting union of external and internal conical members, the external member being also provided at its open end with an elastic, externally-beveled annular lip that engages the opposite part of the internal member with elastic pressure and forms a non-capillary joint and stop with and upon the internal member.

9. In fountain-pens, a cap having within its open mouth a conical seat or chamber for the conical end of the fountain also provided at its mouth with an externally-beveled elastic annular lip engaging the conical end of the fountain at and near its base.

10. An elastic, non-capillary joint for the convenient opening and closing of the outlets of vessels to contain fluids, consisting in the combination of mutually-supporting members having exterior and interior conical surfaces, the outer one of which members is elastic at and near its mouth.

11. An elastic, non-capillary joint for the convenient opening and closing of the outlets of vessels to contain fluids, consisting in the combination of mutually-supporting members having exterior and interior conical surfaces, the outer one of which members is elastic at and near its mouth and is provided with a beveled or conical exterior surface as well.

12. An elastic, non-capillary joint for the convenient opening and closing of the outlets of vessels to contain fluids, consisting in the combination of mutually-supporting members having exterior and interior conical surfaces, the outer one of which members is elastic at and near its mouth and is provided with an external conical or beveled and elastic lip.

13. An elastic cap or cover surrounding and forming a non-capillary joint with the outside of the outlets of vessels to contain fluid, consisting in the combination of mutually-supporting members having exterior and interior conical surfaces, the outer one of which members is elastic at and near its mouth.

14. An elastic cap or cover surrounding and forming a non-capillary joint with the outside of the outlets of vessels to contain fluid, consisting in the combination of mutually-supporting members having exterior and interior conical surfaces, the outer one of which members is elastic at and near its mouth and is provided with a beveled or conical exterior surface as well.

15. An elastic cap or cover surrounding and forming a non-capillary joint with the outside of the outlets of vessels to contain fluid,

consisting in the combination of mutually-supporting members having exterior and interior conical surfaces, the outer one of which members is elastic at and near its mouth and is provided with an external conical or beveled and elastic lip.

16. In fountain-pens, a combined non-capillary and capillary joint between the nozzle and the fountain, the nozzle having an exterior conical surface and the fountain having an interior conical surface or chamber therefor, in combination with an ink-duct conducting ink from the reservoir to the pen by means of capillary grooves or other capillary ducts, and also in combination with a cap provided with a conical chamber for the conical front end of the fountain the two forming a non-capillary joint at and near the mouth of the chamber.

17. A tapered interior member and an exterior member having at and near its mouth an elastic bearing thereon and a positive supporting-bearing thereon back of the mouth, forming a union-joint, substantially as shown and described.

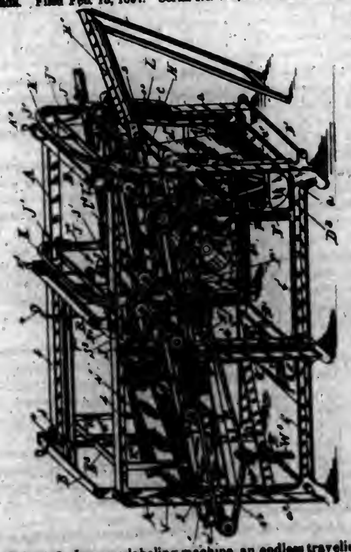
18. A holder of a fountain-pen tapered on its forward open end, in combination with a cap which is elastic at and near its mouth and thereby makes and maintains union-joint connection with the holder.

19. In fountain-pens, a holder provided with a tapered hollow end and with a cap which is elastic and flexible at and near its mouth.

20. In fountain-pens, an internal member having a taper surface and bearing, and an external member or cap having an elastic mouth, seat or chamber, which engages with the internal taper surface and forms a variable elastic joint.

21. In fountain-pens, an internal member having a taper surface and bearing, and an external member or cap having an elastic mouth, seat or chamber, which engages with the internal taper surface and forms a variable elastic combined joint and stop.

22. In fountain-pens, an external member or cap having an elastic mouth, seat or chamber, which engages with a taper surface on an internal member and forms a variable stop.



23. In fountain-pens, an external member or cap having an elastic mouth, seat or chamber, which engages with a taper surface on an internal member and forms a variable stop and elastic joint.

24. In fountain-pens, a cap or exterior member which is elastic at and near its mouth and forms a variable-stop joint on and with a taper surface of an interior member.

25. In a fountain-pen, a cap and a holder engaged and held together by an elastic progressive-wedge union-joint.

26. In fountain-pens, a cap and a holder engaged and held together by an elastic progressive-wedge union-joint which also is a stop.

604,691. CAN-LABELING MACHINE. JOHN L. BARNEY, Toronto, Canada. Filed Feb. 18, 1897. Serial No. 624,012. (No model.)

Claim.—1. In a can-labeling machine, an endless traveling paste-belt having a longitudinal run to apply the paste to the cans, and a vertically-disposed run at its head end, of a vertically-disposed traveling paste-supply belt adjacent to the vertical run of the said paste-belt to supply paste thereto, and a paste-receptacle into which the lower end of said supply-belt extends.

2. The combination in a can-labeling machine with the main frame and a supplemental frame mounted in the head end thereof and means for raising and lowering the head end of the supplemental frame, of three triangularly-arranged rolls mounted in said supplemental frame, an endless paste-belt passed around said rolls with its longitudinal run in the path of the cans, a vertically-disposed traveling paste and supply belt alongside of the vertical run of the paste-belt and also having rolls mounted in the supplemental frame, a paste-receptacle into which the lower end of the supply-belt extends, and means for adjusting the adjacent runs of the two belts toward and from each other.

3. The combination with the main frame, of a pivoted frame mounted therein and vertically adjustable at its head end to vary its inclination, a paste-belt having its rolls mounted in said pivoted frame, and a paste-supply for said belt carried by said pivoted frame, of vertically-adjustable hangers suspended from the main frame over the ends of the paste-belt, rolls journaled in said hanger, an endless can-feeding belt passed around said rollers and guide-rails mounted on the main frame and extending longitudinally over the paste-belt, and means for adjusting the rails for different sizes of cans.

4. In a can-labeling machine, a pasting apparatus consisting of a supplemental frame pivotally connected at one end to the main frame, means for adjusting the opposite end of the supplemental frame, to increase or diminish its inclination, a set of drums journaled in the supplemental frame, a paste-belt passing around the drums, a paste-dish carried by the supplemental frame, a second set of drums one of the said drums journaled in the said dish and the other in the supplemental frame, a supply-belt passing around the second set of drums, adapted to convey the paste from the paste-dish to the paste-belt, an idler engaging the outer surface of the supply-belt, an idler engaging the paste-belt, and a platform carried by the supplemental frame to receive the cans from the hopper and deliver them to the paste-belt, substantially as specified.

5. In a can-labeling machine, a label-holder consisting of an open bottom, laterally-adjustable sides composed of telescopic sections connected to the said bottom, and a head for the said sides, substantially as specified.

6. In a can-labeling machine a label-holder, consisting of an open bottom, laterally-adjustable sides composed of telescopic sections connected to the said bottom, a head for the said sides, and a door formed in one of the said sides, substantially as specified.

7. In a can-labeling machine, a label-holder consisting of an open bottom, laterally-adjustable sides composed of telescopic sections connected to the said bottom, a head for the said sides, a door formed in one of the said sides, and an adjusting-screw for moving the said sides toward or away from each other, substantially as specified.

8. In a can labeling machine, a label-holder consisting of an open bottom, laterally-adjustable sides composed of telescopic sections connected to the said bottom, a head for the said sides, a door formed in one of the said sides, an adjusting-screw for moving the said sides toward or away from each other, a sleeve depending from the under side of the false bottom, a column entering the said sleeve, a laterally-movable base for the said column, spring-actuated rollers connected to the base, idlers connected to the under side of the open bottom, and cords connected to the spring-actuated rollers, passing around the idlers connected to the sleeve, to cause the elevation of the false bottom, substantially as specified.

9. In a can-labeling machine the combination of the pasting apparatus, a label-holder, a supplemental pasting apparatus to gum the lap of the label, consisting of a paste-brush journaled above the label-holder, a paste-receptacle adapted to feed the paste-brush, a reciprocating brush within the paste-receptacle, and a traveler on the end of the shank of the reciprocating brush, engaging a cam on the spindle of the supplemental paste-brush, substantially as specified.

10. In a can-labeling machine the combination of the pasting apparatus, a label-holder, a supplemental pasting apparatus to gum the lap of the label, consisting of a paste-brush journaled above the label-holder, a paste-receptacle adapted to feed the paste-brush, a reciprocating brush within the paste-receptacle, a traveler on the end of the shank of the reciprocating brush, engaging a cam on the spindle of the supplemental paste-brush, a conveyer to roll the cans from the primary pasting apparatus to the labels, and a presser-belt to press the label on the can, substantially as specified.

11. In a can-labeling machine the combination of the primary pasting apparatus, a label-holding receptacle, a platform interposed between the primary pasting apparatus and the label-holder, and longitudinally and laterally adjustable tracks R' R' connected to the platform to receive the cans from the primary pasting apparatus, and deliver them at the edge of the labels, substantially as specified.

12. In a can-labeling machine the combination of the raceway, a presser apparatus located above the raceway, consisting of two vertically and longitudinally adjustable hangers, drums supported in the hangers, a belt passing around the drums, and a spring-supported

hinged leaf at the delivery end of the raceway, substantially as specified.

13. In a can-labeling machine, a feed regulator for the cans, consisting of a rock-shaft 8, a lever 9 connected to the rock-shaft 8, a gate 10 carried by the lever 9, a rock-shaft 17 connected with and operated by the action of the rock-shaft 8, and a gate 20 carried by the rock-shaft 17, substantially as specified.

14. In a can-labeling machine a feed-regulator for the cans, consisting of a rock-shaft 8, a lever 9 carried by the rock-shaft 8 and operated by the action of the can-conveyer, a gate 10 connected to the lever 9, a rock-shaft 17 having a rod 18 operated by the action of the rock-shaft 8, and a gate 20 carried by the rock-shaft 17, substantially as specified.

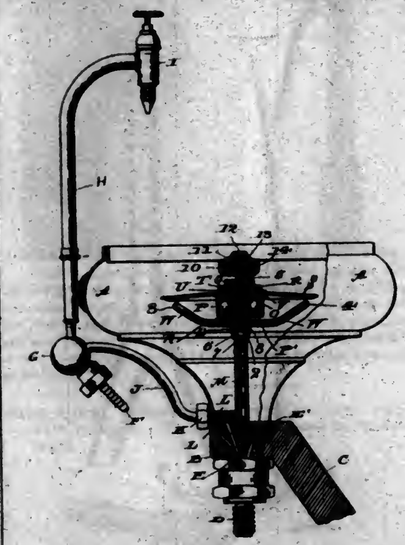
15. In a can-labeling machine a feed-regulator for the cans consisting of a rock-shaft 8, a lever 9 carried by the rock-shaft 8 and operated by the action of the can-conveyer, a vertically-adjustable gate 10 connected to the forward end of the lever 9, a rock-shaft 17, longitudinally-adjustable side rods 18 connected to the rock-shaft 17 and to the lever 9, an arm 19 connected to the rock-shaft 17, and a vertically-adjustable gate 20 carried by the forward end of the arm 19, substantially as specified.

16. In a can-labeling machine a feed-regulator for the cans consisting of a rock-shaft 8, a lever 9 carried by the rock-shaft 8 and operated by the action of the can-conveyer, a vertically-adjustable gate 10 connected to the forward end of the lever 9, a rock-shaft 17, longitudinally-adjustable side rods 18 connected to the rock-shaft 17, and to the lever 9, an arm 19 connected to the rock-shaft 17, a vertically-adjustable gate 20 carried by the forward end of the arm 19, and springs to return the lever and correlative parts to their normal position after being actuated, substantially as specified.

17. The combination with the chute, the paste-belt and the can-conveying belt mounted thereabove and provided with transverse arms to engage the cans and move them over the paste-belt, of oppositely-operating gates located one in advance of the other for controlling the feed of the cans and provided with an operating device located in the path of the belt-arms and to be operated thereby.

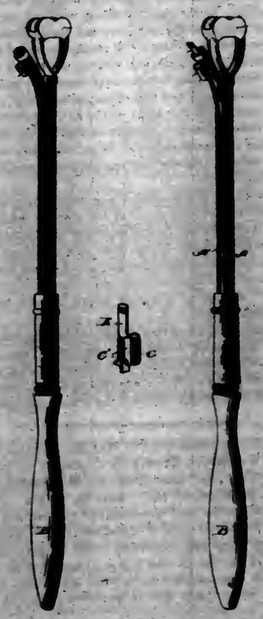
18. A can-labeling machine comprising a frame, a can-chute at the head thereof, a gate mechanism over the chute in the path of the cans, a pasting mechanism to which the chute delivers, a can-conveyer belt over the paste mechanism and provided with means for actuating the said gate mechanism, a label-holder at the rear end of the paste mechanism, a supplemental pasting mechanism at the rear end of the label-holder and a pressing device in rear of said supplemental pasting mechanism.

19. The combination with the can-chute, and the pasting mechanism, of a vertically-adjustable frame above the pasting mechanism, a can-conveying belt and gate mechanism mounted in said frame and adjustable as a whole toward and from the pasting mechanism and chute, the said can-conveying belt having means for actuating the gate mechanism to release one can at a time.



20. A can-labeling machine comprising, the frame having adjustable sides, the longitudinally-extending paste-belt at the lower end of the chute, a can-conveying belt over the paste-belt, a label-holder beyond the lower ends of the said two belts and having adjustable sides, a table between the said holder and the lower end of the paste-belt, adjustable tracks mounted on said table, a leaf at the rear of the label-holder, laterally adjustable guide-rails extending from the lower ends of the sides of the can-chute over the paste-belt, label-holder, and leaf, an endless belt over the label-holder, a supplemental pasting mechanism at the rear end of said belt and over the rear end of the label-holder and a presser-belt over said leaf and in rear of said supplemental pasting mechanism.

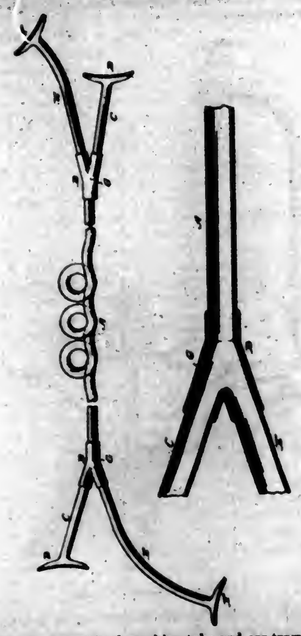
604,692. FOUNTAIN-SPITTOON. THEODORE H. CLARK, Toronto, Canada. Filed Dec. 20, 1897. Serial No. 663,265. (No model.)



Claim.—1. In a spittoon, the combination with the body portion and supply-pipe, of the valve-chamber secured to the upper end of said supply-pipe, radial arms extending therefrom, which arms are apertured near their ends, the valve mounted in said chamber, the threaded stem to said valve, the adjusting head piece to the stem, of the disk mounted above the said chamber, and the ball-bearings, arranged as set forth.

2. In a spittoon, the standard, the body portion mounted thereon, the supply-pipe mounted in said standard, the valve-chamber communicating with said pipe, the exit-ducts leading from the chamber through the standard, radial arms W, the rotary disk mounted above the said valve-chamber, and provided with ball-bearings, the valve and stem mounted centrally in said valve-chamber, and means for regulating the said valve, as shown and described.

3. In a spittoon, the combination with the supply-pipe, the valve-chamber, the radially-arranged pipes leading from said chamber, the rotary disk mounted above the said valve-chamber and having ball-bearing connection therewith, the valve-stem mounted in said chamber, and provided with a duct in said stem opening into the said chamber, the adjusting part of the valve-stem and radial ducts opening downward at the outer end of the adjusting part of the valve-stem, which ducts communicate with the duct in the stem of the valve, as shown and described.



604,698. LIGHTING IMPLEMENT. HARRY M. EDWARDS, Brooklyn, N. Y., assignor to William Vogel & Brothers, same place. Filed Aug. 24, 1897. Serial No. 649,374. (No model.)

Claim.—In a lighting implement, a taper-holder tube, in combination with a thumb-piece provided with an extension made in closed-loop or eye form, through which the taper is adapted to be hooked substantially as described.

604,694. SPEAKING-TUBE. THOMAS FALES, Bridgeport, Ct., assignor of one-half to George J. Thackery, same place. Filed July 20, 1897. Serial No. 646,265. (No model.)

Claim.—1. A combined speaking-tube and ear-trumpet, consisting of the extensible body portion having each end formed with two branch pipes leading to the ear and mouth respectively, the mouth-pipe being provided with a mouthpiece and the ear-tube being provided with an ear-covering which will closely surround the ear, and hold the said covering upon the ear without the aid of the hand.

2. A combined speaking-tube and ear-trumpet, consisting of the body portion having each end forked to provide two branches, one leading to the mouth and the other to the ear, mouthpieces carried by the mouth branches and ear-covers carried by the ear branches, said covers being of elastic material to permit them to cover and snugly fit the ears, and hold the said ear-covering upon the ear without the aid of the hand.

3. A combined speaking-tube and ear-trumpet, consisting of the body portion and forked ends made in one piece of material, mouth and ear pieces carried by the forked ends and having flaring mouths to cover the ears and mouths of the users, said ear-covering adapted to surround the ear and be held thereabout without the aid of the hand, and a forked reinforcement adapted to surround the body portion and ends of the forked branches where the said body portion and forked branches meet.

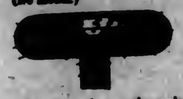
4. A speaking-tube, consisting of the conducting-tube, said tube terminating in the forked reinforced ends, two of the said forked ends carrying a mouthpiece, and the other two being of greater length and carrying each an ear-covering adapted to fit over the ear of the user and be held thereabout without the aid of the user's hand.

604,695. ROLLER-DIE FOR MAKING METALLIC LATHING. ALEXANDER B. FORSTER, Newark, N. J., assignor to the American Metal Lath, Fire Proof, Construction and Manufacturing Company, same place. Filed June 30, 1897. Serial No. 642,804. (No model.)

Claim.—1. In a roller-die for making metallic lathing, a roll having an annular row of female dies extending into its periphery, and an annular row of male dies projecting from the periphery of said roll, the said male and female dies being separated from each other and their relative arrangement being such that those forming the row of male dies break joint with those forming the row of female dies.

2. In a roller-die for making metallic lathing, a roll having an annular row of female dies extending into its periphery, an annular row of male dies projecting from the periphery of said roll, the said male and female dies being separated from each other and their relative arrangement such that those forming the row of male dies break joint with those forming the row of female dies, and having an annular ogee formation interposed between the row of male dies and the row of female dies.

3. In a roller-die for making metallic lathing, the combination of a disk having an annular row of male dies projecting from its periphery, a disk having an annular row of female dies extending into its periphery, the said disks being arranged so that the male dies are separate from and break joint with the female dies, and means for securing the said disks in their proper relative positions.



4. In a roller-die for making metallic lathing, the combination of a disk having an annular row of male dies projecting from its periphery, a disk having an annular row of female dies extending into its periphery, a disk having an annular ogee formation extending around its periphery, the said disks being arranged so that the male dies are separate from and break joint with the female dies and so that the disk having the ogee formation is interposed between the disk having the male dies and the disk having the female dies, and means for securing said disks in their proper relative positions.

5. In a roller-die for making metallic lathing, a roll having an annular row of female dies consisting of apertures extending into the periphery of said roll, and the said roll having an annular row of male dies projecting from its periphery, each of said male dies having a cutting edge substantially concentric with the axis of the roll and with the corners of said edge cut away to permit a gradual entrance and exit of the die into and from the metal on which it operates, the said dies being arranged so that the male dies of one row are separate from and break joint with the females dies of an adjacent row.

6. In a roller-die for making metallic lathing, a roll having an annular row of female dies consisting of apertures extending into the periphery of said roll, each of said female dies having its interior walls inclined to approach each other as they extend inwardly, and the said roll having an annular row of male dies projecting from its periphery, each of said male dies having a cutting edge substantially concentric with the axis of the roll and with the corners of said edge cut away to permit a gradual entrance and exit of the die into and from the metal on which it operates, the said dies being so arranged that the male dies of one row are separate from and break joint with the female dies of an adjacent row, and the relative dimensions of a male and a female die being such that the male die is smaller than the female die so that when the male die of one roll registers with the female die of another roll considerable space between the same will exist to permit the metal upset between them to assume the form of an irregular collar to constitute a key.

7. In a machine for making metallic lathing, the combination with a roll having a series of disks provided one with a series of cutters, another with a series of depressions, and an intermediate disk; of a cooperating roll also having a series of disks provided one with a series of cutters, another with a series of depressions, and an intermediate disk, the depressions in each roll being directly opposite the cutters in the other roll.

604,696. VALVE-HANDLE. HENRY B. FRENCH, Belleville, N. J., assignor of one-half to David Dodd, Newark, N. J. Filed June 30, 1897. Serial No. 643,919. (No model.)

Claim.—1. The combination, in a valve-spindle handle of the character described, of a wooden handle portion provided with a concentric groove in its upper and lower face, said grooves of different diameters, so as to avoid weakening each wooden portion, retaining-plates provided with flanges bent at right angles to said plates, said flanges adapted to enter said grooves so as to support each wooden portion, in case of accidental breakage, said bottom plate having a hole to admit a valve-spindle, a flange rising from the inner surface of said plate and surrounding said hole, for the purpose set forth.

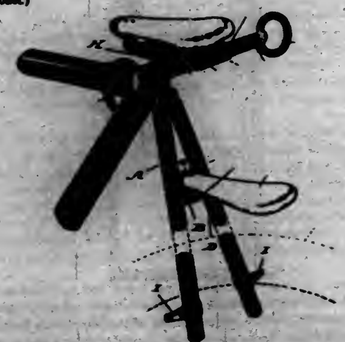
2. The combination, in a valve-spindle handle of the character described, of a wooden handle portion provided with concentric grooves of unequal diameters, as shown, upper and lower retaining-plates provided with flanges to enter said grooves, projections on the edge of the flange of the lower retaining-plate, adapted to enter holes in the bottom of the lower groove of the wooden handle, a square curb having a square hole therethrough, rising from the central inner surface of said lower plate to admit the valve-spindle and support the wooden handle, also having a square hole to fit said curb, means substantially as shown for securing said handle to the spindle, for the purpose set forth.

604,697. DUMPING-WAGON. THOMAS R. HOOPER, Yountville, Cal., assignor of one-half to H. W. Collins and H. L. Goss, Napa, Cal. Filed Oct. 26, 1897. Serial No. 656,502. (No model.)

Claim.—1. The dumping-wagon, substantially as described, composed of the oblong wagon-body elevated on bolsters from axles, the series of tilting sections forming the dumping-bottom thereof, said sections arranged to swing together and in the same direction and longitudinally of the wagon-body, each section having journal-bars secured at a side thereof near one edge and, respectively, to turn at the bottoms of the wagon ends, the edges of the sections beveled to overlap so that the sections can assume the horizontal position when closed together, the single horizontal transverse winding-shaft arranged centrally across the body and mounted on the tops of the sides thereof with a handle at the exterior of a side of the body, and exterior locking means, flexible connections secured to said shaft and at their lower ends to the central parts of the free portions of the dumping-sections, respectively, and arranged to permit the sections to assume the vertical positions and to be drawn up by the winding-shaft without locking on the dead-center, substantially as shown.

2. The dumping-wagon comprising the body, having the strip secured longitudinally along the inner face of one side above the bottom edge thereof, the series of dumping-sections extending longitudinally the length of the body and at their ends eccentrically journaled in the ends thereof so that all the sections swing in one direction, the pivoted side edge of one end section abutting against one side of the body and the free edge of the other end section closing up against said strip when the sections are closed to their horizontal positions, the sections (except said end sections) having projecting plates secured on their upper faces at their free edges, the transverse winding-shaft extending across the body and mounted at the top of the sides with the end handle at the exterior of the body, a swinging latch or hook to engage said handle and hold the shaft against unwinding rotation, and the loose connections secured to said shaft at points, respectively, about in the vertical planes of the section-journals when the sections are in their vertical dumping positions and at their lower ends, respectively, secured to the upper faces near the free edges of said sections, whereby the sections do not lock at the dead center and the connections press laterally against the upper edges of said sections when swinging the same up.

3. The dumping-wagon comprising essentially the oblong body, the dumping-sections arranged longitudinally thereof and eccentrically mounted in the ends thereof and arranged to swing to the horizontal positions with the sections overlapping and to the vertical positions, the transverse winding-shaft on the top of the wagon-body provided with turning and locking means, and the loose connections secured to said shaft, respectively, about in the vertical planes of the axes of said sections with their lower ends secured to the upper faces of said sections, respectively, near the free edges thereof and so arranged that when the sections are in their vertical positions said connections extend up transversely of the sections and against the upper edges thereof, and thereby press laterally against said upper edges of the sections and swing the sections up without locking at the dead-center, substantially as described.



4. A dumping-wagon comprising essentially the wagon-body, the dumping-sections extending longitudinally of the same and mounted eccentrically in the ends thereof, the transverse winding-shaft mounted at the top edges of the sides of the body with the exterior crank-handle, chains secured to the shaft and to the free edges of said sections, and the swinging hook pivoted to the exterior of a wagon-body side to engage said crank-handle when the dumping-sections are elevated and to hold the shaft against unwinding, whereby the hook can be easily knocked from the handle to dump the wagon, substantially as described.

604,698. LATHING. PAUL KLEMM, Stapleton, N. Y., assignor to the Staten Island Construction Company, same place. Filed Apr. 28, 1897. Serial No. 633,633. (No model.)

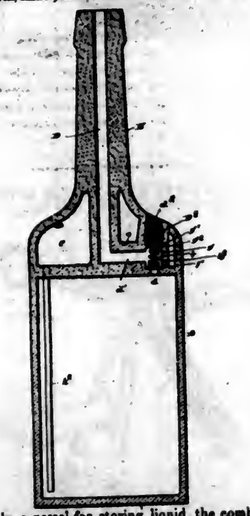
Claim.—A partition-wall formed of I-shaped uprights, tie-rods connecting said uprights, sections or panels formed of parallel laths, and transverse intercrossing wires attached respectively to the top and bottom angle-irons and to intermediate tie-rods, and layers of plaster-of-paris or other covering material applied to opposite sides of said panels so as to form a strong and rigid partition, substantially as set forth.

604,699. SUPPLEMENTAL SEAT FOR BICYCLES. WALTER R. MAYO, Chicago, Ill. Filed Sept. 13, 1897. Serial No. 651,473. (No model.)

Claim.—1. In a bicycle, the combination of the rear forks, a tie-plate uniting the rear forks above the driving-wheel, a seat-spring, a clamp united to the seat-spring embracing the tie-plate, a cross-head connected to the seat-spring on the inner side of the rear forks, a seat-frame connected to the rear of the seat-spring, a seat, the rear of the seat being connected to the seat-frame, and the horn of the seat connected to the seat-spring, substantially as specified.

2. In a bicycle, the combination of the rear forks, a tie-plate uniting the rear forks above the driving-wheel, a seat-spring, a clamp united to the seat-spring embracing the tie-plate, a cross-head connected to the seat-spring on the inner side of the rear forks, a seat-frame connected to the rear of the seat-spring, a seat, the rear of the seat being connected to the seat-frame, the horn of the seat connected to the seat-spring, and hand-grips connected to the saddle-post, substantially as specified.

3. In a bicycle, the combination of the rear forks, a tie-plate uniting the rear forks above the driving-wheel, a seat-spring, a clamp united to the seat-spring embracing the tie-plate, a cross-head connected to the seat-spring on the inner side of the rear forks, a seat-frame connected to the rear of the seat-spring, a seat, the rear of the seat being connected to the seat-frame, the horn of the seat connected to the seat-spring, hand-grips connected to the saddle-post, and foot-rests connected to the rear forks below the supplemental seat, substantially as specified.



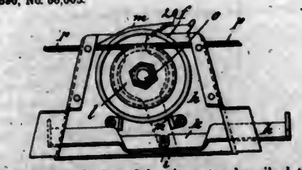
4. In a bicycle, the combination of the rear forks, a tie-plate uniting the rear forks above the driving-wheel, a seat-spring, a clamp united to the seat-spring embracing the tie-plate, a cross-head connected to the seat-spring on the inner side of the rear forks, a seat-frame connected to the rear of the seat-spring, a seat, the rear of the seat being connected to the seat-frame, the horn of the seat connected to the seat-spring, a T-coupling connected to the horizontal part of the seat-post, having hollow screw-threaded branches, and hand-grips

having shanks fitted into the hollow screw-threaded branches of the T-coupling, substantially as specified.

5. In a bicycle, the combination of the rear forks, a tie-plate uniting the rear forks above the driving-wheel, a seat-spring, a clamp united to the seat-spring embracing the tie-plate, a cross-head connected to the seat-spring on the inner side of the rear forks, a seat-frame connected to the rear of the seat-spring, a seat, the rear of the seat being connected to the seat-frame, the horn of the seat connected to the seat-spring, a T-coupling connected to the horizontal part of the seat-post, having hollow screw-threaded branches, hand-grips having shanks fitted into the hollow screw-threaded branches of the T-coupling, and foot-rests connected to the rear forks below the supplemental seat, substantially as specified.

604,700. DEVICE FOR PREVENTING REFILLING VESSELS.

Billings H. Raymond, Detroit, Mich., assignor of three-eighths to George C. Darwin, same place. Filed Jan. 15, 1897. Serial No. 619,260. (No model.)



Claim.—1. In a vessel for storing liquid, the combination of a liquid-chamber, an air-chamber, means of communication between the air-chamber and the normal bottom of the liquid-chamber, a tortuous outlet from the liquid-chamber provided with a valve, and a direct inlet leading into said liquid-chamber adapted to be permanently closed, substantially as described.

2. In a vessel for storing liquids, the combination of a liquid-holding chamber, a direct passage leading into the liquid-holding chamber and provided with a chamber *f* and a collar f^3 above the chamber *f*, a tortuous outlet from the chamber *f*, and a spring-closed valve in the passage below the chamber *f*, the portion of the direct passage above the collar f^3 being adapted to be permanently closed, substantially as described.

604,701. APPARATUS FOR CUTTING DOUBLE-PILE FABRICS.

Reinhold Richter, Reichenberg, Austria-Hungary. Filed Jan. 18, 1897. Serial No. 619,520. (No model.) Patented in Germany June 13, 1896, No. 88,063.

Claim.—1. In a device of the character described, the combination with holding-rollers *a* and *a'* for feeding forward the uncut fabric, of spreading-rollers *b* and *b'*, a railway S, a traveling double-acting shears composed of a circular rotating and a straight-edged knife-blade mounted upon the railway S, means for reciprocating the shears along such railway and means for rotating the circular knife-blade during the reciprocation, substantially as shown and described.

2. In a device of the class described, the combination with the holding-rollers *a* and *a'*, of the spreading-rollers *b* and *b'*, the drawing-rollers *c* and *c'*, the taking-off roller *y*, a railway S, a traveling double-acting shears composed of a circular rotating and a straight-edged shear-blade mounted upon the railway S, means for reciprocating the shears, and means for rotating the circular knife-blade during reciprocation, the shears being located below the rollers *a* and *a'*, substantially as shown and described.

3. In a device of the class described, the combination with a cutting device or shears for cutting the pile of the fabric, of a reciprocating carriage therefor, a railway S upon which the same is mounted, and means for reciprocating the carriage; the said cutting device or shears consisting of a straight-edged knife-blade, a rotary circular knife-blade adjacent thereto so that the two together form a shears, a wheel *l* secured to the rotary circular knife-blade of the shears, and a belt or cord *p* encircling the wheel *l* and permanently secured at the ends in such manner that as the carriage carrying the stationary and rotary knife-blades is reciprocated, rotary motion will be given to the rotary knife-blade *f*, first in one direction and then in the other, according to the direction of the movement of the carriage, substantially as shown and described.

4. In a device of the class described, the combination with a cutting device or shears for cutting the pile of the fabric, of a reciprocating carriage therefor, a railway S upon which the same is mounted, and means for reciprocating the carriage; the said cutting device or shears consisting of a knife-blade having the points 20 and 21 and the undercutting straight edges 9, a rotary circular knife-blade adjacent thereto so that the two together form a shears, a wheel *l* secured to the disk or rotary circular knife-blade of the shears, and a belt or cord *p* encircling the wheel *l* and permanently secured at the ends in such manner that as the carriage carrying the knife-blades is reciprocated rotary motion will be given to the rotary circular knife-blade *f*, first in one direction and then in the other according to the direction of the movement of the carriage, substantially as shown and described.

5. In a device of the class described, the combination with a reciprocating carriage, of means for reciprocating such carriage, a cutting device or shears carried thereby consisting of a rotating disk knife or circular shear-blade *f*, means for rotating the blade *f*, a knife *m* having the cutting edges 9 and the points 20 and 21, and means for vibrating such knife *m* at the end of each reciprocation of the carriage, substantially as shown and described.

6. In an apparatus for cutting double-pile fabrics on the loom, the combination with the loom and the shaft W, of a toothed wheel E upon the said shaft W, a loose intermediate wheel T gearing with the wheel E, the wheel R gearing with the wheel T, the connecting-rod K pivoted upon the crank-pin C of the wheel R, the driving-lever A to be moved alternately backward and forward, upon which the connecting-rod K is pivoted at D, the cord *z* attached to the lower end of the driving-lever A, guide-pulleys *n*, *t*, *u*, *x*, *v'*, *t'* over which the cord *z* passes, a carriage to which the cord *z* is secured so as to move such carriage alternately backward and forward owing to the alternative movement of the driving-lever A, the carriage having a frame *h h'*, carrying upon a pivot-bolt *o*, a vibrating knife *m* having a boss *o'*, and pointed at either end and having an inclined sharp edge on its under or inner side, a cutting disk knife or wheel *f* which together with the knife *m* forms a shears, and a pulley *l* secured to the disk knife, both the disk knife *f* and a pulley *l* being mounted on said boss *o'*, and said disk-knife blade *f* being rotated by means of a driving-cord *p* fixed to both side frames of the loom and passing around the pulley *l*, substantially as shown and described.

7. In an apparatus for cutting double-pile fabrics on the loom, the combination with a railway S fixed transversely between the two side frames of the loom parallel to the breast-beam B, of a carriage adapted to be moved alternately backward and forward along the railway, a shears or pile-cutting device carried by the carriage, consisting of a vibrating knife-blade *m* pointed at either end and having an inclined sharp edge on its under or inner side and being provided with a boss *o'*, and being pivoted upon a bolt *o* fixed to the side of the carriage-frame *h*, and being provided with an arm *m'* projecting downward from the knife-blade below the center upon which it turns, a pin *i* upon the arm *m'*, said pin *i* working in a notch or recess in a sliding plate or bar *k* which projects at each end of the carriage-frame, a circular cutting disk-knife blade or wheel *f* which together with the knife-blade *m* forms a shears, and a pulley *l* secured to the circular disk-knife blade *f*, said circular disk-knife blade being mounted upon the boss *o'*, and being rotated by means of a driving-cord *p* fixed to both side frames of the loom and passing around the pulley *l*, substantially as shown and described and for the purposes set forth.

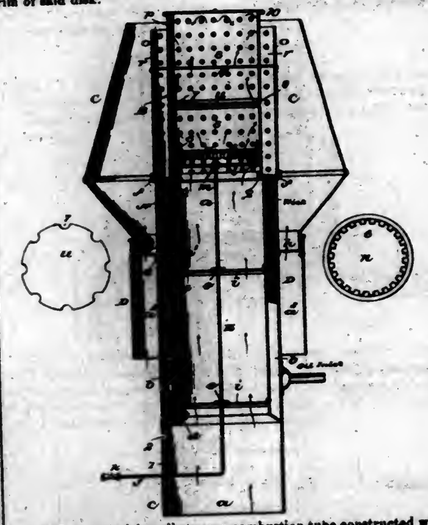
8. In an apparatus for cutting double-pile fabrics on the loom, the combination with a reciprocating carriage, of means for reciprocating such carriage, a shears or cutting device carried by the carriage, and consisting of a knife-blade *m*, provided with a boss *o'*, and pointed at either end and having an inclined sharp edge on its under or inner side adjacent to each point, a cutting circular disk-knife blade or wheel *f* mounted upon the boss *o'*, a pulley *l* secured to the circular disk-knife blade or wheel *f*, the two knives together forming a shears, and the circular disk-knife blade being rotated by means of a driving-cord *p* secured at the ends and passing around the pulley *l*, substantially as described and for the purposes set forth.

604,702. GRAIN CLEANING AND SCALPING MACHINE.

Rel-ford G. Royal, Camden, N. J., assignor of seven-ninths to Richard H. Reeve, same place, Alexander C. Wood and Edward S. Wood, Cinnaminson, N. J., and Eldridge R. Johnson, Philadelphia, Pa. Filed Mar. 22, 1897. Serial No. 628,001. (No model.)

Claim.—1. In a grain cleaning and scalping machine, the combination with an abrading-cylinder of a rotatable drum mounted within the cylinder and grain-carriers mounted upon said drum, said carriers being contradistinguished from brushes and comprising wire strands radially secured at their lower ends to a yielding back to allow of a uniform vibration of each strand throughout its length while in operation, said strands being adapted to receive and carry the grain and to throw it by centrifugal force against the abrading-surface, the outer ends of the strands being out of contact and at a distance from the abrading-surface, substantially as described.

2. In a grain cleaning and scalping machine, the combination with an abrading-cylinder of a rotatable drum mounted within the cylinder and grain-carriers mounted upon said drum, said carriers being contradistinguished from brushes and comprising wire strands radially secured at their lower ends to a yielding back to allow of a uniform vibration of each strand throughout its length while in operation, said strands being spaced to receive and retain the grain in the direction of its length while being carried thereby, and to direct the grain when thrown by centrifugal force with the end against the abrading-surface, the outer ends of the strands being out of contact and at a distance from the abrading-surface, substantially as described.



3. In a grain cleaning and scalping machine, the combination of an abrading-cylinder, of a rotatable drum mounted within the cylinder and grain-carriers mounted upon said drum, said carriers being contradistinguished from brushes and comprising wire strands formed in pairs radially disposed and secured at their united ends yieldingly by being passed through a backing-piece of yielding material, said backing-piece being secured to a longitudinally-disposed holding bar provided upon the circumference of the rotatable drum, said yielding connection providing for a uniform vibration of each strand throughout its length while in operation, said strands being spaced to receive and retain the grain in the direction of its length while being carried and to direct the course of the grain when thrown by centrifugal force with the end against the abrading-surface, the outer ends of the strands being out of contact with and at a distance from the abrading-surface, substantially as described.

604,708. VAPORIZING OIL-STOVE.

William H. Silver, Brooklyn, N. Y., assignor to the Silver & Company, same place. Filed May 24, 1897. Serial No. 637,876. (No model.)

Claim.—1. A vaporizing oil-stove comprising an annular wick-tube having a practically unobstructed central air-chamber open at bottom and top, a superposed combustion-tube having concentric perforated walls and loosely seated at the top of said wick-tube, a fixedly-attached gallery surrounding said wick-tube, an outer drum supported on said gallery, and means for elevating said combustion-tube including a vertical lifter-rod within the wick-tube, a perforated lifter disk carried by the upper end of said rod and serving by its perforations to regulate the supply of air to the interior of the flame, and a lifter-abutment within said combustion-tube to coact with said lifter-disk, substantially as hereinbefore specified.

2. In a vaporizing oil-stove, the combination of an annular wick-tube having a practically unobstructed air-chamber open at bottom and top, a superposed combustion-tube loosely seated at the top of said wick-tube, and means for elevating said combustion-tube comprising a vertical lifter-rod within said wick-tube, a disk-shaped perforated disk carried by the upper end of said rod, and a lifter-abutment within said combustion-tube in the form of a fixed ring having downwardly and inwardly inclined fingers to coact with the upturned rim of said disk.

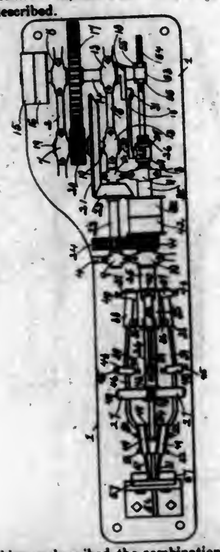
3. In a vaporizing oil-stove, a combustion-tube constructed with concentric outer and inner walls inclosing an annular flame-space and a central air-chamber and provided within the latter with an imperforate air-directing disk having notches in its perimeter forming the air-passages, the projections between said notches bringing the disk into contact with the inner wall of the tube on all sides, for mutual support.

4. In a vaporizing oil-stove, a combustion-tube constructed with concentric outer and inner walls inclosing an annular flame-space and a central air-chamber, the latter closed at top by an imperforate cap and open at bottom, and provided at mid-height within said air-chamber with an imperforate air-directing disk having notches in its perimeter forming the air-passages, the projections between said notches bringing the disk into contact with the inner wall of the tube on all sides, for mutual support, substantially as hereinbefore specified.

604,704. WAGON-BRAKE.

Samuel L. Sibley, Perryopolis, Pa. Filed May 24, 1897. Serial No. 637,914. (No model.)

Claim.—A wagon-brake, consisting of the two horizontal bars, provided with horizontal slots, having angular openings, guides for each of said horizontal bars, in combination with the brake-lever, provided with lugs or pins on each side thereof, adapted to be seated in the said slotted horizontal bars, substantially as described.



604,705. CORK-CUTTING MACHINE.

Henry Weiss, Pittsburg, Pa. Filed May 24, 1897. Serial No. 637,918. (No model.)

Claim.—1. In combination with the herein-described cork-cutting machine, of a revoluble guide-block, guide-boxes pivoted upon the forward end of the said block, rods carrying knives, the rods being loosely fitted within the said guide-boxes, brackets formed upon the rear end of the said block and extending over the said guide-boxes, screws arranged upon the said brackets and bearing upon the outer sides of the said guide-blocks, and screws arranged upon the said block and beneath the said guide-boxes and at their rear ends which form bearings for the under sides of the said boxes, said screws arranged and adapted to adjustably incline the said boxes, substantially as shown and for the purpose described.

2. A cork-cutting machine consisting of the hollow shaft having mounted thereon adjustable guide-boxes, rods loosely fitting within

said guide-boxes provided with adjustable slide-boxes, knives secured to the outer ends of said rods, and means for revolving the said knives, substantially as described.

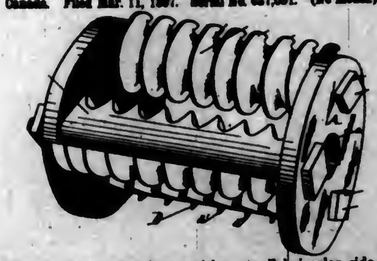
3. In a machine as described, the combination with the rods 39 and arms 46 of the adjustable slide-boxes 44 and 47 into which the said arms are pivoted and by which they may be adjustably inclined.

4. A cork-cutting machine consisting of the shaft having adjustably mounted thereon guide-boxes, each of said guide-boxes being provided with openings into which are loosely fitted suitable rods, the ends of said rods having formed thereon boxes provided with slide-blocks, arms connected to said slide-blocks, and a series of knives suitably attached to said arms, substantially as shown and described.

5. A cork-cutting machine consisting of the hollow shaft having adjustably mounted thereon guide-boxes, each of said guide-boxes being provided with openings into which are loosely fitted suitable rods, the outer ends of said rods having formed thereon hollow boxes provided with slide-blocks, means for adjusting said slide-blocks, arms connected to said slide-blocks, their forward ends being provided with bushings into which are fitted a series of knives, and means for revolving the said knives, substantially as shown and described.

6. A cork-cutting machine consisting of the hollow shaft having adjustably mounted thereon guide-boxes, rods loosely fitted in said guide-boxes, boxes provided with adjustable slide-blocks formed upon the ends of said rods, arms pivoted to said slide-blocks, their middle portions being pivoted to adjustable slide-boxes located within a spider, the forward ends of said arms having attached thereto knife-holders which are provided with bushings into which the knives are fitted, substantially as shown and described.

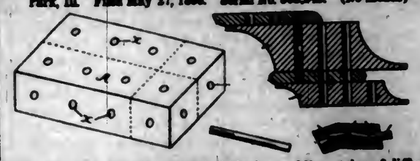
604,706. HAND-GRIP. ADOLPH R. WIRTH and GERHARD J. BRANDT, Milwaukee, Wis. Filed Oct. 26, 1896. Serial No. 610,118. (No model.)



Claim.—1. A hand-grip comprising a hollow core provided at its outer end with an external shoulder, a compressible perforate frame on the core having longitudinal play under pressure toward said shoulder, a series of cane stakes recurved under the inner end of the frame and made fast therewith to said core, a filler of pliable material in weave with the stakes, and end pieces in the form of a ferrule and cap arranged to embrace terminals of the jacket resulting from the interwoven stakes and filler.

2. A hand-grip comprising a hollow core provided at its outer end with an external shoulder, a compressible perforate frame on the core having longitudinal play under pressure toward said shoulder, a series of cane stakes recurved under the inner end of the frame and made fast therewith to said core, a filler of hair-braid in weave with the stakes, and end pieces in the form of a ferrule and cap arranged to embrace the terminals of the jacket resulting from the interwoven stakes and filler.

3. A hand-grip comprising a hollow core provided at its outer end with an external shoulder, a spring-metal grid on the core having longitudinal play under pressure toward said shoulder, a series of cane stakes recurved under the inner end of the grid and made fast therewith to said core, a filler of hair-braid in weave with the stakes, and end pieces in the form of a ferrule and cap embracing the terminals of the jacket resulting from the interwoven stakes and filler.



4. A hand-grip jacket that consists of interwoven cane and hair-braid.

604,707. CUTTER-HEAD. HARVEY M. WILSON, Owen Sound, Canada. Filed Mar. 11, 1897. Serial No. 627,051. (No model.)

Claim.—A cutter-head comprising parallel circular side plates each formed with a central bore, and with centrally-bored recessed seats on its inner side, in combination with stay-bolts extending through the bores in said seats, a cutting-cylinder mounted on each of said stay-bolts, each of said cylinders having hubs fitting the seats in the side plates, and parallel cutting-blades having concave sides to form semicircular spaces between the blades and being longitudinally recessed to form a front cutting edge d^3.

604,708. CHILD'S BUILDING-BLOCKS. CHARLES S. BISHOP, Oak Park, Ill. Filed May 27, 1896. Serial No. 593,945. (No model.)

Claim.—1. In child's building-blocks, molding-strips of different thicknesses, which are multiples of a selected unit of thickness, having at opposite edges similarly-molded face portions corresponding in extent to the thickness, the body portion intermediate said face portions having pin-holes in three longitudinal rows, one outer row being distant from the lateral boundary of the body once the unit of thickness, the other outer row being distant from the other lateral boundary twice said unit, and the middle row being distant from the outer rows twice said unit of thickness.

2. In child's building-blocks, in combination with blocks whose dimensions are all multiples of a selected unit of measure, and which have pin-holes in their faces distant from each other once said unit and from the edges respectively of the blocks half such unit; molding-strips of different thicknesses which are all multiples of a unit of thickness which is an aliquot part of said unit of measure, said molding-strips having at opposite edges similarly-molded face portions corresponding in extent to the thickness, the body portion intermediate said face portions having pin-holes in three longitudinal rows, one outer row being distant from the lateral boundary of the body once the unit of thickness, the other outer row being distant from the other lateral boundary twice said unit, and the middle row being distant from the outer rows twice said unit of thickness.

3. In child's building-blocks, in combination with rectangular blocks whose dimensions are all multiples of a selected unit of measure, and which have sockets in their several faces distant from their edges respectively half the unit of measure and from each other once such unit; right-angle triangular gable-blocks whose three sides are all multiples of the unit of measure, and whose edges at said three sides are provided with sockets at the middle point of each such unit into which said edges can be divided.

4. In child's building-blocks, in combination with rectangular blocks whose dimensions are all multiples of a unit of measure, and which have sockets in their several faces distant from the edges respectively half the unit of measure and from each other once such unit, right-angle triangular gable-blocks whose sides are respectively three, four and five times the unit of measure and whose edges are provided with sockets at the middle point of each such unit into which said edges can be divided.

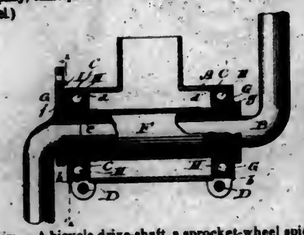
5. In building-blocks for arch construction, wedges of small angle which is an aliquot part of one hundred and eighty degrees, in combination with blocks having their two opposite faces parallel, said wedges having their oblique faces and said other blocks having their opposite parallel faces provided with sockets adapted to receive connecting devices, whereby the parallel face blocks in different numbers or dimensions may be interposed and secured between the wedges to form arches of different span and radius.

6. In building-blocks for arch construction, wedges of small angle which is an aliquot part of ninety degrees, in combination with blocks having their two opposite faces parallel, said wedges having their oblique faces and said other blocks having their opposite parallel faces provided with furrows at corresponding positions, and keys adapted to enter said corresponding furrows to unite the edges to the parallel-faced blocks at their said parallel faces.

7. In building-blocks for arch construction, wedges of small angle which is an aliquot part of ninety degrees, in combination with blocks having their two opposite faces parallel, said wedges having their oblique faces and said other blocks having their opposite parallel faces provided with dovetailed furrows at corresponding positions and double dovetail keys adapted to enter said corresponding furrows to unite the edges to the parallel-faced blocks at said parallel faces.

8. In child's building-blocks for decorative arch construction, blocks which are cylindrical segments with equal oblique bases, provided with sockets at the center of such oblique bases and entering the block at right angle to such bases respectively, and pins adapted to enter such sockets, whereby the span and radius of an arch formed by a series of such oblique cylindrical segments may be varied at will.

9. In child's building-blocks, keystone blocks for arch building comprising two pieces hinged together at one edge and having each a row of perforations; a staple adapted to have one leg inserted in a pin-hole of each block, whereby the spread of the blocks from their hinge edge may be varied by the selection of the perforations used for the staples: substantially as set forth.



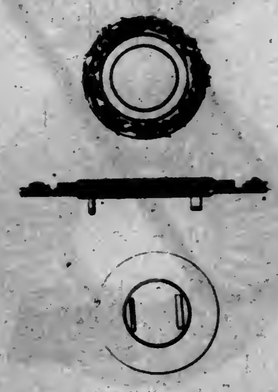
604,709. ROTARY ENGINE. DANIEL B. COOK, Superior, Wis., assignor to the Cook Rotary Engine Company, of Wisconsin. Filed Mar. 8, 1897. Serial No. 626,419. (No model.)

Claim.—1. In a rotary engine, the combination of the main shaft A, the conical collar a, a, and the motor-wheel B, containing the concentric chambers E, E, &c., and provided with the parallel reverse-curve slots h, h', located in the wheel B, and outside of, and concentric and eccentric to the chambers E, E, &c., all of which are rigidly attached, and a stationary sleeve D, projecting into said wheel, completing the inclosure of the chambers E, E, &c., and bearing and holding in position the automatic partitions e, e, &c., which are actuated by said parallel reverse-curve slots h, h', revolving outside of said sleeve and thus causing the successive division of the chambers E, E, &c., into an expansive and a contracting chamber, substantially as specified.

2. In a rotary engine the core C, with the projecting sleeve D, and to which are rigidly attached the valve-plates o, o, &c., and the steam-chest I, I', and exhaust-chamber H, H', and in which revolves the main shaft A, which bears the motor-wheel B; said core and sleeve being also provided with ports and passages connecting the steam-chest I, I', and the exhaust-chambers H H', with the chambers E, E, &c., practically as specified.

604,710. BICYCLE. JAMES R. COWELL, Milwaukee, Wis., assignor, by mesne assignments, to the League Cycle Manufacturing Company, same place. Filed Sept. 14, 1896. Serial No. 605,775. (No model.)

Claim.—A bicycle drive-shaft, a sprocket-wheel spider having its hub fast on the shaft, a shaft-sleeve having an annularly-flanged end in screw-thread connection with said hub a ball-bearing cone in similar connection with the sleeve against its flange, and another such cone in like connection with the other end of said sleeve.



DESIGNS.

28,677. BADGE. GEORGE CORBETT, New York, N. Y., assignor to Alfred S. Bishop, trustee, Pittsburg, Pa. Filed Mar. 21, 1898. Serial No. 674,684. Term of patent 3½ years.

Claim.—The design for a badge herein shown and described.

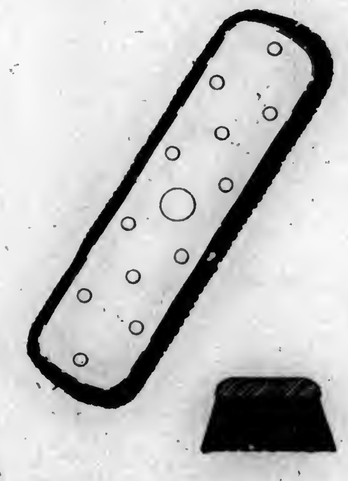
28,678. LOCKET. TILLIE J. ZELTMACHER, New York, N. Y. Filed Jan. 27, 1898. Serial No. 668,295. Term of patent 7 years.

Claim.—The design for a locket herein shown and described.

28,679. HEAD FOR BUTTONS. FRANK P. LAWE, Beebe, Ark. Filed Mar. 24, 1898. Serial No. 675,044. Term of patent 3½ years.

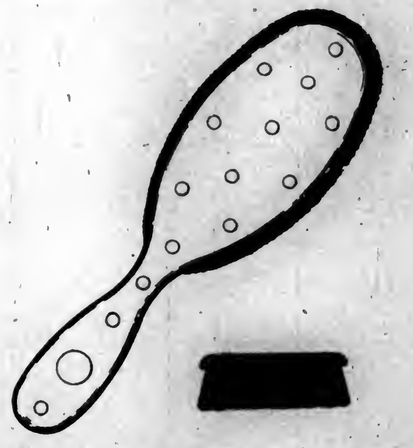
Claim.—The design for a head for a button substantially as herein shown and described.

28,680. HANDLE FOR SPOONS, &c. FRED T. LOVE, Rockford, Ill., assignor to the Rockford Silver Plate Company, same place. Filed Feb. 5, 1898. Serial No. 669,284. Term of patent 7 years.



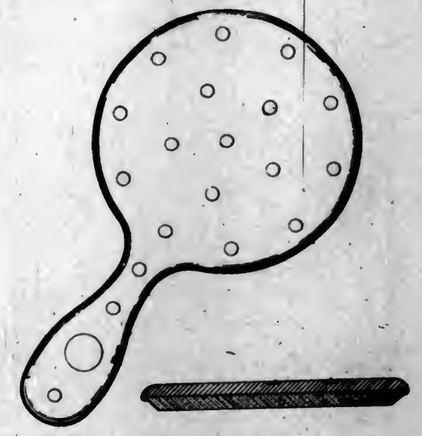
Claim.—The design for a handle for spoons, forks and similar articles herein shown and described.

28,681. HANDLE FOR SPOONS, &c. FRED T. LOVE, Rockford, Ill., assignor to the Rockford Silver Plate Company, same place. Filed Feb. 5, 1898. Serial No. 669,285. Term of patent 7 years.



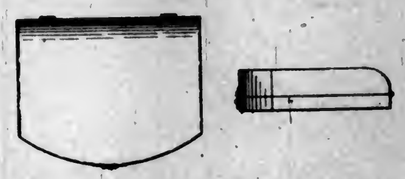
Claim.—The design for a handle for spoons, forks, and similar articles, herein shown and described.

28,682. CLOTHES-BRUSH. FRANK H. LA PIERRE, East Orange, N. J. Filed Apr. 21, 1898. Serial No. 678,396. Term of patent 7 years.



Claim.—The design for a clothes-brush as herein shown and described.

28,683. HAIR-BRUSH. FRANK H. LA PIERRE, East Orange, N. J. Filed Apr. 21, 1898. Serial No. 678,397. Term of patent 7 years.



Claim.—The design for a hair-brush as herein shown and described.

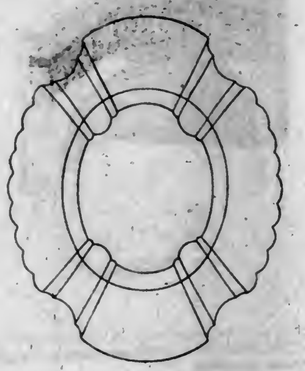
28,684. HAND-GLASS. FRANK H. LA PIERRE, East Orange, N. J. Filed Apr. 21, 1898. Serial No. 678,398. Term of patent 7 years.

Claim.—The design for a hand-glass as herein shown and described.

28,685. BOX. THEODORE W. FOSTER, Providence, R. I. Filed Apr. 13, 1898. Serial No. 677,501. Term of patent 3½ years.

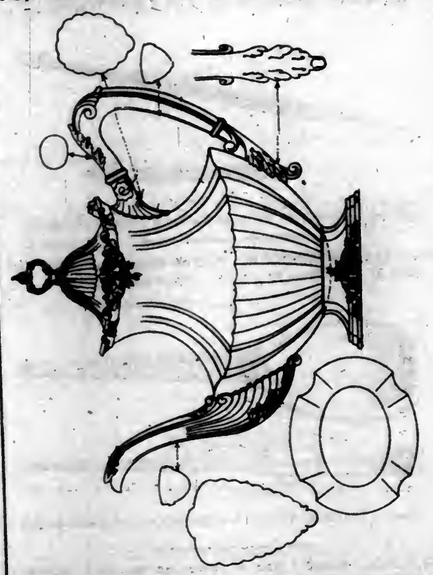
Claim.—The design for a box for manicure or similar articles herein shown and described.

28,686. ORNAMENTAL BOX. HENRY SOBIL, St. Louis, Mo. Filed Apr. 6, 1898. Serial No. 676,716. Term of patent 3½ years.



Claim.—The design for an ornamental box, as herein shown and described.

28,687. BOTTLE. BENNETT ROBY PAINE, Hamden Junction, Ohio. Filed Mar. 14, 1898. Serial No. 673,873. Term of patent 14 years.



Claim.—The design for a bottle, substantially as herein shown and described.

28,688. TEAPOT OR LIKE ARTICLE. AUSTIN F. JACKSON, Taunton, Mass. Filed Dec. 27, 1897. Serial No. 663,775. Term of patent 14 years.

28,688.

Claim.—1. In a design for a teapot, or like article, the body having the shape and ornamentation as herein shown and described.

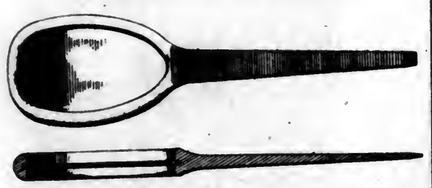
2. In a design for a teapot, or like article, the handle having the shape and ornamentation as herein shown and described.

3. In a design for a teapot, or like article, the spout having the shape and ornamentation as herein shown and described.

4. In a design for a teapot, or like article, the top having the shape and ornamentation as herein shown and described.

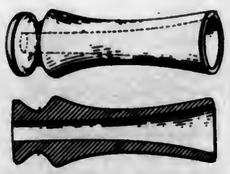
5. The design for a teapot or like article having the shape and ornamentation as shown and described.

28,689. GLOBE. MARSHALL WILFRED GLEASON, Brooklyn, N. Y. Filed Dec. 29, 1898. Serial No. 617,406. Term of patent 3½ years.



Claim.—The design for a globe, herein shown and described.

28,690. FILE. SAMUEL D. BROWN, Andrews Settlement, Pa. Filed Jan. 29, 1898. Serial No. 668,489. Term of patent 3½ years.



Claim.—A design for a file, substantially as herein set forth.

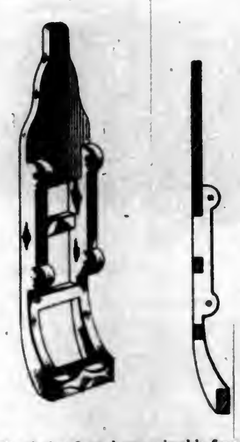
28,691. SCREW-DRIVER. HARRY E. SWARTZ, Reading, Pa. Filed Mar. 31, 1898. Serial No. 675,998. Term of patent 7 years.

Claim.—The design for a screw-driver herein shown and described.

28,692. NOZZLE. JACOB A. THOMAS and WILLIAM W. DRISCOLL, Reading, Pa. Filed Apr. 8, 1898. Serial No. 676,961. Term of patent 3½ years.

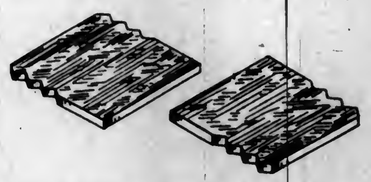
Claim.—The design for a nozzle, substantially as herein shown and described.

28,693. CLOTHES-PIN. FREDERICK C. HASEN, Los Angeles, Cal. Filed Aug. 30, 1897. Serial No. 650,058. Term of patent 14 years.



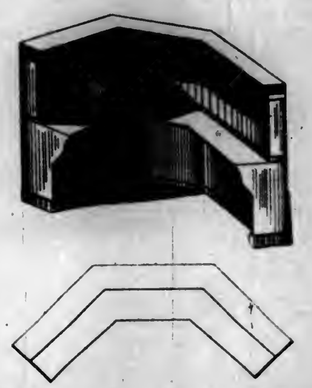
Claim.—The design for a clothes-pin, substantially as herein shown and described.

28,694. SNAP-HOOK. FREDERICK WOOD, Liverpool, England. Filed Feb. 5, 1898. Serial No. 669,277. Term of patent 14 years.



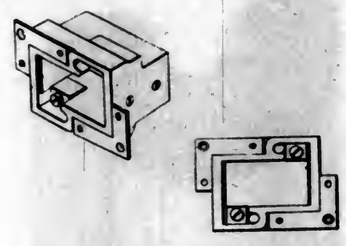
Claim.—The design for a snap-hook substantially as herein shown and described.

28,695. HARNESS-BUCKLE FRAME. GEORGE P. PRESTON, Wickliffe, Ky., assignor of one-half to Nathaniel L. Rogers and Bedford F. Burton, same place. Filed Apr. 4, 1898. Serial No. 676,468. Term of patent 14 years.



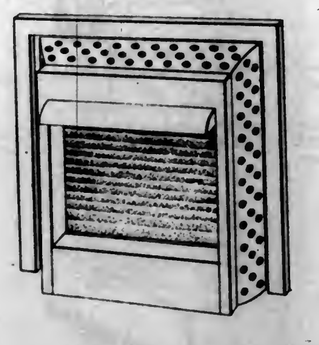
Claim.—The design for a harness-buckle frame substantially as herein shown and described.

28,696. SEAL-PLATE FOR SEAL-LOCKS. JOHN WALTER STEVENS, St. Paul, Minn. Filed Apr. 4, 1898. Serial No. 676,469. Term of patent 7 years.



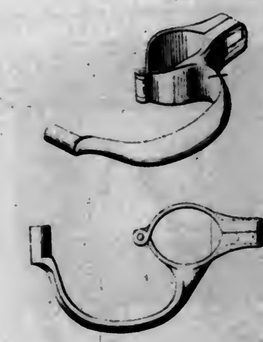
Claim.—The design for a seal-plate for seal-locks substantially as herein shown and described.

28,697. SWITCHBOARD FOR TELEPHONE OPERATORS. WILLIAM F. SMITH, San Francisco, Cal. Filed Apr. 13, 1898. Serial No. 677,502. Term of patent 14 years.



Claim.—The design for a telephone-operator's switchboard as herein shown and described.

28,698. RECEPTACLE FOR ATTACHMENT-PLUGS. WILLIAM P. FRIEDLE, Primos, Pa. Filed Mar. 5, 1898. Serial No. 672,782. Term of patent 7 years.

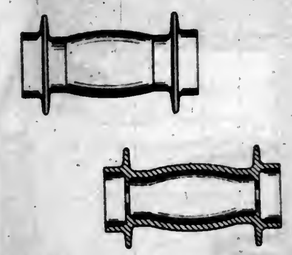


Claim.—The design for a receptacle for attachment-plugs, substantially as herein shown and described.

28,699. GAS-BURNER. EDWARD J. DASCHBACH, Pittsburg, Pa. Filed Mar. 16, 1898. Serial No. 674,117. Term of patent 14 years.

Claim.—The design for a gas-burner substantially as herein shown and described.

28,700. BICYCLE-LAMP BRACKET. EDWIN M. ROSENBLOTH, Philadelphia, Pa. Filed Dec. 23, 1897. Serial No. 663,309. Term of patent 7 years.



Claim.—The design for a bicycle lamp bracket herein shown and described.

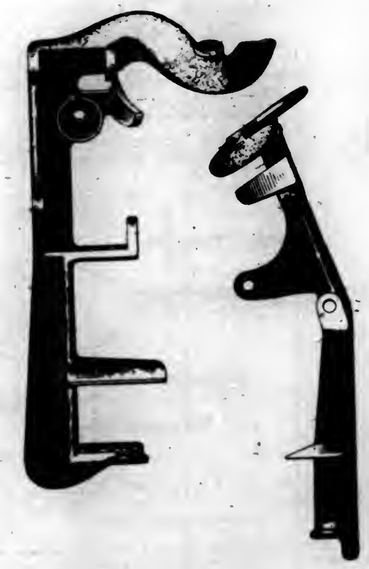
28,701. NIPPLE FOR BICYCLE-VALVES. FREDRICK MARTINEK and OTTO ALBERT LOSE, Chicago, Ill. Filed Apr. 11, 1898. Serial No. 677,236. Term of patent 3½ years.

Claim.—The design for a nipple for bicycle-valves, substantially as herein shown and described.

28,702. BICYCLE-HUB. JAMES ANDERSON COULTER, Ingersoll, Canada. Filed June 1, 1897. Serial No. 639,050. Term of patent 3½ years.

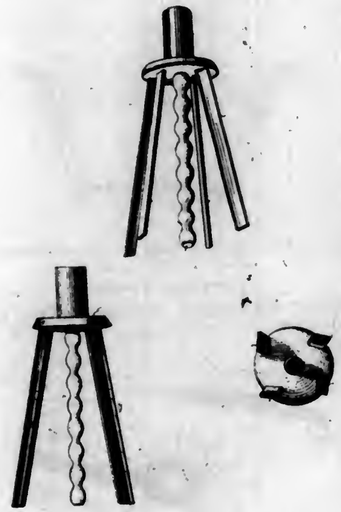
Claim.—The design for a bicycle-hub, substantially as herein shown and described.

28,703. WAGON-BODY. HARRY A. DE HART, Thorofare, N. J. Filed Jan. 13, 1898. Serial No. 666,575. Term of patent 7 years.



Claim.—The design for a wagon-body, as herein shown and described.

28,704. BARREL-HOOP. JOHN G. BAUER and JACOB M. BAUER, Lawrenceburg, Ind. Filed Oct. 23, 1897. Serial No. 656,213. Term of patent 14 years.

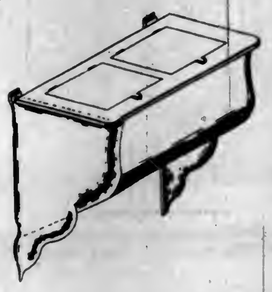


Claim.—The design for a barrel-hoop, substantially as herein shown and described.

28,705. FRAME FOR FRUIT OR VEGETABLE PARERS. FREDERICK B. RISING, Antrim, N. H., assignor to the Goodell Company, same place. Filed Apr. 23, 1898. Serial No. 678,671. Term of patent 14 years.

Claim.—The design for a frame for fruit and vegetable parers, substantially as shown and described

28,706. CHURN-DASHER. EUGENE W. GLADHILL, Abingdon, Ill. Filed Apr. 18, 1898. Serial No. 678,063. Term of patent 14 years.



Claim.—The design for a churn-dasher herein shown and described.

28,707. CUSPIDOR-CLEANER. WILLIAM R. WHITTEMORE, Hartford, Conn. Filed Apr. 9, 1898. Serial No. 677,097. Term of patent 14 years.

Claim.—The design for a cuspidor-cleaner as herein shown and described.

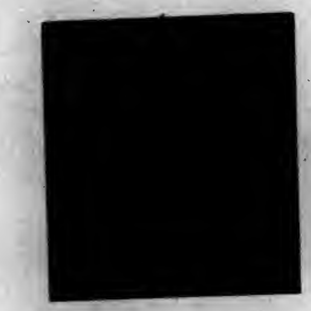
28,708. RESERVOIR FOR STOVES. CHARLES W. WIPPLER, Detroit, Mich. Filed Nov. 8, 1897. Serial No. 657,707. Term of patent 7 years.

Claim.—A design for a reservoir for stoves, substantially as shown and described.

28,709. FURNITURE-FOOT. FRANK STEWART, Chicago, Ill., assignor to the Stockham Manufacturing Company, same place. Filed Mar. 25, 1898. Serial No. 675,188. Term of patent 7 years.

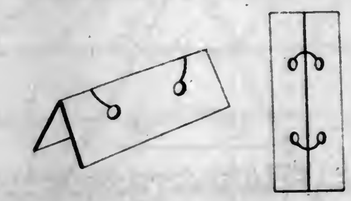
Claim.—The design for a furniture-foot, as herein shown and described.

28,710. MEDICINE-CASE AND DESK. WILLIAM S. COOPER, Birmingham, Ala. Filed Mar. 19, 1898. Serial No. 674,531. Term of patent 3½ years.



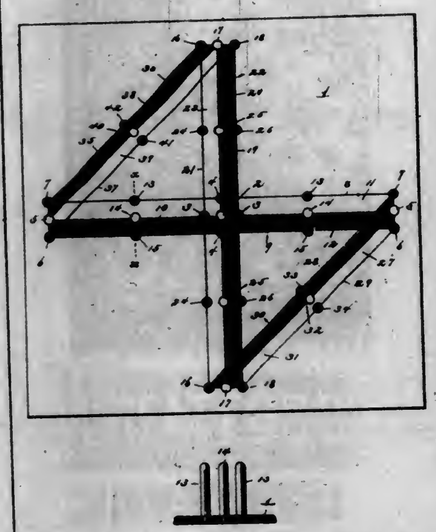
Claim.—The design for the medicine-case and desk herein shown and described.

28,711. PICTURE-MOUNT. JOHN P. ODGERS, Philadelphia, Pa., assignor to the A. M. Collins Manufacturing Company, same place. Filed Apr. 22, 1898. Serial No. 678,627. Term of patent 7 years.



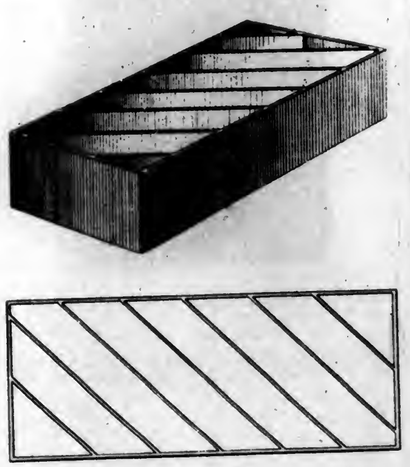
Claim.—The design for a picture-mount, substantially as described and as shown in the accompanying drawing.

28,712. PATTERN FOR PAPER. LOUIS J. W. WALZ, St. Louis, Mo. Filed Dec. 9, 1897. Serial No. 661,325. Term of patent 14 years.



Claim.—The design for a pattern for paper substantially as herein shown and described.

28,713. DISPLAY-CARD. JAMES EDWIN HILLS, New York, N. Y. Filed Mar. 23, 1898. Serial No. 674,943. Term of patent 7 years.

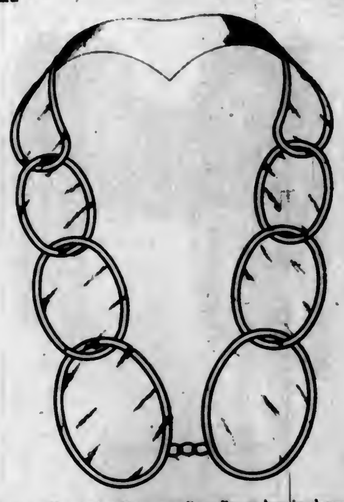


Claim.—The design for a display-card substantially as herein shown and described.

28,714. GAME-BOARD. HENRY BOSOM, Philadelphia, Pa. Filed Jan. 29, 1898. Serial No. 668,490. Term of patent 14 years.

Claim.—The design for a game-board, substantially as shown and described.

28,715. MOLD FOR PAVING-BLOCKS. JOHN LAMSON ADAMS, New York, N. Y. Filed Mar. 22, 1898. Serial No. 675,503. Term of patent 7 years.



Claim.—The design for a mold for paving-blocks herein shown and described.

28,716. WOVEN FABRIC. WILLIAM T. SMITH, Philadelphia, Pa. Filed Apr. 8, 1898. Serial No. 676,959. Term of patent 3½ years.

Claim.—The design for a woven fabric, as shown and described.

28,717. REGALIA-COLLAR. CHARLES H. LIEBERMANN, Columbus, Ohio. Filed Feb. 14, 1898. Serial No. 670,223. Term of patent 14 years.

Claim.—The design for a regalia-collar as herein shown and described.

28,718. FLOUR-TANK. WILLIAM H. CURTON, Louisville, Ky. Filed Apr. 18, 1898. Serial No. 678,086. Term of patent 14 years.

Claim.—The design for a flour-tank, substantially as herein shown and described.

TRADE-MARKS

REGISTERED MAY 24, 1898.

81,570. LADIES' PANTS. COMMERCIAL KNITTING MILLS COMPANY, Troy, N. Y. Filed Mar. 26, 1898.

Essential feature.—The compound word "LAPOYER-MOOR." Used since February 15, 1898.

81,571. SILK VESTINGS, BUTTON-STOCK, AND DRESS GOODS. C. STORR'S Sons, Jersey City, N. J. Filed Mar. 26, 1898.

Essential feature.—A monogram formed of the letters "C S." Used since April 1, 1897.

81,572. CERTAIN NAMED STATIONERY ARTICLES AND MATERIALS FOR ARTISTS AND DRAFTSMEN. L. & C. HARDTMUTH, Vienna and Budweis, Austria-Hungary, and London, England. Filed Mar. 18, 1898.

KOH-I-NOOR.

Essential feature.—The word "KOH-I-NOOR." Used since 1889.

81,573. WRITING-PAPER. WHITING PAPER COMPANY, Holyoke, Mass. Filed Mar. 3, 1898.

CHAUNCY BOND

Essential feature.—The words "CHAUNCY BOND." Used since March, 1894.

81,574. CERTAIN NAMED PHOTOGRAPHIC MATERIAL, APPARATUS, AND PRODUCTS. RADIOTYPE, LIMITED, London, England. Filed Mar. 22, 1898.

Essential feature.—The representation of the head and fore quarters of a unicorn. Used since October, 1897.

81,575. WHEAT BREAKFAST FOOD. PILLSBURY-WASHBURN FLOUR MILLS COMPANY, (LIMITED,) Minneapolis, Minn. Filed Apr. 26, 1898.

Pillsbury's

PYRAMID BRAND

VITOS

WHEATFOOD

BEST GERMOS

THE WORLDS

Essential feature.—The words "PILLSBURY'S PYRAMID BRAND," the representation of a triangle or pyramid, the words "VITOS," "WHEATFOOD," "BEST GERMOS," and "THE WORLD'S." Used since July 1, 1897.

81,576. WHEAT BREAKFAST FOOD. PILLSBURY-WASHBURN FLOUR MILLS COMPANY, (LIMITED,) Minneapolis, Minn. Filed Apr. 26, 1898.

Pillsbury's

PYRAMID OF HEALTH & STRENGTH

PYRAMID BRAND

VITOS

WHEATFOOD

BREAKFAST

Essential feature.—The words "PILLSBURY'S PYRAMID OF HEALTH & STRENGTH, PYRAMID BRAND, VITOS, THE IDEAL WHEATFOOD FOR BREAKFAST." Used since July 1, 1897.

81,577. CEREAL FOOD PRODUCTS. THE H-O (HORSFORD'S OATMEAL) COMPANY, New York, N. Y. Filed Apr. 2, 1898.

PAW-NEE

Essential feature.—The word "PAWNEE." Used since October 27, 1897.

81,578. CERTAIN NAMED MEATS AND COMPOUNDS. SWIFT & COMPANY, Chicago, Ill., and St. Paul, Minn. Filed Jan. 20, 1898.

MINNEPAUL

Essential feature.—The word "MINNEPAUL." Used since December 31, 1897.

81,579. CONDENSED MILK. THE VERMONT CONDENSED MILK COMPANY, Burlington and Richmond, Vt. Filed Feb. 21, 1898.

Essential feature.—The pictorial representation of a mountain. Used since January, 1897.

81,580. BOTTLED CIDER. S. S. PIERCE COMPANY, Boston, Mass. Filed Mar. 30, 1898.

Essential feature.—The representation of a shield, with a lion rampant, the letters and abbreviation "S. S. P. Co.," and the motto "PURITAS ET CURA." Used since May, 1877.

81,581. NATURAL MINERAL WATER AND CARBONATED BEVERAGES. WILSON H. DAVIS, Boston, Mass., and Tenne, Va. Filed Mar. 22, 1898.

Essential feature.—The word "TAKHMAS" and a design or escutcheon surmounted by a deer's head erased and on a scroll. Used since March 8, 1898.

81,582. CANDY. THE BUNTE BON CANDY KITCHEN COMPANY, Columbus, Ohio. Filed Dec. 10, 1897.

Essential feature.—The representation of a dome-shaped beehive supported upon a stand-top and a large figure of a bee on the surface of said hive. Used since June 1, 1897.

81,588. BITTERS. JOHNSTON, HOLLOWAY & CO., Philadelphia, Pa. Filed Feb. 24, 1898.

HOOFLANDS

Essential feature.—The word "HOOFLAND'S." Used since 1842.

81,584. MEDICATED CONFECTIONS, A WORM SPECIFIC. JOHNSTON, HOLLOWAY & CO., Philadelphia, Pa. Filed Feb. 24, 1898.

HOLLOWAY

Essential feature.—The word "HOLLOWAY." Used since 1883.

81,585. LINIMENT. SMITH, KLINE & FRENCH COMPANY, Philadelphia, Pa. Filed Mar. 4, 1898.

PROFESSOR LOW'S

MAGNETIC LINIMENT.

Essential feature.—The words and title "PROFESSOR LOW'S MAGNETIC LINIMENT." Used since 1865.

81,586. LINIMENT. SMITH, KLINE & FRENCH COMPANY, Philadelphia, Pa. Filed Mar. 4, 1898.

DR. LAUBACH'S

ECLECTIC

LINIMENT.

Essential feature.—The title and words "DR. LAUBACH'S ECLECTIC LINIMENT." Used since 1869.

81,587. PILLS. WILLIAM ANDREW PRICE, London, England. Filed Mar. 21, 1898.

Essential feature.—A representation of a gouty patient seated in a chair and having one foot bandaged and supported by a foot-rest. Used since 1810.

81,588. MEDICINAL TABLETS. ANTI-OXPHALIC CHEMICAL CO., Indianapolis Ind. Filed Mar. 30, 1898.

AC

Essential feature.—The letters "A. C." Used since December 1, 1897.

81,589. HOG-CHOLERA REMEDIES. HARRY BRAGG, Connersville, Ind. Filed Dec. 13, 1897.

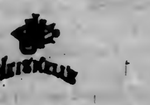
THE THREE GRACES

Essential feature.—The representation of the front part of three hogs standing side by side and the words "THE THREE GRACES." Used since October 15, 1895.

81,590. MEDICINES, MEDICINAL SPECIALTIES, AND ARTICLES FOR THE TOILET. GEBRÜDER KNEIPP & LAHRMANN, Würzburg, Germany. Filed July 24, 1893.

Essential feature.—The portrait and signature of Father Kneipp. Used since September 26, 1897.

81,591. CERTAIN NAMED MEDICINAL REMEDIES AND TOILET PREPARATIONS AND ARTICLES. CATHERINE CLARK DUANE SANDERS, New York, N. Y. Filed Mar. 4, 1898.



Essential feature.—The representation of a crescent and a triangular checkered or paneled figure appearing below the representation of the crescent. Used since February 1, 1898.

81,592. SOAP, PERFUMERY, AND TOILET PREPARATIONS FOR THE TEETH, SKIN, AND HAIR. JOSEPH CROSFIELD & SONS, LIMITED, Warrington, England. Filed Mar. 31, 1898.

ERASMIC

Essential feature.—The word "ERASMIC." Used since January 1, 1891.

81,593. TOILET SOAP. JOHNSTON, HOLLOWAY & CO., Philadelphia, Pa. Filed Feb. 24, 1898.

Essential feature.—A monogram of the letters, character, and abbreviation "J H & Co," the word "HEISKELL'S," and a fac-simile of the firm-signature, "JOHNSTON, HOLLOWAY & CO." Used since January, 1895.

81,594. PERFUMERY. THE FIRM OF ALFRED WEBBEY, Rochester, N. Y. Filed Apr. 4, 1898.

PRISCILLA

Essential feature.—The word "PRISCILLA." Used since January 10, 1898.

81,595. OILS FOR CERTAIN NAMED PURPOSES. TRUB OLSEN, Stockholm, Sweden. Filed Mar. 8, 1898.

Collan.

Essential feature.—The word "COLLAN." Used since October 1, 1880.

81,596. OILS AND CERTAIN NAMED TOILET ARTICLES AND PREPARATIONS. WARRICK FRÈRES, Grasse, France, and New York, N. Y. Filed Nov. 13, 1897.

WARRICK FRÈRES

Essential feature.—The name "WARRICK FRÈRES" and the monogram "W F" appearing behind a rose. Used since 1859.

81,597. LIQUID BLACKING FOR BOOTS AND SHOES. C. I. HAYWARD & SONS, Boston, Mass. Filed May 14, 1897.

Crozine

Essential feature.—The word "CROZINE." Used since March 15, 1897.

81,598. FIRE-CRACKERS. E. J. & L. HEILBRUNN, New York, N. Y. Filed Mar. 22, 1898.

YANG KEY

Essential feature.—The words "YANG KEY." Used since March 1, 1898.

81,599. FIRE-CRACKERS. E. J. & L. HEILBRUNN, New York, N. Y. Filed Mar. 22, 1898.

WAH SHING TONG

Essential feature.—The words "WAH SHING TONG." Used since March 1, 1898.

81,600. POWDERED PREPARATIONS FOR CLEANING OR POLISHING SILVER. JOHN HOWARD MILLER, Philadelphia, Pa. Filed Mar. 5, 1898.

Essential feature.—The representation of a forearm and hand, the latter holding between the thumb and forefinger thereof a small box or package supposed to contain the goods to which the trade-mark is applied. Used since November 20, 1897.

81,601. PAINTS AND PAINTERS' SUPPLIES. NATIONAL MINING AND MILLING COMPANY, Canton, Md. Filed Mar. 26, 1898.

Essential feature.—The representation of two men working in a mine. Used since May 31, 1897.

81,602. PAINTS AND PAINTERS' SUPPLIES. NATIONAL MINING AND MILLING COMPANY, Canton, Md. Filed Mar. 25, 1898.

BASOFINE

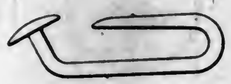
Essential feature.—The word "BASOFINE." Used since October, 1894.

81,603. VARNISH. THE AKRON VARNISH COMPANY, Akron, Ohio. Filed Mar. 11, 1898.

MARBLEINE

Essential feature.—The word "MARBLEINE." Used since November, 1895.

81,604. AXES AND HATCHETS. SUPPLEE HARDWARE COMPANY, Philadelphia, Pa. Filed Mar. 30, 1898.



Essential feature.—The title "BLUE JEANS." Used since January 1, 1897.

81,605. CERTAIN NAMED AGRICULTURAL IMPLEMENTS AND HARDWARE. PUGSA HARDWARE COMPANY, LIMITED, Baton Rouge, La. Filed Feb. 25, 1898.

ISTROUMA.

Essential feature.—The word "ISTROUMA." Used since January, 1893.

81,606. COVERS FOR BICYCLE AND OTHER TRANSMISSION CHAINS. WALTER EDOUARD FELIX MARCHAL, St. Mandé, France. Filed Feb. 16, 1898.

Essential feature.—A representation of a flattened hook with a button at one end. Used since December 1, 1897.

81,607. REMEDY FOR CHRONIC CONSTIPATION, HEPATIC TORPOR, AND JAUNDICE. WILLIAM ROGERS, Providence, R. I. Filed Jan. 26, 1898.

VOUMI

Essential feature.—The word "VOUMI." Used since February 3, 1898.

THE NORRIS PETERS CO. PHOTO-LITH. WASHINGTON, D. C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

EX PARTE ERVIN A. RICE COMPANY.

Decided May 4, 1898.

1. TRADE-MARK—"BETTER THAN MOTHER'S"—MINCE-MEAT.
The phrase "Better than Mother's" refused registration as a trade-mark for mince-meat, as it expresses quality.

2. SAME—WORDS EXPRESSING QUALITY.
A valid trade-mark cannot be predicated upon words or phrases expressing quality. No one can appropriate for his exclusive use words and phrases that all may use. Any one dealing in mince-meat can declare, if the statement be true, that his product is better than any one else's, be that other "mother," "grandmother," or "aunt."

On petition.

TRADE-MARK FOR MINCE-MEAT.

Application for registration filed January 11, 1898.

Ervin A. Rice Company pro se.

DUELL, *Commissioner:*

This is an appeal from the action of the Examiner of Trade-Marks refusing registration of the phrase "Better than Mother's" as a trade-mark for mince-meat.

In view of the fact that appellants are prosecuting their own case I have carefully gone over the proceedings had during the pendency of the case and have given due weight to appellants' views, as set forth in their various letters and the brief in answer to the Examiner's statement.

The question involved is simple and easy of solution: Can a phrase expressing quality be the valid subject of a trade-mark? That the words "Better than Mother's" is such a phrase is evident upon the face thereof. The words clearly import that the article so marked is to be compared with some other known article and that when so compared will be found of superior quality. This is emphasized by the fact that another brand of mince-meat is upon the market to which has been applied the phrase "Like Mother Used to Make." Further proof of the statement that the phrase is intended to express quality is found in appellants' brief. It is there said:

> "Better than Mother's" appeals distinctively to the prevalent notion of universal progress and improvement in every direction and implies that modern methods and progressive ideas have been applied to mince-meat and that our goods are not "Like Mother Used to Make," but are indeed very different and decidedly improved.

It is an elementary principle of the law applicable to trade-marks that a valid trade-mark cannot be predicated upon words or phrases expressing quality. (Browne on Trade-Marks, sec. 29.) No one can appropriate for his exclusive use words and phrases that all may use. Any one dealing in mince-meat can declare, if the statement be true, that his product is better than any one else's, be that other "mother," "grandmother," or "aunt."

The action of the Examiner in refusing registration being correct, his ruling is affirmed.

PALMER AND THOMPSON v. BAILEY.

Decided May 6, 1898.

1. INTERFERENCE—BURDEN OF PROOF—NO DRAWING—INCOMPLETE APPLICATION.
No statutory drawing having been filed by Palmer and Thompson until after the complete application of Bailey was filed, the burden of proof in the interference is upon Palmer and Thompson.

2. INCOMPLETE APPLICATION—NO DRAWING.
The rules of the Office require that in order to constitute a complete application a drawing must be filed whenever the nature of the case admits. Until a drawing is filed the application is not complete. Until an application is completed by filing all the necessary papers and the payment of the fee it cannot be examined, nor can it be placed in interference.

3. DRAWING, STATUTORY REQUIREMENT OF—TINTYPE.
The statutes require that whenever the nature of the case admits of drawings one copy signed by the inventor or his attorney in fact and attested by two witnesses shall be filed in the Patent Office. A tintype not signed by the inventor or his attorney and not attested by two witnesses cannot be considered a drawing within the statutes.

APPEAL on motion.

BICYCLE-SADDLE SPRING.

Application of Byron G. Palmer and William Thompson filed July 12, 1897, No. 644,367. Application of Selden A. Bailey filed May 25, 1897, No. 638,127.

Mr. Julian C. Dowell for Palmer and Thompson.
Mr. Frank C. Somes for Bailey.

DUELL, *Commissioner:*

This case comes before me on appeal by Palmer and Thompson from the decision of the Primary Examiner denying their motion to shift the burden of proof. The state of facts upon which the motion is based shows that Palmer and Thompson filed a petition, specification, and oath and paid the Government fee of $15. They were notified by the Office that a drawing was required; but before the drawing was received a complete application was filed by Bailey. It appears that at the time when Palmer and Thompson paid the fee and filed the papers above stated they filed a tintype in lieu

of a drawing, and they now insist that for the purposes of this interference the tintype should be considered the same as a drawing and the burden shifted to Bailey.

The statutes require that whenever the nature of the case admits of drawings one copy, signed by the inventor or his attorney in fact and attested by two witnesses, shall be filed in the Patent Office. It is admitted that the tintype filed in lieu of the drawing was not signed by the inventors or their attorney and was not attested by two witnesses. Therefore no drawing accompanied the application.

The rules of the Office require that in order to constitute a complete application a drawing must be filed whenever the nature of the case admits. (Rules 30 and 49.) The invention of the Palmer and Thompson application being for a bicycle-saddle spring a drawing of course was required, and until a drawing was filed the application was not completed. Until an application is completed by the filing of all the necessary papers and the payment of the fee it cannot be taken up for examination and is not before the Examiner in charge of the class to which it relates. No more can it be placed in interference, for the reason that Rule 116 expressly provides that—

in original proceedings in cases of interference the several parties will be presumed to have made the invention in the chronological order in which they filed their *completed* applications, etc.

The exact question raised by this appeal does not appear to have been heretofore presented for the decision of the Commissioner. It was, however, held in *Lapham* v. *Bettendorf* (16 O. G., 137) that there was no complete application before the Office until the fee was paid, although the specification, oath, drawings, etc., were on file. In the case of *ex parte Brand* (82 O. G., 893) the fee was paid and a petition, specification, and oath and drawings were filed, but the residence of the applicant was nowhere stated. It was held that the application was not entitled to a record date earlier than the date when these omissions were supplied.

No statutory drawing having been filed by Palmer and Thompson until after the complete application of Bailey was filed, the burden of proof in the interference is upon Palmer and Thompson, and the Examiner was correct in his decision, and it is therefore affirmed.

EX PARTE HALLBERG.

Decided May 7, 1898.

1. APPLICATION—IRREGULAR PAPERS—FILING DATE OF APPLICATION.

Applicant filed a drawing and the first fee of an application on December 31, 1897. At the same time he filed an unsigned paper describing and claiming the device shown by the drawing. On January 3, 1898, he filed a petition, specification and claims, and an oath properly signed, executed, and witnessed. The application was given a filing date as a complete application, January 3, 1898. *Held* that the paper filed December 31, 1897, cannot be treated as a specification, and a petition to change the date of filing the application from January 3, 1898, to December 31, 1897, denied.

2. SAME—REQUISITES OF A COMPLETE APPLICATION.

The Rules of Practice and the statutes require that the specification shall be signed by the applicant, and a complete application must comprise, in addition to the drawing and fee, a petition, specification, and oath, and an application will not be considered as complete until all its parts have been filed in this Office.

3. REFUNDING FEE—INCOMPLETE APPLICATION.

Where an applicant filed an incomplete application and first fee on December 31, 1897, and on January 3, 1898, he completed the application, with the understanding that if it were possible it would be given the earlier date, and upon consideration it was decided that the application could not be given the earlier date, *Held* that the first fee could not be refunded, as it was not paid by actual mistake, but in paying it and completing his application the applicant took his chances as to the earlier date being given to the application, and, further, the application has had a full examination on the merits.

ON petition.

MASSAGE APPARATUS AND VIBRATORS.

Application of Karl V. Hallberg filed January 3, 1898, No. 665,465.

Mr. William E. Boulter for the applicant.

DUELL, *Commissioner:*

A drawing and the first fee of $15 were filed in this case on December 31, 1897. At the same time there was filed a paper describing the device shown by the drawing, and at the end of this description was a set of eleven claims. This paper was not signed.

On January 3, 1898, a petition, a specification containing a set of six claims differing from the eleven claims in the paper of December 31, 1897, and an oath signed and executed by the applicant were received in this Office. The application containing these papers was given a filing date as a complete application, January 3, 1898, and forwarded to the Examiner for consideration. The Examiner examined the application and refused a patent, among other grounds, for the reason that—

under section 4887 of the Revised Statutes which went into effect January 1, 1898, applicant is barred from obtaining a patent in the United States in view of his foreign patentswhich were granted on applications filed more than seven months prior to the filing of this application in the United States.

From this action applicant has petitioned to the Commissioner, praying that in view of the—

fact that the invention desired to be protected was fully disclosed in the specification and drawings filed on December 31, 1897, it is prayed that the action of the Examiner may be reversed and the application be permitted to be considered as coming within the provisions of the law in effect prior to January 1 last. Or, should the present petition be denied, it is prayed that the application the Government filing fee may be returned to petitioner.

The paper filed December 31, 1897, cannot be treated as a specification, even if it did describe the invention. This paper was unsigned and unverified, and there was no petition or oath accompanying it.

The Rules of Practice and the statutes require that the specification shall be signed by the applicant, and a complete application must comprise, in addition to the drawing and fee, a petition, specification, and oath, and an application will not be considered as complete until all its parts have been filed in this Office. As applicant did not file such a specification as required by the rules and statutes and a petition and oath until January 3, 1898, his application cannot be given a date prior to January 3, 1898. (*Ex parte Brand*, 82 O. G., 893.)

Applicant's request to give his application a filing date as of December 31, 1897, and that the application be considered as filed within the provisions of section 4887 in effect prior to January 1, 1898, cannot therefore be granted.

Applicant's request that the first fee be returned to him if his application is not given a filing date of December 31, 1897, is based on the alleged fact that the formal papers of the application were not filed in the Patent Office until favorable assurance was given by the Acting Commissioner to applicant's attorney that the application would probably be given the date of December 31, 1897, and permitted to come within the provisions of section 4887, Revised Statutes, before it was amended, and that had he been informed that the application would not be given the early date he would not have filed the paper on January 3, 1898, but would have asked for the return of the fee paid on December 31, 1897.

After consultation with the Assistant Commissioner I have been assured that applicant is mistaken as to any promises about this matter. It seems that the most that was said to applicant was that if he filed the paper of January 3, 1898, the matter would be given consideration, and if it were possible to give the application the earlier date it would be done.

The rule as to the repayment of fees reads:

209. Money paid by actual mistake, such as a payment in excess, or when not required by law, or by neglect or misinformation on the part of the Office, will be refunded; but a mere change of purpose after the payment of money, as when a party desires to withdraw his application for a patent or for the registration of a trade-mark, or to withdraw an appeal, will not entitle a party to demand such a return.

Under the circumstances of the case I am of the opinion that the first fee was not paid by actual mistake; but in paying it and completing his application applicant took his chances as to the earlier date being given to his application. Furthermore, applicant has had a full examination on the merits of his case by the Primary Examiner.

The petition is denied.

GRIMM v. DOLAN.

Decided May 10, 1898.

1. INTERFERENCE IN FACT—BROAD AND NARROW CLAIMS.

Where Grimm has made a broad claim and Dolan a narrow claim, *Held* that both parties are not claiming substantially the same invention, and under *Hammond* v. *Hart* (83 O. G., 743) an interference does not properly arise.

2. SAME—SAME—MAKING BROAD CLAIM.

If Dolan is the inventor of the broad invention, he should make the broad claim of the issue. As the claims now stand there is no interference in fact, as an interference should not be declared between dominated and dominating claims. (Citing *Hammond* v. *Hart*, 83 O. G., 743.)

APPEAL on motion.

GAS-BURNERS.

Application of Maximilian Grimm filed January 15, 1897, No. 619,357. Application of Edward J. Dolan filed November 10, 1896, No. 611,588.

Mr. Edward N. Dickerson and *Messrs. Foster & Freeman* for both parties.

DUELL, *Commissioner:*

This is an appeal by both parties through their common attorneys from the decision of the Primary Examiner refusing to dissolve the interference on the ground that there is no interference in fact. Both parties are not only represented by the same attorneys, but it is stated that both applications have been assigned to one party.

The issue of the interference is thus defined:

The process of burning acetylene gas, which consists in ejecting the same at suitable pressure through a burner, and in preventing the gas from reaching its kindling temperature at its point of escape to the atmosphere.

This issue is in the words of Grimm's first claim and is stated to embrace his second claim and the fifth claim of Dolan's application. Grimm's second claim is:

2. The process of burning acetylene gas, which consists in causing the gas to reach its kindling temperature only at a distance from the burner-surface and not in contact with the orifice where the escape occurs, substantially as described.

The Dolan claim reads as follows:

5. The herein-described method of producing a flame for acetylene gas without deposition of carbon which consists in dividing a stream of acetylene gas into two fine oblique conical jets of substantially equal pressure and directed toward each other so as to meet in open space whereby the said fine jets of acetylene gas form inverted cones, and burning the said gas from the point of juncture of the said two streams of gas and air in a direction away from said stream.

It is apparent that this is not a case where both parties are claiming substantially the same invention. Grimm has made a broad claim and Dolan a narrow one.

The Examiner impliedly admits this when he says in his decision:

The method defined in claim 5 of his (Dolan's) case falls squarely under and is *dominated by the issue.*

In view of the decision in *Hammond* v. *Hart* (83 O. G., 743) an interference does not properly arise and should not be declared between dominated and dominating claims.

The Examiner in his decision quotes various fragmentary statements from Dolan's specification to sustain his position that the interference should be continued. In view of these quotations it is suggested that Dolan's specification should be amended to more clearly set forth the differences between the process claimed by him and that claimed by Grimm and made the issue of this interference. Presumably Dolan is not the inventor of the process of the issue, because he has failed to claim it, although his attorneys knew the claims made by Grimm. If, however, he is the first inventor, then he should make the broad claim of the issue. As the claims now stand there is no interference in fact, and the Examiner erred in refusing to dissolve the interference, and his decision is therefore reversed.

EX PARTE LYNCH AND HOUGH.

Decided February 25, 1898.

JURISDICTION—EXAMINERS-IN-CHIEF—PRIMARY EXAMINER—REOPENED CASE—APPEAL.

Where the Examiners-in-Chief refused to consider claims rejected by the Primary Examiner and appealed to them on the ground that the Examiner had no authority to reopen the case after a decision by the Commissioner on the merits, and therefore that the Examiners-in-Chief are without jurisdiction to consider the claims rejected by the Examiner, *Held* that

the record shows that the case was reopened by the Assistant Commissioner under Rule 143 and when so reopened it was reopened for all purposes—for the presentation of such claims as the applicant saw fit to offer and for consideration and reexamination by the Examiner *de novo*, just as was done. The Examiner did not exceed his authority, but acted within the practice and clear intent of the Assistant Commissioner's decision. The Examiner having the second time rejected certain claims, and appeal having been taken to the Examiners-in-Chief, the case was within their jurisdiction, and they should have considered the appealed claims on their merits.

ON petition.

BREECH-LOADING CANNON.

Application of Michael A. Lynch and William I. Hough filed October 16, 1890, No. 368,319.

Mr. James J. Sheehy for the applicants.

GREELEY, *Assistant Commissioner:*

This is a petition filed upon the refusal of the Examiners-in-Chief to consider claims rejected by the Primary Examiner and appealed to them. The ground for refusing to consider the claims is that the Examiner had no authority to reopen the case after a decision by the Commissioner on the merits, and therefore that the Examiners-in-Chief are without jurisdiction to consider the claims rejected by the Examiner.

On December 15, 1894, two claims of the application under consideration were appealed to the Commissioner from the decision of the Examiners-in-Chief rejecting said claims. On appeal to the Commissioner the Assistant Commissioner on January 30, 1895, rendered a decision allowing the claims, subject to an amendment limiting them in scope. On March 13, 1895, the case was amended to carry out the decision of the Assistant Commissioner by the substitution of two claims for those appealed. These claims were allowed by the Examiner, who then required certain formal objections to be removed from the case. This requirement was complied with and put the application in condition for issue; but it was withheld in view of a probable interference. While the case was suspended an amendment containing two additional claims was presented, which was refused entry by the Examiner, as in his opinion the claims did not carry out the suggestions made by the Assistant Commissioner in his decision of January 30, 1895.

On petition to the Commissioner the Assistant Commissioner reopened the case under Rule 142. After this decision the claims presented by the amendment of October 2, 1895, and two other claims were entered in the application. The Primary Examiner thereupon considered the case *de novo*, rejected some of the claims that had been allowed, and required that the specification be rewritten, under Rule 74, which requirement was complied with. The application was again reëxamined and certain claims were rejected. The case was finally rejected on May 15, 1897, whereupon appeal was taken to the Examiners-in-Chief. The Examiners-in-Chief, however, refused to consider the appealed claims for the reason heretofore stated.

From the record it is apparent that when the case was reopened by the Assistant Commissioner under Rule 142 it was reopened for all purposes—for the presentation of such claims as the applicant saw fit to offer and for consideration and reexamination by the Examiner *de novo*, just as was done. The Examiner did not exceed his authority, but acted within the practice and clear intent of the Commissioner's decision. The Examiner having the second time rejected certain claims, and appeal having been taken to the Examiners-in-Chief, the case was within their jurisdiction, and they should have considered the appealed claims on their merits.

The petition is granted.

DECISIONS OF THE U. S. COURTS.

Court of Appeals of the District of Columbia.

MCCREERY *v.* COMMISSIONER OF PATENTS.

Decided April 4, 1898.

PATENTABILITY—SYSTEM OF VENTILATION.

A system of ventilation the novel feature of which consists in supplying each of the branch pipes leading into a room or compartment to be ventilated with nozzles composed of articulated sections of such construction that the current of air forced into the pipe may be discharged in any direction in the room by the adjustment of the nozzles, so that the incoming air may be more thoroughly agitated and commingled and drafts prevented. *Held* to be patentable over the systems of ventilation disclosed by patent to Brown, No. 182,746, and to Jennison, No. 177,847.

Mr. Wm. H. Singleton for the appellant.

Mr. W. A. Megrath for the Commissioner of Patents.

SHEPARD, *J.:*

The appellant, Joseph McCreery, appeals from a decision of the Commissioner of Patents denying him a patent for an improved system of ventilation.

There is an inlet for the introduction of the fresh outer air, with which is connected a blower that drives the air into the general supply-pipe.

The latter has branches running into the apartments to be ventilated, with as many outlets therein as desired.

It is in the same manner adapted for ventilating cars, particularly those with compartments. The end of each of the branch pipes in a room or compartment is supplied with a nozzle composed of articulated sections of such construction that the current of air may be discharged in any direction by their adjustment. The incoming air may also be heated when desired.

The object of sending the incoming air in different directions is not only to more thoroughly agitate and commingle the air, but also and more particularly to accomplish this without creating drafts.

Appellant has a patent for the combination of the induction and eduction pipes with the rotary fan for driving the air, issued June 5, 1894. The improvement of the application under consideration consists in forcing the fresh air through the

branch-pipe openings by means of the adjustable nozzles in different directions. By the different directions of these currents, made to meet each other as desired, the object is to so diffuse the air as to prevent injurious drafts.

A number of references were made in the Patent Office to anticipations; but the two patents finally relied upon are one to Aaron B. Brown, dated October 3, 1876, and another to Edward S. Jennison, dated May 23, 1876, the greatest weight being given to the latter.

Having carefully examined the specifications and claims of the foregoing patents, we are constrained to differ from the Commissioner and to hold that neither anticipates the improvement of the appellant. The feature of the Brown patent particularly referred to is that by which the fresh air is admitted around the top of the room at different points, thus giving a different direction to the currents. In a measure this is true and the incoming air is better diffused; but each aperture on one side of a room discharges at the same angle and their currents do not come in contact with each other. They are met merely by the currents coming from either side at a like invariable angle. Appellant overcomes this difficulty of Brown's system of fresh-air introduction by driving the air through the adjustable nozzles, whereby the adjacent currents can be made to intermingle at any angle desired, and these may be changed at any time by resetting any one of the nozzles or shutting it off altogether.

Moreover, a strong draft may be turned in the same way upon any particular part of the room, if so desired.

The Jennison patent is for an improvement in car heaters and ventilators. The fresh air is driven through the heater by a fan and thence in a supply-pipe along the top of the car. Openings at each seat or in each berth, if a sleeping-car, are provided, to which are attached rubber pipes. These hang down, and the warm air, or cold when the heater is not operated, is turned upon the bottom of the car in jets. If these pipes were not flexible and could not be moved, they would distribute the air at the same angle, but at the bottom instead of at the top, as in Brown's system. The pipes are, however, made flexible for the express purpose of permitting the passengers in the car to take them up and turn the air-current upon any part of their bodies while sitting upon a seat or lying in a berth. It is true the specification says that the distributing-pipes may be made of metal; but it is evident that they must be so constructed as to admit of being lifted and used by the occupants of the seats and berths in the same manner as the rubber pipes of preferred use. No attempt is made to show how this might be accomplished.

It is also true that when these pipes are caught up by passengers and held at different angles their currents will vary in direction to some extent, like those ejected from the branch pipes of appellant's system; but that is plainly not the purpose of their use, and no such function as the creation of variable air-currents for the end sought to be attained by appellant was in contemplation. The normal condition of these pipes as ventilators is perpendicular, with their currents discharging against the bottom or floor of the car. They are made flexible, not that their currents may be made to move in different directions, but that individual passengers may at convenience turn them upon their bodies for comfort or pleasure. It is only when used for this special purpose that they operate at all after the manner of appellant's branch pipes. As soon as released they resume their normal condition and operation.

Grant that the difference between the inventions of Brown and Jennison and that of appellant may not be very great, it nevertheless seems to us one that is patentable. (*In re Snyder*, 10 App. D. C., 140.)

For the reasons given the decision appealed from is reversed, and this decision, with the proceedings in this court, will be certified to the Commissioner of Patents. It is so ordered.

Court of Appeals of the District of Columbia.

HILL *v.* HODGE.

Decided April 12, 1898.

1. INTERFERENCE—PATENTABILITY OF A CLAIM IN THE INTERFERENCE.

The question of patentability of the claim in interference is not involved in the interference. (*Hisey* v. *Peters*, 71 O. G., 898; *Doyle* v. *McRoberts*, 79 O. G., 1029.) After the interference shall have been finally determined the question of patentability may be raised against the successful party.

2. SAME—SAME—PARTY TO THE QUESTION OF PATENTABILITY.

When the interference has been determined and the question of patentability is before the Primary Examiner, the defeated party to the interference has no other interest in the decision on patentability than as one of the general public whose interests are under the protection of the Commissioner of Patents.

3. SAME—DISCLAIMER—ESTOPPEL—COMMISSIONER'S DECISION AFFIRMED.

Hodge's evidence in respect of his conception of the invention does not show an intention to disclaim and is not of a nature to estop him from claiming an invention as broad as the issue. The decision of the Commissioner of Patents awarding priority to Hodge affirmed.

4. SAME—PRODUCING SPECIES—RIGHT TO BROAD CLAIM.

As a general proposition an inventor making any generic invention necessarily produces some species of it, and the fact that he has never thought of other specific forms cannot deprive him of his right to a broad claim. The inventor may not regard his invention at the time it is produced as any broader than his specific form; but the question for consideration is not as to his opinion, but is one of fact.

Messrs. Raymond & Omohundro for the appellant.

Messrs. Gridley & Hopkins for the appellee.

SHEPARD, *J.:*

1. This is an interference proceeding involving priority in respect of certain claims of invention of an "improvement in car-door guides."

As declared the interference embraced four issues, on each of which priority was awarded to the appellee, Hodge, by the Examiner of Interferences.

On appeal to the Examiners-in-Chief his decision

was affirmed as to three of the issues and reversed as to the fourth. Hodge acquiesced in this decision, and Hill did the same in respect of issue No. 2. His appeal to the Commissioner was from the award of priority to Hodge as regards issues 1 and 3, which are defined as follows:

1. The combination with a car and its door, of a bracket engaged by said door, an anchor secured to the side of the car, and means whereby said anchor is concealed by said bracket and detachably connected therewith.

3. The combination with a car and its door, of an anchor, a bracket engaged by the door, provided with a hood or pocket, and having a slot in the rear face thereof of less width than the greatest width of the anchor and leading to said hood or pocket whereby the bracket may be slidingly connected with the anchor and the latter concealed thereby.

The Commissioner having decided against him, both issues are involved in this appeal from his decision.

2. Appellant admits that if Hodge in fact invented the subject-matter of the issues his claim to priority over himself is established by the evidence.

But while admitting the superiority of Hodge's claim to his own as regards the subject-matter of issue No. 1 appellant denies his right to an award thereon, because, he says, that prior to Hodge's conception a device embodying the subject-matter thereof had gone into public use. There is some evidence in the record tending to show that before Hodge conceived the idea at all a car-door guide or bracket answering generally the description of the issue had been made by one Leeds and had been used upon freight-cars of the Louisville and Nashville Railroad.

The Commissioner was right in refusing to entertain the issue of patentability. That the question of patentability of the claim in interference is not involved therein has been time and again decided. (*Hisey* v. *Peters*, 71 O. G., 892; 6 App. D. C., 68, 71; *Doyle* v. *McRoberts*, 79 O. G., 1029; 10 App. D. C., 445, 467, and cases cited therein.)

After this controversy shall have been determined the question of patentability may be raised in the Patent Office against the successful party. As a matter of fact the Commissioner, though refusing to take cognizance of the issue of patentability, regarded the evidence of prior invention and public use by Leeds as sufficiently important to require him in rendering his decision to direct the Primary Examiner to inquire into and consider the question of patentability when the matter shall again come before him. When that question shall be raised, Hill will have no other interest in its decision than as one of the general public whose interests are under the protection of the Commissioner of Patents.

3. The anchor of the combination of Hodge, as described in issue No. 3, is firmly fastened in the body of the car. When the bracket is connected by sliding the anchor into the pocket by means of the slot, it will remain fixed in its place. Hill's anchor is so constructed that after sliding into the pocket of the bracket the latter will rotate thereon, except when withheld by the pressure of the closed car-door.

It is admitted that the issue is not limited to a rotative or non-rotative engagement between bracket and anchor, but is broad enough to cover both. Hodge's actual construction is limited to the non-rotative engagement, and his evidence shows that he did not have in contemplation any other specific form thereof. It may be conceded that he did not conceive the idea of the rotative engagement of the appellant's bracket and anchor. In respect of this the Commissioner said:

In making any generic invention the inventor necessarily produces some species of it, and the fact that he has never thought of other specific forms cannot deprive him of his right to a broad claim. The inventor may not regard his invention at the time it is produced as any broader than his specific form, but the question for consideration is not as to his opinion, but is one of fact.

There is no doubt of the correctness of this as a general proposition. (*Roberts* v. *Ryer*, 71 O. G., 892; 91 U. S., 150, 157; *Stow* v. *Chicago*, 104 U. S., 547, 550; *Miller* v. *Eagle Mfg. Co.*, 79 O. G., 1029; 151 U. S., 186, 201.)

4. The appellant admits the soundness of the foregoing proposition, but seeks to avoid its effect through the contention that Hodge has confined his claim of invention to the specific form of his device as constructed and has disclaimed the generic invention. It is not pretended that he has entered any formal or substantial disclaimer upon the files of the Patent Office; but the claim is that he has made it in his evidence in the case.

Passing by the questions whether the effect of a disclaimer can be attributed to the evidence of a party in a case like this for the benefit of his adversary or whether, in the same interest, he can be held estopped thereby, we agree with the Commissioner that Hodge's evidence in respect of his conception of the invention does not show an intention to disclaim and is not of a nature to estop him from claiming an invention as broad as the issue.

It would serve no useful purpose to set forth and review that evidence. We entirely agree with the Commissioner that it shows nothing more than that Hodge when he conceived the invention and reduced it to practice had in mind nothing more than the non-rotative engagement of anchor and bracket.

It follows that the decision appealed from must be affirmed. It is so ordered, and this decision, with the proceedings herein, as required by law, will be certified to the Commissioner of Patents.

Attorneys.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., May 20, 1898.

SIR: The Secretary of the Interior has ordered that E. J. Sloss, of Courtland, Ala., be not recognized after this date as agent or attorney in the prosecution of any claim or other matter before this Department or any Bureau thereof.

Very respectfully,
EDWARD M. DAWSON,
Chief Clerk.

The Commissioner of Patents.

Notice to Show Cause.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., May 7, 1898.

The following notice to show cause is published in the OFFICIAL GAZETTE for the reason that it has been found impracticable to serve notice in the usual way, a registered letter containing notice to the same effect, mailed to Mr. Holgate at his last-known address, having been returned with the report that it could not be delivered.

To George H. Holgate, doing business under the name of the Association American Inventors, last known address Betz Building, Philadelphia, Pennsylvania, present address unknown:

SIR: Copies of charges filed against you as representative of the Association American Inventors by the following-named persons were sent you on the dates mentioned below, and you were given until February 12, 1898, to answer the same, if you desired to do so:

I. N. Fickes, of Holland, Kans.....January 21, 1898.
Nathan Lloyd, of Greenbrier, Mo.....January 22, 1898.
J. L. Zeiger, of Cleveland, Ohio .....January 26, 1898.
John McWilliams, of Egypt Mills, Mo ..February 5, 1898.

You were informed in the letters accompanying the charges of McWilliams, Lloyd, and Fickes that, inasmuch as you were not registered as a patent attorney, disbarment proceedings would not be instituted. It has been determined, however, that inasmuch as you still represent a number of applicants before this Office in applications filed before the 1st of January, 1898, as is shown by a list of such cases filed by your representative on January 14, 1898, and in which registration was waived, said list numbering 171 cases, you are practicing before the Office and within the provisions of the statute you are subject to disbarment proceedings. In view of this fact and in view of the fact that in some of the foregoing cases the filing of the answer was made optional with you you are hereby required to show cause on or before the 15th day of June, 1898, in each of these cases, why you should not be disbarred from practice and why the Commissioner of Patents should not refuse to recognize you as patent agent in accordance with the statutes in such cases made and provided.

C. H. DUELL,
Commissioner.

Regulations in Relation to Mail-Matter.

In order to insure the ready identification of the division from which mail-matter emanating from this Office was sent, and the prepayment of any foreign postage thereon, as well as to prevent the retention for general delivery in the post-office of this city of any wrongly-addressed letter when this Office could supply a fuller or more accurate address, it is directed that the following regulations be observed with reference to all mail-matter forwarded from this Office:

Each envelop forwarded from any division will be stamped or marked in the upper left-hand corner with the division number or letter, as the case may be.

Each envelop addressed to a foreign country must be forwarded to the mail-room and the proper stamps affixed thereto before mailing.

Such mail as is to be delivered in this city shall be directed "Washington, D. C." If a letter addressed to a person in this city and not marked for general delivery be returned to this Office, it will be promptly remailed with an accurate and full local address supplied, if possible. In remailing, the envelop should be marked or stamped "Hold in General Delivery," but no envelop should be thus marked until the address thereon is as full and accurate as the Office can supply. A letter to a person in this city will not be filed "Undelivered" until it is returned to this Office in an envelop thus addressed and marked.

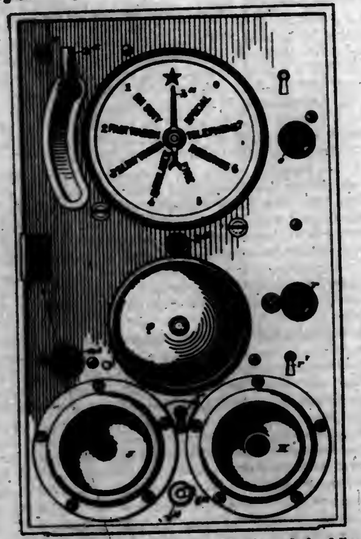
PATENTS

GRANTED MAY 31, 1898.

604,711. RAILWAY SIGNALING APPARATUS. WILLIAM H. RADCOM, Washington, D. C., administrator of William T. G. Pratt, deceased, assignor to Ramadine Ann Pratt, Ramadine Frances Pratt, and Charles Claridge Pratt, Sneyd Park, and Mary Ann Manaka Wreaford, née Pratt, Portico, England. Filed Dec. 7, 1897. Serial No. 661,088. (No model.) Patented in England Nov. 30, 1896, No. 27,125.



Claim.—1. In railway signaling mechanism actuated by a stationary cutter, the combination of a part carried by the train and arranged to be severed by the said cutter, with a device arranged to fall on such severance, a signal and the system of links and levers consisting of the link E, connected with the said device, the lever, F, connected with said link E, the lever G, actuated by said lever, F, and the link, H, connected with said lever, G, and actuating the said signal, for operating the latter, the said links and levers serving to minimize the strain on the operative parts of the said signal substantially as set forth.

2. In railway signaling mechanism actuated by a stationary cutter, the combination of a series of superposed ring-frames carried by the train, with a device supported by the lowest ring frame and arranged to fall on its severance, a signal and connections between the said device and the said signal for operating the latter, the said ring-frames supporting one another, in order that by the severance and consequent removal of the lowest ring-frame, the next lowest ring may automatically take the lowest position, supporting the said device and ready to be struck and severed by the cutter substantially as set forth.

3. In railroad signaling mechanism a stationary, vertical, double-edged knife provided with a base and a clamping device which is adapted to fasten the said knife temporarily to any of the sleepers of a track, in combination with a signal-controlling device carried by the train, and arranged to be cut by the said knife substantially as and for the purpose set forth.

604,712. ELECTRICAL SIGNALING SYSTEM AND APPARATUS. WALTER P. (BAKER, Milford, Conn., assignor to the National Electrical Manufacturing Company, same place. Filed Oct. 1, 1896. Serial No. 607,847. (No model.)

Claim.—1. In a signaling system, the combination of the following instrumentalities in operative relation, to wit: signal-transmitting mechanism comprising a plurality of signaling devices transmitting a variety of calls, one of said signaling devices transmitting calls comprising short signals, and the other of said signaling devices transmitting calls comprising long signals, a controlling device at the central station arranged to be partially actuated by short signals and fully actuated by long signals, a signal-receiver arranged to respond to a call comprising a plurality of long signals and under the control of the controlling device and operable therefrom when the said controlling device has been fully actuated, whereby calls containing short signals indicate themselves on the controlling device only and calls containing long signals will actuate the controlling device to cause the same to permit the secondary signal-receiver to respond to each long signal.

2. In a signaling system, the combination of the following instrumentalities in operative relation, to wit: signaling mechanism transmitting a plurality of calls, one of said calls comprising short signals, and other of said calls comprising long signals, a controller at a central station, a signal-receiver operated from the said controller at predetermined times, and a governing device for the controller comprising in its structure means for preventing the controller from allowing the signal-receiver to operate during the reception of short signals, and means for manipulating the receiver upon the reception of each long signal of a predetermined class of calls.

3. In a signaling system, the combination of the following instrumentalities in operative relation, to wit: signaling mechanism transmitting a variety of calls, one of said calls comprising short signals, and other of said calls comprising long signals, a controller in the circuit responsive to all signals, a signal-receiver responsive to calls comprising a plurality of long signals, a short circuit around the same under the control of the controller, and a governing device for the said short circuit, whereby the controller will open the short circuit of the signal-receiver at the reception of each long signal of a call containing said long signals of a predetermined character, so that the said signals may manifest themselves in the receiver to cause the said receiver to respond to the said call.

4. In a signaling system, the combination of the following instrumentalities in operative combination, to wit: signaling mechanism transmitting a plurality of calls, said calls comprising long and short signals, a signal-receiving device and a controller at the central station in circuit with each other, each arranged to respond to a call comprising a plurality of signals, a governing mechanism for the controller operating in conjunction with the signal-receiving device, the

said governing mechanism being operated by the controller only during the reception of calls containing long signals to permit the signal-receiving device to operate and to respond to each of the said long signals.

5. In a signaling system, the combination of the following instrumentalities in operative relation, to wit: signaling mechanism provided with means for transmitting calls containing long signals and calls containing short signals, a signal-receiving device and a controller therefor operated by the signals, and a short circuit for the said signal-receiving device, a governing device for the said short circuit controlled by the controller and cooperating therewith to break the short circuit of the short-circuited signal-receiving device upon the reception of each long signal so that the normally-short-circuited signal-receiving device will be rendered operative to respond to each call containing long signals at the time of the reception of each of the said long signals of the call, the said controller and short-circuited signal-receiving mechanism operating in unison.

6. In a signaling system, the combination of the following instrumentalities in operative relation, to wit: signaling mechanism provided with means for transmitting a plurality of calls containing long and short signals, a signal-receiving device and a controller therefor, the signal-receiving device comprising in its structure a vibratory part, a governing device operating in conjunction with the controller to govern the operation of the signal receiving device, the said governing device comprising in its structure a vibratory part executing vibrations of a plurality of amplitudes, and rendering the signaling-receiving device operative only upon its vibrations of great amplitude, whereby the swinging part of the signaling-receiver will vibrate in unison with the vibrating part of the governing device only in its vibrations of great amplitude, and will leave the signal-receiving device unaffected during its vibrations of less amplitude.

7. In a signaling system, the combination of the following instrumentalities in operative relation to wit: a signaling-box provided with means for transmitting a plurality of calls containing signals of different lengths or durations, a controller-magnet, a visual indicator, a governor for the visual indicator under the control of the controller and comprising in its structure a vibrating part, the said controller device being arranged to actuate the governor upon the passage of long signals so that upon receipt of each of the said long signals the vibrating part of the governor and the visual indicator will operate in unison.

8. In a signaling system, the combination of the following instrumentalities in operative relation, to wit: signaling mechanism adapted to transmit a plurality of calls consisting of signals of different lengths, an electromagnetic controller at the central station having an armature adapted to make long and short strokes in response to long and short signals respectively, a signal-receiving instrument at central station provided with a vibrating armature and under the control of the controller and operated therefrom at each long stroke of the armature of the said controller, whereby calls comprising long signals will be indicated at the central station by the armature of one signal-receiving instrument vibrating in unison with the long strokes of the other signal-receiving instrument.

9. In a signal-box, the combination of the following instrumentalities in operative relation, to wit: a normally-short-circuited main signaling-movement, an auxiliary signaling-movement in circuit therewith, a signal-receiving magnet in circuit with the signaling-movement and a short circuit for the signal-receiving magnet and means for breaking the short circuit around the signal-receiving magnet operated from the auxiliary signaling-movement.

10. In a signal-box, the combination of the following instrumentalities in operative relation, to wit: main and auxiliary signaling-movements, a short circuit around the main signaling movement, a signal-receiving magnet in the line of the main and auxiliary signaling-movements and a short circuit around the signal-receiving magnets controlled by the auxiliary signaling-movement.

11. In a signaling mechanism, the following instrumentalities in operative combination, to wit: a plurality of signal-wheels with driving-gear, a plurality of contact devices each cooperating with a signal-wheel to send a signal, and an automatically-operated switching device connected to the line and adapted to cooperate with one or the other contact device, and means for connecting the switching device first with one contact device and then with the other contact device, whereby first one of the signal-wheels will thereby be connected in circuit with the line and the other cut out, and then the other signal-wheel will be connected in circuit with the line, so that the signal-wheels will send their signals to line successively.

12. In a signaling mechanism, the combination of the following instrumentalities in operative relation to wit: a plurality of signal-wheels with driving-gear, a plurality of contact devices cooperating with the signal-wheels to send a signal, and a switching device arranged for cooperation with one or the other of the contact devices of the signal-wheels, and means for connecting the switching device in circuit first with one contact device and then with the other contact device, whereby the wheels will successively send their signals to line, and means intervening between the driving-gear and the switching device for actuating the said switching device.

13. In a signaling mechanism, the combination of the following instrumentalities in operative relation to wit: a plurality of signal-wheels with driving-gear, a plurality of contact devices cooperating with the signal-wheels to send a signal, and a switching device arranged for cooperation with one or the other of the contact devices of the signal-wheels, and means for connecting the switching device in circuit first with one contact device and then with the other contact device, whereby the wheels will successively send their signals to line, means intervening between the driving-gear and the switching device for actuating the said switching device, and a short circuiting device for short-circuiting the contact devices.

14. In a signaling mechanism, the combination of the following instrumentalities in operative relation to wit: a plurality of signal-wheels with driving-gear, a plurality of contact devices cooperating with the signal-wheels to send a signal, and a switching device arranged for cooperation with one or the other of the contact devices of the signal-wheels, and means for connecting the switching device in circuit first with one contact device and then with the other contact device, whereby the wheels will successively send their signals to line, means intervening between the driving-gear and the switching device for actuating the said switching device, and a short-circuiting device for short-circuiting the contact devices, and means for actuating the short-circuiting device from the signal-wheel driving-gear.

15. In a signal-box, the combination of a plurality of signal-wheels, and circuit-controllers under control of the signal-wheels, the said circuit-controllers terminating in terminals opposed to each other, a contact normally bearing upon one of the said terminals and adapted when moved to reach contact with the other, and a pivoted arm carrying the said movable contact in operative relation to an arm-swinging device, such as the cam A^{24}, substantially as described and for the purposes set forth.

16. In a signaling mechanism, the combination of a plurality of signal-wheels, a plurality of circuit-controllers, a switching device for putting one or the other of the circuit-controllers into the line and a short-circuiting device for short-circuiting the circuit-controllers, said switching and short-circuiting devices being operated from the motor mechanism for the signal-wheels.

17. In a signaling mechanism, the combination of a plurality of signal-wheels, a plurality of circuit-controllers, a switch-lever for putting one or the other of the circuit-controllers into the line and a short-circuiting lever for short-circuiting the circuit-controllers, and a spring connecting the short-circuiting lever and the switch-lever.

18. In a signal box, the combination of a signaling-movement, winding mechanism for setting the said movement for operation, a releasing mechanism for releasing the movement and means for locking the winding mechanism from being operated when the releasing mechanism has been thrown to release the movement for operation.

19. In a signal mechanism, the combination of a signaling-movement, a winding mechanism for setting the said movement, a releasing mechanism for releasing the movement and means for rendering the winding mechanism inoperative when the releasing mechanism has been actuated to release the movement for operation

20. In a signal mechanism, the combination of a signaling-movement and setting mechanism for setting the same, a releasing mechanism for releasing the movement for operation after it has been set and means for rendering the setting mechanism inoperative to set the movement while the signal is being transmitted.

21. In a signaling mechanism, the combination with a signal-transmitting movement of a setting mechanism for setting the same for operation, a releasing mechanism for the movement, means for rendering the setting mechanism inoperative when the movement has been put in operation by the releasing mechanism and means for rendering the releasing mechanism inoperative during transmission of the signal.

22. In a signaling mechanism, the combination of a step-by-step setting mechanism combined with a transmitting mechanism and a releasing device for the transmitting mechanism provided with a stop for the step-by-step setting mechanism.

23. In a signaling mechanism, the combination with a signal-transmitting movement, of a setting mechanism for setting the same for operation, a releasing mechanism for releasing the movement and means for rendering the setting mechanism inoperative when the releasing mechanism has been operated and for rendering the releasing mechanism inoperative when the setting mechanism is in operation.

24. In a signaling mechanism, the combination of a signal-transmitting device, winding and releasing mechanisms therefor, and locking means actuated from the releasing mechanism for rendering the winding mechanism inoperative when the releasing mechanism is operated.

25. In a signaling mechanism, the combination of a signal-transmitting device, a setting mechanism therefor, a releasing mechanism, means for rendering the setting mechanism inoperative, the said means being controlled from the releasing mechanism, means for rendering the releasing mechanism inoperative during operating of the setting mechanism, and a locking device for the releasing mechanism, whereby both the releasing and setting mechanisms will be rendered inoperative each during the operation of the other, and both will be rendered inoperative during transmission of a signal.

26. In a signaling mechanism, the combination of a signal-transmitting device having setting and releasing mechanism arranged to reciprocally lock one another from movement and a locking device for one of these elements, whereby both may be held locked at predetermined times.

27. In a signaling mechanism, the combination of a signaling device having a driving-gear, a releasing device for releasing the said driving-gear, a latch for holding the releasing device inoperative during the transmission of a signal, a spring for actuating the said latch and a means for restoring the latch to its initial position against the tension of the spring.

28. In a signaling mechanism, the combination of a signaling device having a driving-gear, a releasing device for the driving-gear, a reciprocating latch for holding the releasing device inoperative during transmission of a signal, a spring for actuating the said latch to bring it into position to lock the releasing device and means for reciprocating the latch to restore the same to its initial position against the tension of the spring.

29. In a signaling-box, the combination of a signaling-movement, a movable releasing device for the said movement, means for locking the said releasing device in the position which it assumes when it has released the movement, means for moving the said releasing device in a direction opposite to its movement to release the box, whereby the said releasing device will be restored to its initial position, and a reciprocating latch for locking the releasing device during transmission of a signal.

30. In a signaling mechanism, the combination of a signal-transmitting device having a driving-gear, a releasing device therefor, a reciprocating latch for locking the releasing device during transmission of the signal, the said reciprocating latch being reciprocated in one direction by a spring and reciprocated in the opposite direction by the action of the driving-gear, whereby the driving-gear of the said signaling mechanism may be released, the releasing device therefor held locked during transmission of the signal by the latch and the said latch restored to its initial position at the completion of the signal by the operation of the driving-gear.

31. In a signaling mechanism, the combination of a signal-transmitting device and its driving-gear, of a setting-lever and a reciprocating releasing-plunger and projections carried upon the lever and plunger for cooperating with each other, each to prevent the operation of the other at predetermined times, whereby the setting-lever and releasing-plunger will be rendered inoperative one from the other.

32. A signal-transmitting mechanism combined with a setting mechanism, comprising a swinging pawl and a ratchet cooperating therewith, the said ratchet being provided with a series of teeth and one tooth of greater length than any of the other teeth.

33. The combination with a signaling device and its driving-train of a releasing mechanism therefor, comprising a plunger, a stop-lever A^{27} carried by the plunger, a pin on the driving-gear cooperating with the stop-lever, a latch on the driving-gear serving to lock the stop-lever, and means for withdrawing the latch by the movement of the driving-gear.

34. In a signaling-box, a releasing mechanism comprising the combination of a plunger, a stop-lever A^{27}, a spring for restoring the plunger to its initial position, a latch A^{45}, a spring for impelling the latch into the return-path of the stop-lever and means for withdrawing the latch by the movement of the driving-gear of the signal device.

35. In a signal-box, the combination with signal transmitting mechanism and setting mechanism therefor of a push-rod or plunger carrying a stop or releasing lever for releasing the transmitting mechanism upon movement of the plunger and also a catch-lever A^{61} for locking the setting mechanism while the plunger is out of its normal position.

36. In a signaling mechanism, the combination of a signal-transmitting device provided with a releasing mechanism and a locking mechanism for the releasing mechanism, of a main or setting arbor, a stop-arm on the arbor for cooperating with the releasing mechanism and a lifting-arm on the arbor for cooperating with the locking mechanism.

37. A key-trap comprising a winding-arbor, a stop engaging the key to stop the said key in its rotation, a toothed plate rotated by the key and a pawl engaging the plate to prevent the return movement thereof.

38. In a signaling device, the combination of a winding-arbor, a key-trapping device comprising pawl-and-ratchet mechanism and a locking mechanism for locking the pawl, and means operated by the key for swinging the pawl out of the key-trapping position and engaging the said pawl with a locking device while in such last-named position, whereby the signal may be sent in by a special key which will not be trapped.

39. The combination in a signal-box of a signal-receiving mechanism in the box, a signal-transmitting mechanism and a key-trap cooperating with the signal-receiving mechanism and means for putting the signal-receiving mechanism into circuit by the operation of the key-trap.

40. In a signal mechanism, the combination of a signal-receiving mechanism in the box, a short circuit around the same, a signal-transmitting mechanism combined with a key-trap and circuit-manipulating means actuated by the key-trap for opening the short circuit around the signal-receiving mechanism.

41. In a signaling device, the combination with a winding-arbor of a cam-plate j^{14} moving therewith, a pawl or lever j^{34} cooperating with the cam-plate and a catch-lever j^{35}.

42. In a signal-box-key-trapping mechanism, the combination of a key-arresting projection, a plate moving with the key and provided with teeth, a pawl for cooperating with the teeth and means for swinging the pawl out of the return-path of the teeth.

43. In a key-trapping mechanism for a signal-movement, the combination of a key-arresting projection as j^{35}, a plate moving with the key and provided with teeth and a cam, a pawl for engaging the teeth on their return movement to lock the plate, thereby trapping the key, and a locking or latch device for the pawl, the said cam cooperating with the pawl and its lock to swing the pawl into its locked position out of the return-path of the teeth and to unlock the pawl after the teeth have passed the said pawl on their return movement, substantially as described.

44. A trapping mechanism for signal-box keys comprising a key-arresting projection, a plate moving with the key, a pawl for locking the plate upon its return movement, a locking device for locking the pawl when it has been moved out of the path of the return movement of the plate and a spring uniting the said pawl and locking device.

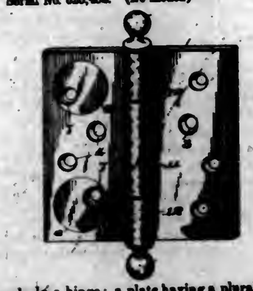
45. In a signal movement, the combination of a key-arresting projection combined with a plate moving freely with the key, a stop-pawl j^{34}, a catch-lever j^{35}, teeth upon the plate for catching with the stop-pawl j^{34} and a cam upon the plate for rocking the pawl and catch-levers.

46. In a signal-box, the combination of a signal-movement adapted to be set by a key, a trapping mechanism for the key and a lever j^{34} for untrapping or releasing the key from the outside of the front plate of the box.

47. A contact device for time-stamp magnets and the like, comprising a magnet, an armature adapted to manipulate the circuit on its return stroke, means for preventing the armature from manipulating the circuit of the time-stamp on its forward stroke, and a retarding means for retarding the return movement of the armature, whereby at the beginning of a signal the armature will be thereby put in position to actuate the time-stamp circuit, and upon the cessation of the said signal the armature will be retracted and caused to manipulate the said time-stamp circuit, substantially as and for the purposes set forth.

48. In a contact device for time-stamp magnets and the like, the combination with the said time-stamp or other magnet, of a circuit therefor, a magnet, an armature therefor, arranged to manipulate the circuit of the time-stamp magnet upon its return stroke only, means for preventing the said armature from manipulating the circuit of the time-stamp magnet upon its forward stroke, whereby the armature will be attracted to its magnet at the beginning of a signal, a train of gearing for retarding the return movement of the armature during the periods intervening between the receipt of integral parts of the signal, whereby the armature will be retracted to its full degree of retraction only upon the completion of the signal, and will in each return stroke manipulate the circuit of the time-stamp or other magnet, substantially as described and for the purposes set forth.

49. In a contact device for time-stamp magnets and the like, the combination of a magnet, an armature therefor carrying a contact-piece, a contact-lever d^{14} provided with an insulating-block d^{16} to be struck by the contact-piece of the armature on the front stroke thereof and a toe d^{18} in metallic connection with the time-stamp circuit to be struck by the contact-piece of the armature on the back stroke thereof and a retarding device for retarding the back stroke of the armature, whereby the armature-contact will strike the contact-toe d^{18} only upon the cessation of a signal.

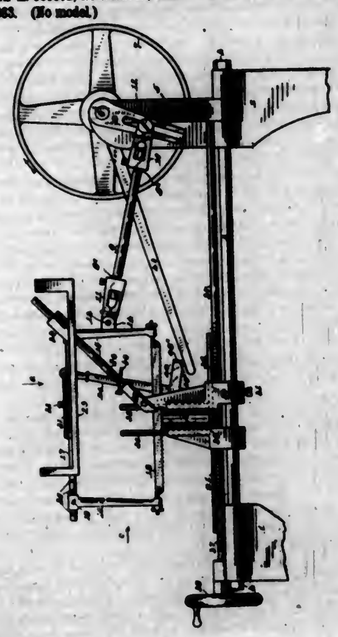


50. In a signaling mechanism, the combination of a signaling-movement combined with a strap or calling-key and actuating mechanism therefor comprising a reciprocating plunger adapted to reach contact with the key, combined with a lock therefor having a bolt arranged to engage the plunger to lock the same, from which lock

its actuating-key can be withdrawn only when the bolt thereof is in its locking position.

51. A signal-box provided with a plate as A turning upon one of its edges, a plurality of pairs of pins on opposite sides of the box, hook-hinges carried by the swinging plate and cooperating with one or the other of the pairs of pins in their extreme positions.

52. The combination in a telephone box of a pull-down-hook signal-setting device, a plunger-box-releasing device, a cut-out or short-circuiting key V and a box-door adapted to restore the plunger-box-releasing device to its normal position should it be accidentally left out and to manipulate the cut-out key.



604,718. HINGE. GEORGE H. BENNOS, Baltimore, Md. Filed Mar. 1, 1897. Serial No. 626,452. (No model.)

Claim.—1. In a hinge; a plate having a plurality of openings in combination with a plate covering said openings, and also provided with an opening, the latter plate being movable with relation to the hinge-plate for bringing its opening into alinement with one of the openings in the plate, substantially as described.

2. In a hinge, the combination with the leaves thereof, of a device movably connected therewith and having an opening therein for the reception of a screw, whereby the movement of said device within a predetermined limit brings the opening therein into alinement with one of a series of openings in the hinge-leaf, substantially as and for the purpose set forth.

604,714. HACK-SAW MACHINE. FRANK S. BRADLEY and FRANK A. COTTON, New Haven, Conn. Filed Dec. 22, 1897. Serial No. 663,063. (No model.)

Claim.—1. In a hack-saw machine, of the character described, the combination, with a suitable reciprocating mechanism and a reciprocating-saw-carrying frame, of a saw-frame support operatively mounted on angularly-disposed guides so that, when the saw-carrying frame is on its return stroke the said support will follow up such guides a sufficient distance to prevent the saw dragging on the work, and on the forward stroke will follow down said guides to reengage the saw, for the purpose set forth.

2. In a hack-saw machine, of the character described, the combination, with suitable reciprocating mechanism and a saw-carrying frame actuated thereby, of a saw-frame support in which said saw-carrying frame is operatively mounted, said support balanced on angularly-disposed guide-rods fixed to one of the work-holding jaws, so that, by means of such guide-rods the saw is relieved on its backward stroke by said support rising on said rods, for the purpose set forth.

3. The combination, in a hack-saw machine, with suitable reciprocating mechanism, of a saw-frame support adapted to hold a reciprocating-saw-carrying frame, of angularly-disposed guide-rods or their equivalent, means on said support whereby it is adapted to operatively engage said rods so as to rise thereon when the saw is retreating and follow down such rods when the saw is advancing, for the purpose set forth.

4. The combination, in a hack-saw machine of the work-holding jaws each provided with a kerf in the body thereof to assist in keeping the saw in vertical alinement during its operation, for the purpose set forth.

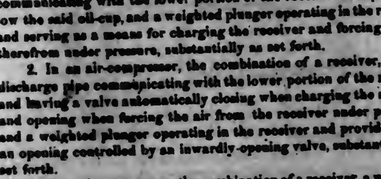
5. The combination, in a hack-saw machine, of the work-holding jaws each provided with a kerf in the body thereof and guide-pins rising above said jaws and placed, one on each side of said kerf, for the purpose set forth.

6. The combination, in a hack-saw machine, of the two side supporting-rods anchored in the supporting-legs, work-holding jaws adjustably mounted on said rods, for the purpose set forth.

7. The combination, in a hack-saw machine, with a threaded-jaw-carrying rod and means for operating the same of side supporting-rods anchored in the machine-legs, a front and rear jaw adjustably mounted on said rods, the former under control of the said threaded rod and the latter temporarily secured to said side supporting-rods, said jaws provided with a narrow kerf therein to guide the saw, and guide-pins rising above said jaws and placed, one on each side of the said kerfs, a floor rigidly secured to one of said jaws and adapted to freely extend through the other of said jaws, for the purpose set forth.

8. The combination, in a hack-saw machine, of the character described, consisting of work-holding jaws and their support, a saw-frame, a support therefor on which said frame is adapted to operate, angularly-disposed guide-rods, means whereby the further downward movement of said frame is arrested so that the saw may simply reciprocate, without cutting, when it has reached its lowest point, for the purpose set forth.

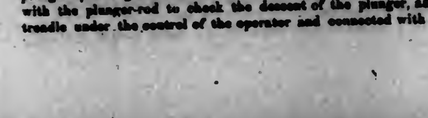
9. The combination, in a hack-saw machine, of the work-holding jaws, narrow guide-kerfs in the body thereof and guide-pins extending above such jaws and placed, one on each side of said kerfs, a saw-carrying frame, a saw-frame support in which each saw-carrying frame is adapted to operate, angularly-disposed guide-rods, means whereby the further downward progress of said saw-carrying frame is arrested so that, the saw may reciprocate without cutting, for the purpose set forth.



10. In a hack-saw machine, the saw-carrying frame and a support therefor, means substantially as shown on the saw-arm-supporting rod for changing the distance between said arms so that saws of different lengths may be used in the same frame, for the purpose set forth.

11. The combination, in a hack-saw machine, of the character described, of the side rods mounted in the machine-legs, work-holding jaws adjustably mounted thereon, said jaws having each a narrow kerf in the body thereof to act as a guide for the saw, guide-pins projecting above the jaws and on each side of the said kerf, a saw-frame having an adjustable back and a support therefor in which such frame is adapted to operate, angularly-disposed guide-rods attached to one of said jaws and means whereby said frame-support is operatively mounted on said guide-rods, means whereby the further downward progress of the saw is checked or the machine stopped for the purpose set forth.

604,715. SCALE-WEIGHT. JOHN F. BRADSHAW, Butte, Mont., assignor of one-half to George G. Bigham, same place. Filed May 6, 1897. Serial No. 635,417. (No model.)



Claim.—1. A scale-weight provided with a crotch or slot and having a preponderance of weight at the side in which the slot or crotch is produced, as and for the purpose set forth.

2. A scale-weight provided with a slot or crotch for the reception of a scale-bar, said weight being made heavier at that side in which the crotch or slot is produced, the upper surface of said weight being inclined in direction of the inner end of said slot or crotch, as and for the purpose set forth.

3. A scale-weight having a slot formed therein and having an inclined face, the said face slanting inward from the outer end of the slot.

604,716. DOOR-CLOSER. CHARLES BEERS, Farwell, Mich. Filed Oct. 8, 1897. Serial No. 654,565. (No model.)

Claim.—A door and gate pulley device consisting of a substantially U-shaped plate having inclined portions and a flat connecting portion, a pulley removably secured to one of the inclined portions, a vertically-disposed pulley, a spindle secured to the flat portion of the plate and on which the vertical pulley is mounted, and a roller-washer, loosely supported on the spindle between the plate and the pulley, substantially as described.

604,717. AIR-COMPRESSOR. ORMAN H. BURNHAM, Chatsworth, Ill. Filed May 4, 1897. Serial No. 635,009. (No model.)

Claim.—1. In an air-compressor, the combination of a receiver having an inner annular oil-cup at its lower end, an air-discharge pipe communicating with the lower portion of the receiver at a point below the said oil-cup, and a weighted plunger operating in the receiver and serving as a means for charging the receiver and forcing the air therefrom under pressure, substantially as set forth.

2. In an air-compressor, the combination of a receiver, an air-discharge pipe communicating with the lower portion of the receiver and having a valve automatically closing when charging the receiver and opening when forcing the air from the receiver under pressure, and a weighted plunger operating in the receiver and provided with an opening controlled by an inwardly-opening valve, substantially as set forth.

3. In an air-compressor, the combination of a receiver, a weighted plunger operating therein, and a brake under the control of the operator for checking and regulating the descent of the weighted plunger, substantially as set forth for the purpose described.

4. In an air-compressor, the combination of a receiver, a weighted plunger operating therein, a brake-lever normally held in engagement with the plunger-rod to check the descent of the plunger, and a treadle under the control of the operator and connected with the brake-lever, whereby the descent of the plunger may be regulated, substantially in the manner set forth.

5. In an air-compressor, the combination of a receiver, a cover having a tubular guide, a plunger having its rod operating through the tubular guide, a brake-lever pivoted to extensions of the tubular guide and operating through an opening in the side thereof, a spring for holding the brake-lever in engagement with the plunger-rod, and means under the control of the operator for moving the brake-lever to control the descent of the plunger, substantially as and for the purpose set forth.

6. In an air-compressor, the combination of a receiver, a weighted plunger operating in the receiver and having a valve-controlled opening, and provided on its top side with lugs, and a weight slipped upon the plunger-rod and supported upon the aforesaid lugs, substantially as and for the purpose set forth.

7. In an air-compressor, the combination of a receiver, a weighted plunger operating therein and adapted to have additional weights slipped upon the plunger-rod, a cover for closing the upper end of the receiver and provided in one side with a series of openings, and a pin or stop adapted to be thrust through any one of the said openings for limiting the upward movement of the plunger, substantially as set forth for the purpose described.

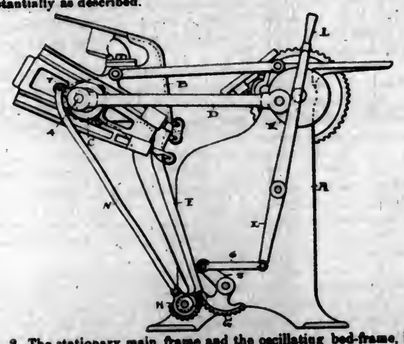
8. In an air-compressor, the combination of a receiver, a plunger operating therein and adapted to receive additional weights which are slipped upon its rod, a cover for closing the receiver and provided in a side with a series of openings, a spring pivotally mounted at one end, and a pin or stop applied to the free end of the pivoted spring and adapted to enter any one of the aforesaid openings, substantially as set forth for the purpose described.

9. In an air-compressor, a receiver having an outer flange at its lower end to receive the feet of the operator, an air-discharge pipe having connection with the lower portion of the receiver, and a weighted plunger operating in the receiver, substantially as and for the purpose set forth.

604,718. RELEASE-RIGGING FOR RAILWAY-CARS. HARRY G. BENNER, Chicago, Ill., assignor to the McConway & Torley Company, Pittsburg, Pa. Filed Dec. 20, 1897. Serial No. 664,231. (No model.)

Claim.—1. In a release-rigging for car-couplers, the combination with an uncoupling lever or shaft provided with a ratchet device, of a lever-handle, an automatically-retracted dog for releasing the lever-handle from the uncoupling-lever, and means for locking the ratchet device of the uncoupling-lever, substantially as and for the purposes specified.

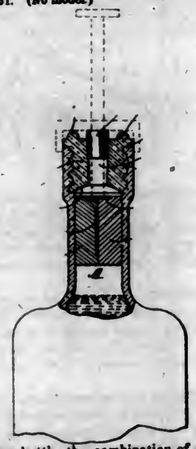
2. In a release-rigging for car-couplers, the combination with an uncoupling-lever having a ratchet device, of a lever-handle having an elongated slot whereby it is journaled on the uncoupling-lever, and provided with a dog which is adapted to engage the ratchet device of the uncoupling-lever, substantially as and for the purposes specified.



3. In a release-rigging for car-couplers, the combination with an uncoupling-lever provided with a ratchet device, of a drop-handle, provided with a dog to engage the ratchet device of the uncoupling-lever, and a pawl or locking-dog adapted to engage the ratchet device of the uncoupling-lever, said dog being counterweighted to be held normally out of engagement with the ratchet device of the uncoupling-lever, substantially as and for the purposes specified.

4. In a release-rigging for car-couplers, the combination with an uncoupling lever or shaft provided with a ratchet device, of a forked-jaw drop-handle loosely journaled on the uncoupling-lever by means of an elongated slot and provided with a dog adapted to engage the ratchet device of the uncoupling-lever when the drop-handle is raised, substantially as and for the purposes specified.

604,719. IMPRESSION THROW-OFF FOR PLATEN PRINTING-PRESSES. FRANK A. BURNHAM, Cleveland, Ohio, assignor to the Chandler & Price Company, same place. Filed July 22, 1897. Serial No. 645,551. (No model.)

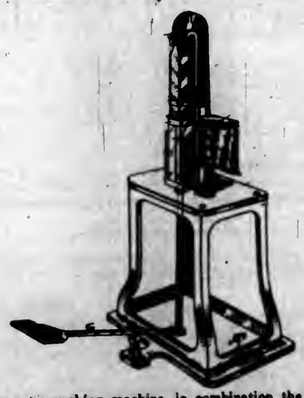


Claim.—1. In platen printing-presses, the bed and the transverse rotatable shaft therein, and the connecting-rod eccentrically connected with the end of said shaft, in combination with throw-off

mechanism consisting of two interlocked members, one of which is pivoted on the bottom of the main frame and the other on the bottom of bed-frame, and constructed to compensate for the movements of the bed-frame on its pivots, whereby the said rotatable shaft is the bed is kept from rotating when the bed-frame moves back and forth, and means for changing the positions of said throw-off mechanism, substantially as described.

3. The stationary main frame and the oscillating bed-frame, in combination with a rotatable transverse shaft in said bed-frame, a connecting-rod eccentrically engaged with said shaft, and throw-off mechanism to rotate said shaft consisting of loosely-connected gears meshing with each other and having their line of engagement across the pivot-center of the bed-frame, whereby when the bed-frame is moved back and forth on its pivots the said rotatable shaft is prevented from turning, substantially as described.

604,720. BOTTLE. ALLAN R. CAMPBELL, Birmingham, Ala., assignor to Archibald Campbell, Huntsville, Ala. Filed July 1, 1897. Serial No. 643,061. (No model.)



Claim.—1. In a bottle, the combination of a threaded stopper having a concave lower end permanently secured within the outer end of the neck thereof and a removable sectional cork placed within the lower portion of the neck thereof, the sections united by a disk, the said stopper having an aperture leading therethrough for discharge of fluid from the bottle, substantially as shown and described.

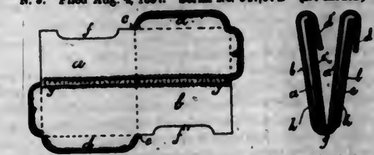
2. In a bottle, the combination of a cork comprising two sections united by a disk in the lower portion of the neck thereof and a concealed coupon between said sections, and a threaded stopper having an aperture leading therethrough and a concave lower end, said stopper permanently secured in the outer end of the bottle-neck, substantially as shown and described.

604,721. TEA-PACKING MACHINE. ALEXANDER H. CANNING, Toronto, Canada. Filed Oct. 12, 1897. Serial No. 654,977. (No model.)

Claim.—1. In combination, the frame, the plunger, a holder having an open side and top and the means independent thereof for closing said top and side, substantially as described.

2. In combination, the frame, the stationary plunger, the vertically-movable holder having an open side and top with means for operating said holder, and means carried by the frame independent of the holder for closing said open side and top, substantially as described.

3. In a tea-packing machine, in combination the frame, the standard, the plunger depending from the top thereof a short distance from the main body of the standard, the holder, means for operating same, and a gage comprising two sides and a top and a block depending from the top, hinged to the standard and designed to be swung so that the block enters the open top of the holder and the side closes the open side when the holder is raised as and for the purpose specified.



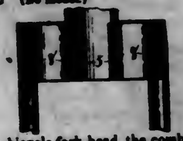
4. In combination, the frame, the stationary plunger, the vertically-movable holder, means for operating the same, said holder having an open top and side, said holder being adapted to receive a package, and the gage supported independently of said holder and adapted to close said open top and side and having a projection adapted to enter the mouth of the holder, substantially as described.

604,722. RETURN-ENVELOP. JESSE M. CARTER, Bowie, Tex. Filed July 28, 1897. Serial No. 646,220. (No model.)

Claim.—The envelop 1, provided with the flap 2, the auxiliary back 5, detachably secured thereto and provided with the vertical slit 6, in combination with the stamp 7, formed with a vertical row of perforations 10, and adapted to be inserted part way through said slit, and simultaneously secured to the envelop 1 and the auxiliary back 5, substantially as shown and described.

604,723. DOUBLE ENVELOP. WALTER S. CARVER, Bloomfield, N. J. Filed Aug. 4, 1897. Serial No. 647,074. (No model.)

Claim.—1. A double envelop composed of a blank formed of a single piece of material and comprising a substantially rectangular portion *a*, *b*, provided with diagonally opposite end flaps *c* and *d*, and folded upon itself, substantially as described.



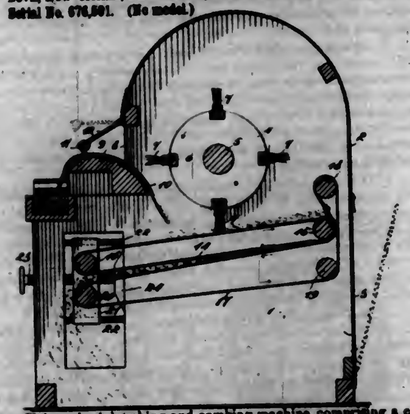
2. A double envelop composed of a blank formed of a single piece of material and comprising a substantially rectangular portion *a*, *b* having a central longitudinal row of perforations, and the diagonally opposite end flaps *c* and *d* and properly folded upon itself, substantially as described.

3. A double envelop composed of a blank formed of a single piece of material and comprising a substantially rectangular portion *a*, *b*, provided with the diagonally opposite end flaps *c* and *d*, and properly folded upon itself, in combination with spreading strips or guards *h*, secured between the inner faces of the envelops, substantially as described.

4. A double envelop composed of a blank formed of a single piece of material and comprising a substantially rectangular portion *a*, *b*, having the diagonally opposite end flaps *c*, *d*, the similarly-disposed notches *f* and *f'*, and flaps *d* and *d'*, folded upon each other, substantially as described.

5. A plurality of double envelops, each composed of a blank formed of a single piece of material and comprising a substantially rectangular portion *a*, *b*, having the diagonally opposite end flaps *c*, *d*, and each blank properly folded upon itself, to constitute two united envelops; said envelops being bound at their meeting edges between suitable covers, substantially as described.

604,724. BICYCLE FORK-HEAD. FRANK B. CASE, Syracuse, N. Y., assignor to R. C. Stearns & Co., same place. Filed Jan. 9, 1897. Serial No. 618,626. (No model.)



Claim.—1. In a bicycle fork-head, the combination of the steering-post slotted at its lower end, fork sides slotted at their upper ends and tubes fitted to said slots to connect the fork sides to the post, substantially as described and shown.

2. In a bicycle fork-head, the combination of the steering-post provided with double slots on both sides of its lower end, fork sides provided with double slots on the inner sides of their upper ends, tubes fitted to said slots, connecting the fork sides to the post, braces fitted to the interior of said tubes, and a crown-piece having a central perforation for receiving the post and formed to cover over the open ends of the fork sides and tubes, substantially as described and shown.

3. In a bicycle fork-head, the combination of the steering-post provided with double slots on both sides of its lower end, fork sides provided with double slots on the inner sides of their upper ends, tubes fitted to said slots for connecting the fork sides to the head, a crown-piece having a central perforation for receiving the post and formed to cover the open ends of the tubes and fork sides, and braces fitted to the interior of the tubes formed of a single piece of metal bent to bear with one edge against the post, and with two edges against the fork sides at the point of connection with said tubes, substantially as described and shown.

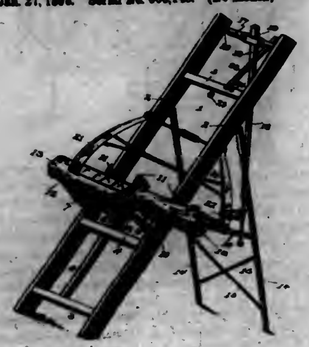
604,725. BRUSHING OR COMBING MACHINE. EDGAR CAMARDOVA, New Orleans, La. Filed Apr. 20, 1897. Renewed Apr. 5, 1898. Serial No. 676,591. (No model.)

Claim.—1. A brushing and combing machine, comprising a casing, a rotary brush, means located at an opening in the casing for holding the goods to be brushed and carrying devices below the brush for receiving and carrying the material brushed from the goods, substantially as described.

2. A brushing or combing machine, comprising a casing, a rotary brush-carrier in said casing, a series of brushes on said carrier, a transversely-curved bed-plate located in an opening in the front of the casing, a holder-bar above the bed-plate, pivoted arms to which said holder-bar is attached, and endless belt movable below the brush-carrier, and means for imparting motion to the brush-carrier and to the endless belt, substantially as specified.

3. A brushing or combing machine, comprising a casing, a brush-carrier mounted to rotate therein, a series of brushes mounted on the carrier, two endless belts arranged below the brush-carrier, one of said belts being below the other, the lower belt being extended over one of the rollers of the upper belt, and means for imparting motion to the brush-carrier and to the endless belts, substantially as specified.

4. A brushing or combing machine, comprising a casing, a brush-carrier mounted to rotate therein, a series of brushes on said brush-carrier, a transversely-curved bed-plate extended along an opening in the front of the casing, a swinging holder-bar above said bed-plate, a tray forward of the bed-plate, endless belts movable in opposite directions below the brush-carrier, means for rotating the brush-carrier, and moving the endless belts, and means for changing the direction of movement of said parts, substantially as specified.



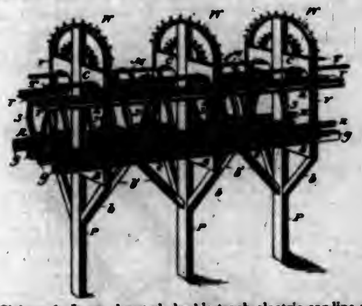
5. A brushing or combing machine, comprising a casing, a brush-carrier mounted to rotate therein, brushes on said carrier, fast and loose pulleys on the extended journal of the shaft of said carrier, a main driving-pulley, bands extended from the driving-pulley and adapted for connection with the fast and loose pulleys, another pulley on said extended journal, endless belts mounted on rollers having journal-bearings in the casing, fast and loose pulleys on an extended journal of one of said rollers, bands extended from the last-named pulley on the journal of the brush-carrier shaft and adapted for engagement with the fast and loose pulleys on the journal of the roller, a shifter-carriage movable on an arm extended outward from the casing, a fulcrumed lever for moving said carriage, and fingers extended from the carriage for engagement with the several bands, whereby they may be shifted to change the direction of rotation of the brush-carriage and endless belts, substantially as specified.

604,726. VEHICLE-WHEEL. LEE R. CHAMBLISS, Langston, Okla., assignor of one-half to Clement B. Black, same place. Filed Dec. 18, 1897. Serial No. 662,286. (No model.)

Claim.—In combination with the felly, the socket 18, provided with the plate 19 and flanges 20; the bolt 16, having right-hand threads 17; the slotted wrench enlargement 15, integral with said bolt; the left-hand-threaded nut 14, integral with said enlargement; thimble 12, secured on the outer end of the spoke 11, and having a threaded bolt extension working in the nut 14, and the spring lock-bar 14½ catching in the slot of the wrench enlargement 15, substantially as shown and described and for the purposes set forth.

604,727. SAWING-MACHINE. FRANK CHIRGAR, Tower, Minn. Filed Jan. 27, 1898. Serial No. 668,140. (No model.)

Claim.—In a sawing-machine, the combination with the frame, 1, the brace, 5, and the buffer-spring, 24, fixed thereto, of the right angular serrated plates forming a log-support, of the spring-actuated shaft, 17, the handle, 18, fixed to said shaft, the saw, 21, connected to said handle, and the buffer-arm, 23, depending from said shaft and having its lower end alined with said buffer-spring, 24, substantially as shown and described.

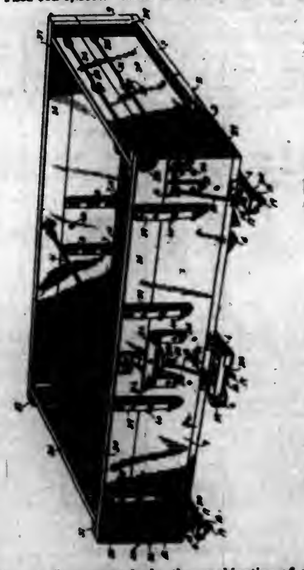


604,728. PROCESS OF PRODUCING SPIEGEL OR SIMILAR METALLIC ALLOY. EDWARD A. S. CLARKE, Chicago, Ill. Filed Nov. 23, 1894. Serial No. 530,332. (No specimens.)

Claim.—1. The hereinbefore-described improvement in the process of producing steel in a Bessemer converter or open-hearth furnace, that consists in charging the converter or open hearth with molten iron and thereafter delivering to said converter or open hearth, after the refining operation, a proper quantity of a molten metallic alloy (such as spiegel) while still in the molten condition in which it is received from the smelting-furnace (*i. e.*, without remelting) suitable additions in proper quantity being made to said molten metallic alloy, before its delivery to the converter, in order to impart to said alloy a character that shall adapt it for use as an addition, after said refining operation to the charge of the converter or open-hearth furnace.

2. The hereinbefore-described improvement in the process of producing steel in a Bessemer converter or open-hearth furnace, that consists in smelting a manganiferous ore adapted to produce a metallic alloy for an addition to the charge of said converter or open-hearth furnace, then delivering said alloy in molten condition from the smelting-furnace into a suitable mixing-chamber and therein adding to the charge of the mixing-chamber a further quantity of molten metal containing one or more agents (such as manganese, silicon, carbon, or the like) in proper quantity to give to the mass of metal within the mixing-chamber the desired grade or character, and thereafter adding a quantity of said molten metallic alloy from said mixing-chamber to the mass of metal within the Bessemer converter or open-hearth furnace at the end of the refining operation.

3. The hereinbefore-described improvement in the process of producing steel in the Bessemer converter or open-hearth furnace, that consists in charging a smelting-furnace with ore sufficiently high in manganese to give to the smelted metal a percentage of manganese in excess of that required to be delivered to the converter or open hearth as a recarburizing addition at the end of the refining operation, then tapping the smelted metal from the furnace and delivering it into a suitable mixing-chamber and therein adding to it molten iron of proper silicon content and in proper quantity to bring the manganese and silicon contents of the mass of metal within the mixing-chamber to the desired percentages, and finally adding a quantity of said molten metal from said mixing-chamber to the mass of metal within the Bessemer converter or open-hearth furnace at the end of the refining operation.



604,729. ELEVATED ELECTRIC CAR-LINE. JOE H. COOLEY, Paris, Tex. Filed Aug. 13, 1897. Serial No. 648,169. (No model.)

Claim.—1. In an elevated double-track electric-car-line system the combination of a single line of posts P, P, P, with cross-beams B, B, B, attached, braces *b*, *b*, *b*, supporting-girders *g*, *g*, *g*, and cross-beams, B, B, B, in like manner, cross-ties *t*, *t*, supporting a single rail R, for car-wheel groove, a system of vertical and longitudinal framework supporting two upper rails *r*, *r*, for each track, upper cross-beams C, C, C, attached to posts P, P, P, supporting electric-wire supports substantially as and for the purposes herein shown and described.

2. In an elevated double-track electric-car-line system the combination of a single line of posts P, P, P, with upper and lower beams B, B, and C, C, attached, braces *b*, *b*, *b'*, *b'*, and vertical supports *v*, *v*, the latter provided with inwardly-projecting bearings *h*, *h*, *h*; curved supports S, S, S, attached at lower ends to girders *g*, *g*, and upper ends shouldered to *r*, *r*, supporting same; semicircular iron braces M, M, to prevent rails *r*, *r* from spreading, substantially as and for the purposes herein shown and described.

604,730. FOLDING WAGON-BODY. GEORGE M. COBB, Charlotte, N. C. Filed Oct. 9, 1897. Serial No. 654,695. (No model.)

Claim.—1. In a wagon-body, the combination of a folding bottom, sides detachably mounted on the bottom, the substantially horizontal link-rods mounted on the outer faces of the sides of the wagon-body, the inclined braces provided at their upper ends with hooks detachably engaging the horizontal link-rods, said braces being adjustably connected at their lower ends with the bottom of the wagon-body, the transverse rods provided at their inner ends with interlocking hooks and extending across the wagon-body, and means for adjustably and hingedly connecting the outer ends of the transverse rods with the sides of the wagon-body, said means serving to hold the hooks in engagement with each other and adapted to loosen the transverse rods to enable the hooks to be disengaged without disconnecting the transverse rods from the sides of the wagon-body, substantially as described.

2. In a wagon-body, the combination of a bottom, sides detachably mounted on the bottom ends, the substantially horizontal link-rods hinged at their ends to the sides of the wagon-body near the upper edges thereof, and provided with central eyes, and inclined braces provided at their upper ends with hooks detachably engaging the central eyes of the link-rods, said braces being adjustably connected at their lower ends with the bottom of the wagon-body, substantially as described.

3. In a wagon-body, the combination of a bottom, a detachable side, cleats secured to the bottom and extending therefrom, a connecting-piece secured to the cleats, an adjustable eyebolt mounted on the connecting-piece, a substantially horizontal link-rod hinged at its ends to the sides of the wagon-body at the upper edge thereof and provided with a central eye and a brace having a hook at its lower end to engage the eyebolt, and provided at its upper end with an eye linked into that of the link-rod, substantially as described.

4. In a wagon-body, the combination of a bottom, middle cleats secured to the bottom and extending therefrom, a connecting-piece mounted on the cleats, the wagon-body side provided on its inner face with metal strips or bars having depending lower portions interlocked with the bottom of the body, a reinforcing plate or frame secured to the outer face of the side and arranged opposite the metal bars or strips, eyebolts passing through the side portions of the plate or frame, the side of the wagon-body and the metal strips or bars, the curved link-bar having a central eye and provided at its ends with eyes linked into the eyebolts, an inclined brace provided at its lower end with a hook and having an eye at its upper end linked into the central eye of the link-bar, and an adjusting-bolt mounted on the said connecting-piece and having an eye to receive the said hook, substantially as described.

604,731. DUPLEX PENCIL-SHARPENER. ISAAC CORY, New Decatur, Ala. Filed July 28, 1897. Serial No. 646,246. (Model.)

Claim.—1. A pencil-sharpener comprising the cylindrical socket or sleeve 4, and the conical hood 12, provided with the straight cutting edge 15 and the spiral cutting edge 14, substantially as shown and described.

2. A duplex pencil sharpener comprising the cylindrical socket or sleeve 4, formed with the spiral slot 8, having the spirally-arranged cutting edges 9 and 10, and the fixed conical hood 12 provided with the straight cutting edge 15 arranged parallel with the axis of said cylindrical socket, and the spiral cutting edge 14 extending around the axis of said hood, substantially as shown and described.

604,732. VALVE. CHARLES R. DALLAS, Pittsburg, Pa. Filed Mar. 6, 1897. Serial No. 626,212. (No model.)

Claim.—1. A valve composed of two hollow nested chambers, of substantially similar form, the inner member being provided with discharge-openings in the wall, a pipe connected to the truncated end of one member and a valve-stem or connecting-rod to the other, one of said members being adjustable on a line parallel to the axis of both members, substantially as shown and described.

2. A valve consisting of two similar hollow members, one nested within the other, the inner member being provided with discharge-openings in the wall, and one of said members being adjustable to form an intermediate discharge and having a form similar to that of the parts composing the valve, and a space between the top of the inner member and the outer member said space being filled with air, gas or liquid, forming a cushion to give a steady action to the valve, substantially as shown and described.

3. A valve consisting of two hollow, nested, approximately conical members, one nested in the other, a pipe opening into the truncated end of the inner member which has openings into the space between the two members, and a valve-stem upon the large end of the other member, substantially as described.

4. A valve consisting of a fixed and movable part one of which constitutes the valve-chamber, one of said parts being movable, the inner member being provided with openings, a supply-pipe connected to the contracted end of the inner part and a valve-stem or connecting-rod connected to the outer part, one of said members being adjustable on a line parallel to the axis of both members, substantially as described.

5. A valve consisting of two approximately conical hollow members, one of which is nested within the other, the inner member being provided with an imperforate head, the outer member having a chamber at one end within which the imperforate head operates, said chamber being filled with air, gas, steam or fluid and forming a cushion which rates the action of the movable member, substantially as shown and described.

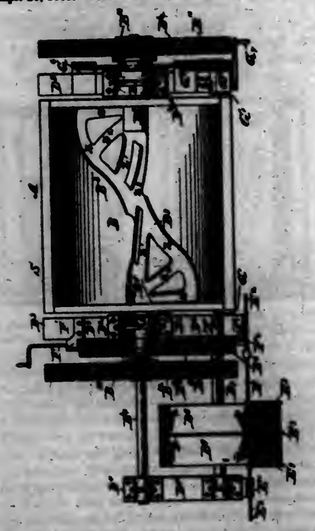
604,733. KINETOGRAPHIC CAMERA. WILLIAM H. DANIELS, New York, N. Y., assignor to Leo Prange, Brooklyn, N. Y. Filed Jan. 11, 1897. Serial No. 618,709. (No model.)

Claim.—1. The combination with a case provided with openings which are in line with each other, a movable picture-carrying surface within the case arranged intermediate and in line with the openings, and automatic means for imparting an intermittent movement to the surface, substantially as described.

2. The combination with a case provided in its opposite sides with openings which are in line with each other, a lens fitted in one of said openings, a movable picture-carrying surface within the case arranged in line with the openings, and means for imparting an automatic intermittent movement to the surface, substantially as described.

3. The combination with a case provided in its opposite sides with openings which are in line with each other, oscillating shutters operating intermittently, a picture-carrying disk within the case in line with the openings thereof, and automatic means for imparting an intermittent, rotary motion to the disk alternately with the shutters, substantially as specified.

4. The combination with a case provided in its opposite sides with openings which are in line with each other, a lens-tube fitted in one of said openings, an automatic, intermittently-moving surface within the case arranged in line with the openings, an oscillating shutter intermediate the lens-tube and movable surface, and means for intermittently actuating the shutter alternately with the intermittent motion of the surface, substantially as specified.

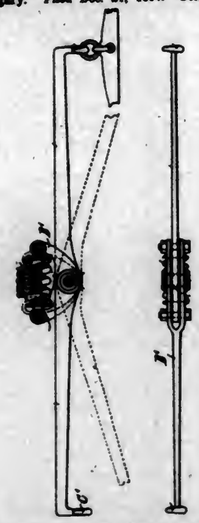


5. The combination with a case having an opening, of a movable surface within the case in line with the opening, an oscillating shutter intermediate the opening and movable surface, said shutter comprising two parts having a relative movement to each other, and means for simultaneously moving the two parts of the shutter in opposite directions, substantially as described.

6. The combination with a case having an opening, of a movable surface within the case in line with the opening, an oscillating shutter intermediate the opening and movable surface adapted to open when moved in one direction, and to remain closed when in the opposite direction, and automatic mechanism for operating the shutter and for moving the movable surface, substantially as described.

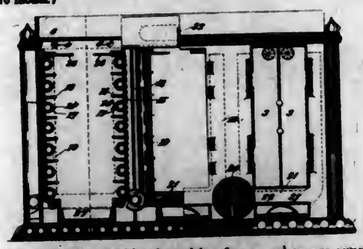
7. The combination with a case, of an oscillating shutter, a crank for operating said oscillating shutter, an intermittently-operated wheel driving motion from said crank, and a disk carried by said wheel, substantially as specified.

8. The combination with a case, of a shutter composed of two parts D', D^2 having arms d', d^2, and one of said arms having lugs d^3, d^4, substantially as specified.



604,734. MIXING-MACHINE. JOHN H. DAY, Cincinnati, Ohio. Filed Apr. 29, 1893. Serial No. 472,361. (Model.)

Claim.—The combination of a hopper, an agitator therein, a power-pulley for operating the agitator and means intermediate between the agitator and power-pulley for enabling the latter to operate said agitator, the idler-pulley E^3 and sliding belt-shifting rod E, E^2, E^3, at the rear of the machine, and a movable rod F extending from the front to the rear of the machine, and there combined with means whereby a movement of rod F shall communicate a move-

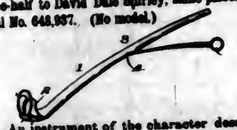


ment to the belt-shifting rod and cause the latter to shift the belt, substantially as and for the purposes specified.

604,735. DRAFT-GEAR. ALEXANDER DIAMANTIDI, Freiland, Austria-Hungary. Filed Dec. 21, 1897. Serial No. 663,852. (No model.)

Claim.—A draft-gear comprising a vertical bolt secured to the carriage-frame, a pair of horizontal bell-crank levers fulcrumed on such bolt and crossing each other like the halves of a pair of scissors and having their inner short arms bent rearwardly, a spring arranged between the ends of the inner short arms of such levers and adapted to be compressed on turning forward the outer ends of the long arms of such levers and means for connecting the outer ends of the long arms of such levers with the harness of the animal or team.

604,736. HEATING-URN FOR BUFFET-CARS. ROBERT M. DIXON, East Orange, N. J. Filed July 8, 1897. Serial No. 643,965. (No model.)

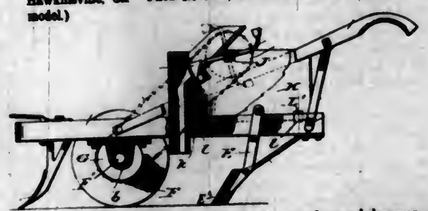


Claim.—1. The combination with a frame and an urn supported above the same, of vertical partitions dividing the interior of the frame into a series of separate compartments, burners within the several compartments, respectively, a flue communicating with an intermediate compartment, and a deflector between the intermediate compartment and the flue, with which the flue would otherwise directly communicate, substantially as and for the purpose specified.

2. The combination with a frame and an urn supported above the same, of vertical partitions dividing the interior of the frame into a series of compartments, burners within the several compartments, respectively, a flue in the frame, a deflecting-plate between the flue and an intermediate compartment with which the flue would otherwise directly communicate, and a flange upon the front of the deflecting-plate, substantially as set forth.

3. The combination with a frame and its flue, of a vertical burner arranged within the frame, said burner consisting of a vertical supply-pipe, a series of perforated horizontal pipes secured thereto, and a series of horizontally-disposed flanges or shelves arranged above each of the perforated pipes, substantially as and for the purpose specified.

604,737. CAPONIZER. ANDREW M. DUNCAN, Allerton, Iowa, assignor of one-half to David Dale Shirley, same place. Filed Aug. 20, 1897. Serial No. 648,937. (No model.)



Claim.—1. An instrument of the character described, comprising a handle and a bowl or spoon shaped end having a slot therein for the reception of the cord of the testicle, a wire loop adapted to be contracted in close proximity to the bowl or spoon shaped end to effect the operation, and means for contracting said wire, substantially as and for the purpose set forth.

2. An instrument of the character set forth, comprising a handle and a concavo-convex end, having a slit therein for the purpose specified, a wire passing through suitable guides upon the convex side of said end and adapted to form a loop which is contracted to perform the operation, and means for contracting said loop, substantially as and for the purpose set forth.

3. An instrument of the character described, comprising a suitable handle having a perforation in its under side and a concavo-convex slit end, a lug or projection on the convex side of said end and at the bottom of the slit, said projection being provided with oppositely-disposed perforations, and wire strands passing through said perforations and forming a loop above the same, said wire also extending through the perforation in the handle and being provided with a ring or its equivalent adapted to be engaged by the hand to contract the loop and perform the operation, substantially as and for the purpose set forth.

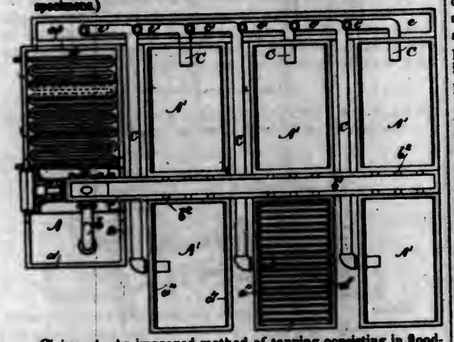
604,738. CORN OR SEED DROPPER. GEORGE R. DYER, Hawkinsville, Ga. Filed Nov. 29, 1897. Serial No. 660,127. (No model.)

Claim.—1. In combination with the frame of a seed-dropper, a driving-wheel journaled in the front part thereof, a seedbox carried by the said frame, a seed-tube connected to said box and arranged to drop the seed behind the said wheel, a spout or chute within the said box discharging into the upper end of the said tube and provided with a slot extending downward from the top and ending in an opening, a shaft journaled in said feed-box, a cup-rod and cup carried by the said shaft and adapted to pass through the said slot and opening, gearing which connects the said shaft with the rotary shaft of the driving-wheel and a cut off which prevents the seed from falling through the said opening from the cup substantially as set forth.

2. In combination with the seedbox of a seed-dropping machine, a rotary shaft mounted in the said box, a cup or cups carried thereby and arranged to dip up the seed and discharge the same, a spout and seed-tube through which the seed from the said cup is dropped by the machine the said spout being slotted and having an opening for the passage of the said cup, and a slotted cut off tube arranged in the said opening to extend above the same, this tube being adapted to allow the passage of the cup through it as the latter is carried around by the shaft substantially as set forth.

3. In combination with the seedbox of a seed-dropping machine having a seed-tube connected thereto, a rotary shaft and a cup-rod and cup carried thereby, the said cup being arranged to dip up seed from the interior of the said box and discharge it into the said tube, and being removable at will from the said rod for the purpose of allowing the substitution of a cup of different size substantially as set forth.

4. In combination with the seedbox of a seed-dropping machine having a seed-tube connected thereto a rotary shaft and cup-rods and cups carried thereby, the cups being arranged and adapted to successively dip up the seed and discharge it into the seed-tube and the said rods being detachable from the said shaft, which is provided at regular intervals with means for permitting the attachment of a greater or less number at will substantially as set forth.

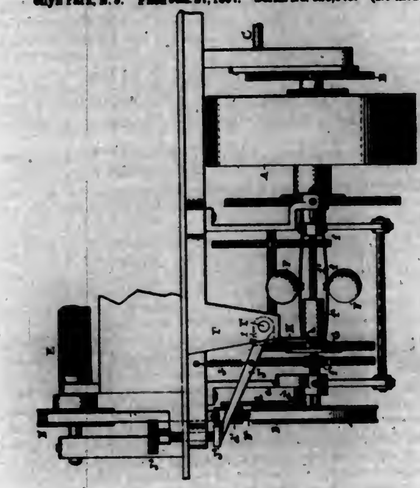


5. In a seed-dropping machine, a cup-rod which is screw-threaded on its ends, in combination with a shaft and seed-cup which are screw-tapped to receive the said ends, a seedbox in which the said shaft rotates to cause the said cup to dip up and discharge the seed, and

means for allowing the seed thus discharged to pass from the machine substantially as set forth.

6. In combination with a seedbox and a spout leading to the outlet, a rotary shaft screw-tapped at regular radial intervals, a series of rods adapted to screw into the said shaft in greater or less number and a series of screw-tapped cups adapted to turn on the threaded outer ends of the said rods, in order that larger or smaller cups may be substituted, the said cups and rods being carried through a slot and opening in the said spout as the said shaft rotates, for the purpose set forth.

7. In combination with the frame of a seed-dropper, a pair of bars or plates detachably secured thereto and depressed between the side bars of the said frame, a seedbox fastened rigidly but detachably to the said bars and resting in the depressed part thereof, a shaft journaled in the said seedbox and provided with cups which dip up the seed therefrom, a spout or chute and seed-tube whereby the seed is received from the said cups and dropped and a driving-wheel and gearing whereby the said shaft is rotated substantially as set forth.



604,739. METHOD OF TANNING. DOUGLAS M. RAYTON, Weymouth, Mass., assignor to Marshall C. Diser, Silas C. Diser, and Walter M. Diser, same place. Filed Nov. 30, 1897. Serial No. 660,191. (No specimens.)

Claim.—1. An improved method of tanning consisting in flooding the hides in a stationary vat with a continuously-flowing tanning liquor kept at a substantially uniform temperature and strength, substantially as described.

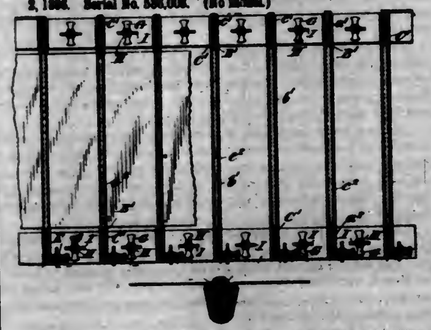
2. An improved method of tanning consisting of flooding the hides in a stationary vat with a continuously-flowing tanning liquor exposed to the action of the atmosphere and kept at a substantially uniform temperature and strength.

604,740. GOVERNOR FOR MOTORS. THOMAS A. EDISON, Llewellyn Park, N. J. Filed Jan. 27, 1897. Serial No. 620,976. (No model.)

Claim.—1. A friction speed-governor having in combination a rotatable element having a friction-surface, two friction-pads bearing thereon at opposite points, and a swiveled equalizing device for maintaining the same uniform pressure between both pads and said friction-surface, substantially as set forth.

2. A friction speed-governor having in combination a rotatable element having a friction-surface, friction-pads bearing thereon at diametrically opposite points on the same side of the friction-surface, and a swiveled equalizing device for maintaining the same uniform pressure between all the pads and said friction-surface, substantially as set forth.

3. A friction speed-governor having in combination a rotatable element having a friction-surface, friction-pads bearing thereon at opposite points, and an equalizing device for maintaining a uniform pressure between each pad and said friction-surface, said device being supported so as to be capable of swinging about an axis perpendicular to the axis of the friction-surface, substantially as set forth.

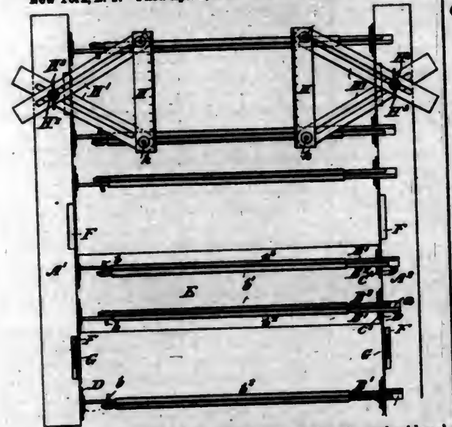


4. In a friction speed-governor, the combination of a friction-disk, and a swiveled yoke carrying friction blocks or pads in contact with said disk at diametrically opposite points on the same side of the disk, whereby a uniform pressure between the disk and pads is produced, substantially as set forth.

5. In a friction speed-governor, the combination of a friction-disk, a yoke carrying friction blocks or pads making contact with said disk at diametrically opposite points on the same side of the disk, a pivoted block in which said yoke is swiveled, whereby a uniform pressure between the disk and pad is produced, and means for moving said block on its pivot to vary the friction between said disk and pads to vary the speed, substantially as set forth.

6. In a friction speed-governor, the combination of a friction-disk, a yoke carrying friction blocks or pads making contact with said disk at diametrically opposite points on the same side of the disk, a pivoted block in which said yoke is swiveled, whereby a uniform pressure between the disk and pads is produced, means for moving said block on its pivot to vary the friction between said disk and pads to vary the speed, and a centrifugal governor for maintaining a uniform speed, substantially as set forth.

7. A friction speed-governor having in combination a rotatable element having a friction-surface, two friction-pads bearing thereon at opposite points, and a swiveled equalizing device connecting said pads for maintaining the same uniform pressure between both pads and said friction-surface, substantially as set forth.



604,741. FABRIC-HOLDING DEVICE FOR EMBROIDERING-MACHINES. THEODOR D. BRAUN, West New York, N. J., assignor, by mesne assignments, to Frederick Braun, New York, N. Y. Filed Apr. 2, 1896. Serial No. 586,008. (No model.)

Claim.—1. In a frame for holding materials to be embroidered, the combination with longitudinal rails, of a number of pairs of trough-like bars, a number of tongue-like bars pivoted to the corresponding end of the trough-like bars, said trough and tongue like bars extending between the rails, screws arranged adjacent to the other ends of the trough-like bars and tongue-like bars, buttons fitted loosely to said screws and capable of being swung over the latter to hold them within the trough-like bars, and nuts applied to the screws, for forcing the buttons in such direction as to cause the tongue-like bars to clamp within the trough-like bars, substantially as specified.

2. In a fabric-holding device for embroidering-machines, the combination with longitudinal rails, of a number of pairs of clamping-bars extending between the rails and clamping devices upon the rails intermediate the clamping-bars, each comprising a screw, a button fitted loosely upon the screw, and a nut likewise upon the screw and freely movable longitudinally thereon and adapted to force the button into contact with the rail, substantially as described.

604,742. EMBROIDERY-FRAME. THEODOR D. BRAUN, West New York, N. J., assignor, by mesne assignments, to Frederick Braun, New York, N. Y. Filed Apr. 2, 1896. Serial No. 585,004. (No model.)

Claim.—1. In a frame for holding materials to be embroidered, the combination with the longitudinal rails, of pairs of clamping-bars, the bars constituting each pair being arranged side by side, and one being pivoted at one end to another and secured at the free end by a fastening device consisting of a notched rotary disk, substantially as specified.

2. In a frame for holding materials to be embroidered, the combination of longitudinal rails, pairs of clamping-bars extending between the said rails, and rotary bearings for the pairs of clamping-bars substantially as specified.

3. In a frame for holding materials to be embroidered, the combination of longitudinal rails, pairs of clamping-bars extending between the said rails, rotary bearings for the pairs of clamping-bars, and detents for holding said bearings against rotary movement, substantially as specified.

4. In a frame for holding materials to be embroidered, the combination of longitudinal rails, pairs of clamping-bars extending between the said rails, rotary bearings for the pairs of clamping-bars, pivots for connecting one bar of each pair at one end to its fellow, and a fastening for connecting the free end of said bar in place, substantially as specified.

5. In a frame for holding fabrics to be embroidered, the combination with longitudinal rails, of several pairs of clamping-bars and transverse receptacles independent of the clamping-bars extending from one longitudinal rail to the other, intermediate and beneath alternate pairs of bars, substantially as described.

6. In a frame for holding materials to be embroidered, the combination of longitudinal rails, two pairs of clamping-bars extending between said rails, pockets intermediate the said two pairs of clamping bars, on that face of one of the rails to which these pairs of clamping-bars extend, and clamping-pieces for said pockets, substantially as specified.

7. In a frame for holding materials to be embroidered, the combination of longitudinal rails, clamping-bars extending between said rails and serving to hold, along parallel lines, the material to be embroidered, additional clamps connected to said rails and means for securing said clamps at different angles with respect to the clamping-bars, substantially as specified.

8. In a frame for holding materials to be embroidered, the combination of longitudinal rails, clamping-bars extending between said rails and serving to hold, along parallel lines, the material to be embroidered, and additional clamps connected to said rails at their ends by longitudinally-slotted rods, and fastening devices whereby longitudinal and lateral adjustment of the clamps is permitted, substantially as specified.

9. In fabric-holding devices for embroidering-machines, the combination with longitudinal rails, of pairs of clamping-bars extending between said rails, rotary bearings for each pair of said clamping-bars, capable of independent rotary movement of the bars in both directions, and means for holding the rotary bearings against movement, substantially as described.

10. In fabric-holding devices for embroidering-machines, the combination with longitudinal rails, of pairs of clamping-bars extending between the rails, and fastening devices carried upon the longitudinal rails each comprising a clamp, slotted bars pivotally connected to the clamp at separated points and securing devices engaging the slots of the slotted bars for holding them against movement, substantially as described.

604,748. FRAME FOR BICYCLES. WILLIAM H. EVANS, Cardiff, England. Filed Oct. 16, 1897. Serial No. 655,268. (No model.)

Claim.—1. In a bicycle-frame, the combination of an upper member divided in two parts, with a connecting-link, the opposite ends of said link being pivoted to the said parts of the upper member, a sleeve movable on said member and over the link-joint aforesaid, a lower member also in two parts pivoted together, a sleeve movable on said lower member and over the pivot-joint aforesaid, and a separable joint connecting the front end of the said lower member with the machine-frame substantially as and for the purpose herein described.

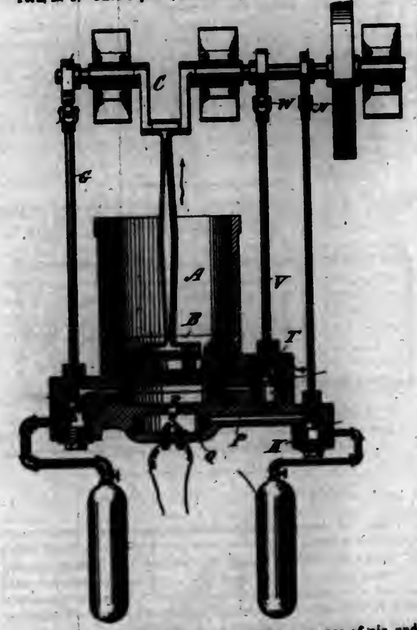
2. A bicycle-frame comprising an upper member made in two parts secured together by a link-joint, a sleeve movable on said upper member and over the link-joint aforesaid, and a lower member the front of which is removably secured to the steering-pillar substantially as and for the purpose herein described.

604,744. ANIMAL-POKE. LEROY W. FERRIS, Phillipsburg, Kans. Filed Sept. 20, 1897. Serial No. 652,486. (No model.)

Claim.—1. In an animal-poke, the combination with the collar and arms formed of a single piece of wire, said arms having forwardly-extending hooked ends, of a sheet-metal strip folded over upon the wire at the junction of the collar and upper arm and secured in position, one end of the strip being bent to form a rearwardly and downwardly extending hook provided with a series of pointed teeth or prods, an adjustable clip to secure the two sides of the collar together at their lower ends, and a spring-protected prod projecting rearwardly from the clip, substantially as described.

2. In an animal-poke, the combination with the collar and the arms formed of a single piece of wire, said arms having forwardly-extending hooked ends, of a block having grooves to receive the spaced wires forming the sides of the collar at their junction with the lower arm, a U-shaped clip embracing the wires and the sides of the block, a pin having a flange intermediate its ends, one portion of the pin on one side of the flange extending through said block and clip and having a threaded end, a nut on said threaded end to adjustably clamp the block and clip to the wires and to each other, and the other portion of the pin being bifurcated to form pointed prods, and springs clamped between the clip and block and having looped portions projecting in front of the pointed ends of the prods, substantially as described.

3. In an animal-poke, a collar or a yoke formed of a single length of wire folded upon itself and having upper and lower arm extensions, a sheet-metal clip carrying spurs and embracing the wire at the junction of the collar and the upper arm extension, a rivet-fastening for rigidly securing said metal clip in place, a clip arranged to slide on the lower arm extension and carrying a spur, and means for securing said sliding clip fast in its adjusted position, substantially as set forth.



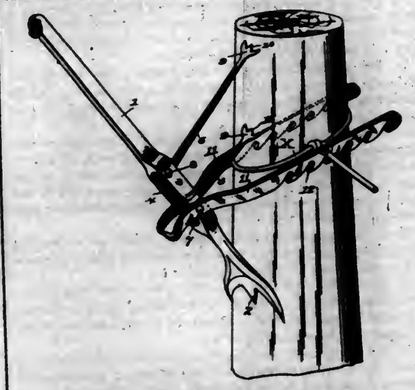
4. In an animal-poke, a collar or yoke having upper and lower arm extensions, a clip carrying a rigid spur and arranged to slide on the lower arm extension, and fastening means for securing the clip fast in its adjusted position, substantially as set forth.

5. In an animal-poke, a collar or yoke formed of a single length of wire and having upper and lower arm extensions, a clip arranged to slide on the lower arm extension and carrying a rigid spur, and a spring-wire guard having one end arranged within the clip and having an offstanding looped portion normally lying beyond the plane of the spur point or points and adapted to yield to permit said point or points to pass through the looped portion, substantially as set forth.

6. An animal-poke having a two-pronged rigid spur, and a spring-wire guard supported in position by the fastening means of the spur and provided with an offstanding yielding member provided with a pair of spaced loops or eyes, normally lying beyond the plane of the spur-points, substantially as set forth.

7. In an animal-poke, a collar having upper and lower arm extensions, a clip fitted to the lower arm extension and adjustable thereon to provide for varying the size of the collar, a rigid two-pronged spur connected with said clip, a spring-wire guard having an offstanding movable member provided with separate loops normally lying beyond the plane of the spur-points, and a single fastening for securing the clip, the spur, and the spring-wire guard in proper relative positions, substantially as set forth.

604,745. COMPRESSED-AIR ENGINE. LOUIS T. GIBBS, New York, N. Y. Filed Sept. 23, 1897. Serial No. 652,672. (No model.)



Claim.—1. The combination of a motor, a source of air under working pressure, a source of gas or inflammable vapor under pressure, valves respectively controlling the admission of said air and said gas to said motor and an igniter; the said parts being so organized and timed that first air and then gas are independently admitted to the cylinder and an explosion or ignition then caused to occur subsequent to the cut-off of the working air, substantially as described.

2. The combination of a motor, a source of air under working pressure, a source of gas or inflammable vapor under pressure, a valve controlling the admission of air to the motor, a valve controlling the admission of gas to the motor and an igniter; the parts being so organized and timed that gas will be independently admitted into the cylinder when the air is at a certain pressure therein and subsequently ignited when said air is at a certain lower pressure, substantially as described.

3. The combination of a motor, a source of air under working pressure, a source of gas or inflammable vapor under pressure, a valve controlling the admission of air to the motor, a valve controlling the admission of gas to the motor and an igniter; the parts being so organized and timed that gas will be independently admitted into the cylinder before the point of cut-off of the air and ignited subsequent to said point of cut-off, substantially as described.

604,746. TOOL FOR TIGHTENING WIRE FENCES. LYLE J. SUGARS, Long Grove, Iowa. Filed Mar. 22, 1898. Serial No. 674,755. (No model.)

Claim.—In a fence-tool of the character described, the combination with an operating-lever having a forked end, the edges of which are beveled or sharpened, and a piercing-tang arranged intermediate between the ends of the fork, said lever formed with an enlarged swell intermediate between its ends, and said swell being provided with an elongated aperture, hook-levers pivoted to the sides of said lever, and dogs having their inner ends pivoted in said aperture provided at their outer ends with forks having sharpened or beveled edges and piercing-tangs, one of said dogs being of greater length than the other, substantially as set forth.

604,747. ELECTRIC RAILWAY. JOHN H. GUEST, Boston, Mass., assignor to Laura M. Child, Edgar O. Ashorn, R. Sherman York, and William L. Whitcomb, same place, and Charles H. Moore, Springfield, Vt. Filed Oct. 30, 1896. Serial No. 610,418. (No model.)

Claim.—1. The combination with the trough-shaped contact-rail forming a working conductor, the supplemental contact-rails or conductors within the same, the metal cross pins or bars mounted in the sides of the trough and passing through said rails but insulated from them, and a filling of insulating cement or concrete in which the rails and pins are anchored.

2. In a conduit-railway system, a switch-operating magnet having spool-heads fitting into a protective tube hermetically sealed at its end with a plug or stopper, and permanent or fixed connections for said switch and magnet passing through and hermetically sealed in said plug or stopper.

3. A switch-operating magnet having spool-heads fitted into a containing-tube having a seal at its end through which permanent magnet connections pass and in which they are hermetically sealed.

4. The combination with the metal tube in which the contact-core slides, of the fixed metal plug filling the bore of the tube at the end, and a circuit connection to said plug extending through the end of the tube.

5. The combination with the metal tube and sliding core therein, of the fixed metal plug filling the bore of the tube and having a conducting extension, and a filling of insulating-cement over said plug.

6. In a sectional electric railway, the combination with an armature adapted to close the circuit to a section, of a supplemental contact carried or operated thereby, and having a lost motion as described, whereby said parts may follow one another in opening contact.

7. The combination with the circuit-closing armature, of a spring-actuated contact operated thereby and working through an opening in said armature.

8. The combination with the tubular armature, of the contact-pin working through said armature and normally supported thereby.

9. The combination with the circuit-closing armature and pin supported thereby, of two springs one tending to lift the armature and the other of inferior power tending to depress the pin, as and for the purpose described.

10. The combination with the trough-shaped stringer carrying the magnetic switches and connections, of a surface contact-rail forming a removable cover-plate for the same.

11. The combination with the trough-shaped stringer containing the magnetic switches, of a trough-shaped cover supported on top of said stringer and containing one or more contact-rails or conductors supported in an insulating-cement contained within said cover, and connections therefrom passing through the bottom of the trough.

12. The combination with the trough-shaped stringer containing

the magnetic switches, of a trough-shaped contact-rail supported on the top thereof and forming a cover therefor, and supplemental contact rails or conductors supported in said cover in a mass of insulating-cement, and connections therefrom passing through the bottom of said cover.

13. The combination with a reciprocating core, of contacts each adapted to touch the same, and actuating-coils wound as described to produce the same polarity in said core, and operating alternately on said core to move it in opposite directions.

14. The combination with the reciprocating core moving in a metal tube, of the magnet-coils on said tube, and a pair of armatures supported on the tube and adapted to close connection with the core at opposite ends thereof.

15. In a conduit-railway system, a trough-shaped stringer containing one or more lines of conductor and magnetic switches, a cover or seal for the same formed as a trough and resting on top of said stringer and a surface contact-rail or conductor supported in said trough in a mass of insulating-cement and having connections passing through said cover into the stringer.

16. A rubbing-contact shoe vertically guided on a swinging hanger, swinging in a vertical plane and provided with a pressure-spring, as and for the purpose described.

17. The combination with the main trolley, of the hanger swiveled on the axle thereof, a vertically-guided spring-actuated shoe carried by said hanger, and suitable abutments or stops between which said hanger may have a limited swing.

18. The combination, substantially as described, with the pair of contact-trolleys moving over a suitable line of rails, of a supplemental contact-shoe supported by and vertically movable independently of said trolley and adapted to engage with a line of supplemental rails between the main rails.

19. The combination, substantially as described, of a trough-shaped main conductor and trolley moving thereon, one or more supplemental contact-rails anchored in the trough, and a contact for the latter supported by the main trolley and adapted to move up and down independently thereof.

20. The combination with the main trolley-wheels, bearing respectively on two parallel lines of insulated conductor, of the hanger supported on an insulating-sleeve between said wheels, and a contact shoe or trolley carried by said hanger.

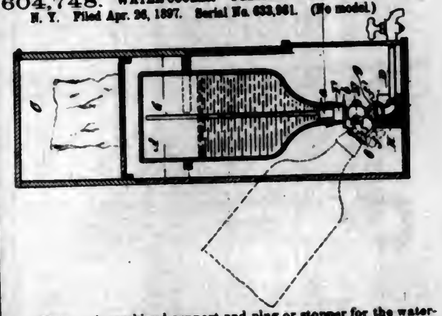
21. The combination, substantially as described, of the arm swiveled on the car-axle and jointed so as to be capable of turning horizontally, a pair of contact-trolleys mounted on the end of said arm and adapted to move over suitable conducting-rails, and two sets of intermediate contact-rails upon which bear a pair of contact-shoes insulated from one another and supported by the said trolley-wheel.

22. The combination, substantially as described, of a main conductor formed as a trough and having a pair of supplemental conductors mounted within it and arranged in sections, a pair of trolley-wheels moving on the edges of said trough, and two independent supplemental contact-shoes insulated from one another and mounted between said trolley-wheels, said supplemental shoes bearing respectively on the sectional supplemental conductors.

23. In an electric railway, a series of insulated sections and normally open magnetic switches therefor through which the car takes power-current, a supplemental series of insulated contacts normally insulated from one another and from the first-named series, and a supplemental generator for operating said switches, said generator being connected with the car over a trolley or moving contact moving upon said supplemental series.

24. In an electric railway, the combination substantially as described, of a series of sectional conductors insulated from one another, means for supplying power to the car over the same, a second series of conductors disconnected from one another, a series of switch-operating magnets, switches actuated thereby but normally open, a supplemental generator, and means for supplying current from the same over the car and a second series of sectional conductors to said magnets.

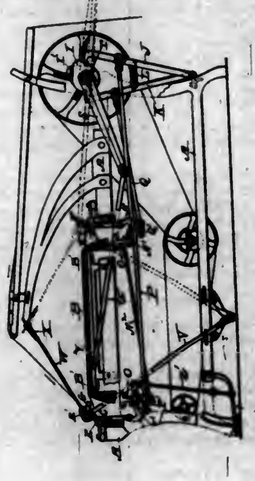
25. In an electric railway, a power-circuit for the car formed over a single series of sectional conductors insulated from ground, a traveling contact, a series of normally open switches operated in succession, and a suitable electric return, and a supplemental switch-magnet circuit supplied from a separate stationary generator and formed over a traveling contact, a second series of insulated conductors, and a third traveling contact carried by the car.



26. The combination, substantially as described, of a trough-shaped conductor forming a portion of the power-circuit, and two sets of insulated conducting rails or contacts anchored in said trough and arranged in sections, one of said sets being connected with suitable switches and forming a part of the power-circuit and the other set being connected with the coils of suitable switch-operating magnets, as and for the purpose described.

27. In an electric-railway system, the combination with the switch-magnet for each section, of a plurality of switch-contacts simultaneously operated thereby and having multiple connections for the power-current.

28. In an electric-railway system, the combination substantially as described, of a series of normally-dead power-supply surface contacts or conductors and a metallic return forming the metallic power-circuit, normally open switches for closing the connections to the sections of power-supply conductors as the car progresses, a sectional switch-operating-magnet circuit independent of the power-circuit and insulated therefrom, and a separate generator for actuating the magnet-switches individually connected to the latter sections of conductor, said switch-operating-magnet circuit being also a metallic circuit and formed over two sets of conductors positive and negative respectively, one set being divided into sections and insulated from the contacts or conductors over which the power-current is supplied to the car, as and for the purpose described.



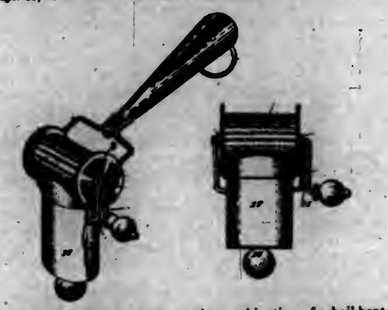
29. In an electric-railway system, a main supply-conductor, a series of branch circuits connected therewith, said branch circuits being normally open, an auxiliary circuit, a series of branch circuits connected therewith, said auxiliary branch circuits being also normally open, but adapted to be closed by the passage of the car, means arranged solely in said auxiliary branch circuits and actuated by the opening and closing of said auxiliary circuit for opening and closing said main circuits, and means for completing the main branch circuits through the translating devices on the car.

604,748. WATER-COOLER. FREDERICK GUTTENBERG, Brooklyn, N. Y. Filed Apr. 26, 1897. Serial No. 633,961. (No model.)

Claim.—A combined support and plug or stopper for the water-receptacle, consisting of a hollow section provided at one end with a vent-tube, a surrounding flange, an auxiliary vent-passage opening below said flange, a central cock, and a spherical or rounded head provided with packing, in combination with a hollow complemental socket for said spherical or rounded head and a draw-off pipe connected to said socket, substantially as described.

604,749. CLOTH-FOLDING MACHINE. EDWARD HALL, Worcester, Mass. Filed Apr. 19, 1897. Serial No. 632,721. (No model.)

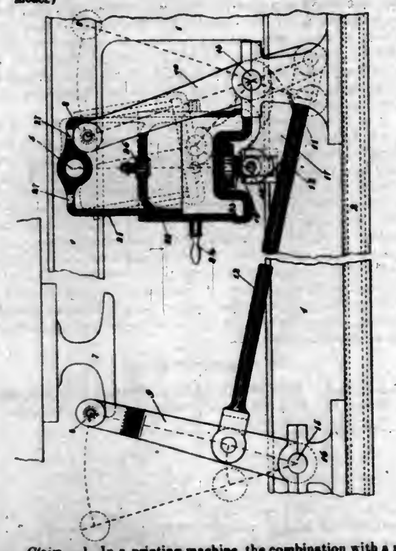
Claim.—In a cloth folding and measuring machine, the combination of table B and frame A, stationary jaws E F mounted transversely thereon in front and back of table B and the movable jaws G H having means for operating them vertically toward and from said stationary jaws E F, said table being shorter than the distance between the jaws to leave sufficient space between the ends of said table and the jaws to permit the folded ends of the cloth to drop down below the level of the table and hang loose between said table and jaws after each fold is laid in the folding and measuring operation, substantially as and for the purpose set forth.



604,750. TIRE. OMOREN B. HALL, Malden, Mass. Filed Mar. 14, 1898. Serial No. 673,706. (No model.)

Claim.—1. A tire comprising a channel-piece directly connected with the rim, a tread portion of resilient material supported in said channel-piece, a metallic fastening-strip or inner steel tire extending longitudinally through the said tread portion and provided at its ends with rigid shoulders to cooperate with engaging portions of the channel-piece to hold the said strip longitudinally, rigid horizontal shoulders at the end of said strip and a clamping device cooperating with said shoulders to hold the strip in engagement with said engaging portions, substantially as described.

2. A tire comprising the channel portion *b* provided with the opening b^3, the tread portion *c*, a fastening-strip a^2 extending longitudinally through said tread portion and provided with the rigid vertical shoulders a^3 to engage the channel-piece at the edges of the opening b^3, the rigid horizontal shoulders a^4, and the locking-bolt *d* cooperating with said shoulders a^4, substantially as described.



604,751. NUTMEG-GRATER. JOHN W. HART, Pittsburg, Kans., assignor of one-half to William J. Kammerling, same place. Filed Apr. 12, 1897. Serial No. 631,986. (No model.)

Claim.—1. In a rotary grater, the combination of a bail bent at points intermediate of its length and provided with journal-eyes or loops at its bent portion, a holder with the longitudinal beads forming grooves to receive the extremities of the bail, which beads extend into the holder and constitute the follower-guides, a handle rigid with the bail and lying at right angles to the holder, a drum journaled in the loops or eyes of the bail, a follower fitted in the holder and provided with a flanged, notched edge adapted to the guides formed by the beads, a headed stem attached to the follower, and a spring, substantially as described.

2. In a nutmeg-grater, the combination of a handle provided with a yoke having its sides extended and arranged at an angle to the handle, a casing adapted to receive a nutmeg and provided at opposite sides with grooves and having the extended portions of the yoke secured to it in said grooves, a grating-drum journaled within the yoke at the inner end of the casing, between the same and the handle, and provided with a crank-handle, and a spring-actuated follower mounted on the casing and adapted to hold a nutmeg against the grating-drum, substantially as described.

604,752. CUSHIONING APPARATUS FOR PRINTING-MACHINES. JOHN T. HAWKINS, Taunton, Mass., assignor to the Campbell Printing Press and Manufacturing Company, New York, N. Y. Filed July 10, 1890. Renewed Oct. 30, 1897. Serial No. 656,961. (No model.)

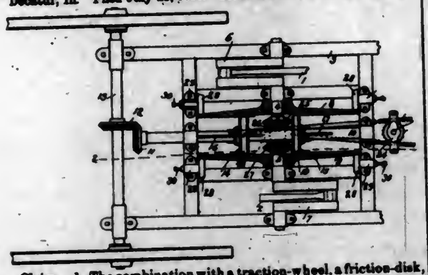
Claim.—1. In a printing-machine, the combination with a reciprocating type-bed, of a vertical plunger, as 21, a vertically-moving air-chamber, or cylinder, sliding thereon; levers, as 9 and 10, and a lever, as 17, for transmitting the motion of said bed to said cylinder, or air-chamber; said levers being fulcrumed and connected substantially as described so that the motion of either of levers 9 and 10 transfers the motion of said bed to said air-chamber: whereby one and the same air chamber, or cylinder, is utilized as a cushion for both strokes of said bed, substantially as set forth.

2. In a buffer, or cushioning, apparatus of a printing-machine, in combination with a reciprocating type-bed, a vertically-moving air-chamber, as 22, sliding upon a vertically-set plunger; levers, as 10 and 17, for transmitting the motion of said bed to said air-chamber; a nut, as 19, journaled in said lever 17, and a screw, as 23, operating within said nut, secured to said air-chamber; whereby, by the rotation of said screw, the volume of said air-chamber may be varied, substantially as and for the purposes set forth.

604,753. WRENCH. GEORGE W. HESSER, Mount Holly, Ohio. Filed Feb. 5, 1897. Serial No. 622,066. (No model.)

Claim.—1. In a wrench the combination of a stationary jaw, a movable jaw supporting cam-surfaces, contractible operating members adapted to engage the cam-surfaces for operating the movable jaw, and means for holding the jaws normally separated, substantially as described.

2. A wrench, comprising a handle portion, a fixed jaw secured to said handle portion, a movable jaw having its shank extended within the handle portion and provided with cam-surfaces, contractible members for engaging the cam-surfaces and moving the movable jaw in contact with the fixed jaw, and a means for normally holding the jaws separated, substantially as shown and described.



3. A wrench, comprising a handle portion, guides extended from one end and supporting a fixed jaw, a movable jaw adapted to slide on said guides and having its shank extended within the handle, cam-surfaces upon the end of said shank, operating members pivoted at one end to the handle portion and adapted at their opposite ends to extend within the handle and engage the cam-surfaces of the shank of the movable jaw, whereby, when the operating members are con-

tracted the movable jaw is moved in contact with the fixed jaw, and a means for holding the jaws normally separated, substantially as shown and described.

4. A wrench, comprising a handle portion, a fixed jaw supported by said handle portion, a movable jaw having its shank extended within the handle and provided with cam-surfaces, operating members pivoted at their lower ends to the handle and slit at their opposite ends to form operating-tongues which are adapted to extend within the casing and engage the cam-surfaces, the edges of the top and bottom walls of the casing working in the said slits, and a means for holding the jaws normally separated, the parts adapted to operate as described.

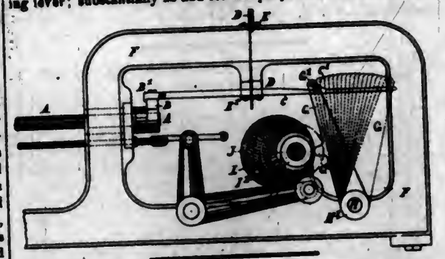
5. A wrench, comprising a casing, guides extended from its upper end, a fixed jaw supported by the guides, a movable jaw having a shank which extends through a perforation in the upper end wall of the casing and between the guides, an arrow-head upon the opposite end of the shank portion, operating members pivoted to the casing at their lower ends and adapted to extend through the side walls of the casing and engage the cam-surfaces of the arrow-head, said operating members being inclined at the point of engagement with the arrow-head, whereby they are prevented from being disengaged from the casing, and a spring for holding the jaws separated, whereby, when the operating members are contracted the movable jaw is moved upon its guides and when the operating members are released the spring returns the movable jaw to its normal position, substantially as shown and described.

604,754. DRIVING MECHANISM. CHARLES T. HILDEBRANDT, Decatur, Ill. Filed July 23, 1896. Serial No. 600,233. (No model.)

Claim.—1. The combination with a traction-wheel, a friction-disk, and means for rotating said disk, of a shaft 10, a pair of wheels mounted thereon and bearing against said disk, racks for moving said latter disks, and a vertically-movable pinion adapted to be moved into engagement with said racks to adjust said latter wheels, substantially as described.

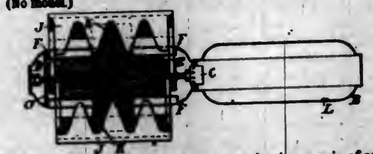
2. The combination with a traction-wheel, of a pair of friction-disks, means for rotating said disks, a wheel which bears against the opposite faces of said disks, means for driving said traction-wheel from said latter wheel, and beveled disks 28 for adjusting said disks toward and from each other, substantially as described.

3. The combination with a drive-disk, of a wheel which bears against one face of said disk and is driven thereby, and adjustable disks bearing against the outer face of said drive-disk near its periphery, substantially as described.



4. The combination with a drive-disk, of a wheel which bears against one face of said disk and is driven thereby, and beveled disks bearing against the outer face of said drive-disk near its periphery, said beveled disks being adjustable radially of said drive-disk, substantially as described.

5. The combination with a traction-wheel, of two friction-disks geared together, means for rotating said disks, an interposed wheel bearing against the inner faces of said disks, independent devices bearing against the outer faces of said disks near their peripheries for adjusting said disks toward each other, and means for driving the traction-wheel from said interposed wheel, substantially as described.



604,755. JACQUARD MECHANISM FOR EMBROIDERING-MACHINES. HENRY HILL, Nottingham, England. Filed Aug. 30, 1897. Serial No. 649,999. (No model.)

Claim.—1. In a device such as described, the combination with the longitudinally-moving shafts, connections between said shafts and the embroidery-frame, a series of hooked jacks pivotally connected to said shafts, the lifting-needles for raising said jacks, a series of oscillating levers corresponding in number to the jacks, each adapted to engage and move a particular jack, and mechanism for imparting to each lever a different length of movement; substantially as and for the purpose set forth.

2. In a device such as described, the combination with the longitudinally-moving shafts, connections between said shafts and the embroidery-frame, a series of hooked jacks pivotally connected to said shafts, a series of lifting needles, each adapted to raise a particular jack, a series of oscillating levers corresponding in number to the jacks and each adapted to engage and move a particular jack, a series of cams or eccentrics corresponding in number to the levers and each adapted to impart a different length of movement to its corresponding lever; substantially as and for the purpose set forth.

604,756. PLUG-TOBACCO CARRIER AND CUTTER. GUSTAVE HIRSCHBRACH, New York, N. Y. Filed Sept. 16, 1897. Serial No. 651,853. (No model.)

Claim.—1. A pocket-case for tobacco having a pair of serrated cutting-blades combined therewith and cooperating to cut off slices of the tobacco, the serrations of one blade intermeshing with those of the other with a shearing action for the purpose set forth.

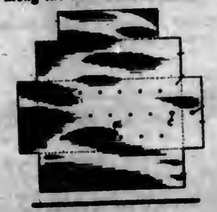
2. A pocket-case for "plug-tobacco" having a cutting device combined therewith, means for forcing the plug into position to be cut, and a stop or guard for limiting the movement of the plug, said cutting device consisting of cooperating serrated blades closing together under said stop.

3. A pocket-case for plug-tobacco consisting of the combination with the outer case A, B, of an inner case or guide D, for a plug of tobacco, the pair of cutting-blades J, located within the outer case and operable from the exterior thereof, the vertical portion of the blades forming part of the wall of the outer case and means for moving the end of the plug past said blades for the purpose set forth.

4. A pocket-case for plug-tobacco consisting of the combination with the outer covered case A, B, and the plug case or guide D, of springs for forcing the plug outward, an adjustable stop M, for limiting the movement of the plug, a spring as O, for holding said stop in vertical position and a cutting device within the outer case and operable through the walls thereof for severing the desired piece from the plug.

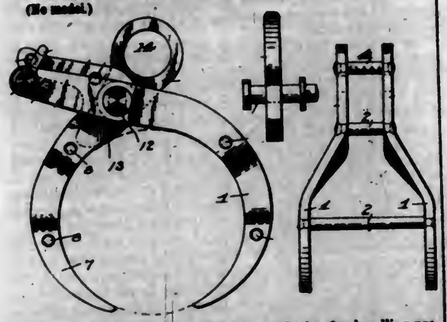
5. The combination with the outer case, of the liner case for a plug of tobacco, the serrated blades hinged within the outer case and adapted to close over the end of the plug, springs for forcing the blades apart, and means for projecting the end of the plug beyond the blades for the purpose set forth.

6. The combination with the outer casing having a hinged cover, of the blades for severing the plug provided with a catch for holding the cover closed, substantially as set forth.



7. The combination with the outer casing, of the plug-guide therein, the spring-follower in said guide, the outwardly-spring-pressed cutting-blades adapted to close over the end of the plug and to be confined in such position by the cover when closed, substantially as and for the purpose set forth.

8. The "plug-tobacco" case consisting of the outer casing having a suitable cover, the inner casing provided with a spring-follower for the plug, the spring-separated blades adapted to cut through the plug, and the stop for limiting the outward movement of the plug, substantially as and for the purpose set forth.



604,757. CARPET-FASTENER. JOHN H. JAMES, London, England. Filed Dec. 20, 1897. Serial No. 662,617. (No model.)

Claim.—1. As a new article of manufacture a carpet-holding device of arched form provided with radial points projecting vertically upward and obliquely on both sides of the center substantially as set forth.

2. A carpet-holder in the form of a section of a cylinder provided with radial points, upwardly projecting at an angle to each other, a longitudinal eye and a strengthening-rod in said eye, the said rod running along the central line of the said device for the purpose set forth.

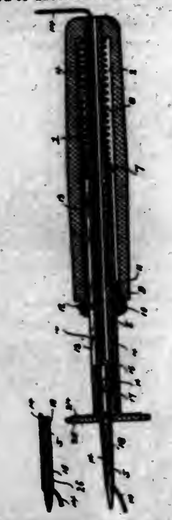
604,758. TONGS FOR HANDLING PROJECTILES. CARL F. JEANNIN, Washington, D. C. Filed Sept. 18, 1897. Serial No. 652,153. (No model.)

Claim.—1. As an improved article, a device for handling projectiles, comprising the pivoted grappling-jaws, a pivot therefor and a projectile engaging and supporting means connected with said pivot, substantially as described.

2. As an improved article, a device for handling projectiles consisting of two pairs of curved arms or jaws, the pivot connecting them with each other, and the finger pivoted intermediate its ends to said pivot whereby its inner end will project between said jaws and bear upon a projectile engaged by said jaws, substantially as described.

3. In a device for handling projectiles, the combination with the curved arms or jaws arranged in pairs, the pivot passing through said jaws, the extensions formed integral with said jaws and projecting outwardly in the same direction and means for connecting them with each other, of the finger pivoted intermediate its ends to said pivot with its inner end projecting between the jaws and adapted to bear against a projectile engaged by the jaws, substantially as described.

4. In a device for handling projectiles, the combination with the curved arms or jaws arranged in pairs and formed with extensions, the yoke pivotally connected with one pair of said extensions and adapted to engage with the other extensions, of the finger formed with an eye at one end and the pivot pin or bolt passing through said finger and arms, substantially as described.



5. In a device for handling projectiles, the combination with the curved arms or jaws, the extensions thereof, the finger, the pivot-pin and the pivoted yoke, of the rod or bolt connecting the extensions of one pair of arms or jaws and serving as a stop, substantially as described.

604,759. TAGGING-NEEDLE. FRANK M. JOHNSON, Union City, Conn., assignor of one-half to Richard C. Warner, Naugatuck, Conn. Filed Aug. 30, 1897. Serial No. 649,902. (No model.)

Claim.—1. A device of the character described, comprising a handle, a tube extending through and beyond the handle at one end and having an opening through which the cord passes outward, a needle at the outer end of the tube and a spring-actuated sheath which normally incloses the outer end of the tube and the needle and is adapted to be pressed backward to uncover the needle in use, said sheath having at its outer end a recess 21 provided upon one side with a hook 22, substantially as described.

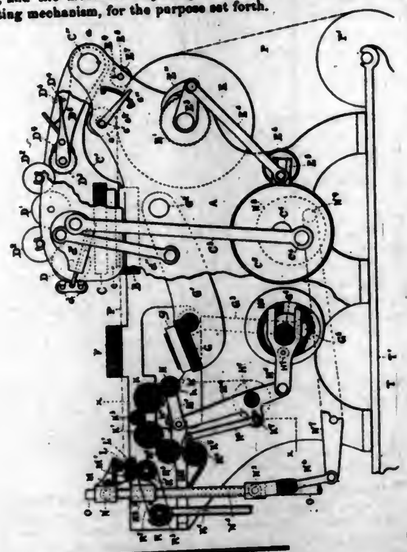
2. A device of the character described, comprising a handle, a tube extending through and beyond the handle at one end and having an opening through which the cord passes outward, a needle at the outer end of the tube, a sheath which normally incloses the outer end of the tube and the needle and is provided with a head 7, a spring lying within the handle and acting against head 7 to hold the sheath at its normal position.

3. A device of the character described comprising a handle, a tube extending through and beyond the handle at one end and having an opening through which the cord passes outward, a needle at the outer end of the tube, a tension-spring recessed into the needle which prevents the cord from slipping backward and a spring-actuated sheath which normally incloses the outer end of the tube and the needle and is adapted to be pressed backward to uncover the needle in use.

4. A device of the character described, comprising a handle, a tube extending through and beyond the handle at its outer end and having an opening through which the cord passes outward, a needle at the outer end of the tube, a sheath which normally incloses the outer end of the tube and the needle and is provided with a head 7, and a spring lying within the handle and acting against head 7 to hold the sheath at its normal position.

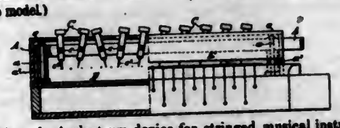
5. A device of the character described comprising a handle, a tube extending through and beyond the handle at one end and having an opening through which the cord passes outward, a needle at the outer end of the tube, a spring-actuated sheath which normally incloses the outer end of the tube and the needle and is provided with a recess 18, a sleeve 9 in the handle through which the sheath passes freely and a screw-pin in the sleeve which engages the recess to hold the sheath against rotation.

604,760. PERFECTING PLATEN-PRESS. FRANK L. JONES and EDWIN C. JONES, Boston, Mass., assignors to the Boston Check and Ticket Company, same place. Filed Nov. 11, 1896. Serial No. 611,773. (No model.)



Claim.—1. The combination of the top print and the under print arranged to oscillate alternately, the intermeshing gears, cranks and pitmen by which such oscillation is performed, the gear E^3, one-fourth of the diameter of said gears, the adjustable crank-pin, E^5, pitman, E^4, pawl and ratchet, E^7, E^8, the feed-cylinder, E, and the presser-roll, *e*, whereby the paper is fed to the said upper and under print between the oscillations of the latter.

2. The oscillating top print having its frame pivoted upon the fixed shaft, C^7, in combination with the fountain and its ink-roll, the gear-frame, D^3, rigidly mounted on said shaft, the arm, D^4, dog D^5, engaging ratchet on said ink-roll, and the projection, D^6, extending from said oscillating frame into contact with said arm, D^4, for the purpose set forth.



3. The combination of the shaft, G^4, cams, H^3, straddle-arms, H^4, friction-rolls engaging said cams, the levers, H^5, the inking-roll and vibrator actuated by said levers, the distributers, the ink-fountain and fount-roll K^6, the dog, K^5, rod, K^9, and the adjusting-slot, K^7, of the lever, H^4, substantially as and for the purpose set forth.

4. The combination of the vertical rods, O, brackets, N^3, fixed thereon, the blocks, N, movable on said rods, the cross-head, N^5, connecting-rods, N^6, joining said cross-head and blocks, link, N^4, lever, N^7, and cam, N^8, substantially as and for the purpose specified.

5. The combination of the vertical rods and the punching and shearing mechanism carried thereby, the printing mechanism, the base for the same having rims, T', feet for said rods clasping said rims, and the means for adjusting said feet toward and from the printing mechanism, for the purpose set forth.

604,761. STRINGED INSTRUMENT. JAN A. JOHKHOFF, Dresden, Germany, assignor to Alfred Grunert, New Gruna, Germany. Filed June 11, 1897. Renewed Apr. 29, 1898. Serial No. 679,255. (No model.)

Claim.—1. A plectrum device for stringed musical instruments consisting of one or more bars extending across the strings and resting on elastic supports and carrying pivoted key-levers provided with operating-fingers which in their oscillations, limited by fixed stops, can engage with the strings in either direction, and produce either a single note or the same note repeated, the strength of the sound being at the same time determined by the pressure exercised on the key-lever, substantially as described.

2. A plectrum device for stringed musical instruments consisting of a bar resting on elastic supports and extending transversely across above the strings of the instrument, said bar carrying pivoted key-levers provided with operating-fingers *c'* and a casing provided with slots for accommodating and limiting the reciprocating movement of the key-levers, substantially as described.

3. A plectrum device for stringed musical instruments consisting of a bar A, guided and supported on pins A and elastic supports *a'*, key-levers C pivoted on said bar in combination with a slotted casing E, substantially as and for the purposes described.

604,762. CRUSHER. ALFRED JORDAN, London, England. Filed July 3, 1896. Serial No. 598,015. (No model.) Patented in England Apr. 21, 1896, No. 8,336.

Claim.—In a crushing or disintegrating apparatus, the combination of a movable jaw, the working face of which is shaped so as to form a segment of the involute of a circle and which is pivoted upon a central spindle; means for rocking the same, and a sliding jaw normally forced into its highest position by means of springs, but capable of being drawn downward by the material under treatment when the movable jaw descends, substantially as described.

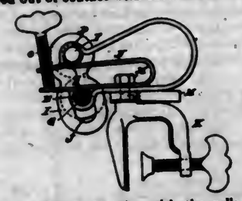
604,768. BROOCH. GEORGE B. KEPLINGER, Chicago, Ill. Filed Mar. 25, 1897. Serial No. 629,161. (No model.)

Claim.—1. As a new article of manufacture, a brooch composed of the continuous front piece, A, having the turned-over rim portion, B; with the back piece having the turned-over rim portion, G, cooperating with the rim portion, B, the depressed concaved portion, F, resting against the central portion of the front piece, A, to strengthen it, said front and back pieces forming an arch-like structure, and the undepressed portion, E, between the rim portion, G, and the depressed portion, F; and means for attaching said brooch to a garment, substantially as described.

2. As a new article of manufacture, a brooch composed of the continuous front piece, A, having the turned-over rim portion, B; with the back piece having the turned-over rim portion, G, cooperating with the rim portion, B, the depressed concaved portion, F, resting against the central portion of the front piece, A, to strengthen it, said front and back pieces forming an arch-like structure, and the undepressed portion, E, between the rim portion, G, and the depressed portion, F; and the pin secured beneath the undepressed portion, E, and having its body portion, H^2, emerging from the shoulder M between the portions, E and F, and caught by the tongue, L, formed by the notch, K, in said shoulder, substantially as described.

3. In a brooch, the combination of the back piece having the turned-over rim portion, G, the depressed concaved portion, F, and the undepressed portion, E; with the pin, H, consisting of the curved portion, H', in the channel between the rim, G, and the portion, F, and secured by the turned-over tongue, J, of the rim, G, and the straight portion, H^2, projecting through the aperture, J, in the undepressed portion, E, and caught by the tongue, L, formed by the notch, K, substantially as described.

604,764. MAGAZINE-FIREARM. WILLIAM R. KING, Chase, Mich. Filed July 21, 1897. Serial No. 645,280. (No model.)

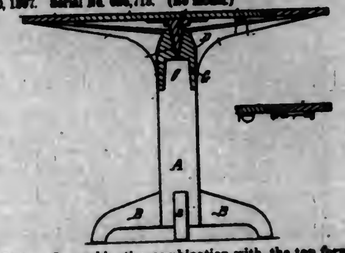


Claim.—1. In a magazine-firearm, the combination with a sliding breech-block, of a dog pivoted thereto and automatically engaging a stationary part of the firearm when the breech-block is closed, a pivoted arm having an enlarged portion or hub presenting shoulders engaged by the depending member of the dog, and a rod passed through the depending member of said dog and extending beyond the front end of the frame where it is provided with a head having spring-clips, said rod also having rigid collars located on opposite sides of the depending member of the dog, substantially as shown and for the purpose set forth.

2. In a magazine firearm, the combination with a sliding breech-block and magazine-tube, of a dog pivoted to the breech-block and presenting horizontal and depending members, the depending member being slotted, an arm or cartridge-carrier pivoted within the frame, its forward end extending through the depending member of the dog, the said arm or carrier being located on a line with the magazine-tube when the breech-block is closed, a hub or projection formed on the arm at its pivoted point and presenting a cam or shoulders against which the dog abuts to actuate the arm; together with the sliding rod connected to the depending member of the dog and extending through the frame, substantially as shown and for the purpose set forth.

604,765. WRINGER. CHARLES A. KOHL, Cleveland, Ohio. Filed Dec. 17, 1897. Serial No. 662,287. (No model.)

Claim.—1. In a wringer, the combination with the rolls, journals at the ends thereof, a spring bearing against the journals adapted to keep the rolls normally in contact, and a roll-separating device in connection with each pair of journals, comprising a horizontally-arranged bar provided with two transverse members interposed between the journals, and means for spreading said members, whereby the rolls will be forced out of contact with each other.



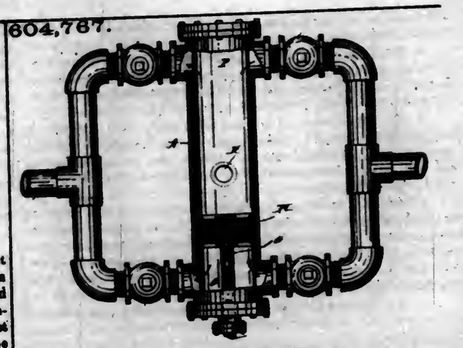
2. In a wringer, the combination with the rolls, of journals at the ends thereof, a horseshoe-spring, the free ends of which form bearings for the journals, a separating device, comprising a curved bar, interposed between the journals and arranged upon and detachably secured to the spring; the free ends of said bar bearing against the free ends of said spring, and means for spreading the ends of the curved bar, substantially as described.

3. In a wringer comprising two rolls provided at their ends with journals, and horseshoe-springs in which said journals are adapted to bear; a roller-separating device, interposed between the journals at each end of the wringer, comprising a U-shaped bar N, each member of said bar having an offset S formed thereon, and one of said members being slotted, and a device for spreading the free ends of said bar, substantially as and for the purpose described.

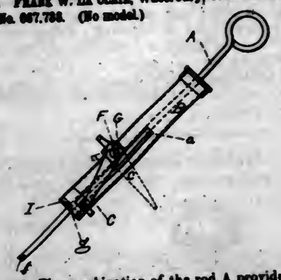
4. In a wringer comprising two rolls provided at their ends with journals, and horseshoe-springs in which said journals are adapted to bear; a roller-separating device, interposed between the journals at each end of the wringer, comprising a U-shaped bar N, each member of said bar having an offset S formed thereon, and one of said members being slotted, and a device for spreading the free ends of said bar, comprising a lever-actuated cam P, pivoted in one end of the bar, substantially as described.

5. In a wringer comprising a pair of rolls provided at their ends with journals, and horseshoe-springs in which said journals have bearings: a roller-separating device interposed between the journals at each end of the wringer, comprising a U-shaped bar N, one of the members of said bar being slotted whereby the bar may be detachably and adjustably secured to the spring, and means for spreading the ends of said bar, substantially as and for the purpose described.

604,766. TABLE. HENRY KOEHL, Hamilton, Ohio. Filed Mar. 10, 1897. Serial No. 626,713. (No model.)



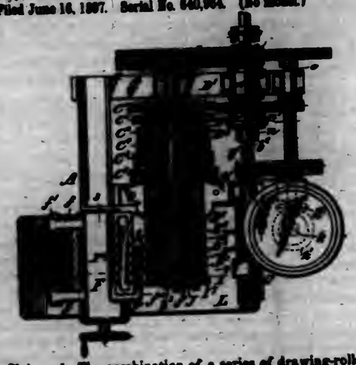
Claim.—In a table, the combination with the top formed with a circular opening in its center, and radial arms supporting said top of a circular disk to occupy said opening, said disk being pivotally mounted above the common center of the arms, whereby it may be rotated in the opening and continue in the plane of the top, a bell secured beneath the disk and a lever depending therefrom to engage with the respective arms and thereby ring the bell.



604,767. HYDRAULIC-PRESSURE PUMP. THOMAS A. KNOBLER and JOSEPH GOMEZ, New York, N. Y. Filed Nov. 26, 1895. Serial No. 570,149. (No model.)

Claim.—In a combined water-pump and air-compressor, the combination with the pump-cylinder of an air-inlet directly from atmosphere to a point midway of the length of the cylinder and above the water-level therein and adapted to form a layer of air above the water in said cylinder, a check-valve on the said air-inlet opening inward, an adjustable valve on the said air-inlet outside of the said check-valve, a reciprocating plunger in said cylinder having a periphery broader than said air-inlet, supply connections near the ends of said pump-cylinder, check-valves thereon opening inward, independent discharge connections from the ends of the cylinder, and check-valves thereon opening outward, substantially as described.

604,767.



604,768. DEVICE FOR STOPPING HOLES IN PNEUMATIC TIRES. FRANK W. LA CLAIR, Waterbury, Conn. Filed Jan. 24, 1898. Serial No. 667,788. (No model.)

Claim.—1. The combination of the rod A provided with a slot in one end thereof; the tube B provided with the longitudinal slot *a*, the transverse slot *f* and the lever-support F; and the lever C provided with the slots *A A'* in one end thereof substantially as described.

2. The combination of the rod A provided with a slot in one end thereof; the tube B provided with the longitudinal slot *a*, the transverse slot F and the end provided with the lip *g*; and the lever C provided with the slots *A A'*.

604,769. WIRE-DRAWING MACHINE. GEORGE B. LAMB, Waterbury, Conn., assignor to the Waterbury Machine Company, same place. Filed June 16, 1897. Serial No. 640,964. (No model.)

Claim.—1. The combination of a series of drawing-rolls, means for operating the same, a die for each of said rolls and a sliding die-box carrying said dies, for moving the dies in front of the rolls, substantially as specified.

2. The combination of a series of drawing-rolls, a drawing-in roll, a die for each of said rolls and a sliding die-box carrying said dies whereby each die may be successively moved in front of the drawing-in roll and then in front of its drawing-roll, substantially as specified.

3. The combination of a series of drawing-rolls, a drawing-in device, a die for each of said rolls, a frame carrying the series of dies,

and means for moving the frame longitudinally relatively to the drawing-rolls, substantially as specified.

4. The combination of a series of drawing-rolls, a frame carrying a series of dies and a corresponding series of idler-rolls, and means for moving said frame longitudinally relatively to the drawing-rolls, substantially as specified.

5. The combination of a series of drawing-rolls, a drawing-in roll, means for engaging and disengaging the drawing-in roll with one of the series of drawing-rolls, a die-box, and means for moving the die-box longitudinally relatively to the series of drawing-rolls, substantially as specified.

6. In a wire-drawing machine, the combination of a series of drawing-rolls of the same diameter, means for rotating the drawing-rolls at varying rates of speed, a wire-block having means for driving it, and mechanism in engagement with the driving means of the rolls and block for varying the speed of the block to correspond with the rate of speed of the drawing-rolls, substantially as specified.

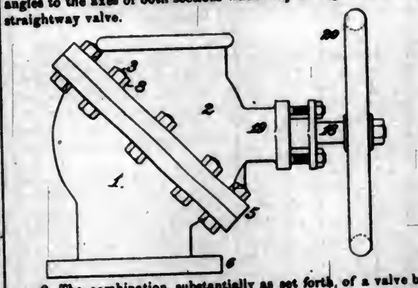
7. In a wire-drawing machine, the combination of a series of drawing-rolls of the same diameter, means for rotating the drawing-rolls at varying rates of speed, a wire-block having means for driving it, and means for varying the rates of speed of the drawing-rolls and the block, said means comprising a driving-shaft, a sleeve on said shaft carrying a fast gear which drives the gearing of the drawing-rolls and block, and a loose gear, each of said gears being provided with a clutch, a sliding clutch on said shaft, a sliding clutch on said sleeve, a gear fast on said shaft, a second shaft having gears fast thereon, one of which is in engagement with the fast gear on the driving-shaft, and the other in engagement with the loose gear on the sleeve, and means for alternately operating the sliding clutches, substantially as specified.

604,770. PNEUMATIC ATTACHMENT FOR TELEGRAPH-KEYS. WILLIAM J. LEES, Pratt, Minn. Filed Apr. 15, 1897. Serial No. 633,337. (No model.)

Claim.—1. A pneumatic attachment for telegraph-keys, comprising an outer wall, a diaphragm, means for securing the device to a key-button, and a tube leading into an air-chamber formed by said outer wall and said diaphragm, for the purpose set forth.

2. As a new article of manufacture, a cushion for telegraph-keys, comprising an inflatable outer wall or shell, a diaphragm forming a closed air-chamber within said shell, means for securing said shell upon a key, and the wall of said chamber being provided with an opening through which air may be forced to inflate said cushion, for the purpose set forth.

3. As a new article of manufacture, a cushion for telegraph-keys comprising a substantially hemispherical shell, having a flexible outer wall, a diaphragm extending across the lower portion of said shell and forming an air-chamber therein, and an inwardly-turned annular flange at the lower edge of said wall, a space being provided between said flange and said diaphragm, for the purpose set forth



4. In a device of the class described, the combination, with a key, of an elastic shell or cap arranged over the same, means for securing said shell to said key, a diaphragm connecting the inner walls of said shell and forming an air-chamber in the upper portion of the same, said diaphragm being provided with an opening in its wall to permit said chamber to be filled with air, and said opening being covered by said key when the cushion is in position thereon to prevent the escape of air from said chamber, substantially as described.

5. The combination, with the key F, of the shell or cap arranged over the same, and comprising an inflatable outer wall D, an inner wall or diaphragm D', extending across the lower portion of the shell and forming an air-chamber therein, the inwardly-turned flange or ring C, an annular recess being provided between the same and said diaphragm to receive the edge of said key, and said diaphragm having an opening leading to said air-chamber, the entrance to said opening being closed by said key when the device is in position thereon, substantially as described.

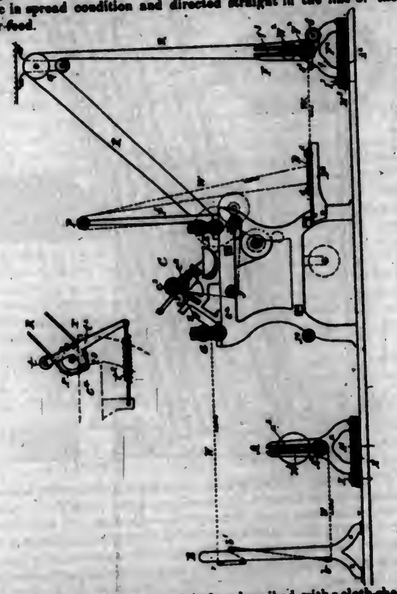
6. As a new article of manufacture, a cushion for telegraph-keys, comprising a substantially hemispherical shell, having an inflatable and flexible outer wall, a diaphragm extending across the lower portion of said shell and forming a closed air-chamber therein, and means provided at or near the lower edge of said wall for securing the same to a telegraph-key, substantially as described.

604,771. THROTTLE-VALVE. ALBERT K. MANSFIELD, Salem, Ohio. Filed Jan. 8, 1897. Serial No. 618,460. (No model.)

Claim.—1. The combination, substantially as set forth, of a valve-body composed of two sections, provided, each, with a pipe connection, and abutting in a plane inclined to the axis of the valve-body, said sections being relatively adjustable to form either a straightway or an angle valve, a valve-face fixed to one of said sections, a valve fitted to move about an axis thereon, an operating-stem which is fitted to be rotated in the other section, at an angle with the abutting face thereof, and gearing through which movement is imparted to the valve from the stem, the stem being, in each adjustment of the valve-body sections, at right angles to the axis of one section, and at right angles to the axes of both sections when they are adjusted to form a straightway valve.

2. The combination, substantially as set forth, of a valve body composed of two substantially hemispherical sections, each provided with a pipe connection the axis of which is offset from the center of the valve-body, and abutting in a plane inclined to the axis of the valve-body, peripheral flanges surrounding the abutting faces of said sections, connecting-bolts passing through said flanges, a valve-face fixed to one of said sections, a valve fitted to move about an axis thereon, a stem which is rotatable in the other section, and gearing through which movement is imparted to the valve from the stem.

3. The combination, substantially as set forth, of a valve-body composed of two sections, each provided with a pipe connection, and abutting in a plane inclined to the axis of the valve-body, a valve-face fixed to one of said sections, a valve fitted to move about an axis thereon, a stem which is rotatable in the other section, gearing through which movement is imparted to the valve from the stem, and a spring interposed between, and acting on, the valve and an abutment independent thereof.



4. The combination, substantially as set forth, of a valve-body composed of two sections, each provided with a pipe connection, and abutting in a plane inclined to the axis of the valve-body, a valve-face fixed to one of said sections, a valve fitted to move about an axis thereon, a gear fixed to said valve, a stem which is rotatable in the other section, a pinion fixed to said stem and forming a joint with a face on the valve-body at the inner end of the stem, and a spring bearing on said pinion and on a fixed abutment.

5. The combination, substantially as set forth, of a valve-body composed of two sections, each provided with a pipe connection and abutting in a plane inclined to the axis of the valve, a transverse ported partition on one of the sections at the end opposite the pipe connection thereof, a central support extending from the partition to the wall of the section, a valve-face on said partition, a valve fitted to move about an axis thereon, a stem which is rotatable on the other section, and gearing through which movement is imparted to the valve from the stem.

604,772. LAPPET-SHEARING MECHANISM. EDWIN T. MARBLE and EDWIN H. MARBLE, Worcester, Mass. Filed Aug. 26, 1897. Serial No. 649,571. (No model.)

Claim.—1. The combination, with a cloth-shearing mechanism, and the guides and parallel rolls at front and rear thereof, that maintain the spread and control the feed of the fabric in a direct or laterally unwavering course of advancement while passing the shearing-cutters; of the feed-carrier frame having the rotatable delivery-drum and beam-roll mounted in bearings thereon and adapted for the support and delivery of the fabric: said feed-carrier frame arranged adjustable to right and left oblique positions for working said drum in skewed relation to the guides and rolls that control the shear-feed, and means substantially as described for transposing the obliquely-delivered web of fabric, skewed and spread, into straight alinement with its line of advancement at the shear.

2. The combination, with a cloth-shearing mechanism, its draft or feed rolls, and the pinch-rolls that hold the fabric taut preceding the shearing cutters; of the obliquely-adjustable feed-carrier frame and the feed carrier drum, disposed in front of said pinch-rolls, said carrier-frame pivoted to its supporting-base at a point central in the length and forward of the vertical plane passing through the feed-carrier axis; said carrier-frame adjustable about said pivot for swinging the feed-carrier drum to right or left angularity for delivering the fabric in a direction oblique to the line of the shear-feed; and a guide intermediate to said carrier and pinch-rolls, adapted for regulating the skew tension of the fabric, and presenting the skewed fabric in spread condition and directed straight in the line of the shear-feed.

3. In combination, as hereinbefore described, with a cloth-shearing machine, a feed-carrier comprising the segment bed-plate having the flanged edge, the swinging carrier-frame resting upon and pivoted to said bed-plate, and provided with end bearings having bearings for the carrier-drum, the jaw-openings for the reception of the winding-beam shaft, the carrier-drum mounted in said bearings, the friction-brake on said drum-shaft, and means for effecting and securing the swing adjustment of said carrier-frame.

4. In a machine for shearing and shearing lappet-cloth, the combination with the shearing mechanism and stationary guide-stand, of the laterally-swinging feed carrier frame having the frictionally-controlled supporting-drum and removable cloth-winding beam mounted thereon, the arm a^3 fixed on said carrier-frame, the sprocket-chain K attached to arm a^3 of said carrier-frame, the upright shaft-stand K^4, the shaft K^2, the hand-wheel K^3 and sprocket-wheel K^2 fixed on said shaft, said sprocket-wheel engaging said chain, and the guiding-wheel K', as shown and described.

5. The combination, with the shearing mechanism comprising the shearing-revolver and ledger-blade, cloth-rest, draft-rolls and pinch-rolls; of the front tension-stand having a series of transverse bars that even and direct the fabric straight to said pinch-rolls; and the obliquely-adjustable feed-carrier frame having thereon the supporting-drum and beam for delivering the cloth therefrom, and means for varying the angular position of said carrier in relation to the stand.

6. In mechanism for shearing and rewinding lappet-cloth, the combination as described, of the shearing mechanism, its draft-rolls, the high guide roll, the receiving-carrier, a power-operated drum turning in bearings on said carrier, a beam for winding or rolling the cloth thereon, a guide bar or roll parallel and adjacent to said drum, and a transverse, obliquely-adjustable deflecting guide-bar arranged between said high-guide roll and the receiving-carrier, substantially as set forth.

7. The combination with the cloth-shearing mechanism, and means comprising pinch-rolls and draft-rolls for directly advancing the cloth therethrough; of an obliquely adjustable feed-carrier and front guide adapted for automatically rendering the cloth in skewed condition; a rear guide, and an obliquely-adjustable receiving-carrier having the supporting-drum and winding-beam mounted thereon, and adapted for controlling the skew in the rewinding of the cloth, and means for rotating said drum, all substantially as set forth.

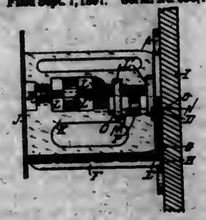
8. In a machine for shearing lappet-cloth, the combination of the cloth-shearing mechanism, its draft-rolls, and means for feeding said shear; of the receiving-carrier adapted for use in right or left obliques relation to said shear, and carrying thereon means for winding up the cloth; a deflecting-guide situated for action on the fabric between said draft-rolls and said receiving-carrier; said deflecting-guide and receiving-carrier being respectively adjustable to varied inclination in relation to the draft-roll axis and to each other, and means for operating the winding-up devices, substantially as and for the purpose set forth.

9. In a cloth-shearing machine of the character described, the rearwardly-projecting brackets or arms D' and the spreader-bar D adjustably secured upon said arms and adapted for right or left oblique adjustment, substantially as and for the purpose set forth.

10. The combination, with the shearing mechanism, its cloth-guides and draft-rolls; of the receiving-carrier comprising the laterally-swinging pivoted carrier-frame, the supporting-drum mounted in bearings thereon, the stretcher-roller adjacent to said drum, the drive-chain connecting from a sprocket on the draft-roll shaft, to a sprocket on the drum-shaft, and the overhead guides for said chain, for the purpose set forth.

604,773. CULTIVATOR. DAVID B. MILES, Blackwater, Mo. Filed Dec. 22, 1897. Serial No. 663,014. (No model.)

Claim.—1. In a cultivator, the combination with the main frame having longitudinal side flanges, of cultivator-beams fitted between said flanges, and means for holding said beams in place, substantially as set forth.



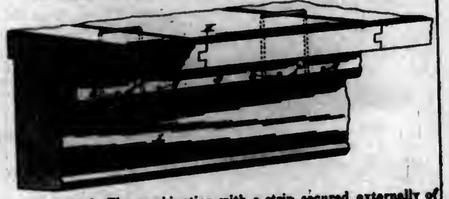
2. In a cultivator, the combination with the main frame having flanges *a*, *b* and *c*, of cultivator-beams fitted between said flanges, and wedge-keys for holding said beams in place, substantially as set forth.

3. In a cultivator, the combination with the main frame having flanges *a*, *b* and *c*, of cultivator-beams fitted between said flanges and provided with stop-lugs, of keys inserted through flanges *a* and *c* immediately at the rear of the stop lugs, substantially as set forth.

4. In a cultivator, the combination with the metallic main frame bent at its sides to form flanges *a*, *b* and *c*, the flanges *a* and *c* being provided with alined perforations, of cultivator-beams fitted between said flanges and provided with stop-lugs, and wedge-keys inserted through the alined perforations immediately at the rear of the stop-lugs, substantially as set forth.

5. A cultivator comprising in combination the following essential elements, to wit: a metallic main frame, formed at the sides with flanges *a*, *b* and *c*, the flanges *a* and *c* having alined perforations, cultivator-beams fitted between said flanges and provided with stop-lugs, wedge-keys inserted through said perforations immediately at the rear of the stop-lugs, a handle-stock secured to the cultivator-frame, a beam-brace having forked ends which engage the rear ends of the cultivator-beams, stock-braces having perforations in their lower ends that receive one of the forks at each end of the beam-brace, clip-plates, and nuts for clamping the clip-plate, cultivator-beams and stock-braces to the beam-brace, substantially as set forth.

604,774. OVAL HOLDER FOR TOILET-PAPER. JOHN H MOSER, Milwaukee, Wis. Filed Sept. 7, 1897. Serial No. 650,748. (No model.)

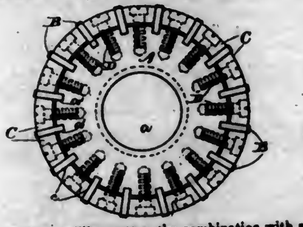


Claim.—1. The combination of a wall-plate provided with a projecting pivot-pin and separating-bar and having a curved slot therein, bordered by a guide-channel formed in its rear surface, of a cast frame formed with right and left offset bars between which the pivot-rod is engaged and a catch connected with said frame and provided with a hooked end adapted to project through said slot and engage in the guide-channel, substantially as described.

2. The combination of a wall-plate provided with a projecting pivot-pin and separating-bar and having a curved slot therein, of a

cast frame formed with right and left offset bars between which the pivot-rod is engaged, and a spring-catch provided with hooked ends engaged between said offset bars, lugs projecting from said frame and bearing upon said catch at the center and at one of said hooked ends respectively, whereby the catch is held in said frame with one end projecting and adapted to be inserted through the slot in the wall-plate, and to engage against the rear surface of the plate, substantially as described.

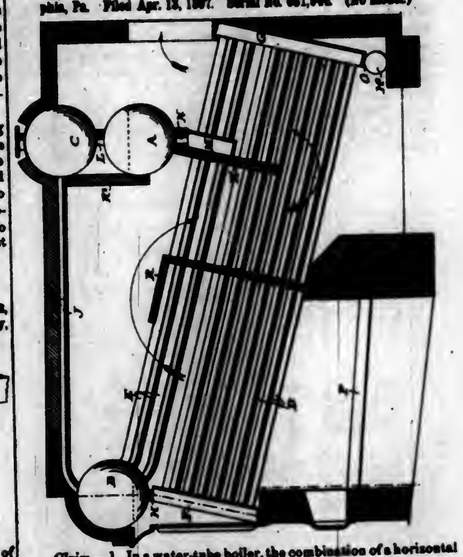
3. The combination of a wall-plate provided with a projecting pivot-pin and having a curved slot therein, together with an aperture for the separating-bar, and a recess in the rear surface of the plate around said aperture, a toothed separating-bar adapted to be inserted through said aperture and provided with a flange adapted to fit into the recess, a cast paper-holding frame provided with offset bars between which the pivot-pin engages, and a holding-catch adapted to project through the curved slot in the wall plate and to engage against the rear surface thereof, substantially as described.



604,775. ROOF-SECURING DEVICE. ALEXANDER H. MOUTHER, Springfield, Mo., assignor of one-half to W. A. Hottleston, Kansas City, Mo. Filed Oct. 26, 1897. Serial No. 656,403. (No model.)

Claim.—1. The combination with a strip secured externally of and a slight distance from the moldboard of a car, of an inverted-U-shaped staple which extends down through two roof-boards, and a space between the moldboard and the strip, and is provided at its lower end with upwardly-disposed hooks engaging the lower edge of said strip, substantially as described.

2. The combination with a strip arranged outward of and a slight distance from the moldboard of a car and below the roof-boards thereof, and nails or screws extending horizontally through said strip and into the moldboard at points about vertically below the joints between the roof-boards, of inverted-U-shaped staples bridging the joints between the roof-boards and extending downward through the latter and between the moldboard and said strip, and having their lower ends bent upwardly to form hooks for reliably securing the roof boards down upon the moldboards, substantially as described.



604,776. MILLING-CUTTER. ALBERT H. MORTON, Lowell, Mass. Filed Mar. 8, 1897. Serial No. 626,963. (No model.)

Claim.—1. In a milling-cutter, the combination with a central stock or body portion comprising an integral block having threaded holes around the periphery and a central aperture, of a series of cutters disposed around the periphery of said stock or body portion, a series of removable wedge-shaped bars or blocks alternating with the cutters and screws passing through said bars or blocks and engaging the threaded holes in the stock or body portion, the inner peripheral faces of said bars or blocks being of greater width than the peripheral face of the stock or body portion exposed between the cutters, whereby the bars or blocks may be caused to forcibly engage the sides of the cutters and securely hold them in position upon the stock or body portion, substantially as described.

2. In a milling-cutter, the combination with the stock or body portion, of a series of blades disposed along the periphery thereof, a series of fixed projections on the stock or body portion extending between the blades, and a series of clamping-blocks interposed between the blades, and arranged to be brought into clamping contact therewith, substantially as described.

604,777. WATER-TUBE BOILER. LAUREN M. MOYER, Philadelphia, Pa. Filed Apr. 13, 1897. Serial No. 631,944. (No model.)

Claim.—1. In a water-tube boiler, the combination of a horizontal bank of water-tubes; a transverse steam-and-water drum; a transverse water-drum; and a transverse steam-drum, all of said three drums being situated within the walls of the furnace, the steam-drum being wholly above the normal water-level and situated in that part of the furnace which is exposed to the least intense heat, substantially as described.

2. In a water-tube boiler, the combination of a horizontal bank of water-tubes; a transverse steam-and-water drum; a transverse water-drum; a transverse steam-drum, all of said three drums being situated within the walls of the furnace; and a vertical baffle bridge-wall extending down from the roof of the furnace and protecting the steam-drum from the most intense heat of the furnace, substantially as described.

3. In a water-tube boiler, the combination of a horizontal bank of water-tubes; a transverse steam-and-water drum; a transverse water-drum; a transverse steam-drum, all of said three drums being situated within the walls of the furnace, the steam-drum being protected from the intense heat of the furnace by the water-drum immediately below it and a baffle bridge-wall immediately in front of it, substantially as described.

4. In a water-tube boiler, the combination of a horizontal bank of water-tubes; a transverse steam-drum wholly above the normal water-level; a transverse steam-and-water drum largely above the normal water-level; and a transverse water-drum largely below the normal water-level, all situated within the walls of the furnace, substantially as described.

5. In a water-tube boiler, a horizontal bank of water-tubes; a transverse steam-and-water drum; a transverse water-drum; and a transverse steam-drum, all situated within the walls of the furnace; and connections by means of which the water-tubes and the three transverse drums form a complete circuit, substantially as described.

6. In a water-tube boiler, the combination of a bank of horizontal water-tubes, connected at both ends by water-legs or manifolds; three transverse drums situated all above and within the vertical lines determined by the bank of tubes and the water-legs or manifolds; and connections by which the three drums are brought into complete circulation with each other and with the water-tubes, substantially as described.

7. In a water-tube boiler, the combination of a transverse water-drum situated near the rear thereof; a bend of water-tubes connected at both extremities by water-legs or manifolds, and all below the level of the water-drum; connections between the water-drum and the rearward portion of the group of water-tubes; a transverse steam-and-water drum situated above and connected with the forward portion of the group of water-tubes; and a transverse steam-drum wholly above the normal water-level and having connections with both the steam-and-water drum and with the water-drum, substantially as described.

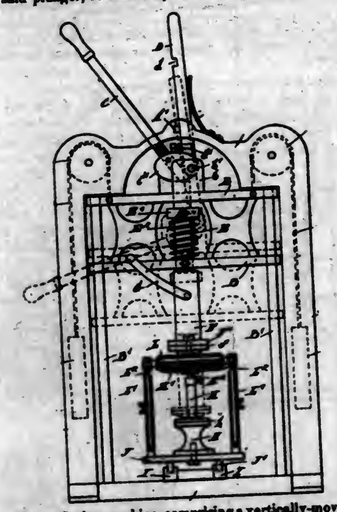
8. In a water-tube boiler, the combination of a transverse water-drum; a transverse steam-and-water drum; a transverse steam-drum; a primary bank of water-tubes connected at their extremities by water-legs or manifolds; an auxiliary bank of water-tubes immediately above the primary bank; connections respectively between the forward water-leg and the steam-and-water drum, the steam-and-water drum and the steam-drum, the steam-drum and the water-drum, and the water-drum and the rear portion of the auxiliary bank of water-tubes, substantially as described.

9. In a water-tube boiler, the combination with the drums, a primary bank of water-tubes with their connections at both ends; an auxiliary bank of water-tubes situated above said primary bank, said auxiliary bank being interrupted and divided into two portions by a transverse water-chamber; and connections between said water-chamber and the water-drum, substantially as described.

10. In a water-tube boiler, the combination of a transverse water-drum; a transverse steam-and-water drum; and a transverse steam-drum, all situated above the water-tubes; a primary bank of water-tubes connected at their extremities by water-legs or manifolds; connections between the forward water-leg or manifolds and the steam-and-water drum; an auxiliary bank of water-tubes immediately above the primary bank, in direct communication at their forward ends with the steam-and-water drum and entering at their rear ends the rear water-leg or manifolds; an intermediate transverse water-chamber dividing the said auxiliary bank into two portions; connections between said intermediate water-chamber and the water-drum, the water-drum and the steam-drum, the steam-drum and the steam-and-water drum, substantially as described.

11. In a water-tube boiler, the combination of a transverse water-drum; a transverse steam-and-water drum; and a transverse steam-drum, all situated above the water-tubes; a primary bank of water-tubes connected at their extremities by water-legs or manifolds; connections between the forward water-leg or manifolds and the steam-and-water drum; an auxiliary bank of water-tubes immediately above the primary bank, entering at both extremities the front and rear water-legs or manifolds; an intermediate transverse water-chamber dividing the said auxiliary bank into two portions and connected with the water-drum; and a second or forward transverse water-chamber similarly dividing the said auxiliary bank and connected with the steam-and-water drum; and connections between the water-drum and the steam-drum, and the steam-drum and the steam-and-water drum, substantially as described.

12. In a water-tube boiler, a bank of simple direct-circulation water-tubes with a distributing-chamber, such as a water-leg or manifold, at both ends of the bank, the said bank being composed of a vertical series of horizontal rows of parallel tubes, the tubes in each horizontal row being regularly staggered with reference to those in the proximate rows, the vertical proximity of each such row to the row next to it being such that the uppermost edge of each of the tubes composing it is situated in a higher horizontal plane than that of the lowermost edge of the tubes in the row next above it; while the horizontal distance between the tubes in each row is such that any given vertical series which results from the regular superposition of the horizontal rows falls by a substantial clearance-space on either side to overlap the opposing sides of the adjacent vertical series, substantially as described.

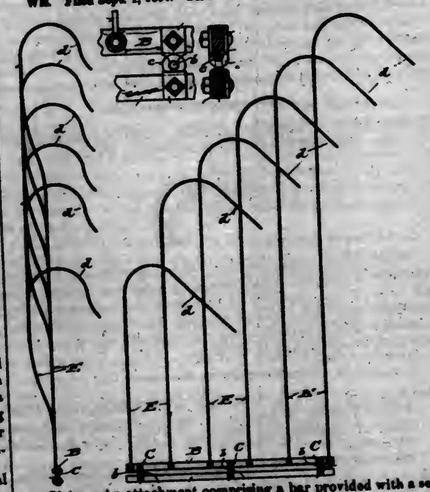


13. In a water-tube boiler, the combination of a horizontal bank of water-tubes; a transverse steam-and-water drum; a transverse water-drum; a transverse steam-drum, all of said three drums being situated within the walls of the furnace; and a vertical baffle bridge-wall extending down from the roof of the furnace and protecting the steam-drum and the water-drum from the most intense heat of the furnace, substantially as described.

604,778. HAT-PRINTING MACHINE. THOMAS J. MCCARTHY, Orange Valley, N. J. Filed July 31, 1897. Serial No. 646,236. (No model.)

Claim.—1. A hat-printing machine, comprising a frame having guideways thereon, a frame mounted to slide on said guides, a lock for holding the frame in its lower position, a plunger mounted in said sliding frame and carrying a printing-die, means for normally retracting the plunger, a lever mounted on the sliding frame and connected to said plunger to project it, and an impression-bed in line with said plunger, substantially as described.

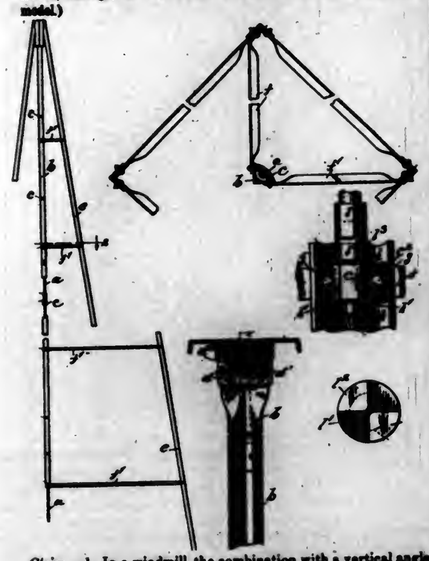
2. A hat printing machine, comprising a frame having vertical guides, a frame mounted to slide on said guides and provided with counterbalances, a lock for holding the frame in its lower position, a plunger mounted in said frame and carrying the printing-die, a spring normally supporting the plunger, a lever connected to said plunger to depress it, and an impression-bed beneath said plunger, substantially as described.



3. A hat-printing machine, comprising a frame having vertical guides, a frame mounted to slide on said guides and having counterbalances attached, a lock for holding said frame in its lower position, a plunger, hollow in its lower portion, mounted in said frame, and carrying the printing-die, a gas heating apparatus within said plunger for heating the die, a spring normally supporting the plunger, a lever connected to said plunger to depress it, and an impression-bed beneath said plunger, substantially as described.

4. A hat-printing machine, comprising a vertically-movable frame having therein a reciprocable plunger carrying a printing-die, a lock engaging said frame in its lower position a lever for depressing the plunger, a transversely-movable slide, an impression-bed mounted thereon, and an inking-roller mounted upon said slide and engaging the surface of the printing-die when the latter is in its upper position, substantially as described.

5. A hat-printing machine, comprising a vertically-movable plunger carrying a printing-die, a counterweighted frame supporting said plunger and mounted to slide vertically, a spring normally supporting the plunger in said frame, a lever for depressing the plunger, a transversely-movable slide, an impression-bed mounted thereon, and an inking-roller mounted upon the slide and engaging the surface of the printing-die when the latter is in its upper position, substantially as described.



604,779. MOWER ATTACHMENT. THEODORE HAHN, Manitowoc, Wis. Filed Sept. 1, 1897. Serial No. 650,277. (No model.)

Claim.—An attachment comprising a bar provided with a series of shackle-joints for vertically-yielding connection with a mower

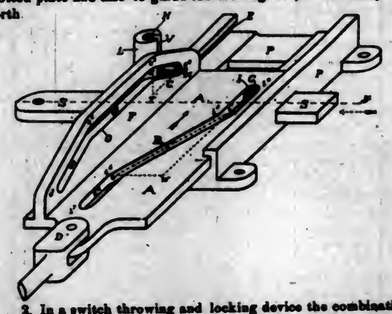
finger-bar in rear of the same, and a series of different-length rods that are rigidly connected to the former bar at intervals thereof, bent below the same a short distance therefrom to have a considerable portion of each rest on the ground and recurved at the rear to form overhanging guards.

604,780. SHAFT-SUPPORT FOR WINDMILLS. LA VERNE W. NOYES, Chicago, Ill. Filed Nov. 20, 1897. Serial No. 659,231. (No model.)

Claim.—1. In a windmill, the combination with a vertical angle-bar braced at intervals to the posts of the tower, of journal-boxes secured between the flanges of said angle-bar, and a shaft journaled therein and lying in the angle between the flanges of said angle-bar, substantially as described.

2. In a windmill, the combination with a vertical angle-bar braced at intervals to the posts of the tower, of a shaft lying in the angle between the flanges of said angle-bar, and journal-boxes for said shaft at intervals resting against and secured to the inner faces of said flanges, the axis of the shaft and the points of support of the box lying substantially in line, substantially as described.

3. The combination with an angle-bar of a journal-box secured between the flanges thereof, and a shaft journaled therein and lying within the angle between said flanges, said journal-box having a central opening and recesses in the sides communicating with holes having oblique side walls, and securing-bolts passing through said holes and having the heads resting in said recesses, substantially as described.



604,781. PETROLEUM-BURNER. WILFRED I. OSBER, Dayton, Ohio. Filed Feb. 20, 1896. Serial No. 580,075. (No model.)

Claim.—In a petroleum-burner, the combination with a burner-tube, a collar surrounding said tube, arms projecting upwardly from said collar, a heat-conductor on said arms, and a flame-spreading plate above said heat-conductor, of a hood inclosing a portion of said burner-tube and providing a space around the burner-tube in which oil is heated, substantially as specified.

604,782. SWITCH THROWING AND LOCKING APPARATUS. ELBERON P. OWEN, Manchester, Va., assignor of one-half to Morten Riddle, Jr., Petersburg, Va. Filed Aug. 11, 1897. Serial No. 647,260. (No model.)

Claim.—1. In a switch throwing and locking device the combination of a flanged-plate having a slot which engages a pin in a switch-bar, and which when operated shall by means of the slot and pin cause the switch-bar to operate the switch-rails, and having in its flanged portion another slot which engages a pin which is directly attached to a locking-bolt, and which when operated shall cause the locking-bolt to enter a perforation or hole in the said switch-bar, and so to lock the switch-rails, a switch-bar having perforations adapted to receive a locking-bolt, a locking-bolt, and a frame to guide the slotted plate and also to guide the locking-bolt, substantially as set forth.

2. In a switch throwing and locking device the combination of the flanged plate A F, having slots B and O, the switch-bar S, having the perforation Q and R, the locking-bolt H and the frame P L, having the slots E and V, all as and for the purpose set forth.

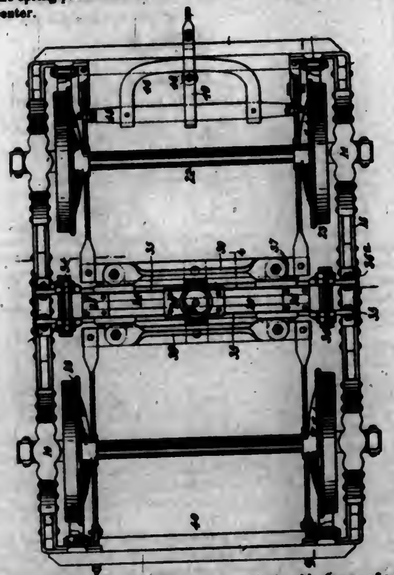
604,783. CARPET-SWEEPER. JOSEPH PARSEL and JOSEPH A. STAVIS, Grand Rapids, Mich. Filed Aug. 20, 1897. Serial No. 648,818. (No model.)

Claim.—1. In a carpet-sweeper, a case having a large opening in the top, a rotary brush and driving mechanism, a screen in said opening, a sponge above said screen, and an upper case inclosing said sponge, substantially as described.

2. In a carpet-sweeper, a case having a large opening in the top, an upper case covering said opening and hinged to said first-named case, a strip surrounding said opening, a screen in said opening, and a sponge supported on said screen, and a rotary brush below said opening, and means for rotating said brush, substantially as described.

3. In a carpet-sweeper, a case having a large opening in the top, a metal strip surrounding said opening, a screen attached to said strip, a case above said screen, a metal lining in said case, a sponge supported on said screen and within said case, a rotary brush below said screen and sponge, and means for rotating said brush, substantially as and for the purpose specified.

604,784. CAR-TRUCK. EDGAR PEMBHAM, New York, N. Y. Filed Aug. 4, 1897. Serial No. 647,094. (No model.)



Claim.—1. In a car-truck, the combination with the side frames, of a car-body-supporting bolster, a spring-plank suspended by links below the bolster, a half-elliptic spring and a pair of spiral springs arranged on the spring-plank and supporting the bolster, the ends of said half-elliptic spring bearing on the spring-plank toward its ends and at its middle supporting said bolster, and the spiral springs also bearing on the spring plank near its ends.

2. In a car-truck, the combination with the side frames, of a car-supporting bolster, a plank suspended below the bolster, spiral springs and a half-elliptic spring between the plank and bolster, and a yielding bearing between the bolster and said half-elliptic spring.

3. In a car-truck, the combination with the side frames, of a car-body-supporting bolster, a spring-plank and two pairs of links whereby said spring-plank is suspended beneath the bolster, and a series of springs all bearing on said plank at or near its ends, a part of said springs directly supporting the bolster at or near its ends, and the rest of said springs supporting the bolster at its center.

4. In a car-truck, the combination with the side frames, of a car-supporting bolster, a plank suspended below the bolster, spiral springs between the plank and bolster, and a half-elliptic spring bearing on the plank near its ends and against the bolster at its center, and a pair of transverse bars or transoms one on each side of the bolster and supported by the truck.

5. In a car-truck, the combination with the side frames, of a car-body-supporting bolster composed of two channel-bars set on edge and held together by bearing-plates at their ends and a suitable plate in the middle, two transverse bars or transoms secured in pockets on the side frames of the truck, two pairs of links suspended from said transoms beyond the ends of the bolster, a spring-plank supported by said links beneath the bolster, and a series of springs arranged on said spring-plank and sustaining the bolster, one of said springs bearing on the spring-plank near its ends and bearing against the bolster at its center.

6. In a car-truck the combination, with the side frame, of a bolster, links depending from supports on the truck-frame and having a slight outward inclination from the point of support, a plank supported by the links at their lower ends, and springs bearing on said plank near its ends, one of said springs supporting the bolster at its center.

7. In a car-truck, the combination with the side frames and transverse bars or transoms 35 seated in pockets on the side frames, of a car-body-supporting bolster arranged between said transoms, two pairs of links carried by said transoms beyond the ends of the bolster, a spring-plank suspended below the bolster by said links, a half-elliptic spring the ends of which bear on said spring-plank near its ends, the center of the bolster resting on said spring and two spiral nest-springs seated in pockets attached to the bolster and the spring-plank near the ends of the latter.

8. In a car-truck, the combination with the transverse end beam connecting the side frames together, of a half-elliptic spring suitably mounted on said end beam and provided on its top with a rolling wheel or the like adapted to coact with the car-body sill against which said wheel normally bears for the purpose set forth.

9. In a car-truck the combination with the transverse end beam of the truck-frame, of a half-elliptic spring mounted on said end beam, adjustable pockets for the end of said half-elliptic spring and means on top of said spring adapted to coact with the car-body sill as set forth.

10. In a car-truck, the combination with the transverse end beam of the truck-frame, of a half-elliptic spring suitably mounted on said end beam, adjustable pockets for the ends of said half-elliptic spring, and a rolling wheel or the like journaled on top of said spring and adapted to coact with the car body sill for the purpose set forth.

11. In a car-truck, the combination with the end beam, of a half-elliptic spring adjustably supported on said beam and provided on its top with a rolling wheel, and pockets for the ends of said half-elliptic spring to rest in, and removable portions adapted to fit said pockets to vary the height of their seating-surfaces for the purpose set forth.

12. The combination with a car-truck equipped with a center-bearing car-body-supporting bolster, of a spring traction-regulating appliance located on the end of the truck outside the wheels, whereby increased traction is obtained on the wheels between the bolster and said end of the truck.

13. In a car-truck, the combination with a center-bearing bolster and the driving-wheels, of a half-elliptic spring adjustably supported on the end beam of the truck outside the driving-wheels and provided with a rolling wheel on its top surface for the purpose set forth.

14. In a car-truck, the combination with a center-bearing bolster and a traction-regulating appliance supported upon the end beam of the truck-frame, of a pair of wheels and their axle between said bolster and traction-regulating appliance on said end beam, and a motor supported on the axle of said wheels.

15. In a car-truck, the combination with the driving-wheels and a motor supported on the axle of said wheels, of a center-bearing bolster supported on the truck-frame and a half-elliptic spring adjustably supported on the end beam of the truck-frame, outside the driving-wheels, and provided with a rolling wheel at its top, for the purpose set forth.

604,785. BAKING-VARNISH. JESSE PETTIBONE, Lockport, N. Y., assignor to the United Indurated Fibre Company, same place. Filed Feb. 17, 1897. Serial No. 623,795. (No specimens.)

Claim.—1. The herein-described baking-varnish or enamel which consists of boiled corn-oil as its essential ingredient, and a resin or gum mixed therewith, substantially as described.

2. The herein-described baking-varnish or enamel which consists of corn-oil, resin or gum, and a drier, said materials being used in substantially the proportions stated, substantially as described.

604,786. COFFIN-FASTENER. LEVI L. FLETCHER, Malta, Ohio. Filed Dec. 6, 1897. Serial No. 661,613. (No model.)

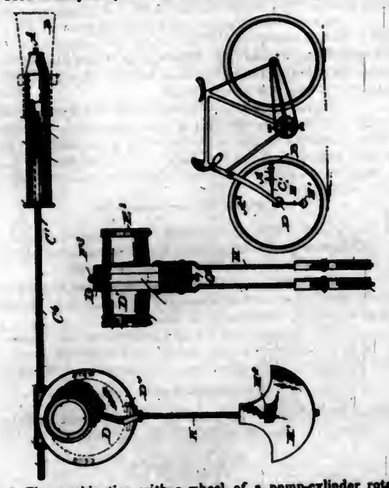
Claim.—1. A catch comprising a base-plate, a latch-piece having a loose fulcrum engagement with an opening in the base-plate, and a spring secured at one end to the base-plate and provided with a slot receiving therein a portion of the latch-piece to pivotally and removably hold the latter in place, substantially as set forth.

2. A catch comprising a base-plate formed with a latch-opening, a latch-piece having a catch arm or hook loosely fitting in the latch-opening, a U-shaped latch-guard inclosing between its side arms said catch arm or hook and having its terminals clenched within the latch-opening, and a leaf-spring secured fast at one end to the base-plate and having its free end engaging with the latch-piece to pivotally and removably hold the latter in place, substantially as set forth.

3. A catch comprising a base-plate formed with a latch-opening and a smaller fulcrum-opening disposed in a line with and adjacent to the latch-opening, a latch-piece having a catch arm or hook loosely fitting in the latch-opening, and a lever-arm portion lying above the plane of the base-plate and disposed approximately at right angles to the catch arm or hook, said lever-arm portion being provided at its inner end with a round fulcrum-knob loosely engaging in the fulcrum-opening, and at its upper edge with an elongated shouldered projection, and a leaf-spring secured fast at one end to the base-plate and having a longitudinally-disposed slot engaging over the shouldered projection of the latch-piece, substantially as set forth.

604,787. PNEUMATIC-TIRE PUMP. CARMELLE PELOQUIN, Murphysborough, Ill., assignor of one-half to August Buta, same place. Filed Nov. 30, 1897. Serial No. 660,257. (No model.)

Claim.—1. The combination with a wheel, of an air-pump carried thereby, and driving means held against rotation during the pumping action and adapted to automatically rotate with the wheel when the pressure in said pump exceeds that of the holding means; substantially as specified.



2. The combination with a wheel, of an air-pump rotated thereby, weighted driving means loosely mounted upon the hub of the wheel, and a connection from said pump loosely mounted in relation to said driving means; substantially as specified.

3. The combination with a wheel, of an air-pump rotated thereby, an eccentric loosely mounted upon the hub of the wheel, a yoke loosely mounted upon said eccentric and connected to the piston-rod of said pump, and means for holding said eccentric against rotation until a predetermined pressure of air is exerted against the piston of said pump; substantially as specified.

4. The combination with a wheel, of an air-pump rotated thereby, an eccentric loosely mounted upon the hub of the wheel, a yoke loosely mounted upon said eccentric and connected to the piston-rod of the pump, and a weight for holding said eccentric against rotation during the pumping action; substantially as specified.

5. The combination with a wheel, of an air-pump rotated thereby, an eccentric loosely mounted upon the hub of the wheel, a yoke

loosely mounted upon said eccentric and connected to the piston-rod of said pump, and an adjustable weight suspended from said eccentric; substantially as specified.

6. The combination with a wheel, of a pump-cylinder rotated thereby, a piston-rod extending from said cylinder, an eccentric rotatably mounted upon the hub of said wheel, a yoke adjustably secured to said piston-rod, and automatic means for holding said eccentric against rotation during the pumping action of the piston-rod; substantially as specified.

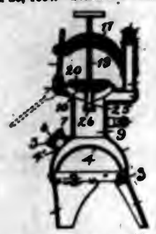
7. The combination with a wheel, of a pump-cylinder rotated thereby, a piston-rod extending from said cylinder, an eccentric rotatably mounted upon the hub of said wheel, a yoke adjustably secured to said piston-rod, means for holding said eccentric against rotation during the pumping action of the piston-rod, and a pawl-and-ratchet device for preventing the rotation of the eccentric at a speed greater than the rotation of the wheel-hub; substantially as specified.

8. The combination with a wheel, of a pump-cylinder carried thereby, a piston-rod extending from said cylinder and provided with a squared portion and a threaded end portion, a weighted eccentric located upon the wheel-hub, a yoke rotatably mounted upon said eccentric and adjustably connected to the threaded end of said piston-rod; substantially as specified.

9. The combination with a wheel, of a pump-cylinder and piston-rod carried thereby, an eccentric formed in sections and secured together so as to rotate upon the wheel-hub and a yoke rotatably mounted upon said eccentric and connected with said piston-rod; substantially as specified.

10. The combination with a wheel, of a pump-cylinder rotated thereby, an eccentric rotatably mounted upon the wheel-hub, and a sectional yoke secured together and connected to said piston-rod; substantially as specified.

11. The combination with a wheel, of a cylinder and piston-rod rotated thereby, a yoke carried by said rod, an eccentric rotatably mounted upon said hub, a threaded extension from said eccentric, a weight adjustable upon said extension, and a nut mounted to adjust said weight; substantially as specified.



12. The combination with a wheel, of a pump-cylinder and its piston-rod, a bearing secured upon the wheel-hub against rotation, an eccentric rotatably mounted upon said bearing, and a yoke rotatably mounted upon said eccentric and connected to said piston-rod; substantially as specified.

13. The combination with a wheel, of a pump-cylinder and its piston-rod, a bearing secured upon the wheel-hub against rotation, an eccentric rotatably mounted upon said bearing, a yoke rotatably mounted upon said eccentric and connected to said piston-rod, ratchet-teeth carried by said eccentric, and a pawl located upon said bearing; substantially as specified.

14. The combination with a wheel, of a pump-cylinder and piston-rod, an eccentric rotatably mounted upon the wheel-hub and provided with flanges at opposite sides thereof, a rotatable yoke located between said flanges and connected with said piston-rod, and a packing-band extending around said yoke and into contact with said flanges; substantially as specified.

15. The combination with a wheel, of a pump-cylinder and its piston-rod, means for reciprocating said rod, a contractible clamp exteriorly threaded and secured to the wheel-rim, and a nut engaging said threads for pressing and holding said clamp into contact with the pump-cylinder, substantially as specified.

604,788. VULCANIZER. BERNARD REIS, Rochester, N. Y., assignor of one-half to the Red Cross Cement and Rubber Company, same place. Filed Dec. 28, 1897. Serial No. 664,313. (No model.)

Claim.—1. In a vulcanizer, the combination with the base, the sheet-metal boiler 3 supported thereon, the heavier cast-metal closed steam-chamber 9 secured to the upper portion of the boiler and having the shaped upper surface, the standard mounted on the chamber, the arm on the standard, and the shaped clamping-block movable on the arm.

2. In a vulcanizer, the combination with the boiler, and the inclosed steam-chamber, constituting a work-support, of the vertical, hollow standard at one side communicating with the steam-chamber, the valve at the upper end thereof, a laterally-extending clamp-arm supported on the tube and extending over the chamber, and clamping devices thereon.

3. In a vulcanizer, the combination with the base, the boiler and the steam-chamber having the concaved upper surface, and the downwardly-extending recess 25 therein, of the standard at the side of the chamber, the arm 17 mounted thereon, the clamping screw operating through the arm and the convex block 20 with which the clamping-screw cooperates.

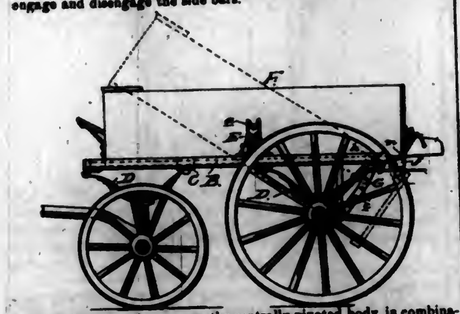
4. In a vulcanizer, the combination with the boiler and the inclosed steam-chamber, the exterior of which constitutes a work-support, of the vertical standard at one side of the work-support, the supporting-arm pivotally mounted on the standard and adapted to swing laterally over or away from the work-support, and clamping devices mounted on said arm.

5. In a vulcanizer, the combination with the boiler, the steam-chamber, the exterior of which constitutes a work-support, the vertical standard at one side of the work-support, the arm pivotally mounted thereon adapted to extend over or away from the work-support, the work-clamp mounted on the arm and the pivoted link at the side of the support adapted to engage the free end of the arm.

6. In a vulcanizer, the combination with a steam-chamber constituting the work-support, the standard at the side thereof, the arm pivoted on the standard and adapted to be moved laterally over and away from the work-support, the clamping-screw on the arm, and the block with which said screw cooperates.

7. In a vulcanizer, the combination with the steam-chamber, constituting a work-support, the hollow standard communicating with the interior thereof, the arm swiveled on the standard, the clamping device on the arm, the collar on the standard for securing the arm, and the adjustable valve at the upper end of the standard.

8. In a vulcanizer, the combination with the base, the boiler 3 having the convex exterior and the hemispherical concave bottom 4, of the steam-chamber 9 attached to the upper portion of the boiler having the shaped upper face, and clamping devices mounted on the steam-chamber embodying a shaped clamping-block, substantially as described.



9. In a vulcanizer, the combination with the boiler 3 having the convex exterior and the hemispherical concave bottom 4, the inclined threaded nipple 4× on the boiler, the glass 6 and the flanged nut 5 on the nipple, substantially as described.

604,789. DUMPING-WAGON. OLIVER B. REYNOLDS, Brockton, Mass. Filed Aug. 16, 1897. Serial No. 648,490. (No model.)

Claim.—1. In a dumping-wagon, a tilting body having trunnions about which it tilts and means whereby the trunnions are maintained approximately in the center of gravity of the load.

2. A dumping-wagon having a tilting body, trunnions about which the body tilts and means for adjusting the position of the trunnions on the body whereby the center of movement of the body is essentially the center of gravity of the load.

3. In a dumping-wagon, the side-bars having vertically-disposed standards or hangers, the body having centrally-located trunnions pivotally mounted in said standards whereby the body is substantially balanced and is tiltable about said trunnions, slidable bolts on the body, adapted to engage the side-bars to detachably lock the body thereto, said bolts having their outer ends made tapering or wedge-shaped and adapted to slightly elevate the rear end of the body and thereby remove the weight of the load from the trunnions, and a lever and connections whereby the bolts are operated and made to engage and disengage the side bars.

4. In a dumping-wagon, the centrally-pivoted body, in combination with slide-bolts for locking said body with a stationary part of the wagon, said bolts having tapering or wedge-shaped ends adapted to slightly elevate the rear end of the body and thereby remove the weight of the load from the pivots about which the body tilts, a lever and rods connecting the bolts with the lever upon each side of the pivot of the latter, and a means for holding the lever against accidental movement.

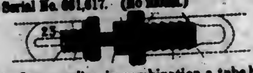
5. A dumping-wagon having a body with trunnions at its center adapted to enter open bearings in hangers on the main frame whereby the body is substantially balanced and tiltable about its central axis, bolts at the rear of the body and locking the same to the frame, and means for elevating the forward end of the body whereby the trunnions are lifted out of their bearings and the body tilted about the locking-bolts.

6. In a dumping-wagon the body portion, the stationary frame and means for supporting and elevating the front end of said body, bolts connecting the rear portion of the body to said frame and means whereby the bolts may be adjusted in vertical planes to vary the inclination of the body, said bolts serving as pivots about which the body is tiltable.

7. In a dumping-wagon, the side-bars of the main frame, a bracket depending from each of said bars and provided with a vertical series of holes or sockets, a tiltable body and bolts carried by the body and fitted to said series of holes or sockets and adjustably securing the rear of the body to said bars, and forming the axis about which the body is tiltable when its front end is raised.

8. In a dumping-wagon, the body thereof having a discharge, in combination with a chute pivotally secured to said body, pistes projecting from the body and having notched edges, and links on the chute adapted to detachably engage said edges and thereby secure the chute in its adjusted positions.

9. A dumping-wagon having a body provided with vertically-adjustable trunnions about which it tilts, in combination with a frame having hangers or standards to receive said trunnions.

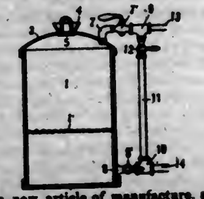


10. A dumping-wagon having a body provided with centrally-located side trunnions, means for vertically adjusting said trunnions, hangers or standards for the trunnions and means whereby they are adjusted vertically to correspond with the adjustment of the trunnions.

11. In a dumping-wagon, the stationary frame, and the tiltable body, in combination with levers fulcrumed to said body and provided with trunnions, a latching device for detachably securing the free end of the lever in its adjusted positions, and hangers or standards on the stationary frame each consisting of a channeled or slotted fixed member, a vertically-adjustable member having a bearing for said trunnions and a means for securing the movable member in its adjusted positions.

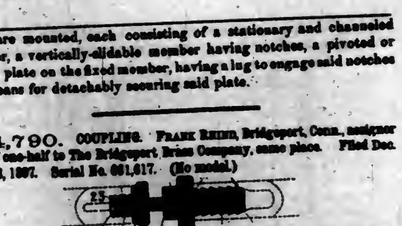
12. In a dumping-wagon, the combination of the frame having adjustable hangers or standards, of a tiltable body having levers fulcrumed to its sides and provided with trunnions, and latching devices for the levers each consisting of a stationary member, a member hinged or pivoted thereto, and provided with recesses or notches adapted to receive the free end of the lever and means for detachably securing the movable member.

13. In a dumping-wagon and in combination with a tiltable body having side trunnions, the hangers or standards in which the trunnions are mounted, each consisting of a stationary and channeled member, a vertically-slidable member having notches, a pivoted or hinged plate on the fixed member, having a lug to engage said notches and means for detachably securing said plate.



604,790. COUPLING. FRANK REID, Bridgeport, Conn., assignor of one-half to The Bridgeport Brass Company, same place. Filed Dec. 13, 1897. Serial No. 661,817. (No model.)

Claim.—1. In a coupling in combination a tube having a tapered seating end, a nipple also having a tapered seating end adapted to engage with the end of said tube said nipple being free as to rotation and limited as to longitudinal motion in relation to said tube, a thread on said tube and a nut on said thread adapted to hold said parts in their seated position, substantially as described.

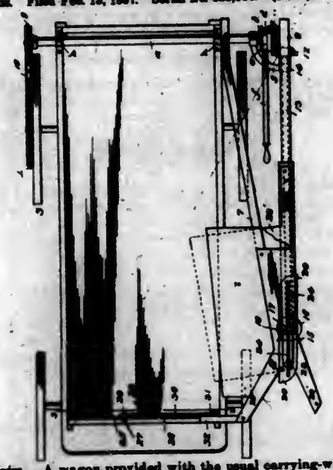


2. In a coupling in combination a tube provided with means for engaging a flexible pipe and flared at its free end, a nipple on said tube and tapered to receive the flared end thereof, a thread on said tube intermediate of its length and a nut on said thread adapted to bear against said nipple and to force said flared tube and said tapered nipple portion into engagement, substantially as described.

604,791. BEER-PIPE CLEANER. BERT REESE, Detroit, Mich. Filed July 8, 1897. Serial No. 643,912. (No model.)

Claim.—As a new article of manufacture, a beer-pipe cleaner, consisting of a pressure-tight chamber or tank, said tank having a flat bottom and a bulged head, a funnel 4 fitted in said head and a stopper 5 adapted to screw thereinto, the perforated or screen diaphragm extending across the interior of said tank, the water-inlet cock 7' leading into the interior of said chamber through the upper portion of one end, and a fluid-outlet 8' at the other, the T connections 9 and 10 united with said cut-offs 7' and 8', the pipe 11 and valve 12 located between said T connections in such a way as to establish communication therebetween, and the flexible tubes 13 and 14 also united with said T connection, all substantially as and for the purpose set forth.

604,792. CLAMP FOR RAILS. HIRAM K. RITTER, Reading, Pa. Filed Oct. 27, 1897. Serial No. 656,608. (No model.)



Claim.—1. A clamp for securing rails, &c., in place consisting of a body, slit transversely producing two parts one of which is adapted to be forced beneath the flange of one member and the other part to overlap said flange, and a tongue formed on said body to engage the flange of the other member, substantially as shown and described.

2. In combination, a railway-rail having notches therein, cross-ties also having notches therein, a clamp-plate having a body for engagement with a flange of the rail and a notch therein, a hook formed upon said clamp adapted for engagement with the flange of the tie and a notch therein, and a tongue so arranged as to be forced beneath the flange of the rail, as specified.

3. The herein-described combination of two beams crossing each other, a clamp-plate consisting of a body adapted to overlap the flange of one of said beams, a tongue for passing beneath said flange, and a hook projecting at right angles to the tongue and body adapted to engage with a flange of the other beam, as shown and described.

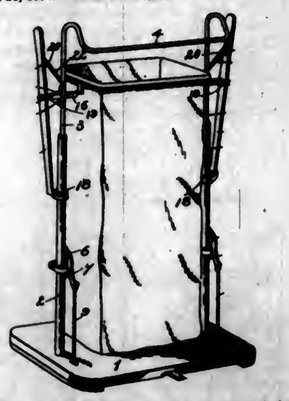
604,793. CORN-CUTTER. WILLIAM ROWLAND, Independence, Kans. Filed Feb. 13, 1897. Serial No. 623,336. (No model.)

Claim.—A wagon provided with the usual carrying-wheels, the sprocket-wheel rim 1 removably secured to one of said wheels, in combination with the tube *a* mounted in the brackets A A, fixed to the upper edge of the sides of the wagon near its rear end, the shaft 8 journaled in said tube, the sprocket-wheel 9 fixed on one end of said shaft, the sprocket-chain 10 connecting said rim 1 and sprocket-wheel, the bevel gear-wheel 11 fixed on the opposite end of said shaft, the platform-frame 7 pivoted at its rear end to said tube *a* and adjustably connected at its forward end to the front end of the wagon-box, the longitudinal tube A fixed in said platform-frame, the shaft 13 journaled in said tube A, the bevel gear-wheel 12 fixed to the rear end of said shaft 13 and the bevel-gear 15 fixed to the forward end of said shaft, the vertical shaft 17 journaled in the forward end of said platform-frame, the bevel gear-wheel 16 fixed to the lower end of said vertical shaft and in mesh with the gear-wheel 15, the diverging finger guards 29 and the throat-plate 23, fixed in the forward end of the platform-frame, the cutter-blades 30, 30 horizontally fixed to said vertical shaft, the reel or fan arms 24, 24 fixed to said shaft above said blades, and the shield 28 fixed to said platform above the fan-arms and inclined downwardly over the inside of the wagon-body, substantially as shown and described.

604,794. BOLSTER FOR RAILWAY-CARS. CHARLES T. SCHOCH, Philadelphia, Pa. Filed Feb. 25, 1898. Serial No. 671,560. (No model.)

Claim.—1. A bolster, comprising a body member made U shape in cross-section and having its top covered in by a substantially U-shaped channel cover-plate, inserted within the body and secured to its sides substantially as described.

2. A bolster, comprising a member U shape in cross-section, with one surface substantially level and the opposite surface bellied, and a channeled cover-plate riveted within and to the sides of the U-shaped member, substantially as described.



3. A bolster, comprising a body U shape in cross-section, and a channel cover-plate arranged within the sides of the body and united therewith, the whole constituting a boxed girder, substantially as described.

4. A bolster, of box form, comprising a girder U shape in cross-section, having its top closed by a cover channel-plate inserted between and riveted to the sides of the girder, and end and center braces, substantially as described.

5. A bolster, comprising a body member made U shape in cross-section, and having solid sides and bottom, and a top member arranged within and riveted to the sides of the body member, and the whole constructed of pressed steel, substantially as described.

6. A built-up bolster, comprising a body member made U shape in cross-section, and having its top covered in by a channel cover-plate arranged between and riveted to its sides, and adapted for interchange in ordinary diamond trucks, substantially as described.

604,795. SACK-HOLDER. EDWARD H. SCHWEY, Shoals, Ind. Filed Apr. 28, 1897. Serial No. 634,203. (No model.)

Claim.—1. A sack-holder having a frame provided with oppositely-alined guides, a sectional stretcher having relatively-adjustable members adapted to engage the mouth of a sack, and provided respectively with alined terminal stems or shanks fitted to slide in said guides, said members having alined telescoping arms, operating-levers respectively connected with the stems or shanks and having sliding fulcrums upon the frame, and means for locking said levers with the stretcher members at the desired relative adjustment, substantially as specified.

2. A sack-holder having a frame provided with oppositely-alined guides, a sectional stretcher having relatively-adjustable members adapted to engage the mouth of a sack, and provided respectively with alined terminal stems or shanks fitted to slide in said guides, said members having alined telescoping arms, operating-levers respectively connected with the stems or shanks and having sliding fulcrums upon the frame, and locking devices yieldingly held in operative engagement with the levers, to maintain the stretcher members at the desired relative adjustment, substantially as specified.

3. A sack holder having a frame, a sectional stretcher adapted to engage the mouth of a sack and having members of which one is adjustable relatively to the other and is provided with a stem or shank fitting in a guide on said frame, an operating-lever connected with said stem or shank, and means for securing the lever at the desired adjustment, said means consisting of a gravity-pawl engaging a ratchet on the lever, substantially as specified.

4. A sack-holder having a frame, a sectional stretcher having relatively-adjustable members provided respectively with stems or shanks fitted in guides on said frame, operating-levers connected with said stems or shanks, set-screws for engaging the stems or shanks to secure them at the desired adjustment, and yielding pawls for engaging the levers, substantially as specified.

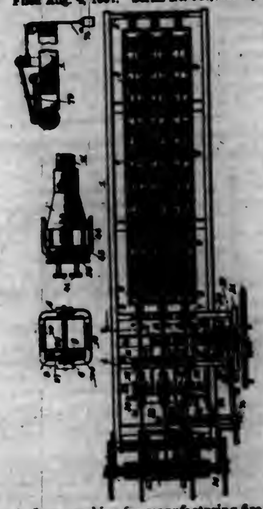
5. A sack-holder having a frame including standards curved laterally at their upper extremities and connected by a cross bar, and a stretcher mounted upon the frame below the plane of said cross-bar and adapted to support a measure, said cross-bar forming a guard or rest for a measure supported by the stretcher, substantially as specified.

6. A sack-holder having standards of sectional telescoping construction, a stretcher carried by the movable sections of the standards and comprising relatively-adjustable members, and operating-levers connected with the stretcher members and having their fulcrums mounted to slide upon the fixed members of the standards, substantially as specified.

7. A sack-holder having a frame including standards, each of which comprises a fixed tubular member and a movable member fitted to slide in the tubular member, means for locking the movable members at the desired adjustment, a sectional stretcher having its members mounted respectively upon the movable standard members, collars mounted to slide upon the fixed standard members, and operating-levers fulcrumed upon said collars and operatively connected with the stretcher members, substantially as specified.

8. A sack-holder having standards, each of which comprises a fixed tubular and a movable member, a stretcher supported by the movable members of the standards, pawls for engaging said movable members to secure them at the desired adjustment, a trip-bar terminally connected by links with said pawls, and oppositely-disposed trip-levers or treadles operatively connected with the trip-bar, substantially as specified.

604,796. STANDARD. CHARLES J. SHAW, Owosso, Mich., assignor to W. H. Shaw, Duffield, Mich. Filed Dec. 20, 1897. Serial No. 617,209. (No model.)



Claim.—1. In an end standard of the class described, the combination with the upper open box or member, the uprights detachably secured thereto at their upper ends, of the lower clamping members and fastening devices for detachably securing the clamping members together and to the lower ends of the uprights; substantially as described.

2. An end standard of the class described, the same comprising an upper member, uprights having upper and lower inwardly bent or extending ends, a lower member having open box-like portions adapted to receive the lower inwardly-bent ends of the uprights, fastening devices connecting said lower ends to the lower member, and fastening devices connecting the upper ends to the upper member.

3. The herein-described end standard, the same comprising an open box, uprights having upper and lower inwardly-bent ends, which uprights converge downwardly, lower separable clamping members, the upper one of which is provided with open boxes that receive the lower inwardly-bent ends of the uprights, fastening devices connecting the upper bent ends of the uprights to the bottom of the upper box, and fastening devices passing through the lower inwardly-bent ends of the upright and the two clamping members.

604,797. MACHINE FOR MAKING FIRE-ESCAPE LADDERS. MICHAEL SHIRK, Spring Mills, and JOHN O. A. KNEPPLY, Johnstown, Pa., assignors to the Johnstown Fire Escape Company, Limited, Johnstown, Pa. Filed Aug. 4, 1897. Serial No. 647,009. (No model.)

Claim.—1. In a machine for manufacturing fire-escape ladders, the combination of a spool-carrying frame, a tube connected to the frame and through which the wires pass from the spools, a pair of jaws pivotally connected to the tube and provided with perforations through which the wires pass, devices to open said jaws to separate the wires for the insertion of a rung, and means to rotate the spool-frame and the jaws, substantially as described.

2. In a machine for manufacturing fire-escape ladders, the combination of the spool-carrying frames, tubes rigidly connected to the frames, recessed cones carried by said tubes, inner tubes slidably supported in the first-named tubes to rotate therewith, disks carried by the said inner tubes, a pair of jaws pivoted in each of said disks, each jaw having perforations through which the wires pass, curved arms on said jaws working in the recesses in the cones, means to reciprocate the inner tubes to open or close the jaws, and means to rotate the spool-frames, the tubes, and the jaws, substantially as described.

3. In a machine for manufacturing fire-escape ladders, the combination of the spool-carrying frames, wire-twisting devices carried by the frames, gearing to rotate the frames and twisting devices simultaneously, a driving-wheel, a clutch connection between said gearing and the driving-wheel, a drum on which the completed ladder is wound, and mechanism operated by the successive rungs of the completed ladder to disengage the members of said clutch, substantially as described.

4. In a machine for manufacturing fire-escape ladders, the combination of spool-carrying frames, wire-twisting devices carried by the frames, gearing to rotate the frames and twisting devices simultaneously, a driving-wheel, a clutch connection between said gearing and the driving-wheel, a drum on which the completed ladder is wound, a roller journaled in the frame over which the completed ladder moves to the winding-drum, a spring-actuated pivoted lever connected at one end to the movable member of the clutch, a locking-lever pivoted on the frame and engaging at one end the spring-actuated lever to hold the clutch members locked, an arm pivotally connected to the other end of said locking-lever and projecting over the said roller to be engaged by the successive rungs of the completed ladder to trip the locking-lever and release the clutch mechanism, substantially as described.

5. In a weaving-machine of the class described, the combination with the twisting mechanism; of the drum for the woven structure, ratchet mechanism arranged on the drum-shaft and having a swinging pawl-carrying arm, a normally-elevated movable support carrying a head slidably engaging said pawl-carrying arm, and a normally-elevated movable contact-bar arranged beneath the drum and engaging with said movable support, substantially as set forth.

6. In a machine for manufacturing fire-escape ladders, the combination of the wire-twisting devices, the drum on which the completed ladder is wound, a ratchet-wheel on the shaft of the drum, an arm pivoted at one end on the drum-shaft, a spring-pawl carried by the arm to engage the teeth of the ratchet-wheel, a sliding head on the arm, means connected to the sliding head to oscillate said arm to turn the wheel and drum, a sliding bar arranged below the drum transversely thereof and adapted to be engaged and moved by the completed ladder as it is wound on the drum, a weight to normally hold the bar in contact with the woven structure on the drum and connections between said bar and the sliding head, substantially as described.

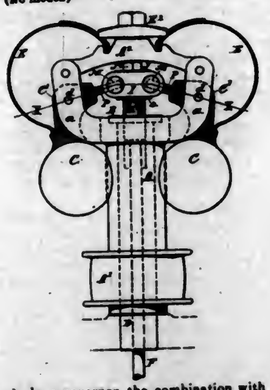
7. The combination of the wire-twisting devices, the flanged drum on which the completed ladder is wound, a ratchet wheel rigid on the shaft of the drum, an arm pivoted at one end on the drum-shaft, a spring-pawl carried by the arm to engage the teeth of the wheel, a sliding head on the arm, means connected to the sliding head to oscillate said arm to turn the ratchet-wheel and drum, a bracket supported on the frame to have vertical movement, a bar carried by the bracket and extending across below the drum, a weight to hold the bar normally in engagement with the completed ladder on the drum, a U-shaped bar straddling the flange of the drum and connected at one end to the sliding head, a pulley journaled on the other end of said U-shaped bar to engage the bar carried by the bracket, whereby the position of the head is changed as the ladder is wound on the drum and the speed of the drum thereby decreased, substantially as described.

8. In a machine for manufacturing fire-escape ladders, the combination of the wire-carrying spools, collars secured at one end to said spools, a pair of bars engaging the collars on adjacent pairs of spools, a bolt connecting said bars midway their length, and thumb-nuts on said bolt to regulate the pressure of the bars on the collars, substantially as described.

9. In a weaving-machine of the class described, the combination of a spool-holder, and the twisting device having means for separating the strands of wire, and causing the latter to approach and recede from the axis of rotation, substantially as set forth.

10. In a weaving mechanism of the class described, a rotatable twisting device having wire-holders each provided with a plurality of perforations for threading the wire strands therein, and means for causing the two sets of wire strands to approach and recede from the axis of rotation.

11. In a weaving-machine of the class described, a rotatable twisting device having wire-holders each provided with a plurality of perforations for threading the wire strands therein, and means for simultaneously adjusting said holders to cause the sets of strands carried thereby to approach and recede from the axis of rotation.



12. In a weaving-machine of the class described, a rotatable

twisting device having a pair of movable wire-holders, and means for causing said holders to move in a direction toward and away from each other.

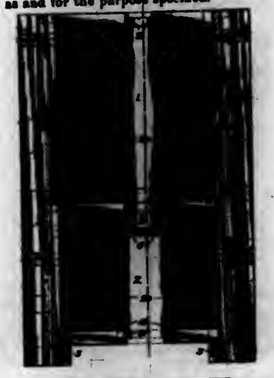
13. In a weaving-machine of the class described, a rotatable twisting device having a pair of pivotal wire holders or jaws provided each with a plurality of wire openings or perforations, and means for oscillating said holders or jaws on their pivots.

14. In a weaving-machine of the class described, the combination with the twisting mechanism for the parallel cables, of a rotatable drum for the woven structure, and means for automatically stopping the rotation of said drum and the operation of the twisting mechanism when a certain predetermined length of the woven structure is complete.

604,798. GOVERNOR MECHANISM. JOHN W. SMITH and ALBERT H. ANTHONY, Worcester, Mass. Filed Jan. 15, 1898. Serial No. 666,771. (No model.)

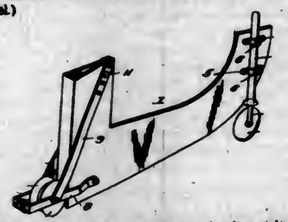
Claim.—1. In a governor, the combination with the ball-lever and valve-actuating rod; of a center block running on the valve-rod head, and a connection from said center block to said ball-lever consisting of the transversely-disposed joint-roller and the finger-pin engaging with said roller for operation substantially as set forth.

2. The combination, with the swinging governor-lever, and the swiveling center block carrying the endwise-movable rod; of the transversely-disposed roller mounted to rock within a cylindrical recess formed in one of the parts, and a straight projecting finger-pin rigidly fixed on the other part and extending into a hole formed in said roller perpendicular to the axis thereof, and movable therein, substantially as set forth.



3. The combination, as described, of the valve-rod, the valve-rod head having the conical-faced flange and centering stud thereon, the conical-faced washer fitting over said stud, its fastening-screw, the center block mounted to turn on said head and having cone-shaped recesses matching said flange and washers, the governor-ball levers and a hinging joint connection joining said center block and governor-ball levers, substantially as set forth.

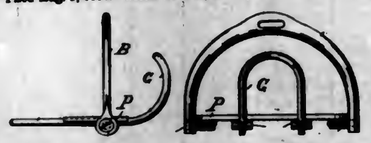
4. In combination, the rotatable sleeve having the bifurcated arms, the governor-ball levers pivoted to said arms, the central valve-rod having the conically-flanged head, the center block mounted on said head to turn freely between the conical bearing-surfaces, the joint rollers arranged in transversely-disposed openings extending across the opposite ends of said center block, said rollers having a hole therein perpendicular to their axis, and the finger-pins respectively fixed in the governor-ball levers and fitting into the holes in the joint-rollers, for the purposes set forth.



604,799. WINDOW-SCREEN. ELWYN SPEAKER, Egan City, Ill. Filed Sept. 24 1897. Serial No. 652,897. (No model.)

Claim.—1. In an adjustable screen, the combination of wings having transverse grooves or seats in their inner faces, and channels at the bottoms of the said grooves or seats, longitudinally-slotted plates fitted into the said transverse seats, and clamp-bolts mounted in openings in the screen and passing through the slotted plates and having their heads operating in the aforesaid channels, substantially as set forth.

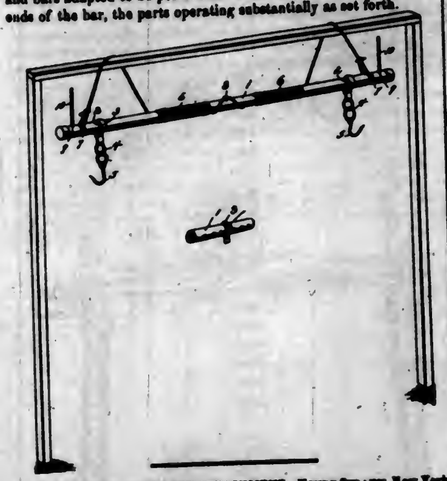
2. In combination, a screen, laterally-adjustable wings having transverse grooves formed with undercut edges and inner ends, plates having their edges and inner ends beveled and fitted into the said transverse grooves and having longitudinal slots which extend through the outer ends of the plates, and clamp-bolts passing through openings in the side stiles of the screen and having their headed ends operating in the grooves of the wings and slots of the aforesaid plates, substantially as and for the purpose specified.



604,800. RUNNER FOR SEED-PLANTERS. WILLIAM I. SPENCER, Admire, Kans. Filed Feb. 16, 1898. Serial No. 670,545. (No model.)

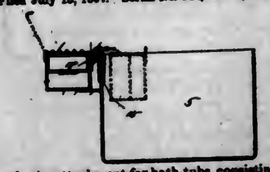
Claim.—A runner for seed-planters, having at its forward end a vertically-adjustable swiveled colter-wheel, and at its heel a seed-coverer, consisting of two disks the contiguous faces of which are convex, arms pivoted to the runner and to the disks, and having their rear ends bent at right angles to their length and slotted, a bolt for clamping the slotted ends together in desired adjustment, and links pivoted to said arms and having vertical rows of perforations through which passes a bolt for the purpose of adjusting the covering-disks, substantially as set forth.

604,801. STIRRUP. CARL STRENKER, Dinglingen, Germany. Filed Aug. 5, 1897. Serial No. 647,908. (No model.)



Claim.—A stirrup the foot-plate of which is pivotally connected by its middle length axis to the Π-shaped main body and in which base-plate a fork-like-shaped bow is adjustably guided, substantially as set forth.

604,802. HOISTING DEVICE. ROLLA STEWART and WILLIAM R. WINCHEL, Wolcott, N. Y. Filed June 23, 1897. Serial No. 641,968. (No model.)

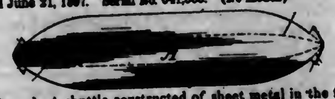


Claim.—1. The combination with a suitable support of a supporting-bar, and a rope attached at its ends to the respective ends of said bar and adapted to be drawn over said support, with its looped portion attached to said bar, substantially as set forth.

2. The combination with a suitable support of a bar, a rope secured at its ends to the respective ends of the bar, said rope adapted to be suspended by said support and have its looped end attached to the bar intermediate its ends, and supporting-hooks loosely attached to said bar, substantially as set forth.

3. The combination with a suitable support of a bar, a rope secured at its ends to the respective ends thereof, a hook carried by the bar intermediate its ends, said hook adapted to receive the looped portion of the rope when the same has been passed around said support, said bar being formed with annular grooves adjacent its ends, looped straps engaging said grooves, hooks carried by said straps, and bars adapted to be positioned within the passages formed in the ends of the bar, the parts operating substantially as set forth.

604,803. BATH-TUB ATTACHMENT. HENRY STRAUS, New York, N. Y. Filed July 15, 1897. Serial No. 644,721. (No model.)



Claim.—1. An attachment for bath-tubs, consisting of an oblong casing or receptacle which is divided by a transverse partition into two compartments, one of which is adapted to receive soap, and the other a sponge, said attachment being provided at its opposite ends with holders or receivers for a glass, and for a brush and comb, and said attachment being also provided with a hinged cover and with spring-clamps by which it may be connected with the bath-tub, substantially as shown and described.

2. The herein-described attachment for bath-tubs, said attachment being oblong in form and open at the top, and provided with a hinged cover, and at the opposite ends thereof with holders or receivers for a glass and brushes and other toilet articles, and said attachment being also divided transversely into two separate compartments, substantially as shown and described.

3. An attachment for bath-tubs, which is open at the top and oblong in form, and provided with a transverse partition, into two compartments, one of said compartments being provided with a detachable perforated receptacle, and the other with an open receiver, and the walls of said attachment below said detachable receptacle and said receiver being perforated, substantially as shown and described

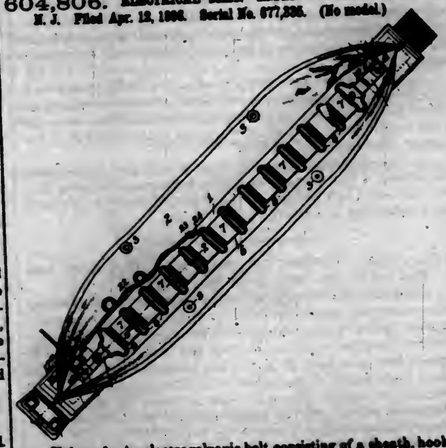
4. An attachment for bath-tubs, which is open at the top and oblong in form, and provided with a transverse partition, into two compartments, one of said compartments being provided with a detachable perforated receptacle, and the other with an open receiver, and the walls of said attachment below said detachable receptacle and said receiver being perforated, said attachment being also provided with hinged clamps by means of which it may be connected with the bath-tub, substantially as shown and described.

604,804. SHUTTLE FOR LOOMS. LEE STURGES, Chicago, Ill. Filed June 21, 1897. Serial No. 641,585. (No model.)

Claim.—1. A shuttle constructed of sheet metal in the form of a seamless three-sided shell having tapered points and integral deck portions at said points closing the ends of the otherwise open side.

2. A shuttle constructed of sheet metal in the form of a seamless three-sided shell having tapered points, provided with integral deck portions closing the ends of the otherwise open side, and provided with metal filling occupying the cavities within the points beneath the deck portions.

604,805. HEEL-SPRING FOR BOOTS OR SHOES. GEORGE R. SWAN, Beaver Dam, Wis. Filed Apr. 22, 1897. Serial No. 633,363. (No model.)



Claim.—1. A spring attachment for heels, comprising a plate adapted for attachment to a heel and having an opening therein, a tread-block having its ends resting against the inside of the plate, the tread-block being of reduced thickness at its rear end and its forward thickened end projecting outward through the slot in the plate, and a spring bearing against and exerting a downward pressure on the block, the spring at its forward end pressing against the front end of the tread-block and the rear end of the tread-block being free to slide on the plate when the front end is pressed inward, substantially as described.

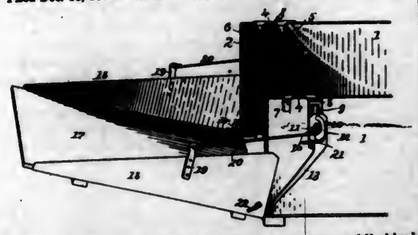
2. A spring attachment for heels, comprising a plate adapted for attachment to a heel and having a slot therein, a tread-block of tapering outline projecting through said hole having a lug upon the thicker end thereof limiting its outer projection and an inwardly-extending knob upon the same end, the smaller end of said tread-block resting upon the inner side of the plate, and a spirally-coiled spring mounted upon the plate within the reduced end of the tread-block and having a loop projecting forwardly from the middle thereof, and terminating in an eye encircling the knob on the tread-block, whereby the block is loosely held projected and its rear or reduced end is free to move on the plate, substantially as described.

3. A spring heel attachment, comprising a plate adapted for attachment to a heel, said plate having an opening therein, lugs on each side of said opening projecting beyond the upper surface of the plate, a pin connecting said lugs, a tread-block loosely swinging in the opening of the plate and provided with a knob at the top of its thickened forward end, a spring coiled around said pin having bearing upon said plate and provided with an extension which embraces the knob on the tread-block, a lug horizontally projected from the tension-control or forward end of the tread-block adapted for engagement with the upper surface of the plate, and a loop formed upon the plate at its forward portion and exteeding upwardly therefrom, substantially as described.

604,806. ELECTRICAL BELT. ANDREW J. TAYLOR, Vineland, N. J. Filed Apr. 12, 1898. Serial No. 677,326. (No model.)

Claim.—1. An electrogalvanic belt consisting of a sheath, hook-plates attached thereto, a battery detachably connected to said hook-plates within the sheath, and battery-electrodes arranged outside of the sheath and having a hinged connection with the sheath and electrical connection with the hook-plates in the battery, substantially as described.

2. An electrogalvanic belt comprising a sheath, hook-plates attached thereto, hinge-plates having electrical connection with said



hook-plates, battery-electrodes hinged to the hinge-plates and provided with removable fibrous pads, and a battery detachably connected to the hook-plates within the sheath, substantially as described.

3. An electrogalvanic belt comprising a sheath, hook-plates attached thereto, battery-electrodes having hinged electrical connections with said hook-plates, fibrous pads removably fitted to said battery-electrodes, and a battery connected to said hook-plates, substantially as described.

4. An electrogalvanic belt consisting of a sheath, the hook-plates attached to the sheath, the clips attached to the hook-plates to have electrical connection therewith by the same rivets which attach said hook-plates to the sheath, the loops having hinged connection with the clips, a battery having its cells joined by hinged loops and provided with attaching-loops that engage the hook-plates, and a conductor provided at its ends with hooks, one of said hooks engaging with an auxiliary loop and the other hook detachably connected to any one of the series of hinged loops between the battery-cells, substantially as described.

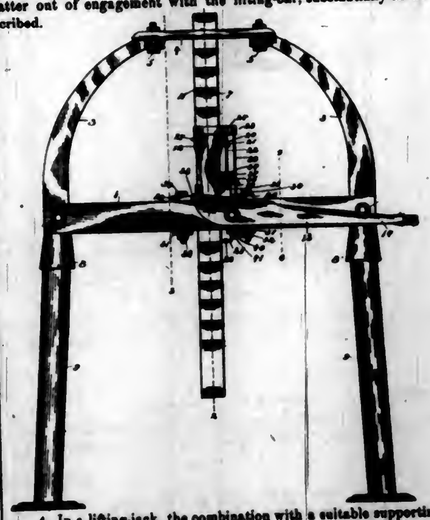
5. An electrogalvanic belt comprising a sheath, the hook-plates attached thereto, the clips also attached to the hook-plates, the auxiliary loops hinged to the clips, a battery with attaching-loops engaging with the hook-plates, a terminal conductor having a hook engaging with the auxiliary loop, and a terminal body electrode attached to the terminal conductor and provided with a removable fibrous pad, substantially as described.

604,807. SCOOP-BOARD. FRANK M. TENNEY, Decatur, Ill. Filed Dec. 18, 1897. Serial No. 662,461. (No model.)

Claim.—1. A scoop-board fastening comprising a saddle-block composed of horizontal portion 4 and downward extensions 5, 6, 7 and 8, the last-named extension being vertically slotted, a plate 10 having a hitch-loop and a hinge-strap and a bolt to bind the plate to the slotted extension of the saddle-block, substantially as set forth.

2. A scoop-board fastening comprising a saddle-block composed of horizontal portion 4 and downward extensions 5, 6, 7 and 8, the last-named extension being vertically slotted, a plate 10 slotted horizontally and having a hitch-loop and a hinge-strap, and a bolt to bind the plate to the slotted extension of the saddle-block, substantially as set forth.

3. A scoop-board fastening comprising a vertically-slotted member adapted to be secured to a side-board of a wagon-bed, a plate slotted horizontally and having a hitch-loop and a hinge-strap, and a bolt to bind the horizontally-slotted plate to the vertically-slotted member, substantially as set forth.



4. In a scoop-board fastening, the combination of a plate slotted horizontally, a hitch-loop on the plate, a hinge-strap extending from the plate, and a bolt to fasten the plate to a side-board of a wagon-bed, substantially as set forth.

604,808. LIFTING-JACK. FRANK A. UPTEGROVE, Caney, Kans. Filed Feb. 20, 1897. Serial No. 624,401. (No model.)

Claim.—1. In a lifting-jack, the combination with a supporting-frame comprising parallel separated horizontal beams, of an operating-lever having its side portions arranged outside of said beams, a lifting-bar mounted to operate between said beams and provided on opposite sides with teeth, dogs pivotally connected to said lever on axes at right angles to the fulcrum of said lever and engaging said lifting-bar on opposite sides, and a spring connecting said dogs for holding the same in yielding engagement with said lifting-bar, substantially as described.

2. In a lifting-jack, the combination with a suitable supporting-frame comprising parallel beams, of a lifting-bar movable between said beams and provided on opposite sides with teeth, a lifting-lever embodying side portions which embrace said beams, dogs pivotally connected to said lever and engaging the lifting-bar on opposite sides, a spring for holding said dogs in yielding engagement with said lifting-bar, a rock-shaft, and links interposed between said shaft and dogs for tripping the latter, substantially as described.

3. In a lifting-jack, the combination with a suitable frame, of a toothed lifting-bar movable in said frame, an operating-lever fulcrumed on the frame, dogs pivotally connected to said lever and engaging the lifting-bar, means for holding said dogs in yielding engagement with said bar, a rock-shaft extending longitudinally of the lifting-bar and journaled thereon and also provided with a double crank, and links interposed between said crank and dogs for throwing the latter out of engagement with the lifting-bar, substantially as described.

4. In a lifting-jack, the combination with a suitable supporting-frame, of a toothed lifting-bar slidingly mounted therein, an operating-lever fulcrumed on said frame, dogs pivotally connected to said lever and engaging said lifting-bar, a second set of dogs fulcrumed on the frame and engaging said bar, means for holding said dogs in yielding engagement with said bar, and a pair of rock-shafts for independently moving said dogs out of engagement with the bar, substantially as described.

604,809. VALVE. WILLIAM G. URMSON, New Brunswick, N. J. Filed June 1, 1897. Serial No. 638,972. (No model.)

Claim.—1. A valve comprising a tubular portion, a valve-seat extended downward in the tubular portion, a tube of yielding material in said tubular portion and a flap-valve in said yielding tube, the said flap-valve being extended normally at a transverse incline whereby it is caused to have an equal pressure at all its bearing-points, on the valve-seat, substantially as specified.

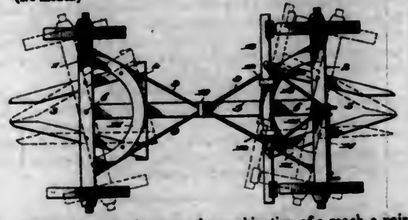
2. A valve, comprising a tubular casing having an interiorly-threaded portion, a valve-carrier having an exterior thread engaging therein, the said carrier having an inwardly extending valve-seat, a tube of yielding material in said valve-carrier, and a flap valve in said tube and having a hinge connection therewith at one side, the said flap-valve being normally extended at a transverse incline, whereby the pressure is equalized on the valve-seat, substantially as specified.

3. A valve, comprising a casing having annular ribs on its outer side, and a thimble for engaging over the nipple extended from a pneumatic tire into which the valve-casing is extended, the said thimble having its outer end turned over the end of the nipple, substantially as specified.

4. A valve comprising a tubular casing having its inner portion reduced, forming an exterior annular shoulder at the junction of the outer portion, the outer portion of said casing being provided with an interior screw-thread at the base of which an annular shoulder or seat is formed, a valve-carrier having an exterior screw-thread engaging with said interior screw-thread and adapted to engage its inner end against the shoulder or seat in the valve-casing, the said valve-carrier having an inwardly-extended valve-seat, and a flap-valve for engaging against said seat, the said flap-valve being normally extended at a transverse incline, substantially as specified.

5. A valve for a pneumatic tire, comprising a tubular casing having an interiorly-screw-threaded portion, a flap-valve arranged therein, a plug-cap having an exteriorly-screw-threaded portion for engaging the thread of the casing, the said screw-threaded portion having a longitudinal opening or slit, and a tongue pivoted to swing into and out of the slit, substantially as specified.

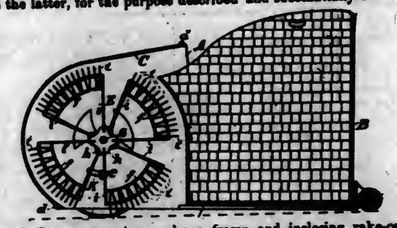
6. A valve for a pneumatic tire, comprising a tubular casing having an interiorly-screw-threaded portion and having an annular flange at its outer end, and also a projection outward from said flange forming a bearing, a plug-cap for engaging in said screw-threaded portion and having an annular channel in the inner side of its finger-piece, a flexible packing in said channel for engaging on the end of the valve-casing, a tongue pivoted to swing into and out of a slit in the threaded portion of the plug, and a valve in the valve-casing, substantially as specified.



604,810. AUTOMATIC JETTY FOR DEEPENING TIDAL WAYS. JOHN A. L. WADDELL, Kansas City, Mo. Filed Dec. 23, 1897. Serial No. 663,131. (No model.)

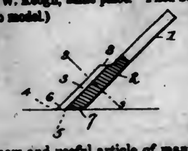
Claim.—1. In combination with piles driven into the bed of a tidal waterway on the side opposite to that which it is desired to deepen, and extending to the surface of the water, or above or below it, the top-hinged gates *b*, placed on the upstream side of the piles, substantially as shown.

2. In an automatic jetty, the combination of the piles *a*, extending in a line from the shore opposite to the harbor to be deepened and inclined in the direction of the outgoing tide, with the top-hinged gates *b*, on the upstream side of the row of piles and extending approximately from the surface of the water to near the bottom of the river, and also with sheet-piling driven into the river-bed and extending up toward the gates, for the purpose of preventing the current from washing the ground from the piles, substantially as shown.



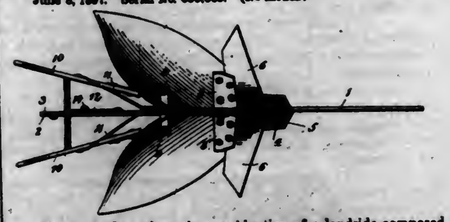
604,811. RUNNING-GEAR FOR VEHICLES. ROBERT H. WALLACE, New Concord, Ohio. Filed Mar. 31, 1897. Serial No. 630,151. (No model.)

Claim.—In a running-gear, the combination of a reach, a pair of axles pivoted to the ends of the reach, the centrally-arranged guide-block mounted on the reach between the ends thereof and provided with diagonally-disposed openings, the wires or rods 9 disposed diagonally of the running-gear, extending through the openings of the guide and secured at their terminals to the axles near the ends thereof, and the semicircular guides mounted on the axles and interposed between the ends of the wires or rods to take up the slack of the latter and cause the wheels to track perfectly in turning the vehicle, substantially as and for the purpose described.



604,812. ROTARY LAWN-RAKE. FREDERICK H. WALTON, Orono, Me. Filed May 8, 1897. Serial No. 635,647. (No model.)

Claim.—1. In a rotary lawn-rake composing a revolving rake, inclosing casing and frame mounted upon supporting-wheels having internal gears; a wheel-plate having a protruding hollow axle for mounting the driving-wheels, upon one side and a projection near its periphery on the opposite side, said projection provided with two opposite flanges and adapted to enter the opening in a locking-plate attached to the frame, for the purpose described; a hollow locking-plate with inwardly-disposed lips adapted to engage the flanges protruding from the projection on the wheel-plate, and having an opening for the rake-shaft to pass therethrough; a retaining-bolt connecting the driving-wheel, wheel-plate, and frame; with a pinion mounted upon the rake-shaft within the driving-wheel and meshing into the gear on the latter, for the purpose described and substantially as shown.



2. In a rotary lawn-rake a frame and inclosing rake-casing mounted upon driving-wheels; a rotating rake having spiral vanes with protruding rake-teeth; in combination with adjustable driving-wheels having internal gears thereon; a wheel plate with hollow driving-wheel axle protruding from one side, and a projection having opposite flanges adapted to engage in a locking-plate, protruding from its opposite side; a locking-plate with hollowed center and internally-protruding lips, so constructed to receive a circular or ball shaft-bearing within said plate and the projection locking in the same protruding from the wheel-plate; a ball-journal with central shaft-opening; a cam-bar protruding from a transverse hole in the rake-shaft; a pinion with cam-openings inclosing the said cam-bar and constructed to operate the rake-shaft in one direction only, said pinion mounted upon said rake-shaft and engaging the gears on the driving-wheels, all for the purpose described and substantially as shown and set forth.

604,818. SHREDDING-KNIFE. BERA H. WARD, Chicago, Ill., assignor to John W. Keogh, same place. Filed Sept. 20, 1897. Serial No. 652,336. (No model.)

Claim.—As a new and useful article of manufacture a knife for the purpose described having its forward side provided with upright grooves or channels constituting the edges 4 arranged at right angles to the line of movement of the knife and at short intervals apart, and a second series of edges arranged to the rear with respect to said edges 4 and in a plane therewith, and the bevels 6 7 formed along the lower edge of said knife, substantially as set forth.

604,814. PLOW. WILLIAM H. WARD, Dodd City, Tex. Filed June 8, 1897. Serial No. 639,835. (No model.)

Claim.—1. In a plow, the combination of a landside composed of two plates or component parts detachably connected and having their front ends of unequal length, and a point having a bar secured to the longer front end of the landside and having its rear end abutting against the front end of the shorter plate and coming flush with the outer side thereof, substantially as set forth.

2. In a plow, the combination of a landside composed of component plates or parts detachably connected together and having their front ends of unequal length, the plate having the shorter end being disposed on the outer side, a point having a bar placed against the projecting end of the inner plate and having its rear end abut-

ting against the front end of the shorter plate and coming flush therewith, and a beam secured to the inner side of the landside, whereby the outer side of the landside is unobstructed throughout its length, substantially as and for the purpose set forth.

3. In a plow, the combination with the point, and a landside secured so as to have the point project from either side, of a runner and a fastening for adjustably connecting the runner with the landside, substantially as set forth.

604,815. SOLITAIRE, BUTTON, &c. WILLIAM WEST, Aston, England, assignor of two-thirds to Richard Poore, London, England. Filed Mar. 8, 1898. Serial No. 673,070. (No model.)

Claim.—The herein-described button or fastening appliance, comprising the cupped disk *a* provided with a central aperture surrounded by the annular flange *b*, a rigid frame secured to one face of said disk and composed of standards *c c* provided with laterally-projecting heads *d d* and a centrally-perforated connecting-bridge *e* near said heads, the perforation in said bridge being in line with the central aperture of the disk, the bar *f* having a trough-shaped under face adapted to engage on the heads of the standards *c c* and provided with a stem *h* that is axially and longitudinally movable in the perforations of the said bridge and disk, a washer *j* secured on said stem beyond where it is passed through the disk-aperture, and a coiled spring *i* surrounding said stem between the bridge *e* and washer *j* and having one end housed in the annular flange *b*, substantially as specified.

604,816. SOFT-TREAD HORSESHOE. ROBERT S. WIESENFELD, Baltimore, Md., assignor of one-half to Joseph Friedenwald, same place. Filed May 7, 1897. Serial No. 635,534. (No model.)

Claim.—1. In a horseshoe having a channeled under face, a tread located in the channel, and alining openings in the walls of the channel, the openings in one wall having flaring mouths on the inside of the walls, and fastening means extending through the tread and the openings in the walls, the flaring mouths guiding the fastening means to the openings substantially as described.

2. In a horseshoe, a channel in its under face with corrugated bottom, a tread located therein, laterally-extending fastening means, and tongues on the edges of the walls adapted to be bent inwardly to secure the tread in place, substantially as described.

3. A horseshoe having a channeled under face, the bottom of the channel being corrugated, and a solid corrugated tread fitting said channel, and tongues on the edges of the channel to hold the tread in place.

4. A horseshoe having a channeled under face, a tread located therein and extending above the walls of the channel, and heels and toe-pieces also extending above the walls of the channel, substantially as described.

604,817. TEMPORARY BINDER. JAMES E. WOODWORTH, Milwaukee, Wis.; Hattie E. Woodworth administratrix of said James E. Woodworth, deceased. Filed Dec. 2, 1895. Serial No. 570,732. (No model.)

Claim.—1. A temporary binder embodying a clamping-strip provided with hollow transversely-apertured posts, another clamping-strip having unyielding inelastic transversely-apertured stems engaging the posts, and a pin engaging registering apertures in each of said posts and stems.

2. A temporary binder embodying a clamping-strip provided with hollow posts having longitudinal series of transverse apertures, another clamping-strip having unyielding inelastic transversely-apertured stems engaging the posts, and a pin engaging registering apertures in each of said posts and stems.

3. A temporary binder embodying a clamping-strip provided with hollow transversely-apertured posts, another clamping-strip having unyielding inelastic stems apertured transversely at intervals longitudinally thereof, and a pin engaging registering apertures in each of said posts and stems.

4. A temporary binder embodying a clamping-strip provided with hollow transversely-apertured posts, another clamping-strip having transversely-apertured stems engaging the posts, a channeled stub on the posts, and a pin engaging the stub and registering apertures in each of said posts and stems.

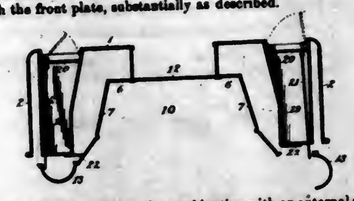
5. A temporary binder embodying a clamping-strip provided with hollow posts, another clamping-strip having stems engageable with said posts, one of each pair of said engageable parts being formed with a longitudinal series of transverse apertures therethrough, and the other of each pair of said engageable parts being formed with at least one such transverse aperture therethrough, and an independent removable pin adapted for engagement with the registering apertures of said pair of engageable parts.

6. A temporary binder embodying a clamping-strip provided with hollow transversely-apertured posts, another clamping-strip having transversely-apertured stems engaging said posts, and an independent removable pin engaging registering apertures in each of said posts and stems.

7. A temporary binder embodying a clamping-strip provided with hollow posts having longitudinal series of transverse apertures, another clamping-strip having transversely-apertured stems engaging said posts, and an independent removable pin engaging registering apertures in each of said posts and stems.

8. A temporary binder embodying a clamping-strip provided with hollow transversely-apertured posts, another clamping-strip having stems apertured transversely at intervals longitudinally thereof, and an independent removable pin engaging registering apertures in each of said posts and stems.

604,818. SKIRT-PROTECTOR MATERIAL. WILLIAM F. WYMAN, Oshkosh, Wis. Filed Nov. 29, 1897. Serial No. 660,079. (No model.)

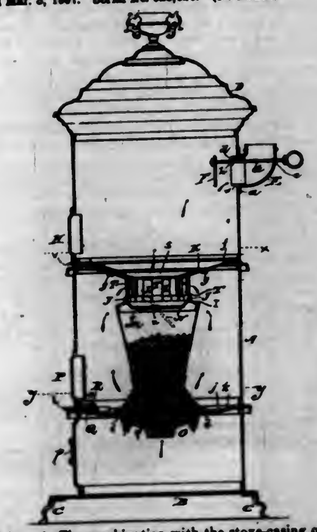


Claim.—1. A skirt-protector material comprising a facing-strip, and a binding-strip of less width than the facing-strip, this binding-strip being stitched to one side of said facing-strip, turned back away from the seam and stitched to the other side of the aforesaid facing-strip, the original seam being concealed inside the fold formed by said binding-strip.

2. A skirt-protector material comprising a facing-strip, a binding-strip of less width than the facing-strip and a stiffening-cord, the binding-strip being stitched to one side of the facing-strip turned back away from the seam over the cord and stitched to the other side of said facing-strip, the original seam being concealed with the cord inside the fold formed by said binding-strip.

604,819. HEATING APPARATUS. JOHN W. YATES, Nashville, Tenn. Filed May 15, 1897. Serial No. 636,673. (No model.)

Claim.—1. A fireplace-heater comprising an external casing, a fire-box casing having its side and rear walls arranged parallel with corresponding walls of the external casing and forming therewith the air-circulating spaces which discharge over the top of the grate through the front plate, a forwardly-inclined deflector within the grate-casing and overhanging the grate therein, a transverse smoke-arch above the deflector of the grate-casing to receive the products of combustion therefrom, horizontal base-flues arranged in the lower part of the air-chamber between the external and grate casings and discharging at their rear ends to a suitable flue, and a plurality of descending flues spaced relatively to each other within the air-chamber at the sides of the grate-casing and communicating with the smoke-arch and the base-flues, whereby the air-chamber is divided by a series of flues through which the products of combustion pass to the exit-flues and the ascending currents of air are divided into strata or columns which are brought successively in contact with



smoke-flues and the grate-casing prior to the discharge of the air through the front plate, substantially as described.

2. In a fireplace-heater, the combination with an external casing, and a grate-casing forming between itself and the external casing an air-circulating chamber, of the front plate having the hinged perforated guards at the bottom thereof, the base-flues arranged in the horizontal planes of the hinged guards and having the removable closures 22, the damper within the base-flues and having their operating-rods extending through said flues, the transverse smoke-arch over the grate-casing, and the downdraft smoke-flues situated at the sides of the grate-casing and communicating with the smoke-arch and the base-flues, substantially as described.

3. In a fireplace-heater, the combination with an external casing, of a grate-casing situated within the external casing and having a water-back situated in front of the air-circulating chamber provided between the grate and external casings and also having an inclined overhanging deflector, the base-flues at the sides of the grate-casing, the transverse smoke-arch, and the downdraft smoke-flues communicating with said arch and the base-flues, substantially as described.

604,820. HEATING AND COOKING DEVICE. JAMES ALLINGHAM, Chicago, Ill., assignor to the Allingham Stove Works, of Illinois. Filed Mar. 3, 1897. Serial No. 625,828. (No model.)

Claim.—1. The combination with the stove-casing of a grate, a cross-partition above the grate, having a fuel-magazine extending downward from its central portion, said fuel-magazine having a discharge end of such a size relative to the casing, and in such a position with respect to the grate that the fuel supplied therefrom will not spread outward against the walls of the casing; said fuel-magazine being also provided with openings near the top of the same for the passage of the burning gases arising from the grate, and a dumping-trap located in the upper portion of said fuel-magazine and below said openings therein, substantially as described.

2. The combination with the stove-casing and grate of the cross-partition above the grate, the fuel-magazine extending downward from said cross-partition and provided with openings in the upper portion thereof for the passage of burning gases arising from the grate below, a dumping-trap located in the upper section of said fuel-magazine and below said openings, whereby an auxiliary combustion-chamber is formed above said dumping-trap, substantially as described.

3. In a stove, the combination with the casing of a cross-partition made of two parts, an outer and an inner part, which are adapted to expand and contract by heat and cold, independently of each other, a rotary register depending from said cross partition and an automatically-adjusting trap below said register, substantially as described.

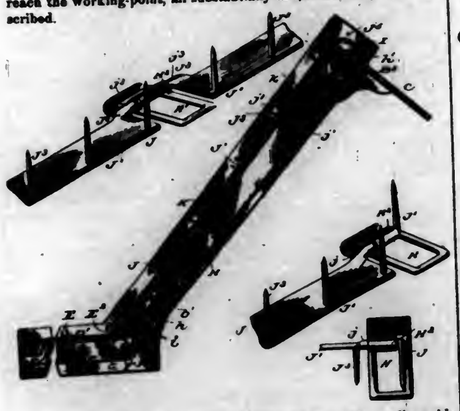
4. In a stove, the combination with the casing, of a cross-partition made of two parts, an outer and an inner part, which are adapted to expand and contract by heat and cold independently of each other, and located above the fire-grate, the inner part of said partition being provided with a central feed-opening, a fuel-magazine depending from said partition and communicating with said central opening, and an automatically-adjusting dumping-trap located below said central feed-opening, substantially as described.

5. In a stove, the combination with the casing, of a cross-partition provided with a central feed-opening, a fuel-magazine depending from said cross-partition and communicating with said opening, an automatically-adjusting dumping-trap below said opening, and a rotating register, provided with lateral openings below said cross-partition and above said dumping-trap, substantially as described.

6. In a stove, the combination with the outer casing, A, of a cross-partition, located above the grate, and composed of the outer plate, *f*, and the inner plate, K, the inner plate, K, being provided with a central opening, to the edges of which central opening are attached a series of pendants, J J, extending downward from the plane of the said cross-partition, and the fuel-magazine, M, located below said cross-partition and attached to the lower ends of the pendants, J J, and the damping-trap N below said pendants, substantially as described.

7. In a stove, the combination with the outer casing, A, of a cross-partition, located above the grate, and composed of the outer plate, *f*, and the inner plate, K; the said inner plate, K, being provided with a central feed-opening, to the edges of which central opening are attached a series of pendants, J, J, extending downward from the plane of said cross-partition, the register-plate, S, provided with the vertical valves, T T, and the fuel-magazine, M, located below said cross-partition and attached to the lower ends of the pendants, J J, and the damping-trap N below said register, substantially as described.

604,821. SHEEP-SHEARS. HORACE B. BURKE, Fort Pierce, Fla. Filed July 12, 1897. Serial No. 644,236. (No model.)



Claim.—The combination with a pair of shears comprising blades with attached handles connected by a flat spring-like portion bent in semicircular form, and provided about centrally with an opening, of a shank provided at its rear end with a projecting pin fast in said opening, said shank having a transverse opening at an intermediate point and provided at its forward end with a series of rigid parallel teeth, and inwardly-projecting pins on the handle portions of the shears slidingly fitting in the opening of said shank, substantially as described.

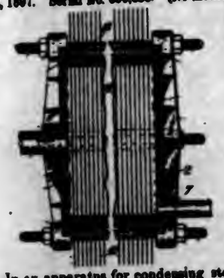
604,822. GRAIN-CARRIER. ALVA R. DEWEESE, Quincy, Ohio. Filed Apr. 1, 1897. Serial No. 630,297. (No model.)

Claim.—1. In an endless conveyer, the combination of the platform, sprocket-wheels at the ends thereof, endless chains arranged to move rake-bars over the platform and return them under the platform; the L-bars having hinge-studs *c*, *c'*, on their ends journaled on the chains substantially as described, said studs having upstanding trip-fingers c^3 on their ends; with a stationary pin at the discharge end of the conveyer adapted to engage the trip-fingers on the rake-bars and cause the bars to partly turn on their hinges as they pass over the discharge end of the platform and thus withdraw from the straw, and a guard-plate for turning the rake-bars to natural position at the front or grainward end of the platform, all substantially as and for the purpose described.

2. In an endless conveyer, the combination of the platform, the endless carriers running up over the platform and back thereunder, rake-bars J having upstanding teeth J^3 at their rear edge, and journal-pins *j* on their front edge at each end, by which they are hinged on said carriers, and also upstanding tripping-fingers *j'* on the ends of pins *j*; with fixed studs at the discharge end of the conveyer adapted to engage said trip-fingers and cause the rake-bars to partly turn downward and backward and withdraw from the straw, &c., on the conveyer as they pass over the discharge end thereof; and means

for throwing said rake-bars into their natural position before they reach the working-point, all substantially as and for the purpose described.

3. In an endless conveyer, the combination of the endless side chains H and intermediate endless chain H' having links provided with journal-bearings; and the sectional rake-bars J' having pins j^3 on their inner ends journaled in chain H', and pins j on their outer ends journaled in a chain H, said pins j having trip-fingers j' on their outer ends; with stationary studs at the discharge end of the conveyer adapted to engage said trip-fingers and cause the rake-bars to tilt rearwardly and thus withdraw from the straw, &c., all substantially as and for the purpose described.



4. In a conveyer the combination of the board b, the endless side sprocket-chains and endless intermediate sprocket-chain running over said board, and the sprocket-wheels, and shafts at each end of the board, the curved plate I at the discharge end of the conveyer; the sectional rake-bars J having pivot-pins j, and j^3 by which they are hinged to said side and intermediate sprocket-chains respectively and provided with tripping-fingers j' on their outer ends; with the fixed studs j^4 secured to the side boards and adapted to engage fingers j' and cause the rake-bars to partly turn and withdraw from the straw, &c., and the curved plate i attached to the lower end of the board for turning the rake-bars back to natural position at the lower end of the conveyer, all substantially as and for the purpose described.

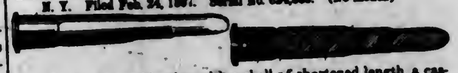
5. In an endless conveyer, the combination of the rake-bars having upstanding teeth, journal-pins on their front edges at each end, by which they are hinged on endless belts or chains, and also upstanding tripping-fingers; and a slotted plate overlying the upper surface of the conveyer and covering the rake-bars which travel thereunder while the teeth project upward through and travel in the slots in the plate; with fixed studs attached to the side boards at the discharge end of the conveyer in position to engage said trip-fingers and cause the rake-bars to tilt backward and withdraw from the straw, &c., on the carrier; and a curved plate attached to the lower end of the conveyer adapted to cause said rake-bars to turn into normal position, all substantially as and for the purpose described.

6. In an endless conveyer, the combination of the side and intermediate endless carriers, the sectional rake-bars J having hinge-studs j, j^3, in their ends pivoted to said side and intermediate carriers substantially as described, and provided with trip-fingers j', in their outer ends and also having a series of equidistant upstanding teeth; and a fixed plate overlying said rake-bars having a series of parallel longitudinal slots through which the teeth of the upper series of bars project as they travel thereunder; with a guard-plate I and stationary studs at the discharge end of the conveyer adapted to engage said trip-fingers and cause the rake-bars to partly turn rearwardly and thus withdraw from the straw, &c., as they pass over the upper end of the conveyer, and a plate i attached to the lower end of the conveyer for turning the rake-bars to normal position, all substantially as and for the purpose described.

7. In a conveyer, the combination of the board as b, the sprocket-wheels and shafts at each end thereof, the side and intermediate chains running thereover; the plate I at the discharge end of the conveyer; and the plate i at the receiving end thereof; with the rake-bars J having hinge-studs j, j^3, on their front edges pivoted to said side and intermediate chains and provided with tripping-fingers j'; the fixed studs j^4 attached to the side boards adapted to engage fingers j' and cause the rake-bars to tilt backward and withdraw from the straw, &c.; and the plate K covering the board b and overlying the upper set of rake-bars, but provided with longitudinal slots through which the teeth of the upper set of rake-bars project as the bars travel thereunder, all substantially as and for the purpose set forth.

604,823. CONDENSER. CHARLES S. FORBES, Strathdon, Scotland. Filed Nov. 15, 1897. Serial No. 659,093. (No model.)

Claim.—1. In an apparatus for condensing steam or vapor, the combination with end plates having suitable inlet and exit openings, of pieces of thin, perforated metal separated from each other by packing-rings of yielding material, said pieces being held in position by means of fastening devices passing through the end plates substantially as and for the purpose set forth.

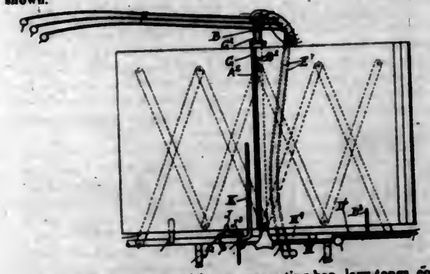


2. In a condenser the combination of end plates having respectively an inlet-opening and an outlet-opening in them, with a series of lamina of conducting material arranged in the intervening space, and adapted to allow the passage of vapor through them, and fastening devices connecting the said lamina to the framing of the said end plates substantially as set forth.

3. In a condenser the combination of metallic lamina adapted to allow the passage of vapor through them, packing-rings of yielding material interposed between said lamina, and fastening devices securing the same, with fixed parts of the condenser to which the said fastening devices are attached and which have respectively an inlet and an outlet opening in them, portions of the said lamina being arranged and adapted to project into the refrigerating medium surrounding the condenser substantially as set forth.

4. In combination with a condenser having an inlet-opening and an outlet-opening, a series of lamina adapted to allow the passage of vapor through them and arranged between the said openings, means for fastening the said lamina in position, a series of resilient packing-washers interposed between said lamina, and provided with lugs, and guides engaging the said lugs substantially as and for the purpose set forth.

5. In a condenser a series of lamina adapted to allow the passage of vapor through them and means for holding them in position, in combination with a casing having an inlet-opening and an outlet-opening and means for supplying refrigerating material to the said casing, the said plates being so arranged that the vapor to be condensed and the refrigerating material will be applied to the same side of the said plates substantially as set forth.

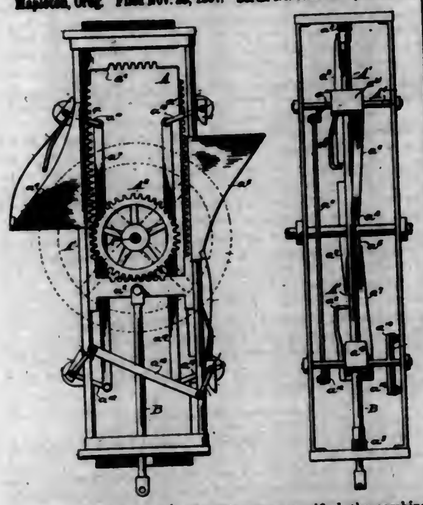


604,824. BLANK CARTRIDGE. LAWSON M. FULLER, New York, N. Y. Filed Feb. 24, 1897. Serial No. 624,889. (No model.)

Claim.—In combination with a shell of shortened length, a casing having its rear end reduced and fitted in said shell, the body portion of the casing forming a continuation with the shell and tapering gradually toward its outer end, the forward portion of said casing being formed in sections, each being less in diameter than that portion immediately preceding producing shoulders which fit against corresponding shoulders or projections in the bore of the gun to prevent the outward passage of the rear portion of said casing, the foremost section having its walls reduced in thickness, the inner configuration of the casing conforming to the outer configuration, a charge of compressed powder conforming to the inner configuration and lending strength to said casing, and a primer fixed in said shell, substantially as described.

604,825. MUSIC-LEAF TURNER. CHARLES GITTUS, Jr., Golden Gate, Cal., assignor of two-thirds to Arthur F. Farman, Jr., and Louis C. Gittus, same place. Filed Apr. 30, 1897. Serial No. 634,694. (No model.)

Claim.—1. In a music-leaf turner, the cross-bar D, provided with a longitudinal groove in its outer edge near one end, and the rod D^6 secured to the cross-bar, combined with the spring-actuated finger D^5 placed upon the rod, and the sliding block D^6 placed upon the rod and having its inner end to catch in the groove, substantially as shown.



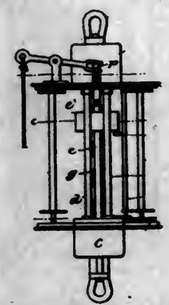
2. A leaf-turner comprising a supporting-bar, lazy-tongs connected therewith, and side bars hinged to said supporting-bar and adapted to be secured to the ends of said lazy-tongs, substantially as described.

3. A leaf-turner comprising a supporting-bar, a clamp-bar thereon upon which the sheet or book is placed, a spring-supported rest for the lower edge of the sheet or book, a top clamp-bar hinged at one end to said supporting-bar, and a catch for the other end of said top clamp-bar, substantially as described.

4. A leaf-turner comprising a supporting-bar, means for clamping the sheet or book thereon, spring-actuated wires secured to a head on said bar in such a way as to extend out therefrom in a horizontal position and adapted thence to be forced down and placed under the sheet or under certain leaves of the book, a catch to retain said wires down, and means for releasing the latter consecutively from said catch, substantially as described.

5. A leaf-turner comprising a supporting-bar, a screw or bolt passing through the upper end thereof, a head provided with a nut engaging said screw or bolt, wires secured to pivots in said head, springs wrapped around said pivots and arranged to exert a torsional strain on the same, and stops bearing on said wires and limiting the action of said springs, substantially as described.

604,826. DEVICE FOR CONVERTING MOTION. AMOS HADSALL, Mapleton, Oreg. Filed Nov. 23, 1897. Serial No. 659,642. (No model.)



Claim.—1. In a device of the character specified, the combination with a gear-wheel and two rack-bars adapted alternately to operate the same, of automatically-operating shifting mechanism comprising, in part, cam-plates secured to the rack-bars, springs exerting lateral pressure on the cams, and means comprising a spring-retaining arm and a fin engaged thereby for holding the springs under requisite tension until a full stroke of the rack-bars has been completed, substantially as described.

2. In a device of the character specified, the combination with a gear-wheel, of two rack-bars mounted for reciprocatory motion and adapted to be shifted laterally, of means for bringing alternate rack-bars into engagement with the gear-wheel at the termination of each stroke, comprising two cam-plates, one mounted on each of the rack-bars, two shafts each carrying a spring in engagement with the cam-plate, and an arm, a fin also carried by each rack-bar with which the arm engages to hold the spring under requisite tension, two shafts, each carrying a dog adapted to bear upon the rack-bar frame on opposite sides thereof, and links connecting, through the medium of arms, with the respective shafts, substantially as described.

3. In a device of the character specified, the combination with a gear-wheel, of two rack-bars mounted for reciprocatory and lateral motion with relation to the gear-wheel, a cam-plate carried by each rack-bar, a spring, and mechanism for holding the same under requisite tension to effect lateral shifting of the rack-bars, and means for effecting accurate meshing between the respective rack-bars and the gear-wheel at the end of each stroke, comprising a toothed stop-plate arranged at each end of the rack-bar-carrying frame, and with which the teeth of the gear-wheel engage at the limit of each stroke, substantially as described.

604,827. WEIGHING-SCALE. JOHN HEMPSTALL, Lyttelton, New Zealand. Filed Mar. 21, 1895. Serial No. 542,689. (No model.) Patented in New Zealand Oct. 21, 1893, No. 6,508, and in England Apr. 8, 1895, No. 7,184.

Claim.—1. In a self-registering scale, the combination with an indicator-apron, of mechanism for automatically moving the indicator-apron a predetermined distance after a body has been weighed, reciprocating means adapted to be actuated by the body being weighed, and a marking device carried by said means, and adapted to make contact with the indicator-apron when moved in one direction, and to be out of contact with the apron when moved in the opposite direction, substantially as described.

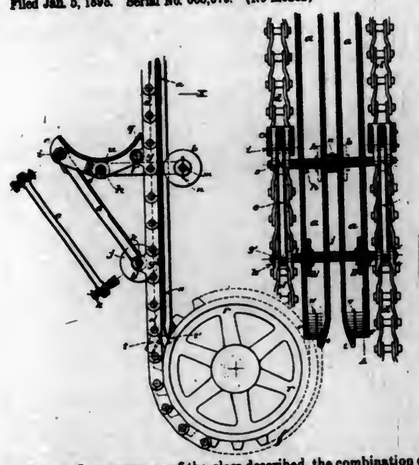
2. In a scale, the combination with a screw-spindle, of a threaded head adapted to travel upon said spindle, means for attaching a weight to the head, devices for automatically returning the head to its normal position after a body has been weighed, and weight-indicating devices actuated by the head, substantially as described.

3. In a self-registering scale, the combination with the weighing mechanism, of an endless scale-ribbon and a support therefor, and means actuated by the weighing mechanism for moving the scale-ribbon, substantially as described.

4. In a self-registering scale, the combination with the weighing mechanism, of a traveling indicator-apron, marking device and an endless scale-ribbon and its support, and means for actuating the indicator-apron, scale-ribbon and marking device, substantially as described.

5. In a self-registering scale, the combination with a traveling indicator-apron, of a marker and means for moving the same in a direction transverse to that in which the indicator-apron travels, devices for returning the marker to its normal position and mechanism for locking it in such position, substantially as described.

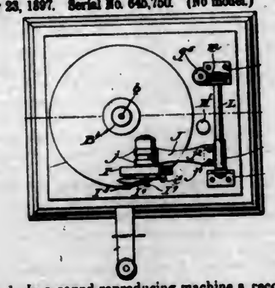
6. In a scale, the combination with a screw-spindle, of a threaded head adapted to travel upon said spindle, means for attaching a weight to the head, devices for automatically returning the head to its normal position after a body has been weighed, and a scale-ribbon connected to the said head, substantially as described.



7. In a self-registering scale the combination with a traveling indicator-apron, means for moving it step by step, a marker adapted to reciprocate across the indicator-apron, and to be in contact therewith when moving in one direction only and to be out of contact therewith when moving in the opposite direction and means actuated by the body being weighed to reciprocate the marker, substantially as described.

8. In a scale, the combination with a suitable frame, of a screw-spindle mounted therein, a spring connected to the screw-spindle and frame, of a threaded head adapted to travel upon the screw-spindle, means for attaching a weight to the head, and a scale-ribbon connected to said head, substantially as described.

9. In a self-registering scale, the combination with a screw-spindle, means actuated by the body being weighed for rotating the same, devices for locking the screw-spindle against movement, and means for releasing said locking means, substantially as described.



10. In a self-registering scale, the combination with the weighing mechanism and a marking device carried thereby, of an indicator-apron, devices adapted to hold said apron stationary while the weighing mechanism is moving in one direction and to move it a predetermined distance while the said mechanism is moving in the opposite direction, and the said marking device being adapted to make contact with the indicator-apron when traveling in one direction, and to be out of contact therewith when moved in the opposite direction, substantially as described.

604,828. CONVEYER. HARRY F. HODGES, New York, N. Y. Filed Jan. 5, 1898. Serial No. 665,679. (No model.)

Claim.—In a conveyer of the class described, the combination of fixed guides having front and rear faces, a conveyer-chain running near and parallel to said fixed guides, and a carrier attached to said chain, said carrier comprising contact devices at its upper part adapted to engage the rear faces of the guides, and contact devices at its lower part adapted to engage the front faces of the guides, substantially as set forth.

604,829. SOUND-REPRODUCING MACHINE. JOSEPH W. JONES, Philadelphia, Pa., assignor to himself and Joseph A. Vincent, same place. Filed July 23, 1897. Serial No. 645,750. (No model.)

Claim.—1. In a sound-reproducing machine a record-disk, suitably supported and rotated, a sound-box provided with a diaphragm and stylus, the latter being adapted to the record, a lever secured to the sound-box and hinged to a sleeved portion or carrier which is guided upon a horizontal bar, said lever being hinged in such a manner as to allow a slight movement of the sound-box and stylus independent of the motion imparted by the feed mechanism, the sleeved portion or carrier having a depending portion adapted to a feed-screw, the horizontal bar for guiding said carrier, the feed-screw arranged below the horizontal bar, a worm-wheel on said screw, and a worm driven from the source of power to impart motion to the worm-wheel.

2. A feed-motion for a sound-reproducing machine comprising a horizontal bar, a carrier mounted thereon having a depending portion engaging a feed-screw, the feed-screw, means as shown for imparting motion thereto, a sound-box provided with a diaphragm and stylus, the latter being adapted to a sound-record, and an arm secured to the sound-box and hinged to the carriage in such a manner as to allow a slight movement of the sound-box and stylus independent of the movement imparted thereto by the feed-screw.

3. A sound-reproducing machine consisting of a record-disk suitably supported and rotated, a sound-box provided with a diaphragm, a stylus-lever extending across the face of the diaphragm, having a rigid portion fulcrumed by a spring to the sound-box and a flexible portion secured by a screw to the sound-box, an adjusting-screw located at or near the center of the stylus-lever, one end of which is in contact with the diaphragm, a sound-box lever hinged and guided upon a horizontal bar, said lever having a depending portion provided with a screw-thread, a screw for engaging the threaded depending portion of said lever, a worm-wheel upon the end of said screw, and a worm driven from the source of power for operating said worm-wheel.

4. A sound-box for a sound-reproducing machine, consisting of a diaphragm mounted in a box or casing, a stylus-lever having a rigid portion hinged to the box or casing by a thin leaf-spring, and a flexible portion united through the medium of a rubber cushion to the box or casing, and an adjustable set-screw threaded to the stylus-lever at or near the center thereof, adapted to engage a buffer secured to the center of the diaphragm.

5. In a sound-reproducing machine, a sound-box comprising a shell or casing provided with a diaphragm and stylus-lever, the latter passing diametrically across the face of the diaphragm, and having a rigid portion connected to the sound-box by a spring, and a flexible portion pivoted at the opposite side and provided with a buffer, and an adjusting-screw adapted to the center of the stylus-lever and bearing against the diaphragm, substantially as specified.

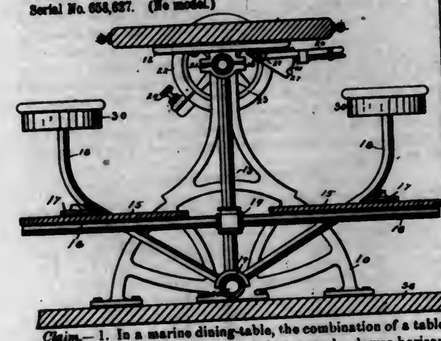
6. In a sound-reproducing machine a sound-box provided with a diaphragm and securing-ring, a stylus-lever extending across the face of the diaphragm having a rigid portion fulcrumed by a spring to the securing-ring and a flexible portion formed integral therewith and secured to said ring by a screw and an adjusting-screw passing through the stylus-lever and acting upon a buffer fixed to the center of the diaphragm, substantially as specified.

7. In a sound-reproducing machine, a sound-box provided with a diaphragm, a stylus-lever extending diametrically across the face of the diaphragm and having a rigid portion fulcrumed at one side of the sound-box and a flexible portion secured to the opposite side of the sound-box with an adjustable screw threaded to the stylus-lever at or near the center and adapted to press upon the diaphragm, substantially as specified.

8. In a sound-reproducing machine, a sound-box provided with a diaphragm and securing-ring, a stylus-lever, extending across the face of the diaphragm, having a thickened and rigid portion fulcrumed by a spring to the securing-ring and a flexible portion united by a yielding pivotal connection to the opposite side of the securing-ring with an adjustable screw passing through the stylus-lever and acting upon the diaphragm, substantially as specified.

9. In a sound-reproducing machine, a sound-box provided with a diaphragm and securing-ring, a stylus-lever extending diametrically across the face of the diaphragm, the same being thick and rigid at one end and thin and flexible at the other, a leaf-spring interposed between the rigid portion of the stylus-lever and the securing-ring, an elastic buffer interposed between the flexible end of the stylus-lever and the securing-ring with a screw for holding the same in position, and an adjusting-screw passing through the center of the stylus-lever and acting upon the diaphragm through the medium of an elastic buffer, substantially as specified.

604,830. COMBINATION-TOOL. JOSEPH C. KAEMER, Menia, Tex. Filed Aug. 26, 1897. Serial No. 649,851. (No model.)



Claim.—1. In a device of the class described, the combination with a hatchet or analogous tool composed of a head, and a handle rigid with the same and having a longitudinal slot, of a bar provided at one end with a socket and pivoted at its other end in the longitudinal slot of the handle and adapted to lie in the slot when the hatchet is in use, said handle and bar being provided with opposite notches forming a wire-cutter, and a fastening device adapted to secure a tool in the socket of the bar and retain the latter in the slot of the handle, substantially as described.

2. In a device of the class described, the combination of a handle provided with a longitudinal opening, a pivot extending across the opening at one end thereof, a bar arranged within the opening and adapted to receive a screw-driver or similar tool, and provided with a slot receiving the said pivot, said slot being disposed at an angle and forming a wedge-shaped portion adapted to be interposed between the pivot and the handle at the adjacent end of the slot, whereby the bar is rigidly locked in position, substantially as described.

3. In a device of the class described, the combination of a handle provided with a longitudinal opening and having a threaded perforation at one side thereof, a pivoted bar arranged within the opening and provided with a socket and having a threaded perforation at one side thereof adapted to register with the threaded perforation of the handle, and a screw adapted to engage the said perforations and capable of securing the bar in the opening of the handle and also of securing a screw-driver, bit or similar tool in the socket of the bar, substantially as described.

604,831. SELF-LEVELING MARINE DINING-TABLE. JOHN H. LASKEY, Boston, Mass. Filed Dec. 22, 1896. Renewed Nov. 15, 1897. Serial No. 658,627. (No model.)

Claim.—1. In a marine dining-table, the combination of a table, an upper horizontal shaft upon which it is mounted, a lower horizontal shaft and a seat-support mounted thereon, and provided with a seat, a foot-platform, a support for said platform and a connection between the upper and lower horizontal shafts, said table, seat and platform adapted to oscillate in unison and maintain positions relative to each other.

2. In the construction of a marine dining-table, a frame structure composed of two longitudinal shafts connected by perpendicular shafts, a platform mounted on shafts running at right angles and secured to the perpendicular shafts, and seats mounted on the lower longitudinal shaft; all pivoted on uprights, secured to the deck, substantially as shown and described.

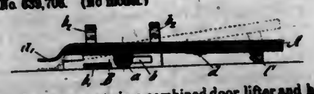
3. In the construction of a marine dining-table, the combination of a frame structure pivoted on uprights secured to the deck, a locking device consisting of a shaft running longitudinally with the table and revoluble in bearings mounted on the upper longitudinal shaft of the framework, a pulley secured to one end of said shaft, and a lever and latch on the other end, a quadrant provided with a notch to receive the latch, a rope on one end connected to the pulley and having the other end connected to the levers, said levers connected to the lock-shafts by links, and a spring mounted on said shaft to force them into the end standard, all mounted on the lower longitudinal shaft, substantially as shown and described.

4. In a marine dining-table, the combination of a frame comprising uprights secured to the deck, and a horizontal shaft, about which it oscillates, and a means for counterbalancing said structure consisting of a shaft slidable in bearings secured to the deck, a stiff spiral spring and resisting-collar on said shaft, a rope or connection from one end of said shaft and secured to the lower longitudinal shaft, and a swiveled pulley-block secured to the deck and through which the rope or connection passes.

5. In a marine dining-table, the combination with a stationary support or frame, and a frame mounted therein and adapted to oscillate and comprising a table and a seat and seat-support connected and movable therewith, of means for locking the oscillating frame to the stationary frame, comprising a spring-actuated shaft slidable in bearings and having an end to engage the stationary frame or support, a second shaft having an operating-lever and pulley, a rope or connection secured to said pulley, a bell-crank lever having an arm connected with the slidable shaft and the other arm connected with said rope, a quadrant fixed to the table-support and a latch to detachably engage the quadrant.

6. In a marine dining-table, the combination of the upper and lower horizontal shafts and the intermediate vertical upright, a table mounted on the upper shaft, a friction-wheel on said shaft, a friction-band surrounding the wheel, the screw whereby the band is adjusted and the stationary support to which the band is secured.

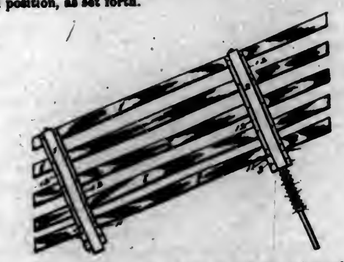
604,832. CENTRIFUGAL MACHINE. EUSTACHY ŁUKIEWSKI and EDWARD KRAJEWSKI, Warsaw, Russia. Filed May 28, 1897. Serial No. 638,573. (No model.)



Claim.—1. A centrifugal for sugars, consisting of an interior drum adapted to be rotated and to receive the materials to be separated, said drum being provided with an imperforate bottom declining downwardly and outwardly, in combination with an exterior casing provided with a gutter, said gutter having a spout at its lowest point provided with an opening in its bottom adapted to be closed by a valve, and a second gutter concentric with and below the first, and adapted to drain off the overflow from said first gutter, said second gutter being likewise provided with a spout lying below the first and having likewise an opening in its bottom adapted to be closed by a valve, and a valve-stem carrying said valves, and suitable means for operating the same substantially as described.

2. In an apparatus for separately collecting syrups as described, the combination of a centrifugal drum and an exterior casing provided with collecting-gutters concentric to each other, said gutters being provided with spouts having apertures in their bottoms, said apertures adapted to be closed by separate valves, and a valve-stem carrying said valves and adapted to be operated by suitable means substantially as set forth.

3. In an apparatus for separately collecting syrups as described, the combination of a centrifugal drum and an exterior casing provided with collecting-gutters concentric to each other, said gutters provided with spouts having apertures in their bottoms, said apertures adapted to be closed by separate valves, and a valve-stem carrying said valves operated by suitable means, said valve-stem adapted to be displaced in three positions, *i. e.* for opening either of said apertures singly, or both simultaneously, and suitable means for cleansing the apparatus with a steam-jet, substantially as set forth.



604,833. MACHINE FOR LIFTING DOORS AND HOLDING SAME. RUDOLF MÜLLER, Linz, Austria-Hungary. Filed June 7, 1897. Serial No. 639,708. (No model.)

Claim.—Improvements in a combined door lifter and holder, the treadle-board A, the roller-like bottom block *a* and the metal foot or under grip *a'* on said treadle-board, the pegs a^2 on the block *a* and the swinging lift-limiting prop C all in combination with the shore B having slots *b* adapted to receive the said pegs a^2, and the cross-piece *b'* and the struts *b* on the shore B, substantially as described.

604,834. CHUTE. JOSEPH W. MYERS, Sikeston, Mo. Filed Jan. 28, 1897. Serial No. 621,061. (No model.)

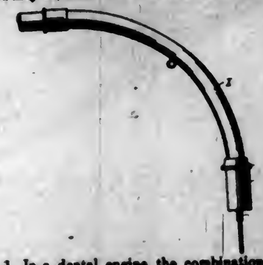
Claim.—1. A chute consisting of sides and a floorway, telescopic tubes attached to one end of the chute, the inner tube having a lug and the outer tube having a slot and external pins and means engaging said lug and pins and means to secure the elevated tube in adjusted position, as set forth.

2. The combination with a chute of tubular telescopic sections connected to the forward end thereof, the inner tube provided with a lug and the outer tube with a longitudinal slot in which the lug works, and means to elevate and hold the outer tube in place, as set forth.

3. The combination with a chute of an elevating mechanism consisting of a tubular housing provided with a longitudinal slotted opening; a shaft mounted within said housing and provided with a lug adapted to protrude through said slotted opening; fulcrum-points formed upon opposite sides of said housing and means for engaging said fulcrum-points and leg to the end that said shaft may be forced in and out of its housing, substantially as described and for the purpose set forth.

604,885. VALVE. SAMUEL H. MCCARROLL, Providence, R. I. Filed Sept. 30, 1897. Serial No. 653,604. (No model.)

Claim.—1. The improved valve herein described, having a valve-case with three tubular branches, having open ends, a rotatable cylindrical valve mounted in said valve-case and capable of closing all said tubular branches, but provided with a transverse port through it, which is made continuous with either two of the branches, when desired, by the partial rotation of the valve, pipes opening into said tubular branches, respectively, caps to cover the open outer ends of said tubular branches and a leather packing-ring in each tubular branch arranged to lie in contact with the cylindrical surface of the valve, substantially as specified.

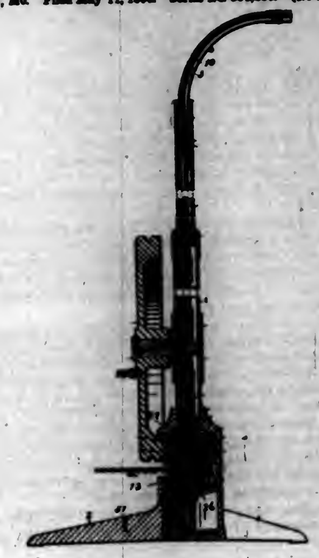


2. In combination with a valve-case, having a tubular bore and a plurality of tubular branches or ways, a cylindrical valve mounted rotatably in said bore and provided with a port through it transversely, which by the partial rotation of the valve may be made continuous with either two of said tubular branches, and flexible packing-rings, suitably supported in said tubular branches bent as shown and secured in position in the branches, respectively, and adapted to lie in contact with the cylindrical surface of the valve, substantially as described.

3. In combination with a valve-case, having a tubular bore and a plurality of tubular branches or ways, a cylindrical valve mounted rotatably in said bore and provided with a port through it transversely, which by the partial rotation of the valve may be made continuous with either two of the tubular branches, a flexible packing-ring adapted to lie in contact with the cylindrical surface of the valve, and a metallic supporting-ring upon said packing-ring secured to the interior surface of a tubular branch and adapted to confine said flexible ring in position to maintain its said contact with the valve, substantially as shown.

4. In combination with a valve-case having a tubular bore and a plurality of tubular branches or ways, a cylindrical valve mounted rotatably in said bore and provided with a transverse port, a metallic sheet covering the cylindrical surface of the valve, but cut away into a series of alternate bars and slots arranged parallel with each other and registering with the openings of said valve-port, and a flexible packing-ring suitably supported in a tubular branch of said valve and adapted to lie in contact with the metallic covering upon the cylindrical surface of the valve, substantially as set forth.

5. In a valve having a tubular bore and a plurality of tubular branches or ways, a cylindrical valve mounted rotatably in said bore and provided with a transverse port, a flexible packing-ring adapted to lie in contact with the cylindrical surface of the valve, a supporting-ring, suitably mounted and adapted to hold said packing-ring in operative position and a netting stretched across the tubular branch or way and held upon said supporting-ring by bolts, substantially as specified.



604,886. DENTAL ENGINE. ARTHUR J. MCDONALD, Kansas City, Mo. Filed May 11, 1896. Serial No. 591,185. (No model.)

Claim.—1. In a dental engine, the combination with a rotary driving-shaft mounted in a tubular support, of a rotatable cap movable lengthwise upon the said support, a curved tubular arm secured to the said cap, and a flexible shaft located in the said tubular arm and connected to and rotatable with the driving-shaft, substantially as described.

2. In a dental engine, the combination with a rotary driving-shaft, of a tube in which the shaft is mounted, a flexible shaft provided at one end with a rigid spindle a portion of which is cylindrical and the outer end of which is otherwise than round and is adapted to be inserted within a similarly-shaped opening in one end of the driving-shaft, a cap rotatably and longitudinally movable in one end of the tube and provided with a peripheral flange abutting against one end of the tube and having an axial opening in which the cylindrical portion of the spindle is rotatably fitted, and a curved tubular arm in which the flexible shaft is rotatable, one end of the said tubular arm being rigidly secured to the flanged end of the cap, substantially as described.

604,887. DENTAL ENGINE. ARTHUR J. MCDONALD, Kansas City, Mo. Filed May 11, 1896. Serial No. 591,186. (No model.)

Claim.—1. In a dental engine, the combination with a rotary driving-shaft, of a wheel secured thereto and rotatable therewith, a wheel rotatable around but independently of the driving-shaft, and means for bringing the two wheels into or out of engagement with each other, substantially as described.

2. In a dental engine, the combination with a rotary driving-shaft, of a wheel secured thereon and rotatable therewith, a wheel rotatable around but independently of the driving-shaft, and means for imparting longitudinal motion to the driving-shaft, for the purpose of engaging or disengaging the two wheels, substantially as described.

3. In a dental engine, the combination with a driving-shaft rotatable in a suitable support and longitudinally movable therein, of a flexible shaft connected to and rotatable with the driving-shaft, a wheel secured upon and rotatable with the driving-shaft, a wheel independently rotatable of the driving-shaft, means for rotating the second-named wheel, and means for engaging the two wheels with each other when the driving-shaft is moved longitudinally in its support in the proper direction, substantially as described.

4. In a dental engine, the combination with a driving-shaft rotatable in a suitable support and longitudinally movable therein, of a flexible shaft connected to and rotatable with the driving-shaft, a wheel secured upon and rotatable with the driving-shaft, a second wheel rotatable independently of the driving-shaft, means for imparting rotation to the second wheel, means for imparting rotation in the same direction to the driving-shaft when it is moved longitudinally in one direction, and means for reversing the direction of rotation of the driving-shaft when it is moved in the opposite direction longitudinally, substantially as described.

5. In a dental engine, the combination with a rotary driving-shaft, of a wheel secured thereon and rotatable therewith, a wheel rotatable independently of the driving-shaft, a plate rotatable with the driving-shaft, a roller located between the independent wheel and the plate, means for moving the driving-shaft in one direction for the purpose of engaging the two wheels together, and means for moving the driving-shaft in the opposite direction for the purpose of engaging the roller with the independent wheel and the said plate, substantially as described.

6. In a dental engine, the combination with a rotary driving-shaft, of a wheel secured to and rotatable with the driving-shaft, a plate secured to and rotatable with the driving-shaft, a wheel rotatable independently of the driving-shaft and located between the said plate and the first wheel, a roller located between the independent wheel and the said plate and adapted to have a rolling connection between the two, a lever for controlling the lengthwise movement of the driving-shaft in opposite directions, whereby when moved in one direction, the roller may be brought into engagement with the independent wheel and the plate, and when moved in the opposite direction the independent wheel may be brought into engagement with the wheel secured to the driving-shaft, substantially as described.

7. In a dental engine, the combination with a longitudinally-movable rotary shaft provided with a suitable support, of a driving-pulley mounted upon said support and rotatable about and independently of said shaft, a friction-wheel secured to the shaft at one end of the said pulley and rotatable with the driving-shaft, a plate on said shaft at the other end of said pulley also rotatable with the driving-shaft, a roller interposed between the driving-pulley and said plate, and means whereby the shaft may be longitudinally shifted to alternately bring the friction-wheel and roller in contact with the driving-pulley for reversing the rotary movement of the shaft.

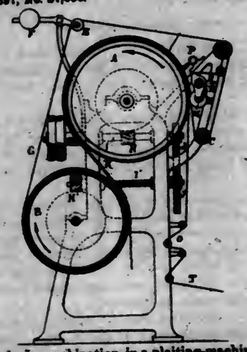
8. In a dental engine, the combination with a rotary driving-shaft, of a plate secured to and rotatable therewith, a driving-wheel rotatable independently of the driving-shaft, a roller between the plate and driving-wheel, and means for bringing the plate and driving-wheel in and out of revolving contact with the roller, substantially as described.

9. In a dental engine, the combination with a rotary driving-shaft, of a driving-wheel rotatable independently of the driving-shaft, a plate secured to and rotatable with the driving-shaft, a roller located between the plate and driving-wheel, and a lever pivoted to a suitable support and adapted to engage the driving-shaft for the purpose of moving the said shaft lengthwise whereby the roller is made to have a revolving contact with the plate and the driving-wheel, substantially as described.

10. In a dental engine, the combination with a rotary driving-shaft, of a wheel rotatable therewith, a wheel rotatable around but independently of the driving-shaft, means for preventing longitudinal movement of the independent wheel, and means for bringing the two wheels into or out of engagement with each other, substantially as described.

11. In a dental engine, the combination with a rotary driving-shaft, of a driving-wheel rotatable around the driving-shaft, two devices rotatable with the driving-shaft, means for engaging the driving-wheel with one of the said devices for rotating the driving-shaft in one direction, and means for engaging the driving-wheel with the other device for rotating the driving-shaft in the opposite direction, substantially as described.

12. In a dental engine, the combination with a rotary driving-shaft, of a flexible shaft rotatable therewith, and connected thereto, a driving-wheel rotatable in a fixed plane independently of the driving-shaft, means for imparting rotation from the driving-wheel to the driving-shaft in one direction when the driving-shaft is moved in one direction, and means for imparting rotation to the driving-shaft in the opposite direction when the driving-shaft is moved lengthwise in the opposite direction, substantially as described.



604,888. BICYCLE-FRAME. JOHN R. HASELL, Tacoma, Wash. Filed Feb. 4, 1897. Serial No. 621,905. (No model.)

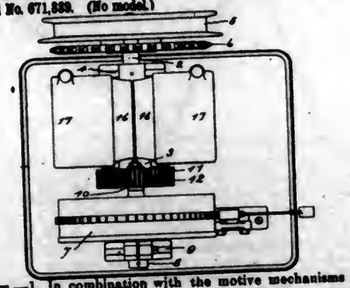
Claim.—1. In combination with a bicycle-frame hollow tubular lugs arranged one above the other and extending inwardly at different angles from the head, similar lugs formed on the middle-post tube at the bottom and top thereof, a removable tube of a length to fit between the lugs, and nuts revolubly secured on the ends of said tube, said nuts being threaded internally to fit corresponding external threads formed on the lugs whereby the tube may be fitted between the two upper lugs thereby forming a diamond frame, or between the two lower lugs forming a drop or lady's frame, substantially as described.

2. In a bicycle-frame, joining-lugs at the head, crank-hanger and top of the middle-post tube having hollow tubular lugs formed thereon, said lugs being threaded externally, a tube of a length to fit between the lugs, and nuts revolubly secured at the ends of said tube, said nuts being threaded internally to fit the threads of said lugs, whereby the tube may be fitted between the two upper lugs forming a diamond-frame wheel or between the two lower lugs forming a drop frame, substantially as described.

604,889. PLAITING-MACHINE. HENRY PERVILHAC, Lyons, France. Filed Oct. 23, 1897. Serial No. 656,169. (No model.) Patented in France May 31, 1897, No. 267,110; in Austria Sept. 21, 1897, No. 47/5,223; in Switzerland Oct. 14, 1897, No. 15,214, and in England Nov. 13, 1897, No. 27,008.

Claim.—1. In combination, in a plaiting-machine, a drum, means for moving the drum, a series of cords passing over the same and means for moving the cords at a less surface speed than the drum, the fabric to be plaited being fed between the drum and cord, substantially as described.

2. In combination, the heated rotary drum, the cords with means for moving them at a less surface speed than that of the drum, and the steam-pipe arranged outside the drum for acting upon the material, substantially as described.



3. In combination, the rotary drum, the cords with means for moving the same at a less surface speed than the drum, the spring-

pressed pulleys by which the cords pass and the steam-pipe acting on the goods adjacent to said pulleys, substantially as described.

4. In combination, the smooth internally-heated drum, means for moving the said heated drum, a frictional drum, means for moving the said frictional drum at a less surface speed than the heated drum, guide-rollers having equidistant grooves, the spring-pressed pulleys, tension-pulleys and the cords passing around the friction-drum to be moved thereby about the heated drum to act on the goods, the said cords being moved slower than the heated drum, substantially as described.

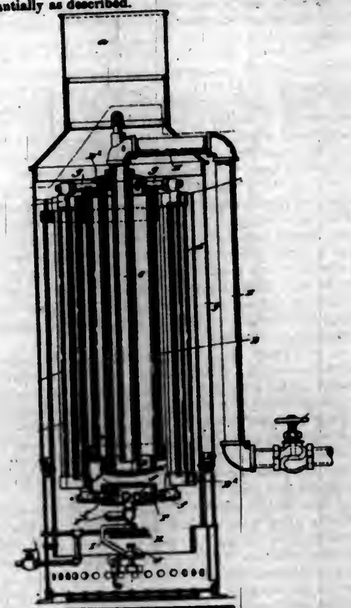
5. In combination, the heated drum, means for moving the same, a drum having a friction-surface adapted to grip a cord or band, and the cord or band passing around the drums with means for moving the friction-drum slower than the heated drum, substantially as described.

604,840. GOVERNING MECHANISM FOR THROTTLE-VALVE CLOSERS. JOHN R. REYNOLDS, Hartford, Conn. Filed Feb. 28, 1896. Serial No. 671,889. (No model.)

Claim.—1. In combination with the motive mechanisms of a throttle-valve closer, cylinders located on opposite sides of the driving-spindle, a speed-reducing mechanism connected with the driving-spindle, and oppositely-facing pistons movable within the cylinders and provided with parts connected by intermeshing teeth with the speed-reducing mechanism and adapted to be given very slow short rectilinear movements in opposite directions in the cylinders by the rotation of the speed-reducing mechanism and connected parts, substantially as specified.

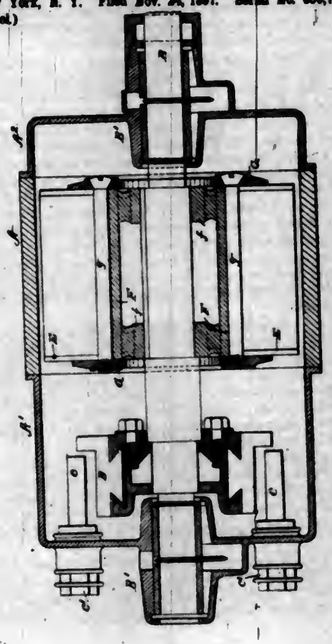
2. In combination with the motive mechanisms of a throttle-valve closer, a plural number of cylinders located on different sides of the driving-spindle, a speed-reducing mechanism connected with the driving-spindle, and a plural number of pistons movable within the cylinders and provided with parts connected by intermeshing teeth with the speed-reducing mechanism, which parts are so arranged that the pistons move simultaneously oppositely and each of the parts assists in guiding the opposite piston from that to which it is connected, substantially as specified.

604,841. NAPHTHA-RETORT. JOHN V. RICE, Jr., Edgewater Park, N. J., assignor to the John V. Rice, Jr., Company, same place. Filed May 22, 1895. Renewed Nov. 1, 1897. Serial No. 657,079. (No model.)



Claim.—1. In a pressure-generator of the class described, the combination with a retort and a burner below it, of an independent hollow casing situated between it and the burner, and connecting-pipes between said casing and the upper end of the retort, substantially as described.

2. In a pressure-generator of the class described, the combination of the combustion-chamber, the vapor-generating retort within the same, a tube or chamber encircled by the said retort, an independent hollow casing located below the retort, an oil-supply pipe connecting with said casing, suitable connecting-pipes between the casing and the upper end of the retort, and a burner located below the said casing, substantially as described.

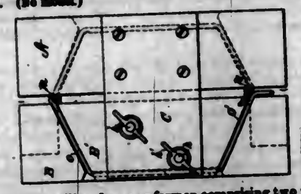


3. In a pressure-generator, the combination of a combustion-chamber, a vapor-generating retort within the same, a burner below said retort having a burner supply-pipe, a tube or chamber centrally located within the retort and smoke-flues passing upward through the retort and arranged in a series around the central tube, substantially as described.

4. In a retort of the class described, the combination of the combustion-chamber, the retort within the same, a hollow casting below the retort, groups of vertical pipes located around the retort and pipe connections at the upper end of said groups with the upper end of said retort and at the lower end of said groups with the casting below the retort, together with an oil-supply pipe entering said casting, substantially as described.

5. In a pressure-generator of the character described, the combination of a combustion-chamber, a retort within the same, a central tube or chamber within said retort, a hollow annular casting below the retort, groups of vertical pipes arranged around the retort and having connections at their upper ends with the upper end of the retort and at their lower ends with the annular casting, a pipe leading from the upper end of the retort to the work to be performed by the gas and a burner located below the annular casting, all arranged substantially as described.

604,842. ELECTRIC MOTOR OR DYNAMO. ANDREW L. RICE, New York, N. Y. Filed Nov. 24, 1897. Serial No. 659,708. (No model.)

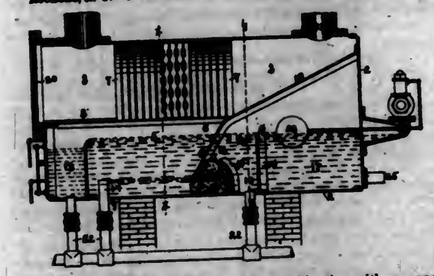


Claim.—1. The combination with the motor having its brushes arranged one above the other, of an inclosing casing having at one end an extension of less width than the body of the casing, said extension inclosing and supporting the brushes, and having a door in one side thereof to give access to the brushes, substantially as described.

2. In an armature, the combination with a spider having radial arms grooved longitudinally in their outer surfaces, rings surrounding and supported by said spider and provided in their inner edges with cuts corresponding to said grooves, and fastening-bolts surrounded partly by the rings and partly by the arms, substantially as described.

3. An armature-frame comprising in combination, a spider having radial arms grooved longitudinally in their outer surfaces, rings surrounding and supported by said spider and provided in their inner edges with cuts corresponding to said grooves, end plates or flanges provided with bolt-holes, and fastening-bolts engaging the arms and rings, substantially as described.

604,843. FORMER FOR WINDING ARMATURE-COILS. ANDREW L. RICE, New York, N. Y. Filed Nov. 19, 1897. Serial No. 659,163. (No model.)



Claim.—1. A coiling frame or former comprising two parts having a winding-space between them, and grooves or winding-channels in each part transverse to the plane of the winding-space, those in one part being on the face of the former, and those in the other part in the rear thereof, substantially as described.

2. A coiling frame or former comprising two parts and means for attaching the two parts rigidly together and for detaching them when desired, said former having at each end a winding-space or slit through which the wire can pass from front to rear, grooves or channels in each part, those in one part being in the face, and those in the other part in the rear, so that the coil, when completed, lies partly on one side of the former and partly on the other, substantially as described.

3. A two-part former having slits or winding-spaces extending through the same, and pins or bearings crossing said slits, the face of one part being provided with two oblique grooves leading from the respective pins, and with a channel connecting the grooves, the rear of the other part having corresponding grooves and channel, substantially as described.

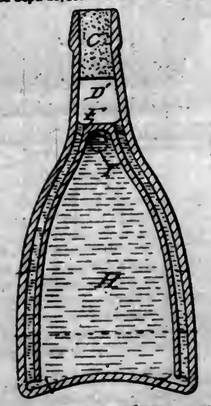
4. A former composed of two detachable parts, one of said parts having a detachable cheek-piece, bounded by grooves or channels in which the coil is wound, the other part having on its opposite side corresponding winding-grooves, slits or spaces being provided for the passing of the wire from the face to the rear of the former, and vice versa, substantially as described.

604,844. STEAM-SEPARATOR. GEORGE I. ROGERS, New Rochelle, N. Y. Filed Jan. 12, 1896. Serial No. 575,470. (No model.)

Claim.—1. In a steam-separator, in combination with an upper compartment having inlet and outlet openings, a lower compartment having inlet and outlet openings, a removable cover to said upper compartment, a removable partition-plate, strips supporting the same, a fixed partition-apron, separating said compartments and a plurality of partitions in said lower compartment for controlling the movements of the several drip matters or materials as and for the purposes set forth.

2. In a steam-separator, in combination with the upper and lower compartments, each having inlet and outlet openings, a removable cover to said upper compartment, a removable partition-plate, a transverse baffle device, strips supporting said partition-plate and baffle device, and a partition-apron, as and for the purposes set forth.

3. In a steam-separator, in combination with the upper and lower compartments, each having inlet and outlet openings, a removable cover to the upper compartment, a removable partition-plate, a transverse baffle device in the upper compartment, strips supporting said removable partition-plate and baffle device, and an overflow and underflow exit for the said lower compartment, as and for the purposes set forth.



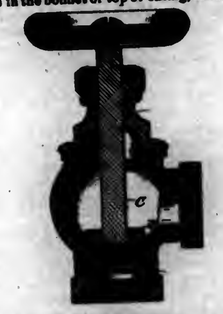
4. In a steam-separator, in combination with the lower or drip-receiving compartment, a partition-dam over which the lighter foreign matters or materials pass or flow; a partition-apron under which the water passes, an upwardly-projecting retarding-dam, and a final partition-dam over which the water of condensation passes for discharge or exit, as and for the purposes set forth.

5. In a steam-separator, in combination with the lower or drip-receiving compartment, a partition-dam over which the lighter foreign matter or materials pass or flow, a partition-apron under which the water of condensation passes, a discharge-pipe or blow-nozzle extending up from the bottom of said drip-receiving compartment to a height somewhat above the bottom edge of said partition-apron, a retaining-partition, and a final partition-dam over which the water passes for the discharge or exit, as and for the purposes set forth.

6. In a steam-separator, in combination with the lower or drip-receiving compartment, a partition-dam over which the lighter foreign matter or materials pass or flow, a partition-apron under which the water of condensation passes, a retaining-partition, filtering or clarifying material inclosed by and between said partition-apron and said retaining-partition, as and for the purposes set forth.

7. In a steam-separator in combination with the lower or drip-receiving compartment, a partition-dam over which the lighter foreign matter or materials pass or flow, a partition-apron under which the water of condensation passes, a retaining-partition, and a discharge-nozzle extending up from the bottom of said drip-receiving compartment to a height somewhat above the bottom edge of said partition-apron, as and for the purposes set forth.

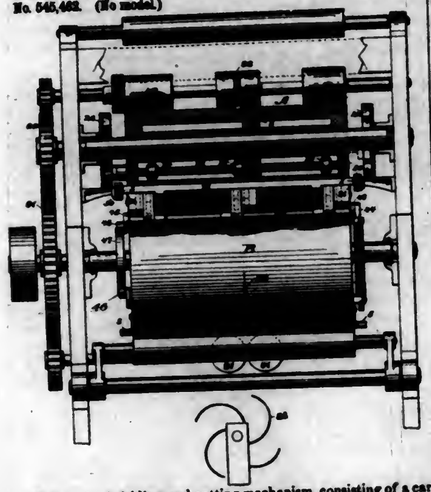
604,845. NON-REFILLABLE BOTTLE. EDMUND ROSNER, New York, N. Y. Filed Sept. 25, 1897. Serial No. 653,094. (No model.)



Claim.—1. As an article of manufacture, a non-refillable bottle having its liquor-containing chamber permanently closed at its upper portion and communicating at different points in its bottom portion by means of channels with the mouth of the bottle above said chamber.

2. In a non-refillable bottle, the combination with a body portion and a neck, of a partition at the neck, a filling-aperture in said body adapted to be sealed, and channels extending through said partition to and opening into the lower portion of the body of the bottle respectively at different points.

604,846. VALVE. WILLIAM H. SHAY, Newburg, N. Y., assignor of one-half to Benjamin Franklin Shay, Poughkeepsie, N. Y. Filed Jan. 5, 1897. Serial No. 618,094. (No model.)



Claim.—In an angle-valve of the character specified, compris-

ing the casing having inlet and outlet openings, and a valve-seat placed at the opening of greatest depth, a valve-stem having at the lower end a valve formed by joining the larger ends of the frustums of two cones, said valve having each end screw-threaded, the lower end of valve being adapted to fit a screw-threaded socket in the valve-seat when shut, and when open the upper end of valve to fit the screw-threaded recess in the bonnet or top of casing, as shown and described.

604,847. FOLDING AND CUTTING MECHANISM.

EDWARD P. SHELDON, Brooklyn, N. Y., assignor to Robert Hoe, Theodore H. Mead, and Charles W. Carpenter, New York, N. Y. Filed Apr. 12, 1895. Serial No. 545,462. (No model.)

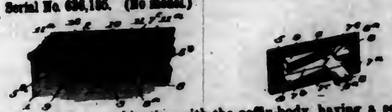
Claim.—1. A folding and cutting mechanism, consisting of a carrier supporting a blade constructed so as to tuck and sever material fed within its range of action, and a companion carrier provided with means coöperating with said blade to freely receive the doubled portion of the material tucked by said blade and then support the same by means nipping the material at opposite sides of the blade while the latter is performing its severing operation, substantially as described.

2. A folding and cutting mechanism, consisting of a carrier supporting a blade constructed so as to tuck and sever material fed within its range of action, and a companion carrier provided with means coöperating with said blade to freely receive the doubled portion of the material tucked by said blade and then support the same by means nipping the material at opposite sides of the blade independent thereof while the latter is performing its severing operation, substantially as described.

3. The combination with a carrier supporting a blade, a companion carrier supporting spring-seated jaws, and means for feeding a sheet thereto, of means causing the blade to move primarily to tuck the sheet between said jaws, and, secondarily, to force the blade through said sheet while it is pressed by the jaws against the blade-carrier on opposite sides of the blade, substantially as described.

4. The combination with a carrier supporting a blade, a companion carrier supporting spring-seated jaws, and means for feeding a sheet thereto, of means causing the blade to move primarily to tuck the sheet between the open jaws, and secondarily to force the blade through said sheet while it is pressed by the jaws against the blade-carrier on opposite sides of the blade, and means causing the jaws to close and nip the severed ends of the divided sheet, substantially as described.

5. The combination with a carrier supporting a blade, a companion carrier supporting jaws, and, means for feeding a sheet thereto, of means causing said blade primarily to tuck the material between said jaws, means holding said jaws open and one of them out of contact with the material during the tucking movement of the blade, means moving said blade secondarily to force it through the material to sever it, and means causing both of said jaws while separated to nip the material on opposite sides of the blade against its straining force during the severing operation, substantially as described.



6. The combination with a carrier supporting a blade, a companion carrier supporting jaws, and, means for feeding a sheet thereto, of means causing said blade primarily to tuck the material between said jaws, means holding said jaws open and one of them out of contact with the material during the tucking movement of the blade, means moving said blade secondarily to force it through the material to sever it, means causing both of said jaws while separated to nip the material on opposite sides of the blade against the straining force during the severing operation, and means causing the jaws to nip the severed ends of the divided sheet and carrying the same onward, lap its plies together and deliver the same associated, substantially as described.

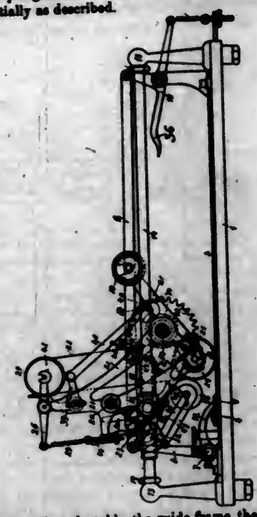
7. In a sheet-delivering mechanism consisting of a rotating carrier supporting a blade and means for projecting it primarily to tuck outward the material and secondarily, to sever the same, and of a companion rotating carrier provided with spring-seated jaws coöperating with said blade to support the material while being tucked and severed, the combination of guards 50 constructed and operating to maintain the foremost jaw in its depressed condition during the tucking operation, substantially as described.

8. In a sheet-delivering mechanism consisting of a rotating carrier supporting a blade and means for projecting it primarily to tuck outward the material and secondarily, to sever the same, of a companion rotating carrier provided with spring-seated jaws coöperating with said blade to support the material while being tucked and severed, the combination of guards 50 constructed and operating to maintain the foremost jaw in its depressed condition during the tucking operation and to release the same so that the material is nipped between the jaws and the carrier of said blade during the severing operation, substantially as described.

604,848. COFFIN-LID FASTENER.

CHRIS H. SMITH, Elgin, Ill., assignor of one-half to G. A. Rowe, same place. Filed May 13, 1897. Serial No. 636,185. (No model.)

Claim.—The combination with the coffin-body, having a series of pockets in the upper edge of its sides, each having a lock-plate having a keyhole-slot having beveled portions 7^a pendent wedges 9 having the beginning-point of incline at the said beveled portions, and having pendent lugs 8 at each point of beginning, said lugs having beveled edges 8^a, of a lid having a series of lock-plates having T-heads, beveled edges 8^a, all being arranged substantially as shown and described, whereby the shank of the lock-plate will be guided by the edges 7^a, and the head by the beveled edges 8^a, when the parts are joined as hereinbefore described.



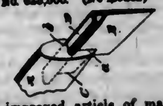
604,849. MACHINE FOR MULTIPLYING COPIES OF MANUSCRIPT.

EUGEN STRÖHER, Zurich, Switzerland, assignor to C. A. Meyer & Co., same place. Filed Apr. 7, 1897. Serial No. 631,145. (No model.) Patented in Switzerland Sept. 17, 1896, No. 13,131, and in Austria Nov. 10, 1896, No. 46/4,530.

Claim.—1. In combination, the table, the guide-frame, the carrier moving thereon comprising a pivoted portion, the traveling band, the rollers therefor on the carrier, the driving-disk having connections to the band for driving the same through contact with the sheet, the spring for returning the band to normal position and means for lifting the pivoted carrier-frame when it reaches the end of its course whereby the driving-roller will be lifted and the band will be free to return to normal position, substantially as described.

2. In combination, the table, the guide-frame, the carrier-frame, the band thereon with means for operating the same including a spring-drum for returning the band to normal position and the brake for controlling the band, said brake being in turn controlled by the spring-drum, substantially as described.

3. In combination, the table, the guide-frame, the carrier thereon comprising the pivoted part, the traveling band on the carrier, the spring drum connected with the band, the means for operating the drum, the rollers for carrying the band on the carrier, the brake controlling one of the rollers, the draw-bar connected with the brake, the pin on the spring-drum for operating the draw-bar and the stops 43, 38, substantially as described.



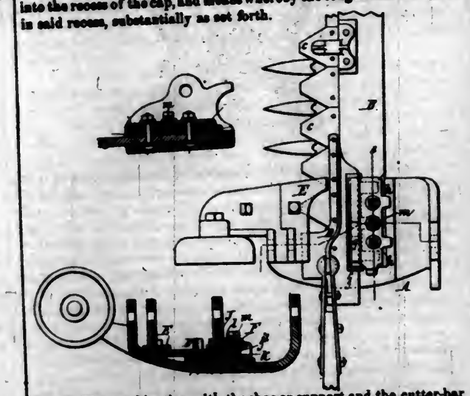
4. In combination, the table, the guide-frame, the carrier moving thereon, the printing device on the carrier, the clamp for holding the sheet to the table and the connections leading to the clamp for operating the same, said connections being operated by the carrier as it reaches the limit of its movement.

5. In combination, the table, the guide-frame, the carrier moving thereon, the printing device on the carrier, the clamp 6, the arm 12 carrying the same, the lever 8, rod 9 and the lever 10 having the arm 36 in the plate of a part of the carrier, substantially as described.

604,850. KNIFE.

AARON WRIGHT, Hudson, N. Y. Filed Feb. 13, 1897. Serial No. 623,300. (No model.)

Claim.—As an improved article of manufacture, the herein-described knife comprising the handle having a recess open at the lower edge and forward end of the handle, and provided with the upper enlarged portion, and the blade having the integral shank and also having the stiffening portion D, at its upper edge extending throughout the length of the blade and shank; the said shank being arranged in the recess of the handle with the stiffening portion D, in the upper enlarged portion of said recess, substantially as specified.



604,851. MOWER.

THOMAS S. BROWN, Poughkeepsie, N. Y., assignor to the Adriance, Platt & Company, same place. Filed Dec. 15, 1897. Serial No. 661,978. (No model.)

Claim.—1. The combination with the finger-bar, the shoe or support arranged at the inner end of the same, the reciprocating cutter-bar and its head, of a removable lower gib resting upon the finger-bar and supporting the rear portion of said head, an upper removable gib bearing with its front portion upon said head and with its rear portion upon the lower gib, and means whereby said gibs are held in place, substantially as set forth.

2. The combination with the shoe, of a cap having one or more recesses in its under side, a reciprocating cutter-bar and its head, and removable gibs arranged on the upper and lower sides of said head and provided with tongues which are arranged in the recesses of the cap, and means whereby the gibs are clamped, substantially as set forth.

3. The combination with the shoe and the reciprocating cutter-bar head, of a cap secured to the shoe and provided on its under side with a forwardly-facing shoulder and with one or more recesses, a lower gib consisting of a wear-plate bearing against the under side of the cutter-bar head and provided with a tongue projecting into the recess of the cap, an upper gib consisting of a wear-plate interposed between the top of the cutter-bar head and the under side of the cap, a depending offset arranged between the rear edge of the cutter-bar head and the shoulder of the cap and a tongue projecting into the recess of the cap, and means whereby the tongues are clamped in said recess, substantially as set forth.

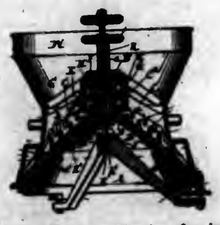
4. The combination with the shoe or support and the cutter-bar head, of a cap which projects over said head, an upper gib seated in the under side of said cap and having a curved tongue, a lower gib having a tongue on which said curved tongue rests, and a clamping-screw which bears upon the curved tongue and whereby the upper gib is pressed upwardly and the lower gib downwardly, each against its seat, substantially as set forth.

604,852. DOOR-FASTENER.

HENRY R. BUTTS, St. Louis, Mo., assignor to Lucinda Butts, same place. Filed Oct. 8, 1897. Serial No. 654,601. (No model.)

Claim.—1. A door-fastener comprising a clip, a pivot traversing said clip, a sustaining-bar pivoted on said pivot, a spring mounted on said pivot and impinging the bar, and engaging arms pivoted on said bar.

2. A door-fastener comprising a sustaining-bar, means for pivoting said bar to a door, the outer end portion of which bar is bent outwardly from the door, engaging arms pivoted on said outwardly-bent portion of the bar and a hook fixed to the door and so arranged as that the sustaining-bar engages in the lip thereof when the device is in an operative position.



604,858. GRINDING-MILL.

THOMAS CASCADEN, Jr., Waterloo, Iowa, assignor to the Davis Gasoline Engine Works Company, same place. Filed June 21, 1897. Serial No. 641,557. (No model.)

Claim.—1. In a grinding-mill the combination of an inner cone or crushing surface having a central post rising above the same, a ball-support around said post, an outer shell provided with arms extending over said cone or crushing surface and provided also with a vertical ring or hub to which said arms are joined and antifriction-balls interposed between said post and the vertical inner surface of said ring or hub.

2. In a grinding-mill the combination of a cone or crushing surface having a post rising above the same, an outer shell having inwardly-extending arms and sustained from said post, a ring or hub for said arms having its interior formed with vertical and horizontal bearing-surfaces, antifriction-balls interposed between said cone-post and the vertical bearing-surface of said ring or hub and beneath the

horizontal bearing-surface of said ring or hub, said balls serving to receive the strain from said ring or hub in both vertical and lateral directions.

3. In a grinding-mill the combination of an inner cone or crushing surface provided with a raised central post, an outer shell having inwardly-extending crushing-arms, a ring or hub for said arms encircling the cone-post, antifriction-balls interposed between said ring or hub and the cone-post and a ring arranged beneath said balls and serving to guard the same against the mass of material being ground.

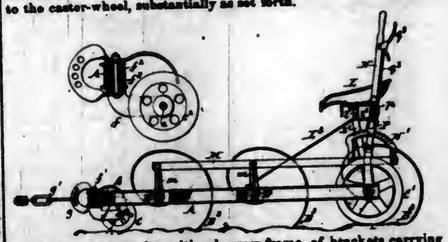
4. In a grinding-mill the combination of an inner cone or crushing surface provided with a raised central post, an outer shell having inwardly-extending crushing-arms, a ring or hub for said arms encircling the cone-post, antifriction-balls interposed between said ring or hub and the cone-post and a ring arranged beneath said balls and serving to guard the same against the mass of material being ground, said ring having teeth upon its under surface.

5. In a grinding-mill the combination of an inner cone or crushing surface, an outer shell having arms extending above said cone or crushing surface, a hub for said arms encircling a post rising from said cone, a cob-breaker mounted upon said cone-post and antifriction-balls interposed between the cob-breaker and said hub and a ring serving to close the space between the cob-breaker and the hub beneath it and being provided with pockets whereby said antifriction-balls are retained in place.

6. In a grinding-mill the combination of an inner cone or crushing surface an outer revoluble shell having inwardly-extending crushing-arms provided with a hub, a post rising from said cone and passing through said hub, a stationary cob-breaker upon said hub, antifriction-balls interposed between said cob-breaker and said hub and a ring for guarding said antifriction-balls against the material being ground.

7. In a grinding-mill the combination of an inner cone or crushing surface, a revoluble shell mounted over said cone or surface, inner and outer grinders at the base of said shell, a bracket located beneath said inner cone and provided with a series of arms extending outwardly and connected with the outer ring of the outer grinder and a screw for adjusting said bracket.

8. In a grinding-mill the combination of an inner cone or crushing surface, an outer revoluble shell, inner and outer grinders at the base of said shell, a bracket connected with the outer ring of the outer grinder, and an adjusting-screw leading from said bracket centrally upward through said cone and provided with hand-wheels.



9. In a grinding-mill the combination of an inner cone or crushing surface, an outer revoluble shell, inner and outer grinders at the base of said shell, a post rising centrally from the top of said cone and having an opening therethrough, an adjusting-screw passing through said cone-post and a bracket connected with said adjusting-screw, said bracket being connected also with the outer grinder and a hand-wheel mounted upon said adjusting-screw.

10. In a grinding-mill the combination of an inner cone or crushing surface provided with a central post rising above the same, an outer shell provided with inwardly-extending arms having a hub encircling said post, a cob-breaker fixed to but vertically movable upon said central post, inner and outer grinders at the base of said shell, a bracket connected with the outer grinder, an adjusting-screw leading from said bracket up through the cone-post and cob-breaker and means substantially as shown for effecting the adjustment of said screw.

11. In a grinding-mill the combination with an inner cone or crushing surface, an outer revoluble shell provided with openings therethrough for the passage of grain, the inner and outer grinders at the base of said shell, said outer grinder comprising a vertically-adjustable casing extending above the openings in the shell and provided at its base with a grinding-ring and a bracket connected with said vertically-adjustable casing and a screw for adjusting said bracket and said casing leading upward centrally through the cone.

604,854. SPRING-TOOTH HARROW. HENRY J. CASE, Owasco, N. Y., assignor to the Adriance, Platt & Company, Poughkeepsie, N. Y. Filed Feb. 15, 1897. Serial No. 623,472. (No model.)

Claim.—1. The combination with a harrow-frame, of a bracket carrying a caster-wheel and pivoted to said frame, a scraper separately pivoted to swing concentric with the pivot of said bracket and engaging at its rear end with the caster-wheel, and a draft device connected with said scraper, whereby the lateral movement of the draft device is communicated to the scraper and by the latter to the caster-wheel, substantially as set forth.

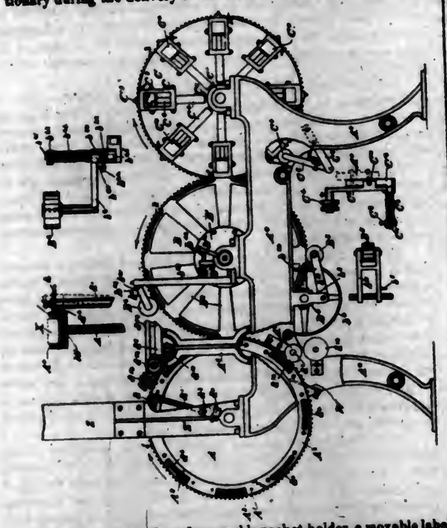
2. The combination with a harrow-frame, of brackets carrying caster-wheels and pivoted to said frame, scrapers separately pivoted to swing concentric with the pivots of said brackets and engaging at their rear ends with the caster-wheels and provided with arms in front of their pivots, and a transverse draft-bar arranged in front of the harrow-frame and connected at its ends with the front arms of said scrapers, substantially as set forth.

3. The combination with a harrow-frame, of grooved caster-wheels pivoted to said frame, scrapers pivoted concentric with the pivots of said caster-wheels and engaging with their rear ends in the grooves of said wheels, clevises secured to said scrapers and arranged in front of the pivots thereof, and a draft-bar having its ends connected with said clevises, substantially as set forth.

4. The combination with a harrow-frame having a journal-opening, of a hollow tooth-bar bearing against the inner side of said frame, a journal secured in said bar, a screw secured in the outer end of said journal and bearing with its head against the outer side of said frame, a supporting-wheel mounted upon said bar and having its hub provided with annular recesses in its ends, a collar seated in the outer recess and bearing against the inner side of the frame, and a collar seated in the inner recess and secured to the tooth-bar, substantially as set forth.

5. The combination with a harrow-frame having a journal-opening, of a hollow tooth-bar bearing against the inner side of said frame, a journal secured in said bar and provided outside of said frame with an enlargement which bears against the outer side of said frame, a tooth secured to said enlargement, and a brace secured at its front end to the frame and engaging at its rear end with said enlargement, substantially as set forth.

6. The combination with the adjusting-lever and its segment, of a locking-slide mounted on said lever, means whereby said slide can be locked on the lever in an elevated position to clear the segment, and releasing devices whereby the slide is automatically released from the lever to interlock with the segment, substantially as set forth.



7. The combination with the adjusting-lever and its segment, of a locking-slide mounted on said lever and provided with a releasing-arm, means whereby said slide can be locked on the lever in an elevated position to clear the segment, and a releasing-stop on the segment which is adapted to engage with the arm of the slide and release the latter from the lever, substantially as set forth.

8. The combination with the adjusting-lever and its segment, of a locking-slide mounted on the lever and provided with a lip which is adapted to engage in a notch in the lever for locking the slide in an elevated position, and having a releasing-arm, of a releasing-stop on the segment which is adapted to engage with the arm of the slide and release the lip of the latter from the notch in the lever, substantially as set forth.

604,855. LABEL-AFFIXING MACHINE. ARTHUR R. COWLES and FRANK S. REYNOLDS, Rochester, N. Y. Filed Aug. 7, 1896. Renewed Sept. 29, 1897. Serial No. 653,519. (No model.)

Claim.—1. The combination of a packet-holder, a movable label-carrier, a movable magazine adapted to present successive labels to said label-carrier, means cooperating with said label-carrier for removing a label from said magazine and for carrying it on the label-carrier to the packet-holder, and mechanism for moving the magazine and the label-carrier with substantially the same speed in the same direction when the label is presented to the label-carrier, whereby the label-magazine and the label-holder are both movable but relatively stationary during the delivery of the label from the former to the latter.

2. The combination of a packet-holder, a movable label carrier, a movable magazine adapted to present successive labels to said label-carrier, means cooperating with said label-carrier for removing a label from said magazine and for carrying it on the label-carrier to the packet-holder, a device for interposing adhesive or moisture between the packet and the label, and mechanism for moving the magazine and the label-carrier with substantially the same speed in the same direction when the label is presented to the label-carrier, whereby the label-magazine and the label-holder are both movable but relatively stationary during the delivery of the label from one to the other.

3. The combination of a movable packet-holder, a movable label-carrier, a movable magazine adapted to present successive labels to said label-carrier, means cooperating with said label-carrier for removing a label from said magazine and for carrying it on the label-carrier to the packet-holder and then releasing it, a device for gumming or moistening the packet while on the packet-carrier and before it meets its label, mechanism for moving the magazine and the label-carrier with substantially the same speed in the same direction when the label is presented to the label-carrier, and mechanism for moving said packet-holder with substantially the same speed as the label-carrier when the label meets its packet, whereby a label is relatively stationary to the label-carrier and to the packet-holder during its delivery to and from the label-carrier.

4. The combination of a movable packet-holder, a continuously-moving label-carrier, a movable magazine adapted to present successive labels to said label-carrier, means cooperating with said label-carrier for removing labels successively from said magazine and for holding a series of labels upon said label-carrier and carrying them to the packet-holder and then releasing them, mechanism for moving the magazine and the label-carrier with substantially the same speed in the same direction whenever the means for removing a label from said magazine is in operation, and mechanism for moving said packet-holder with substantially the same speed as the label-carrier when the label meets its packet, whereby a label is relatively stationary to the label-carrier and to the packet-holder during delivery of the label to and from the label-carrier.

5. The combination of a movable packet-holder, a continuously-moving label-carrier, a movable magazine adapted to present successive labels to said label-carrier, means cooperating with said label-carrier for removing labels successively from said magazine and for holding a series of labels upon said label-carrier and carrying them to the packet-holder and then releasing them; a device for interposing adhesive or moisture between the packet and the label, mechanism for moving the magazine and the label-carrier with substantially the same speed in the same direction whenever the means for removing a label from said magazine is in operation, and mechanism for moving said packet-holder with substantially the same speed as the label-carrier when the label meets its packet, whereby a label is relatively stationary to the label-carrier and to the packet-holder during delivery of the label to and from the label-carrier.

6. The combination of a movable packet-holder, a continuously-moving label-carrier, a movable magazine adapted to present successive labels to said label-carrier, means cooperating with said label-carrier for removing labels successively from said magazine and for holding a series of labels upon said label-carrier and carrying them to the packet-holder and then releasing them, a device for gumming or moistening the packet while on the packet-holder and before it meets its packet, mechanism for moving the magazine and the label-carrier with substantially the same speed and in the same direction whenever the means for removing a label from said magazine is in operation, and mechanism for moving said packet-holder with substantially the same speed as the label-carrier when the label meets its packet, whereby a label is relatively stationary to the label-carrier and to the packet-holder during delivery of the label to and from the label-carrier.

7. The combination of a movable packet-holder, a continuously-moving label-carrier, a movable magazine adapted to present successive labels to said label-carrier, means cooperating with said label-carrier for removing labels successively from said magazine and for holding a series of labels upon said label-carrier and for carrying them to the packet-holder and then releasing them, a gumming device having a raised portion supplied with adhesive, mechanism for moving said gumming device to press said raised portion upon a portion of a packet, means for moving said packet-holder with substantially the same speed and in the same direction as the label-carrier when the packet meets its label, whereby the label is placed upon the gummed portion of the packet, and mechanism for moving the magazine with substantially the same speed as the label-carrier and in the same direction whenever the means for removing a label from said magazine is in operation, whereby a label is relatively stationary to the label-carrier and to the packet-holder during the delivery of the label to and from the label-carrier.

8. The combination of a packet-hopper, a continuously-moving packet-carrier having a series of packet-holders, a moving label-magazine, a continuously-moving label-carrier provided with means for taking a series of labels from said label-magazine, one for each packet, and for carrying them to said packet-holders, mechanism for moving said label-magazine and said label-carrier in the same direction and with substantially the same speed when the label is presented to the label-carrier, and a gumming or moistening device for supplying adhesive or moisture between the label and the packet.

9. The combination of a packet-hopper, a continuously-moving packet-carrier having a series of packet-holders, a continuously-moving label-magazine, a continuously-moving label-carrier provided with means for taking a series of labels from said magazine, one for each packet-holder, and for carrying them to said packet-holders, mechanism for moving said label-magazine and said label-carrier in the same direction and with substantially the same speed when the label is presented to the label-carrier, and a gumming or moistening device for operating on each packet in a packet-holder.

10. The combination of a packet-hopper, a moving packet-carrier, a moving label-magazine, a pneumatic label-carrier, movable from said magazine to said packet-carrier, and moving with substantially the same speed and in the same direction as the label-magazine when a label is presented to the label-carrier, an air-exhausting device, means for connecting the exhausting device with said label-carrier when it registers with said magazine whereby a single label is taken thereout, and for disconnecting the exhaust from said label-carrier when the label is carried to said packet-carrier, and a gumming or moistening device for supplying adhesive or moisture between the label and the packet.

11. The combination of a packet-hopper, a continuously-moving packet-carrier having a series of packet-holders, a continuously-moving label-magazine, a continuously-moving label-carrier provided with a series of pneumatic suction devices and movable from said magazine to said packet-carrier, mechanism for moving the label-magazine and the label-carrier with substantially the same speed and in the same direction, when the label is presented to the label-carrier, an air-exhausting apparatus, connections therefrom to each of said suction devices, means for connecting said exhausting apparatus with each suction device when it registers with said magazine, whereby a single label is withdrawn from said magazine and is carried to said packet-carrier upon said label-carrier, and for disconnecting said exhaust from said suction device when the label meets a packet, and a gumming or moistening device for supplying adhesive or moisture between the label and the packet.

12. The combination of a packet-hopper, a movable packet-carrier, a movable label-magazine, a label-carrier movable from said magazine to said packet-carrier, a perforated label-holder thereon, an air-exhausting apparatus, means for connecting said label-holder with said exhaust apparatus when the holder registers with said magazine, whereby a label is withdrawn from said magazine and is carried to said packet-carrier, and for disconnecting said exhaust from said label-holder when the same meets a packet, mechanism for moving said label-carrier and said magazine with substantially the same speed and in the same direction when a label is presented to the label-carrier, and a gumming or moistening device for operating on the packet before it reaches the label and while on said packet-carrier.

13. The combination of a packet-hopper, a continuously-moving

packet-carrier having a series of packet-holders, a continuously-moving multiple label-magazine, a continuously-operating label-carrier movable from a magazine to a packet-carrier and having a series of pneumatic label-holders thereon consisting of perforated elastic plates, an air-exhaust apparatus, means for connecting said exhausting apparatus with said label-holder when it registers with said magazine to carry a label therefrom to said packet-carrier, and for disconnecting said exhausting apparatus from said label-holder when the same meets a packet, mechanism for moving said label-carrier and said magazine with substantially the same speed and in the same direction when a label is presented to the label-carrier, and a gumming or moistening device for operating on each packet while on said packet-carrier before it meets its label.

14. The combination of a packet-holder, a movable label-magazine, a label-carrier movable from said magazine to said packet-carrier and having a label-holder thereon, provided with a printing-plate, means for inking said printing-plate, means cooperating with said label-carrier for removing a label from said magazine and for delivering it to the packet-holder upon said printing-plate, mechanism for moving said magazine and said label-carrier with substantially the same speed and in the same direction when a label is presented to the label-carrier, means for pressing the label against the printing-plate during its movement toward the packet-carrier, and a device for interposing adhesive or moisture between the packet and the label, whereby the label is printed and affixed to the packet.

15. The combination of a packet-holder, a movable label-magazine, a label-carrier movable from said magazine to said packet-carrier and having a label-holder thereon, provided with a printing-plate, means for inking said printing-plate, means cooperating with said label-carrier for removing a label from said magazine and for delivering it to the packet-holder upon said printing-plate, mechanism for moving said magazine and said label-carrier with substantially the same speed and in the same direction when a label is presented to the label-carrier, means for pressing the label against the printing-plate during its movement toward the packet-carrier, and a device for gumming or moistening the packet while in the packet-holder and before it meets its label.

16. The combination of a packet-hopper, a packet-carrier having a series of packet-holders, a label-magazine, a label-carrier movable from said magazine to said packet-carrier and having a series of label-holders thereon, each being a perforated printing-plate, means for inking said printing-plate, an air-exhaust apparatus, means for connecting said exhaust apparatus with each label-holder when it registers with said magazine and until the label meets its packet, and for disconnecting said exhaust when the label meets its packet, whereby the label is carried upon said printing-plate to said packet-carrier and is pressed against a packet, whereby the label is printed and affixed to the packet, and a gumming or moistening device for operating on each packet while on said packet-carrier and before it meets its label.

17. The combination of a packet-carrier, a label-magazine, a label-carrier, and an exhaust apparatus, said label-carrier moving from the delivery end of the label-magazine to said packet-carrier and having a cavity therein connecting with said exhaust apparatus, a perforated printing-plate on said cavity, a valve controlling the connection of the exhaust with said cavity and adapted to connect the cavity with the exhaust when the printing-plate registers with the delivery end of the magazine and to disconnect said cavity from the exhaust when the label meets its packet, and an inking device for inking said printing-plate before the label is carried thereon.

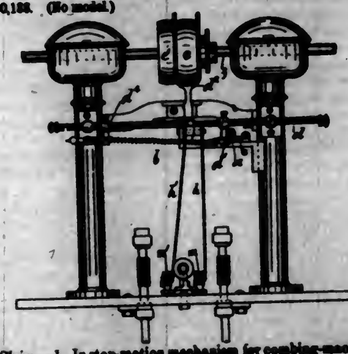
18. The combination of a packet-carrier, a label-magazine, a rotary label-carrier, said label-carrier revolving from the delivery end of the label-magazine to the packet-carrier and having a cavity in its outer portion, a perforated printing-plate on said cavity, a hollow axle for the label-carrier, said cavity connecting with the hollow axle, an exhaust apparatus connecting with said hollow axle, a valve controlling the connection of the exhaust with the cavity adapted to connect the cavity with the exhaust when the printing-plate registers with the delivery end of the magazine and to disconnect from the exhaust when the label meets its packet, and an inking device for inking said printing-plate before the label is carried thereon.

19. The combination of a packet-carrier, a label-magazine, a label-carrier, and an exhaust apparatus, said label-carrier moving from the delivery end of the label-magazine to the packet-carrier and having a series of cavities, a perforated printing-plate on each cavity, a common chamber connected with said exhaust apparatus and a separate connection between said chamber and each cavity, and a valve controlling the connections of the exhaust with the cavity adapted to connect each cavity with the exhaust when the printing-plate registers with the delivery end of the magazine, to sustain the connection with the exhaust until the label meets its packet, and then to disconnect the cavity from the exhaust, and an inking device for inking said printing-plates before the labels are carried thereon.

20. The combination of a packet-carrier having a series of packet-holders thereon and side flanges for said packet-holders provided with a slot on one side opposite each packet-holder, an arm pivoted to the frame to move to and from the packet-holders, a device for normally pressing said arm toward the packet-holders, a surface on said packet-holder between each two slots for engaging and moving said arm from said packet-holders, and a wheel freely revolvable on said arm and adapted to enter said slots to press upon the packets in said holders.

21. A magazine mechanism for cut sheets consisting of a series of magazines for such cut sheets, a moving support adapted to carry said magazines successively to a delivery-point, mechanism for removing said cut sheets from said magazines successively, said support having a socket for each magazine and a catch for engaging a lug upon each magazine, whereby said magazines are removable and replaceable at will.

22. The combination of a revolvable wheel A having a series of packet-holders on the periphery thereof, a revolvable wheel B having a series of label-holders thereon, a revolvable wheel C having a series of label-magazines thereon, gearing for moving said three wheels with equal peripheral speed, mechanism cooperating with said wheel B for removing labels successively from said label-magazines and for retaining the same upon the successive label-holders and for releasing the labels successively from said label-holders when a label meets its packet, and a device for interposing gum or moisture between said label and its packet.

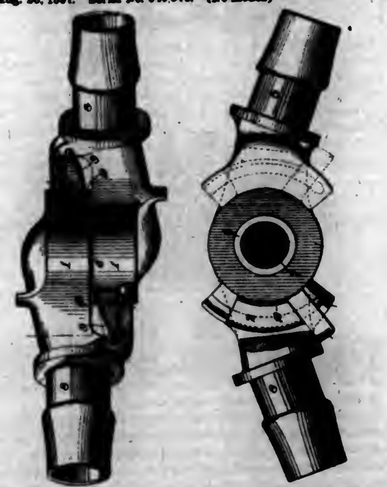


23. The combination of a revolvable wheel A having a series of packet-holders on the periphery thereof, a revolvable wheel B having a series of label-holders thereon, a revolvable wheel C having a series of label-magazines thereon, gearing for moving said three wheels with equal peripheral speeds, mechanism cooperating with said wheel B for removing labels successively from said label-magazines and for retaining the same upon the successive label-holders and for releasing the labels successively from said label-holders when a label meets its packet, and a device for interposing gum or moisture between said label and its packet, and a wheel A^7 for pressing the label against the packet after it had adhered thereto.

24. A label-magazine and a support therefor, consisting of the label-box c provided with the notched lug c^6 and the pin c^8 upon the stem c^4 in combination with a socket c' on said support for the pin c^8 and a perforation C^9 on said support for the lug c^6 and a spring-pressed pin C^8 for pressing said lug to cause its notch to engage with the perforation C^9 and the pin c^8 to engage the socket c'.

25. A top delivery for cut sheets consisting of a box open at the delivery end, mechanism for constantly pressing the sheets transversely toward said delivery end, means on said delivery end for holding one edge of the topmost sheet, and a knife attached to said delivery end and projecting over another edge of said sheet, in combination with apparatus for extracting a label transversely from the magazine.

26. A label-magazine for top delivery consisting of the label-box c, the spring-pressed piston c^3 tending to move the labels thereon toward the delivery end of said box, plates c^5 extending over corners of the open end of said box and an adjustable knife c^9 extending diagonally over a portion of the open end of said box opposite to said plates.



604,856. STOP MECHANISM FOR COMBING-MACHINES. JONAS DEBET, Bingley, England. Filed Mar. 31, 1897. Serial No. 630,188. (No model.)

Claim.—1. In stop-motion mechanism for combing-machines, the combination with spring-actuated belt-shifting mechanism having a detent for holding it against the action of its spring, of detector-levers adapted to rest on the slivers, connections between said levers and detent whereby the descent of either or both of the levers will release the said detent, and means whereby the levers may be independently moved to inoperative positions.

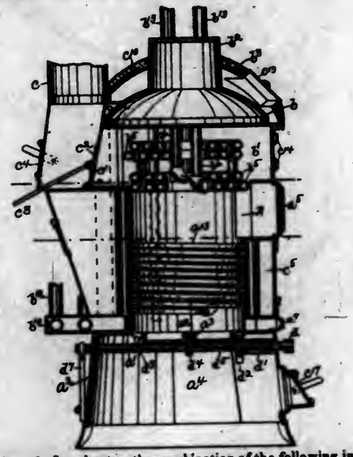
2. In stop-motion mechanism for combing-machines, the combination with spring-actuated belt-shifting mechanism, of a lever having a detent for holding said mechanism against the action of its spring, said detent having an inclined side, detector-levers adapted to rest on the slivers, rods connected with the detector-levers and having connections whereby they will release the detent on the descent of one of the detector-levers, and means operated by the spring-actuated movement of the belt-shifter to ride under the inclined side of the detent and elevate its lever and also the rods and the detector-levers.

604,857. PIPE-COUPLING. WILLIAM W. EDWARDS, Wilmerding, Pa., assignor to Henry Herman Westinghouse, Pittsburg, Pa. Filed Aug. 26, 1897. Serial No. 649,570. (No model.)

Claim.—1. In a half-section of a pipe-coupling provided with a lateral opening and adapted to be coupled with a similar half-section by a partial rotary movement, a flange or hook on the end of the coupling, and a stop formed on the half-section between the back of the half-section and the plane of the face of the half-section and offset from the plane of the face, substantially as set forth.

2. In a half-section of a pipe-coupling, provided with a lateral opening and adapted to be coupled with a similar half-section by a partial-rotary movement, a flange, or hook, on the end of the coupling and a projection, or extension, formed integral with the flange, or hook, and adapted to form a stop to limit the rotary movement of the half-section when coupled with a similar half-section, substantially as set forth.

3. In a pipe-coupling, comprising two half-sections having lateral openings and adapted to be rotated in a longitudinal plane to effect the coupling of the half-sections, a lug or projection formed on the curved end portion of a half-section and adapted to engage with the casting or shell of the other half-section to limit the relative rotary movement of the half-sections, substantially as set forth.



604,858. WASHBOILER ATTACHMENT. JAMES H. SHARINE, Early, Iowa. Filed May 4, 1897. Serial No. 635,095. (No model.)

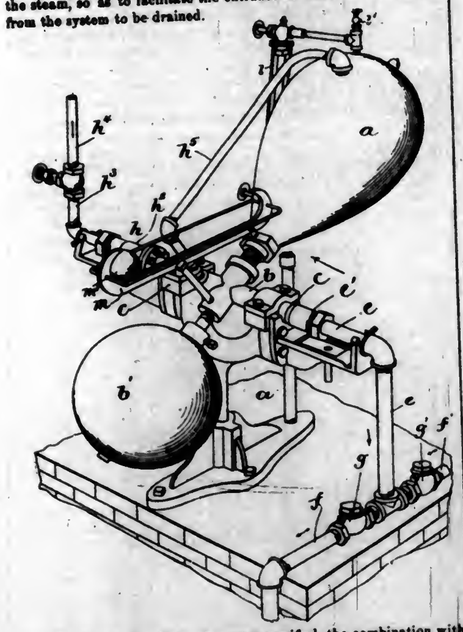
Claim.—1. In a washboiler attachment for heating water, a sheet-metal plate having a lateral extension and an opening in said extension to admit a tube and downwardly-extended flanges to rest upon a plurality of straight and parallel pipes connected at their ends, a plurality of parallel pipes connected at their ends, a tube fixed to one of the parallel pipes and extended up through the opening in the sheet-metal plate and a coinciding opening in the flat bottom of a washboiler and means for fastening the said parts together for the purposes stated.

2. An attachment for washboilers, comprising a series of straight parallel pipes connected at their ends, externally-screw-threaded tubes fixed to the open ends of the parallel pipes, nuts placed on said tubes, sheet-metal plates having parallel flanges projecting downward and resting on said pipes and lateral extensions with holes therein to admit the said tubes that extend up through coinciding holes in the bottom of a washboiler, a washer and nut placed on one of the screw-threaded tubes, a washer and a short internally-screw-threaded coupling placed on the other short tube, and an upward extension having a spout at its top fixed in said coupling, all arranged and combined with a washboiler substantially as shown and described.

604,859. HEATER. ELIJAH C. HALL, Braintree, Mass. Filed July 2, 1897. Serial No. 643,189. (No model.)

Claim.—1. In a heater, the combination of the following instrumentalities, viz: a hollow casting forming the walls of a fire-pot, a hollow dome supported above said casting, a coil of pipe in the fire-pot having its opposite ends connected to the said hollow casting near the top and bottom of the same, and a coil of pipe intermediate of the hollow casting and the said dome and connected therewith for the circulation of liquid from the hollow casting through the coil of pipe into the said hollow dome, substantially as described.

2. In a heater, the combination of the following instrumentalities, viz: an inclosing shell, a hollow casting located therein and forming the walls of a fire-pot, a hollow dome supported above said hollow casting, and a plurality of horizontal coils of pipe interposed between said hollow casting and the said dome and placed one above the other and connected therewith, substantially as described.



3. In a heater, the combination of the following instrumentalities, viz: an inclosing shell, a hollow casting provided with openings a^{10} a^{12}, a coil of pipe located in said hollow casting and having its end extended into the openings a^{10} a^{12} and connected to the hollow casting, and a coil of pipe located above the hollow casting and having one end connected thereto, substantially as described.

4. In a heater, the combination of the following instrumentalities, viz: a hollow casting forming the walls of a fire-pot and provided with a fuel-opening a^7, clinker-opening a^8 and openings a^{10} a^{12}, of a coil of pipe located in said hollow casting and having its ends extended into the openings a^{10} a^{12} and connected to the hollow casting to communicate therewith for the circulation of water from the bottom of the hollow casting through the coil of pipe to the top or upper part of said casting, substantially as described.

604,860. STEAM-TRAP. BURTON W. HILL, Somerville, Mass. Filed May 18, 1896. Received Nov. 11, 1897. Serial No. 658,203. (No model.)

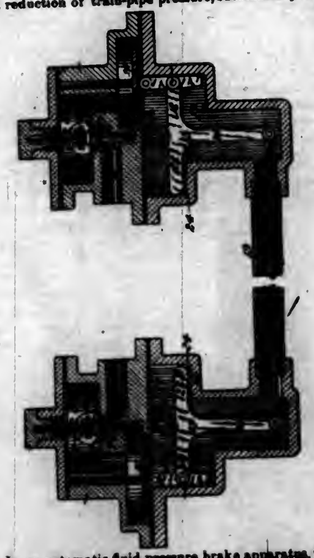
Claim.—1. A steam-trap comprising in its construction a shaft mounted to turn in bearings and provided with a longitudinal passage in each end, branch pipes connected with one end thereof, one of the branch pipes being adapted to be connected to the system to be drained and the other to the boiler, a chamber rigidly connected with the said

shaft to turn therewith and adapted to receive water from one of said branch pipes and discharge it through the other, a counterbalance for the chamber, a live-steam-supply pipe connecting the upper portion of the chamber with the passage at the other end of the shaft, and a valve located within said shaft and operated by the movements of the chamber to admit steam to the chamber and to cut it off therefrom, whereby a vacuum may be formed in the chamber after cutting off the steam, so as to facilitate the entrance of water to the chamber from the system to be drained.

2. In a device of the character specified, the combination with the pipes b and h mounted in bearings, the chamber a connected at its lower end with the pipe b and adapted to turn therewith and with the pipe h, the pipe h^2 connecting the pipe h with the upper portion of the chamber, the pipe h^3 for live steam and having its end provided with a valve-seat, and a valve operated toward and from the said seat by the oscillation of the pipe h, the said valve being movable in the direction of the axis of said pipe.

3. In a device of the character specified, the combination with the stationary pipe h^3 having a valve-seat and the guides i' i^2, the casing h^3 mounted to rotate on the pipe h^3, the valve having the threaded stem i^4 and fitted to the said guides, and the threaded sleeve i^5 connected to rotate with the casing h^3.

4. In a device of the character specified, the combination with the stationary pipe h^3 having a valve-seat and the guides i' i^2, the casing h^3 mounted to rotate on the pipe h^3, the valve having the threaded stem i^4 and fitted to the said guides, the threaded sleeve i^5 having the flanges i^7 i^8 provided with fluid-passages, and an adjusting-screw i^9 passing through the casing and engaging with a portion of one of the flanges, substantially as described.



604,861. AUTOMATIC FLUID-PRESSURE BRAKE APPARATUS.

THOMAS J. HOGAN, Pittsburg, Pa., assignor to the Westinghouse Air Brake Company, same place. Filed Mar. 13, 1897. Serial No. 627,363. (No model.)

Claim.—1. In an automatic fluid-pressure brake apparatus, the combination, with a section of train-pipe, on a car, of operatively-connected means for simultaneously effecting a local release of fluid from the train-pipe at more than one point in the length of the train-pipe section, substantially as set forth.

2. In an automatic fluid-pressure brake apparatus, the combination, with a train-pipe, of means, actuated by a reduction of train-pipe pressure, for locally exhausting fluid under pressure from the train-pipe simultaneously at two points in the length of the train-pipe, substantially as set forth.

3. In an automatic fluid-pressure brake apparatus, the combination, with a train-pipe, of two release-valve devices connected therewith and adapted to effect a local exhaust of fluid therefrom, and means whereby the two release-valves may be operated simultaneously by a reduction of train-pipe pressure, substantially as set forth.

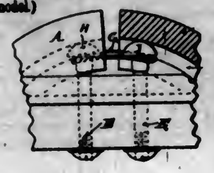
4. In an automatic fluid-pressure brake apparatus, the combination, with a train-pipe, of two release-valve devices which are so connected that the operation of one may effect the simultaneous operation of the other, substantially as set forth.

5. In an automatic fluid-pressure brake apparatus, the combination, with a train-pipe, of a release-valve device adapted to be operated by variations of fluid-pressure, and connected with and adapted to positively operate another release-valve device, substantially as set forth.

6. In an automatic fluid-pressure brake apparatus, the combination, with a train-pipe, of two release-valve devices, each adapted to be actuated by variations of fluid-pressure, and so connected together that the operation of one will effect a simultaneous operation of the other, substantially as set forth.

7. The combination, with two connected valve devices, of a fluid-pressure-actuated member, or abutment in each valve device, and a connection between the fluid-pressure-actuated members, or abutments, whereby the operation of either valve device by fluid-pressure may effect a simultaneous operation of the other, substantially as set forth.

8. The combination, with two valve devices, of a piston, or other fluid-pressure-actuated member, for each valve device and means connecting the pistons whereby each piston is adapted to operate both valve devices, substantially as set forth.

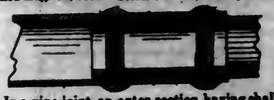


9. The combination, with a pipe connected with a number of valve devices adapted to be operated by variations of fluid-pressure in the pipe, of means, operative by variations of pressure in the pipe, and simultaneously actuated for effecting variations of fluid-pressure at different points in the pipe, substantially as set forth.

10. The combination, with a train-pipe, of two valve devices for releasing fluid under pressure therefrom, a piston in each of the valve devices, a lever adapted to be actuated by each piston, and a connection between the levers, substantially as set forth.

11. The combination, with two valve devices, of two connected levers having changeable fulcrums, and a piston connected to each lever and adapted to operate both valves, substantially as set forth.

604,862. MEANS FOR FIXING RUBBER TIRES ON WHEELS.



ALFRED HOPTON, London, England. Filed Feb. 5, 1897. Serial No. 622,142. (No model.)

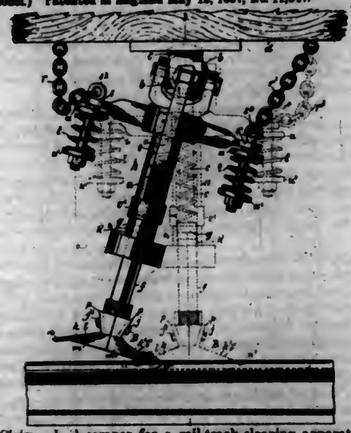
Claim.—In a wheel for a vehicle, a tire constructed of suitable material, provided with a groove throughout its length, and slot to accommodate the head and pin of a bolt, in combination with a wheel-rim made to conform in shape to the tire, and provided with holes to receive the bolts, the slotted plate G, and the bolts H and J arranged in the ends of the tire, substantially as described.

604,863. PIPE-JOINT.

GUSTAV HOYER, Schlüsselburg, Germany, assignor to the Fahrradwerke Weltrad, vormals Hoyer & Gluhn, same place. Filed Aug. 13, 1897. Serial No. 648,112. (No model.)

Claim.—In a pipe-joint, an outer section having shallow annular grooves formed near the end thereof, an inner section fitting within the outer section and a reinforcing-section of uniform thickness throughout, said reinforcing-section being permanently fitted in the inner section, said inner and reinforcing sections being simultaneously pressed outward or expanded into the grooves of the outer section and at those points only, the flange produced by the groove in the reinforcing-section being deeper in proportion than the other section, substantially as set forth.

604,864. CAR-COUPLING.



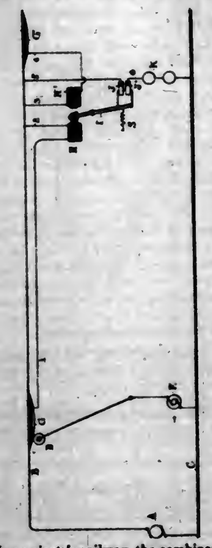
GEORGE B. JOHNSTON, St. Thomas, Ont. Filed Oct. 27, 1897. Serial No. 656,496. (No model.)

Claim.—In a car-coupler, two draw-heads, each having a longitudinal vertical slot formed at one end thereof, the walls of said slot having longitudinal ways formed therein near the bottom of the slot, the outer ends of said ways being deepened to form a flared mouth, bars extending across the forward end of the slot, one above the other, said bars having registering holes therethrough, a swing-pin pivoted in said slot, a coupling-link enlarged and rounded at one end to fit against the walls of the flared mouth and be limited in its backward movement thereby, the other end being adapted to pass into the ways of the other draw-head and engage the swing-pin, and a coupling-pin adapted to pass through the openings in said bars, as and for the purpose described.

604,865. RAIL-TRACK CLEANER.

EDWARD G. JOHNS, Cape Town, Cape Colony. Filed Oct. 21, 1897. Serial No. 655,984. (No model.) Patented in England May 12, 1897, No. 11,847.

Claim.—1. A scraper for a rail-track-cleaning apparatus, consisting of a shaft to which are rigidly fixed two plates bent to, or meeting together at an angle along a central longitudinal line, thus each plate forming two lateral oblique planes, one of such planes having on the bottom edge thereof a tooth-like projection, as and for the purpose described and set forth.



2. A holder for the scraper of a rail-track-cleaning apparatus, consisting of a T-shaped frame the center leg of which is hollow and occupied mainly by a helical spring and the lower end being adapted to retain the headed end of the shaft of the scraper, and the cross-bar of which is provided with a hole at each extremity thereof to receive an eyebolt, as and for the purpose described and set forth.

3. In a rail-track-cleaning apparatus, the combination with a suitable carriage, of the T-shaped scraper-holder suspended from the center of its cross-bar by a gimbal-joint from a bearing-bracket on the under frame of the carriage, and from the extremities of its cross-bar by means of chains attached at one end to the under frame of the carriage and at the other to eyebolts adapted by means of helical springs and washers to cushion the movement of the said scraper-holder, as and for the purpose described and set forth.

4. In a rail-track-cleaning apparatus, the combination with a suitable carriage of the T-shaped scraper-holder suspended by a gimbal-joint, chains and spring-cushioned eyebolts to the under frame of the carriage: lateral spring sliding guides adapted to control any lateral movement of the holder, and the scraper and scraper-shaft, as and for the purpose described and set forth.

604,866. SIGNAL FOR ELECTRIC RAILWAYS.

WILLIAM H. JORDAN, Brooklyn, N. Y. Filed Feb. 16, 1897. Serial No. 623,723. (No model.)

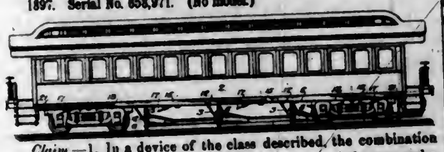
Claim.—1. In an electric railway, the combination with the main or working conductors, of an electromagnetic signal-controller connected between one of the main or working conductors and two distant contact-plates located in close proximity to the same conductor, and which contact-plates are adapted to be electrically and successively connected with the other main or working conductor through the contact devices and circuit connections of a moving vehicle, substantially as set forth.

2. In an electric railway, the combination with the main or working conductors, of two electromagnets for controlling a signal, said magnets being independently connected between one of the main or working conductors and two distant contact-plates located in close proximity to the same conductor, and which contact-plates are adapted to be electrically and successively connected with the other main or working conductor through the contact devices and circuit connections of a moving vehicle, substantially as set forth.

3. In an electric railway, the combination with the main or working conductors, of a signal-circuit, an electromagnetic device for controlling said signal-circuit, said device being connected between one of the main or working conductors and two distant contact-plates located in close proximity to the same conductor and which contact-plates are adapted to be electrically and successively connected with the other main or working conductor through the contact devices and circuit connections of a moving vehicle, substantially as set forth.

4. In an electric railway, the combination with the main or work-

ing conductors, of a signal-circuit, two electromagnets for controlling said signal-circuit, said magnets being independently connected between one of the main or working conductors and two distant contact-plates located in close proximity to the same conductor and which contact-plates are adapted to be electrically and successively connected with the other main or working conductor through the contact devices and circuit connections of a moving vehicle, substantially as set forth.



5. In an electric railway, the combination with the main or working conductors, of a signal-circuit, a switch for controlling said circuit, an electromagnetic device for operating said switch, said device being connected between one of the main or working conductors and two distant contact-plates located in close proximity to the same conductor and which contact-plates are adapted to be electrically and successively connected with the other main or working conductor through the contact devices and circuit connections of a moving vehicle, substantially as set forth.

6. In an electric railway, the combination with the main or working conductors, of a signal-circuit, a switch for controlling said circuit, two electromagnets for operating said switch, said magnets being independently connected between one of the main or working conductors and two distant contact-plates located in close proximity to the same conductor and which contact-plates are adapted to be electrically and successively connected with the other main or working conductor through the contact devices and circuit connections of a moving vehicle, substantially as set forth.

7. In an electric railway, the combination with the main or working conductors, of a signal-circuit connected across said conductors, a switch for controlling the signal-circuit, an electromagnetic device for operating said switch, said device being connected between one of the main or working conductors and two distant contact-plates located in close proximity to the same conductor and which contact-plates are adapted to be electrically and successively connected with the other main or working conductor through the contact devices and circuit connections of a moving vehicle, substantially as set forth.

8. In an electric railway, the combination with the main or working conductors, of a signal-circuit connected across said conductors, a switch for controlling the signal-circuit, two electromagnets for operating said switch, said magnets being independently connected between one of the main or working conductors and two distant contact-plates located in close proximity to the same conductor and which contact-plates are adapted to be electrically and successively connected with the other main or working conductor through the contact devices and circuit connections of a moving vehicle, substantially as set forth.

604,867. DUST-CONVEYER FOR RAILROAD PASSENGER CARS OR COACHES. AARON H. LE VAN, Reading, Pa. Filed Nov. 18, 1897. Serial No. 658,971. (No model.)

Claim.—1. In a device of the class described, the combination with a car, of hangers depending from the bottom of the car, and a longitudinal series of funnels located beneath the car and supported in the hangers, said funnels being provided with rearwardly-extending tubes having their rear ends supported within the mouths of the adjacent funnels, substantially as described.

2. A device of the class described comprising a longitudinal series of funnels provided at their reduced ends with tubes fitting in the mouths of the adjacent funnels, said funnels being provided at their mouths with stop-flanges, pins or projections mounted upon the funnels in rear of the stop-flanges, hangers supporting the funnels and having the stop-flanges abutting against their front faces, said hangers being provided with slots or openings to permit the passage of the pins, and latches mounted on the hangers and adapted to cover the slots or openings, substantially as and for the purpose described.

3. In a device of the class described, the combination of a funnel having an arched upper portion and a flat bottom portion and provided with a stop-flange, a hanger composed of vertical sides, a horizontal bottom portion supporting the funnel, and a curved connecting portion extending over the top of the funnel and conforming to the configuration of the same, means for detachably locking the funnel in the hanger, and braces, substantially as described.

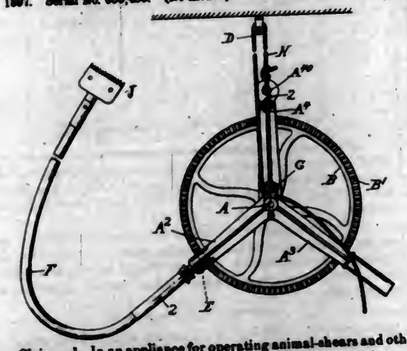
4. In a device of the class described, the combination with a car, of the side conveyers mounted upon the car below the body thereof and provided with curved terminals extending inward in rear of the steps of the car, said conveyers being provided with openings having flaring mouths, substantially as described.

5. In a device of the class described, the combination with a car, of a series of hangers mounted on the car and depending from the bottom thereof, the said hangers being provided with horizontal bottom portions and having curved connecting-pieces arranged above the horizontal portions, and a horizontal series of funnels arranged within the hangers and having flat bottom portions and arched top portions to fit the hangers, said funnels being provided with rearwardly-extending tubes having their rear ends arranged within the mouths of the adjacent funnels, substantially as described.

6. In a device of the class described, a side conveyer comprising a tube or conduit, designed to be mounted on the body of a car at the bottom thereof and provided with openings, plates pivoted between their ends at the openings, arranged at an angle to the tube or conduit and forming flaring mouths or entrances, springs engaging the plates and stops mounted on the tube or conduit and arranged to be engaged by the plates, substantially as described.

604,868. WINDOW STRUCTURE. THEODORE H. SCHEITZ, Philadelphia, Pa. Filed Oct. 2, 1897. Serial No. 653,516. (No model.)

Claim.—1. The combination of devices forming a window structure with a main frame, whereby a pair of window-sashes are suspended and counterbalanced within the frame and adapted to be held therein at any angle of inclination or bodily removed therefrom when desired; said devices consisting of the following elements in combination, namely, a pair of sectional stiles B, B provided with longitudinal guideways *b* and composed of two separate and independent sections arranged end to end, the upper section being stationary and the lower section bodily adjustable laterally; springs *d* operating to maintain the lower stile-sections out in normal position to preserve the continuity of the guideways, weight-boxes the walls of which are adapted to furnish one bearing for said springs, locking devices E operating to maintain the lower sections in normal as well as in retracted position, sashes to slide in the guideways, sash-cords and counterweights; said parts being combined, arranged and operating, substantially as described.



2. In a window structure, the combination with a sliding sash, of a hanger consisting of a vertically-movable portion slotted to engage a pin or stud of the sash, and having at each end a projecting slotted lug, a counterbalance-weight, a cord connected at one end to said weight and at the other end to the upper of said lugs, and a second cord connected at one end to the opposite end of the said weight, and to the lower lug of said hanger, said second cord having a portion of its length constituted by a spring, substantially as specified.

3. In a window structure, the combination with the main frame, of adjustable stile-sections therein, provided with longitudinal guideways, means to maintain the stiles in and out of normal position, sashes to slide in the guideways, and angular hangers F for the sash-cords, pivoted to supports on the sashes, said hangers being constructed with a slotted vertical member, and with opposite horizontal members, perforated for the passage of sash-cords, the knots of which are inclosed in the hangers; and counterweights on the opposite ends of the sash-cords; substantially as described.

4. The combination, forming a window structure, with a main frame, sectional stiles arranged end to end, the upper section being stationary and the lower section being adjustable laterally, vertical guideways therein for the sashes, weight-boxes having walls *d'* recessed at a^3 to permit access thereto, springs *d* interposed between the lower stile-sections and the walls of the weight-boxes, and locking devices consisting of normally-projecting spring-actuated bolts *e*,

casings therefor in the ends of the lower section, and keepers e^4 mounted in the opposing end of the upper section, with sockets e^4 adapted to engage the said bolts; said elements being combined and operating substantially as and for the purposes set forth.

604,869. MECHANISM FOR OPERATING ANIMAL-SHEARS OR OTHER TOOLS. JOHN K. STEWART, Chicago, Ill. Filed Oct. 16, 1897. Serial No. 655,459. (No model.)

Claim.—1. In an appliance for operating animal-shears and other tools, a frame or spider, and means for suspending it flexibly, such frame comprising a rigid handle; a drive-wheel and a driven wheel both mounted on the frame; and a tool-actuating flexible shaft operatively connected with the driven wheel.

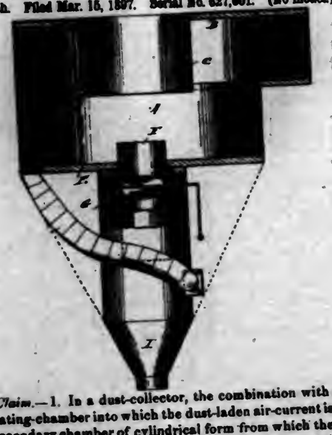
2. In an appliance for driving and operating animal-shears or other tools, a frame, a driving and a driven wheel journaled therein; a cable by which the frame is flexibly suspended, each cable extending from the frame over a supporting sheave-pulley, and thence back to the frame, and suitably secured thereto at two points, and a slip-and-grip device at one of said points to permit adjustment, all combined and operating substantially as set forth.

3. In an appliance for operating animal-shears or other tools, in combination with the spider having arms A^3 and A^4 radiating from the central hub; and a driving-wheel journaled at the hub; one of said arms having means for suspending the frame; the other of said arms extending in a position to serve as a directing-handle, and a third arm having bearings for a pinion, a pinion journaled in said arm actuated by the centrally-journaled wheel, and a flexible shaft operatively connected with and actuated by said pinion and adapted to carry the tool at the remote end.

4. In combination with the frame consisting of a hub having two radial arms, the driving-wheel journaled at the hub-center; a pinion journaled on one of the arms and driven by the drive-wheel, and the flexible shaft operatively connected with and driven by the pinion, the other arm being adapted to serve as a directing-handle for the frame, and a third radial arm pivoted about the hub-center, and a suspending-cable attached to such arm at a point remote from the center, the frame being provided with another point of attachment for the cable near the hub-center.

5. In combination with the frame consisting of a hub having two rigid radial arms, the drive-wheel journaled at the hub-center; a pinion journaled on one of the arms and driven by the drive-wheel, and the flexible shaft operatively connected with and driven by the pinion, the other arm being adapted to serve as a directing-handle for the frame, and a third radial arm pivoted about the hub-center and a suspending-cable attached to such arm at a point remote from the center, the frame being provided with another point of attachment for the cable near the hub-center, the attachment at one of said points being made by a slip-and-grip device engaging the cable.

6. In combination with the frame consisting of a hub having two rigid radial arms, the drive-wheel journaled at the hub-center, a pinion journaled on one of the arms and driven by the drive-wheel and the flexible shaft operatively connected with and driven by the pinion; the other arm being adapted to serve as a directing-handle for the frame, and a third radial arm pivoted about the hub-center and a suspending-cable attached to such arm at a point remote from the center, the frame being provided with a slip-and-grip device for engaging the cable at a second point of attachment near the center on the side opposite that from which the rigid arms project.



604,870. BULLET-PROOF FABRIC. CASIMIR ZDOLEK, Chicago, Ill. Filed May 14, 1897. Serial No. 636,443. (No specimens.)

Claim.—1. As a new article of manufacture, a bullet-proof fabric comprising an inner or cushioning layer of unwoven fibers and one or more outer layers of closely woven or braided silk cords or strands, which consists of a number of fibers tightly wrapped or twisted together, said layers being suitably secured together.

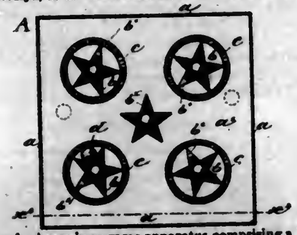
[redacted]

2. As a new article of manufacture, a bullet-proof fabric composed of an inner cushioning layer of unwoven or loose silk fibers compactly inclosed within a suitable covering, and one or more outer layers, each composed of closely woven or braided silk cords or strands, which consists of a number of fibers tightly wrapped or twisted together, the whole being secured together by stitching or otherwise.

604,871. DUST-COLLECTOR. WILLIAM R. ALLINGTON, Saginaw, Mich. Filed Mar. 15, 1897. Serial No. 627,601. (No model.)

Claim.—1. In a dust-collector, the combination with a primary separating-chamber into which the dust-laden air-current is delivered, of a secondary chamber of cylindrical form from which the separated dust is discharged, the axial portions of said chambers being in open communication with each other for the return of the purified air from the secondary to the primary chamber and a pipe or passage connecting said chambers, the connecting pipe or passage communicating with the primary chamber near its peripheral wall and with the secondary chamber tangential to the axis thereof, substantially as described.

2. In a dust-collector, the combination with a primary chamber having a tangential inlet for the dust-laden air, a purified-air outlet and a bottom wall having an aperture therein near the periphery of the chamber, and a secondary chamber of cylindrical form communicating with the primary chamber through a central aperture in its bottom wall, and also by an external pipe or passage connecting the peripheral aperture and said secondary chamber and entering the latter tangentially, substantially as described.



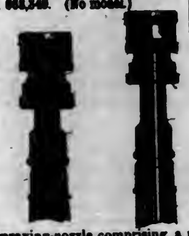
3. In a dust-collector, the combination with a casing providing a primary chamber into which the dust-laden air is delivered, said chamber having a peripheral outlet in its bottom wall for the separated dust, of a secondary chamber of cylindrical form located below the primary chamber and an external duct or passage connecting said chambers, said duct or passage leading from said peripheral aperture to and entering the secondary chamber tangentially, and an air relief-pipe connecting said chambers, substantially as described.

4. In a dust-collector of the class described, the combination with a casing constituting a primary separating-chamber into which the dust-laden air-current is delivered, said primary chamber having its bottom wall provided with a peripheral dust-outlet, of a secondary chamber of cylindrical form and an external spiral pipe or passage connecting said secondary chamber tangentially with the peripheral dust-outlet, substantially as described.

5. In a dust-collector of the class described, the combination with the primary and secondary air-chambers of cylindrical form having an external spiral pipe or passage connecting their peripheries, the secondary chamber having a dust-outlet to which its walls converge and the primary chamber having a purified-air outlet with a relief-pipe connecting said primary and secondary chambers, substantially as described.

6. In a dust-collector of the class described, the combination with primary and secondary air-chambers of cylindrical form having a spiral pipe or passage connecting their peripheries, the secondary chamber having a dust-outlet to which its walls converge and the primary chamber having a purified-air outlet with a relief-pipe connecting said primary and secondary chambers, and a valve in said relief-pipe, substantially as described.

604,872. PUZZLE OR GAME APPARATUS. CHARLES R. BALDWIN, Brooklyn, N. Y. Filed Mar. 16, 1897. Serial No. 627,842. (No model.)

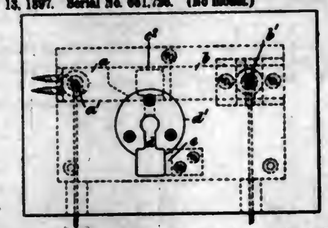


Claim.—1. A puzzle or game apparatus comprising a board with an elevated marginal rim, an indicating-star mounted rotatively on said board, a series of characters marked on said board around said indicating-star, an obstacle-star mounted rotatively on the board, and a ball to roll freely over the board.

2. A puzzle or game apparatus comprising a board with an elevated marginal rim and having the letters of the alphabet arranged in a circle thereon, a rotatively-mounted indicating-star *b*, on the board within said circle, said star having one of its points marked so as to distinguish it from the other points, and a ball free to roll over the said board and to rotate said star by contact with its points.

3. A puzzle or game apparatus comprising a board with an elevated margin, a ball free to roll over said board, a plurality of indicating-stars *b*, each having a marked point, mounted rotatively on the board, the letters of the alphabet being arranged in a circle on the board about each of said stars *b*, and an obstacle-star $b^{\times}$, rotatively mounted on the board within the space inclosed between the stars *b*, substantially as set forth.

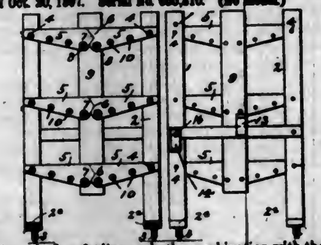
604,873. SPRAYING-NOZZLE. JOHN BEAN, Los Gatos, Cal., and ROSCOE BEAN, Hudson, Mich. Filed Feb. 4, 1895. Renewed Jan. 26, 1898. Serial No. 668,249. (No model.)



Claim.—1. A spraying-nozzle comprising a main tube provided at its upper discharge end with an end wall, and a cylindric chamber exterior to the wall and having sliding telescopic connection with said main tube, and normally held at the extreme outward limit of its movement by the force of the outflowing liquid, said main tube having an eccentric discharge opening obliquely or spirally into said chamber, and a spray-orifice in the outer wall of the chamber out of line with said discharge-orifice, substantially as described.

2. A spraying-nozzle comprising a tube closed at its end except for a discharge-orifice therein and provided with a sliding telescopic cap having a spray-orifice out of line with the discharge-orifice, and a stop for limiting the outward movement of the cap under the force of the outflowing liquid, comprising an elongated recess parallel with the axis of the tube, and a stud carried by the cap and engaging said recess.

3. A spraying-nozzle comprising a main tube provided in its upper end with an eccentric outwardly-directed discharge-passage, a cap inclosing the end of the tube and having sliding telescopic connection therewith, a stop for limiting the outward movement of the cap under the pressure of the outflowing liquid, a central spray-orifice in the end wall of the cap, and a central clearing-point on the end of the tube opposite the spraying orifice adapted to enter and clear said orifice when the cap is moved downwardly on the tube, substantially as described.



604,874. SAFETY DEVICE FOR ELECTRIC CARRIAGES. REGINALD T. D. BROCKMAN and WALTER C. BERRY, London, England, assignors to the Electrical Vehicle Syndicate, Limited, same place. Filed Dec. 13, 1897. Serial No. 661,736. (No model.)

Claim.—1. The combination of a closed box, a keyhole leading into the box, two open contacts within the box remote from the keyhole and connected to the circuit-wires and a key so shaped that it passes through the keyhole and when the key is turned connects the contacts.

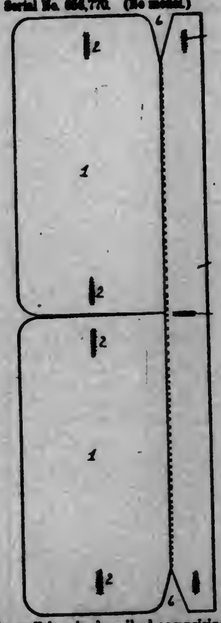
2. The combination of a closed box, a key leading into the box, two open contacts within the box remote from the keyhole and connected to the circuit-wires, a key so shaped that it passes through the keyhole and a projection on the key adapted to enter between the contacts.

604,875. SHOE-RACK. BERNEY B. CARNEY, North Adams, Mass. Filed Oct. 20, 1897. Serial No. 656,210. (No model.)

Claim.—1. In a folding rack, the combination with the front and rear stationary standards, the connecting-bars at the lower ends thereof provided with casters, and the longitudinal connecting-rods secured to said standards near the upper and lower ends and intermediate said ends, of the inwardly-extending arms pivoted to said rods, formed with interlocking V-shaped recesses and beveled points at their inner ends, the vertically-movable bars, the longitudinal rods secured thereto to which the inner ends of said arms are pivoted, and the intermediate rods secured to said arms, substantially as described.

2. In a folding rack, the combination with the front and rear stationary standards formed with upper and lower holes to receive locking-pins, the longitudinal connecting-bars provided with casters, the longitudinal connecting-rods secured to said standards, the inwardly-extending arms pivoted to said rods and formed with interlocking beveled points and recesses at the inner ends, the vertically-movable bars, the connecting-rods to which the inner ends of said arms are pivoted, the locking-arms pivoted to the diagonally opposite standards, the lugs on the other standards and on the vertically-movable bars and the locking-pins, substantially as described.

604,876. CYCLE-HANDLE-BAR FASTENING ATTACHMENT. EDWARD H. CRAPTIUS, Marysville, Cal. Filed Dec. 13, 1897. Serial No. 661,738. (No model.)



Claim.—1. In a bicycle, the vertically-movable handle-bar post with corrugations, locking-cam and cam-block, a two-part elastic head formed of disks with corrugated exterior faces, corresponding corrugated disks fixed upon the handle-bar, a cam turnable upon the handle-bar between the two parts of the head of the handle-bar post whereby the parts may be separated and caused to engage with the disks upon the handle-bar and lock the latter in any desired position.

2. An adjusting and clamping device for handle-bars of bicycles consisting of disks fixed upon the central portion of the handle-bar having their inner faces radially corrugated, a correspondingly-shaped head for the handle-bar post having a slot formed in the upper end in line with the frame of the machine, through which head the handle-bar is adapted to pass with its corrugated disks exterior to the circular head-disks of the post, a cam fitting the channel in the head of the post and turnable about the handle-bar which passes therethrough, a lever by which the cam is actuated, and lugs with which the cam engages when turned, whereby the channeled post-head is separated and its outer faces interlocked with those of the disks upon the handle-bar and the latter is locked in any desired position.

3. The steering-post of a bicycle having a slotted head, the parts of which are movable to and from each other, and which have radially-corrugated outer surfaces as shown, central openings through which the handle-bar passes through said head, a cam fitting between the two parts turnable upon the handle-bar, and lugs with which the cam engages to separate the disks forming the head of the post, or allow them to approach each other, circular disks fitted upon the handle-bar exterior to the disks forming the post-head and correspondingly corrugated so as to be engaged thereby when the head is spread by the action of the cam, a cylindrical hood or collar inclosing the parts and having inwardly-turned flanges upon the opposite edges adapted to engage corresponding channels in the outer faces of the disks which are fixed to the handle-bar whereby they are maintained in position and protected from dust.

4. In a handle-bar adjustment of the character described, the circular rotary cam with its projecting lever, a collar or casing surrounding and inclosing the interlocking disks of the handle-bar and the steering-post head, said collar having a channel or slot in the line of travel of the movable cam-lever, and a gate fixed to the cam-lever and slidable therewith to open the channel when the lever is moved to disengage the locking mechanism, and to close the channel when the lever is moved to again interlock the parts.

604,877. CUFF. CHARLES A. CHENEY, Philadelphia, Pa. Filed Oct. 20, 1897. Serial No. 656,770. (No model.)

Claim.—The cuff herein described comprising a band provided with means whereby its free ends may be secured together and a cuff-body divided into separate sections near its mid-length, each section being separately attached to the band and having both ends provided with a buttonhole whereby the said sections may be secured by links, substantially as described.

604,878. CAN-OPENER. CALVIN FRANCISCO, Newark, N. J. Filed Aug. 3, 1897. Serial No. 646,902. (No model.)

Claim.—1. A can-opening device, combining therein, a cover and a handle having legs and provided with a cutter or knife on one of the legs thereof, extending downward and through said cover, substantially as and for the purposes set forth.

2. A can-opening device, combining therein, a cover, a handle, a cutter or knife, and means connected with said handle and said cutter or knife for securing said handle directly above said cutter or knife upon said cover, substantially as and for the purposes set forth.

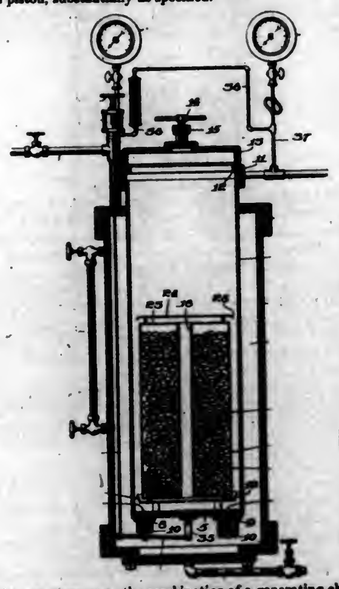
3. A can-opening device, combining therein, a cover, a handle, a cutter or knife, and means connected with said handle and said cutter or knife for securing said handle directly above said cutter or knife upon said cover, and said cutter consisting, essentially, of a shank *d* adapted to be secured upon the top of said cover and having a bladed' extending downward and through said cover, substantially as and for the purposes set forth.

4. A can-opening device, combining therein, a cover, a handle *c*, having a leg provided with a grooved or channeled end c^4, a cutter or knife having a shank arranged in said grooved or channeled end of the handle, and means for attaching it to said cover, substantially as and for the purposes set forth.

5. A can-opening device, combining therein, a cover, and a handle *c*, having a leg provided with a grooved or channeled end c^4, a shank *d* of a cutter arranged in said grooved or channeled end having a blade *d'* extending downward and through said cover, and means, for securing said end c^4 of the handle and said shank *d* to said cover, substantially as and for the purposes set forth.

6. A can-opening device, combining therein, a cover, and a handle *c*, having a leg provided with a grooved or channeled end c^4, a shank *d* of a cutter arranged in said grooved or channeled end having a blade *d'* extending downward and through said cover, and means, for securing said end c^4 of the handle and said shank *d* to said cover, consisting, of pins or rivets b' and b^3 passed through perforations in said end c^4 and the shank *d* and the body portion of said cover, substantially as and for the purposes set forth.

604,879. ACETYLENE-GAS GENERATOR. WILLIAM W. GOODWIN, Bordentown, N. J. Filed Apr. 13, 1896. Serial No. 587,401. (No model.)



Claim.—1. In a gas apparatus, the combination of a generating-chamber in which the source of gas is obtained, of a surrounding water-containing chamber or space with the lower portion of which the generating-chamber has communication, valve mechanism for controlling the communication between said chambers, and a gas-operated governor operatively connected with the valve mechanism, substantially as specified.

2. In a gas-generator, the combination of an outer water-chamber, a generating-chamber supported within the water-chamber and having a valved port at its lower end which opens into said water-chamber, a receptacle supported in said generating-chamber said receptacle having a central perforated tube therein and layers of carbid &c. surrounding said tube and partially separated from each other by diaphragms, and means for controlling automatically the valve of said port, substantially as specified.

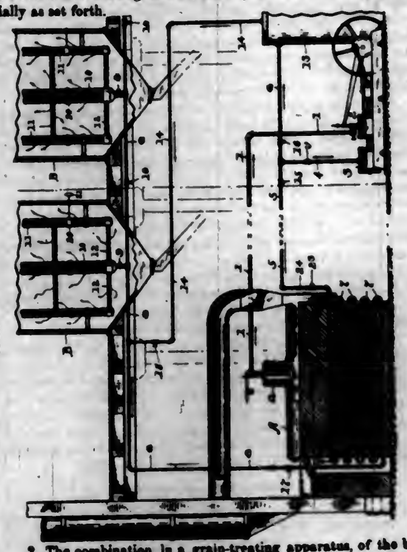
3. In a gas-generator, the combination of a generating-chamber in which the source of gas is contained, a water-chamber having communication with the lower portion of said generating chamber, and means for automatically controlling such communication, a return port or passage from the generating-chamber to the water-chamber, and an automatically-operating valve which controls the said port or passage, substantially as specified.

4. In a gas apparatus, the combination with a generating-chamber in which the source of gas is contained, a water-chamber having communication with the lower portion of the generating-chamber, valve mechanism controlling such communication, a gas-operated governor connected to the said valve mechanism, a return port or passage from the generating-chamber to the water-chamber, and a safety-valve, controlling said return port or passage, substantially as specified.

5. In a gas apparatus, the combination of a generating-chamber in which the source of gas is contained, a water-containing chamber with the lower portion of which the generating-chamber has communication by a port in its bottom wall, a normally-closed valve for controlling the said port, a cylinder, a piston therein, a spring acting upon the piston, means to depress the spring and piston, connections between said piston and the valve, and a pipe leading from the generating-chamber to said cylinder and communicating with the same below its piston, substantially as specified.

6. In a gas apparatus, the combination of a generating-chamber, a vessel therein provided with a perforated pipe, detachable diaphragms for said vessel and of less diameter than the vessel, and means for supplying liquid to said pipe, substantially as described.

7. In a gas apparatus, the combination of a generating-chamber, a vessel therein to receive layers of carbide, &c., diaphragms of less diameter than the vessel and provided with drooping edges and adapted to separate such layers except at the outer marginal portions thereof, and means for supplying water to such vessel, substantially as described.

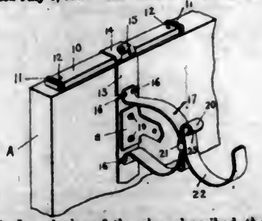


8. In a gas-generating apparatus, the combination of a generating-chamber, a water-chamber with the lower portion of which the generating-chamber communicates, means for automatically controlling such communication, a vessel in the generating-chamber adapted to receive layers of carbide &c. said vessel having a central perforated tube, diaphragms to separate such layers and a diaphragm supported above said vessel, substantially as specified.

9. In a gas-generating apparatus, the combination of an outer cylinder having a removable screw cap or head at each end, an inner cylinder extended through and supported in the upper cap or head of said outer cylinder, a valved port in the lower end of the inner cylinder, means for automatically actuating the valve of said port, and means for introducing water within the outer cylinder, substantially as described.

10. In a gas-generating apparatus, the combination of an outer cylinder capped or headed at both ends, an inner cylinder extended through and supported in the upper cap or head of said outer cylinder, a valved port in the lower end of the inner cylinder, a pipe rising from the outer cylinder, a governor-cylinder on said pipe, a piston therein connections between the piston and the valve of said port, and a pipe leading from the inner cylinder to said governor-cylinder, substantially as described.

604,880. GRAIN-TREATING APPARATUS. GEORGE R. GORHAM, Chicago, Ill., assignor of one-half to Abel R. Angle, Indianapolis, Ind. Filed May 14, 1897. Serial No. 636,630. (No model.)



Claim.—1. The combination, in a grain-treating apparatus, of the furnace and boilers, an air-compressor driven from said boilers, coils of pipe arranged within said furnace, a heating-drum arranged adjacent thereto and heated therefrom, a pipe running from said air-compressor and connected both with said coils and with said drum, a pipe connected both with said coils and said drum and running past the grain-bins, said grain-bins, perforated columns therein, said pipe being connected by branches to said columns, and valves arranged in the various pipes, whereby the air may be directed through one or both of said heating devices, and any or all of said bins, substantially as set forth.

2. The combination, in a grain-treating apparatus, of the bins, vertical perforated columns within the bins, valves interposed in said columns at intervals whereby the effective height thereof can be varied, air-pipes connected to the bottom of said columns, and an air-compressor for supplying air to said pipes, said several parts being arranged and operating substantially as shown and described.

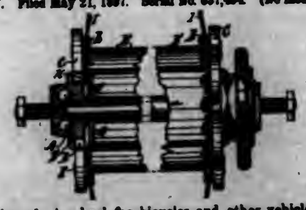
3. The combination, in a grain-treating apparatus, of a furnace and boiler, an air-compressor driven therefrom, heating-coils arranged within the structure of said furnace, a cold-air reservoir suitably located, a pipe leading from the compressing-cylinder of said air-compressor having branches which lead to said coils and to said reservoir, valves whereby the flow of air can be caused to travel in either direction from said air-compressor, pipes leading from said coils and said air-reservoir to a common point where they unite, a continuation of one of said pipes past grain-bins, said grain-bins, perforated columns extending vertically up in said grain-bins, connections between said pipe and said columns, and suitable valves interposed in said several pipes, whereby the flow of air can be controlled, and whereby either cold or hot air can be driven by means of said air-compressor into said perforated columns and thus through the grain in said bins, substantially as and for the purposes set forth.

604,881. CURTAIN-FIXTURE. HENRY L. GREEN, Worcester, Mass. Filed July 6, 1897. Serial No. 643,456. (No model.)

Claim.—1. In a device of the class described, the combination of a wooden supporting-strip 10 secured on top of a window-casing, and having strengthening-wires 11 for holding the same a short distance up therefrom, and a curtain-fixture having a metallic base-piece 13 with a socket 14 at its upper end adapted to engage the supporting-strip 10, whereby the curtain-fixture may be adjustably supported without defacing the front of the window-casing, substantially as described.

2. In a curtain-fixture, the combination of a metallic base-piece 13 having sockets, a yoke-piece 17 engaging said sockets, and an angle-piece 18 detachably secured to the base-plate 13 by the metallic fasteners 19, substantially as described.

3. In a curtain-fixture, the combination of a support or yoke having a socket 20 adapted to receive a metallic curtain-rod, a hook 22 having a coil 24 adapted to engage the socket 20, one of said parts being provided with a locking-tongue adapted to engage a notch in the other piece to detachably secure said parts together, substantially as described.



4. In a curtain-fixture, the combination of the base-piece 13, the angle-piece 18 detachably secured thereto by the metallic fasteners 19, a yoke-piece 17 engaging sockets in the base-piece formed by integral tongues or projections 16, a socket-piece 20 adapted to receive one end of a metallic curtain-rod, and a detachable hook 22 having a coil 24 at its upper end with a notch 23 formed therein in position to engage an integral locking-tongue 25 extending from the socket-piece 20 to detachably secure said parts together, substantially as described.

604,882. BUTTON-BACK. ALBERT HALL, Brooklyn, N. Y. Filed May 29, 1897. Serial No. 638,694. (No model.)

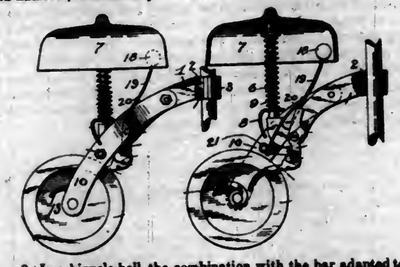
Claim.—The combination with a pronged button, of a cap composed of a metal cup having an upwardly-projecting central interior post, provided at its upper end with a head, the prongs of the button passing down between the inner edge of the cup and the outer edge of the head and being curled up under the head, on the outer face of the post, substantially as herein shown and described.

604,883. WHEEL FOR BICYCLES. GEORGE HAYES, New York, N. Y. Filed May 21, 1897. Serial No. 637,494. (No model.)

Claim.—1. A wheel for bicycles and other vehicles, having a central axle-hub suspended within the hollow of an encircling spoke-nave by series of binary arc suspensory springs of flat metal, arranged around the axle-hub, standing outwardly therefrom parallel to the plane of the wheel and transversely to the hub, the ends of each spring secured to the axle-hub by ring-plates placed thereupon, and each spring formed with a deep depression between its two arcs, the web passing through a clamping device upon a cross-rod forming part of the spoke-nave, securing the spring to the spoke-nave, essentially as set forth.

2. In a wheel for bicycles and other vehicles, having an axle-hub suspended within an encircling spoke-nave by binary arc suspensory springs, the regulating device K, arranged and adapted for operation upon the springs, essentially as set forth.

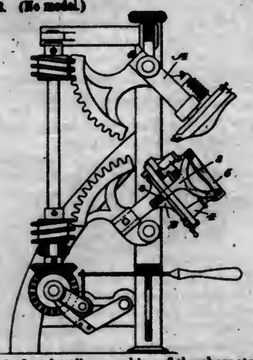
3. In a wheel for bicycles and other vehicles, the combination consisting of first; the axle-hub A, constructed with groove H, and flanges G; second, the spoke-nave B, constructed with two cheek-rings arranged parallel to the plane of the wheel, encircling the axle-hub and connected together; and third; two sets of binary arc suspensory springs secured to the axle-hub by rings, and to the spoke-nave by hanger-blocks, essentially as set forth.



4. In a wheel for bicycles and other vehicles, a ball-bearing axle-hub having interiorly back of the ball-bearings near each end of the hub, an encircling groove adapted for reception of resiliently-sustained cheek-rings of a special spoke-nave, essentially as set forth.

5. In a wheel for bicycles and other vehicles, an axle-hub having a spindle midway between expanded ball-bearing ends, the two additional guard-flanges herein described, for the purpose set forth.

6. In a wheel for bicycles and other vehicles, the spoke-nave B, constructed with cheeks as rings placed parallel to the plane of the wheel, with as a part thereof, a midway drum B, and having semicircular peripheral projections for securing spokes thereto, essentially as set forth.



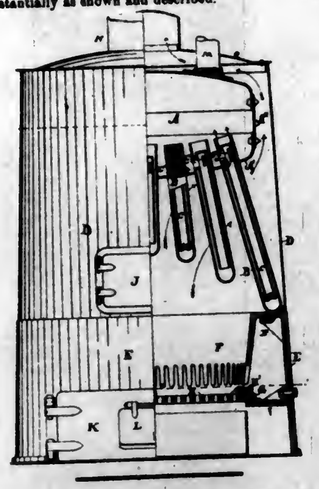
604,884. BICYCLE-BELL. CHRISTIAN JETSCHKUS, Scranton, Pa. Filed Dec. 31, 1897. Serial No. 664,963. (No model.)

Claim.—1. In a bicycle-bell, the combination with the bar, having a stop-pin at one end, the upwardly-extending rod, gong and coiled spring, of the wheel provided with a cam, the trigger, the pivoted arm to which the trigger is pivoted formed with a notch, the pin on the trigger, the spring bearing against said arm and the hammer-rod and hammer, substantially as described.

2. In a bicycle-bell, the combination with the bar adapted to be connected with a bicycle-brake, the upwardly-extending rod, the coiled spring, and the gong, of the arms pivoted to said bar, the connecting-rod, the coiled spring thereon, the bracket connected with said arms through which said rod passes, the wheel, the cam thereon, the arm pivoted to said bar and formed with a notch, the trigger pivoted thereto provided with a pin engaging with said notch, the projection on one of the side arms adapted to engage with said arm carrying the trigger, the hammer-rod and the hammer, substantially as described.

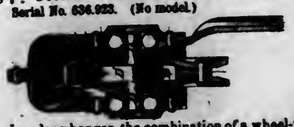
604,885. ATTACHMENT FOR SOLE-LEVELING MACHINES. CHARLES S. JOHNSON, Lynn, and GEORGE W. SPAULDING, Beverly, Mass.; said Spaulding assignor to said Johnson. Filed June 14, 1897. Serial No. 640,722. (No model.)

Claim.—1. In a leveling-machine of the character described, the combination with an adjustable last-carrier of a gage arranged to be moved into and out of position as described, and mechanism for adjusting said last-carrier with reference to the gage, for the purpose set forth.



2. In a leveling-machine of the character described, the combination with an adjustable last-carrier of a pivoted arm having a fixed relation to the machine and provided with a templet as described, and mechanism for adjusting said last-carrier with reference to said templet, for the purpose set forth.

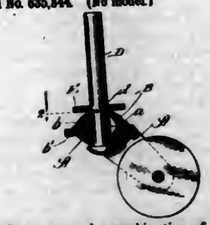
3. In a leveling-machine of the character described, the combination with an adjustable last-carrier of a pivoted arm having a fixed relation to the machine and carrying a templet detachably secured thereto, said templet having a contour substantially corresponding to that of the last which is to be used on the machine, and mechanism for adjusting said last-carrier with reference to said templet, for the purpose set forth.



4. In a leveling-machine of the character described, the combination with the rocking arm B, carrying an adjustable last-carrier, of an arm 2 pivoted to said arm B and carrying a detachable templet 5, arranged to be moved into position over said last-carrier, and mechanism for adjusting said last-carrier with a last thereon, with reference to said templet 5, for the purpose set forth.

604,886. STEAM OR HOT-WATER BOILER. JAMES B. JOHNSTON and CLARENCE B. LITTLE, Dayton, Ohio. Filed Mar. 1, 1897. Serial No. 625,923. (No model.)

Claim.—In a steam and hot-water boiler, the combination with a slightly-inclining and circular base E having an inwardly-projecting rim P, and a circular boiler having its top and bottom plates rounded, of a plurality of heating-tubes A radially mounted in said bottom plate and a portion of which rests upon the rim P and forms the sole support for said boiler, a plurality of circulating-tubes C held concentrically within said tubes A, the said tubes C having their upper ends closed and provided with a series of side passages C' through which the colder water passes from the boiler into said tubes, the said passages C' being essentially deep and narrow so that a substantially less area of space is provided for the passage of the descending colder water than is provided for the ascending hot water, substantially as shown and described.

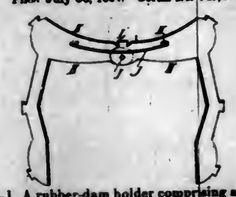


604,887. DOOR-HANGER. DAVID NICKEL, Morris, Ill. Filed May 17, 1897. Serial No. 636,923. (No model.)

Claim.—In a door-hanger, the combination of a wheel-frame provided with two internal cups on each side—one circumscribing the other—facing or opposing each other, caps arranged withid the larger cups and provided with cups facing or opposing such smaller cups, balls arranged between the cups in the caps and the smaller cups in the frame, and a wheel or pulley provided with an axle having its spindles resting and riding upon the balls, substantially as described

604,888. CASTER. DAVID NICKEL, Morris, Ill. Filed May 10, 1897. Serial No. 635,844. (No model.)

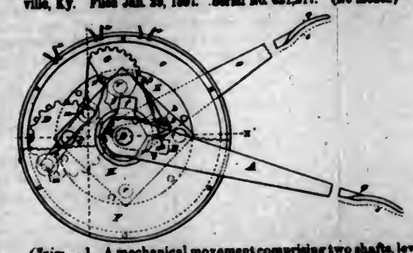
Claim.—1. In a caster, the combination of a cup-shaped lower member having an axial hole, and a cup-shaped upper member having an axial hole, the cups being opposed and the holes registering when the two are in place, whereby a long or extended journal or bearing for a pintle is secured, means forming a part of one member of the caster to permit it to be clasped and attached to the other member when in position to insure their movement in unison, and a pintle insertible from below to pass through the axial holes in the cup-shaped members and effect the attachment of the caster to an article of furniture, substantially as described.



2. In a caster, the combination of a cup-shaped member having an axial hole and holes near its outer edges, and a cup-shaped member having an axial hole and lugs near its outer edges adapted to be inserted through the holes and bent to permit it to be clasped and attached to the other member to insure their movement in unison with the cups opposed and the holes registering when in position, and a pintle insertible from below to pass through the axial holes in the cup-shaped members and effect the attachment of the caster to an article of furniture, substantially as described.

604,889. HANDLE. WILLIAM R. RICHARDS, New York, N. Y. Filed July 8, 1895. Serial No. 555,262. (No model.)

Claim.—In combination with an escutcheon-plate having two semicircular openings communicating but with their centers slightly out of line, a drawer-pull having a shank provided with corresponding semicircular projections slightly out of line adapted to enter the openings in the plate and to be turned to frictionally engage the walls of the openings, substantially as described.



604,890. RUBBER-DAM HOLDER. WILLIAM M. SENSER, Louisville, Ky. Filed July 30, 1897. Serial No. 646,461. (No model.)

Claim.—1. A rubber-dam holder comprising an arch to pass over the face and perpendicular side extensions or legs with attaching-buttons, means for allowing the side extensions or legs to be adjusted toward each other, and a spring to restore the parts to their normal position.

2. A rubber-dam holder comprising an arch provided with buttons as described, parallel side extensions pivotally connected at their upper end to the arch and having buttons, and springs connecting the arch and side extensions.

604,891. BICYCLE PROPULSION. GEORGE D. ADAMSON, Louisville, Ky. Filed Jan. 29, 1897. Serial No. 621,217. (No model.)

Claim.—1. A mechanical movement comprising two shafts, levers fulcrumed on said shafts, a double-crank shaft mounted in proximity to said first-named shafts, a spur gear-wheel on said double-crank shaft, cam-wheels mounted at a point above said crank-shaft, chains connected to double-crank shaft and passing over the cam-wheels and attached to the levers, substantially as described.

2. The combination in a bicycle of shafts, levers fulcrumed on said shafts, a double-crank shaft mounted in proximity to said first-named shafts, cam-wheels mounted at a point above said crank-shaft, chains connected to the double-crank shaft and passing over the cam-wheels and attached to the levers, and the hollow axle having said first-named shafts mounted centrally, substantially as described.

3. The combination in a bicycle of shafts, levers fulcrumed on said shafts, a double-crank shaft mounted in proximity to said first-named shafts, a spur gear-wheel on said double-crank shaft, cam-wheels mounted at a point above said crank-shaft, chains connected to the double-crank shaft and passing over the cam-wheels and attached to the levers, the driving-hub and a gear-wheel suitably fastened to the inside of said driving-hub of bicycle, substantially as described.

4. The combination of crank-shaft, cam-wheel provided with keeper-tooth mounted in proximity to said crank-shaft, chain attached to said crank and passing over said cam-wheel engaging said keeper-tooth and oscillating lever to which the end of said chain is attached, substantially as described.

5. The combination of the nut *i* having a groove in its periphery, with a lever carrying a tongue *k* and screw *l* engaging said groove and nut, respectively, a shaft taking into said lever, the end of said shaft being threaded and longitudinally grooved, and the aperture in the lever being provided with longitudinal ribs corresponding to the grooves on the shaft, substantially as, and for the purpose specified.

6. A bicycle-hub comprising shell F, flange *c* suitably attached to said shell, spur gear-wheel securely fastened to inside said flange, and bearings *a*, *a*, substantially as described.

604,892. PAPER-FEEDING MACHINE. JAMES M. BLAISDELL, Winthrop, Mass., assignor to the Perfection Labeling Machine Company, of Maine. Filed Sept. 3, 1897. Serial No. 650,696. (No model.)

Claim.—1. An apparatus for feeding sheets of paper from a pile of such sheets, comprising a sheet-picker into contact with which the top sheet is adapted to be forced by atmospheric pressure, and means for producing a change of position of said sheet-picker relative to the part of said top sheet which is acted upon by such pressure, while such action is going on, to thereby progressively pick up said sheet and separate it from the sheet below, substantially as described.

2. The combination with a sheet-picker into contact with which a sheet is adapted to be forced by atmospheric pressure; of a support for a pile of sheets; a retaining device to hold a portion of the top sheet stationary with relation to the support; means for producing a change of position of said sheet-picker relative to said support and to that part of the top sheet which is being acted upon by such pressure whereby said sheet-picker and said top sheet are caused to travel one past the other to progressively subject the sheet to atmospheric pressure; and means for subsequently releasing the portion acted upon by the said retaining device, substantially as described.

3. In a sheet-feeding device, the combination with an exhausted chamber having an inlet in a wall thereof, of a support for the sheets, means for producing a relative movement of said chamber and said support whereby the sheets are brought to a position to be acted upon by atmospheric pressure at the chamber-inlet, a retaining device for the sheets adapted to engage and hold one portion of the sheet while another portion thereof is drawn into contact with the wall of the chamber, means for pressing said support toward said retaining device, and means for releasing the sheet from said retaining device after that portion of the sheet which is not held by said device has been drawn into contact with the wall of the chamber, and for simultaneously preventing the movement of the support toward the retaining device, substantially as described.

4. In a sheet-feeding device, the combination with an exhausted chamber having an inlet in a wall thereof; of a support for a pile of sheets arranged to support the pile so that the top sheet thereof is adjacent to but wholly out of contact with the wall of said chamber where the said inlet is situated; a retaining device to hold a portion only of the top sheet stationary with relation to the said support, the remainder of the sheet being free to move into contact with the wall of the chamber at the inlet aforesaid; and means for producing a movement of one of said parts past the other whereby the exhaust chamber and that part of the sheet drawn into contact therewith have a movement one past the other, so that the sheet is progressively acted upon by pressure at the inlet and that portion of the sheet not held by the retaining device progressively picked up into contact with the chamber over the inlet thereto, substantially as described.

5. In a sheet-feeding device, the combination with a traveling carrier comprising a rotatable drum from which the air is partially exhausted, said drum being provided with one or more inlets, of a sheet-support adjacent to said drum, means for rotating said drum to cause the inlets to travel past said support, means for moving said support toward the wall of the drum, a retaining device for the sheets on said support to retain a portion of the top sheet while another portion thereof is being drawn into contact with the wall of the drum, a stop or projection connected with said drum and adapted in the movement thereof to engage the said retaining device and cause it to release the top sheet, and means whereby the movement of said retaining device to release the top sheet prevents the movement of the support toward the wall of the carrier, substantially as described.

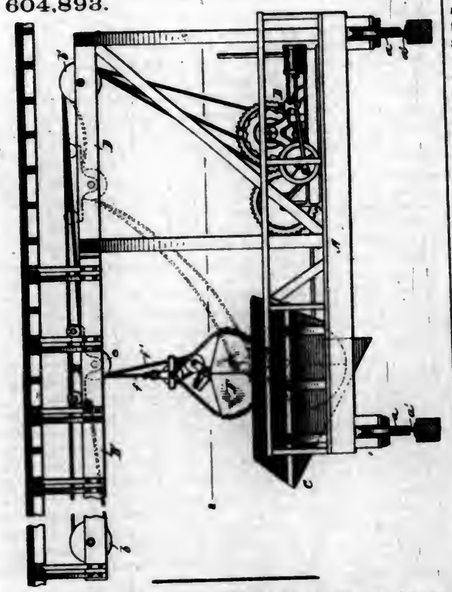
6. In a sheet-feeding device the combination with the traveling carrier comprising a rotatable drum from which the air is exhausted, said drum being provided with one or more inlets, of a sheet-support adjacent to said drum, a stationary shutter for the inlet, said shutter terminating at a point adjacent to the sheet-support, a retaining device for holding a portion only of the sheet stationary with relation to the said support, the remainder of the sheet being free to move into contact with the drum at the inlet, means for rotating said drum to cause the inlets to travel past the surface of the sheet which is drawn into contact therewith, but prevented by said retaining device from being carried along thereby; and means for subsequently operating the retaining device to release the sheet, substantially as described.

7. In a sheet-feeding device, the combination with an exhausted chamber having an inlet in the wall thereof, of a support for a pile of sheets arranged to support the pile so that the top sheet thereof is adjacent to the wall of said chamber where the said inlet is situated, a retaining device to hold a portion only of the top sheet stationary with relation to said support, the remainder of said sheet being free to move into contact with the wall of said chamber at the inlet, means for producing a movement of one of said parts past the other whereby the exhaust-chamber and that part of the sheet which is drawn into contact therewith have a movement one past the other so that the sheet is progressively picked up by atmospheric pressure at the inlet; and means for closing the said inlet up to the time the said inlet is in position to cause the pressure thereat to act upon the sheet, substantially as described.

8. In a sheet-feeding device, the combination with an exhausted chamber provided with an inlet in the wall thereof, of a support for the sheets adapted to be moved toward the wall of said chamber by means of a weight and pulley, a presser-foot provided with a spring whereby it is normally pressed down upon the surface of a sheet on the support, said presser-foot having a loose pivotal connection with said support, an arm or projection from said presser-foot adjacent to said pulley, means for producing a relative movement of the chamber and the sheet-support, and a tripping projection adapted to engage said arm and move the same into engagement with the pulley, whereby said arm is rocked on the pulley as a fulcrum, to lift the presser foot and at the same time to prevent rotation of the pulley and check the movement of the support which would otherwise result, substantially as described.

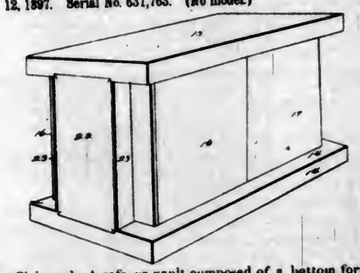
9. In a sheet-feeding device, the support *c*, weight c^2 and pulley c^4, and the presser-foot *d* having an elongated slot d^5 adapted to engage projections or pins to support said presser-foot, the spring d^3 whereby said presser-foot is normally pressed toward said support, and the arm d^3 overlying said pulley, substantially as described.

604,893. HOISTING AND CONVEYING APPARATUS. JEREMIAH CAMPBELL, Chelsea, Mass. Filed Dec. 4, 1897. Serial No. 660,894. (No model.)



Claim.—1. In a hoisting and conveying apparatus, the combination of a movable car or truck, a shovel and trolley operating engine mounted thereon, a space in which the steam-shovel may be held while it is being moved with the car or truck, and a movable boom-section adapted to hold the trolley while it is being transferred with the shovel and engine, and two or more stationary boom-sections with which said movable section is adapted to cooperate.

2. In combination, the car or truck A, a shovel and trolley operating engine carried thereby, a hopper C, a movable boom-section D adapted to receive and hold the trolley, the sheaves mounted thereon and two or more stationary booms.



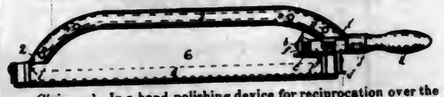
3. The combination of the truck or car A, the shovel and trolley operating engine thereon, the steam-shovel carried thereby with its operating-ropes connected therewith, the trolley carried thereby disconnected from its operating-rope and a boom-section or support for said trolley carrying sheaves for the operating-rope and which boom-section or support is adapted to be moved into line with a stationary boom-section, and said stationary boom-section.

4. The combination in a hoisting and conveying apparatus, of a movable truck or car, a trolley-support mounted therein, a trolley carried thereby, a support at one side of and below the trolley-support, a steam-shovel adapted to be carried upon said support and the shovel-operating rope extending over a sheave on said trolley to an operating-engine.

604,893.

604,894. SAFE. OLIVER E. CONVERSE, St. Louis, Mo. Filed Apr. 12, 1897. Serial No. 631,763. (No model.)

Claim.—1. A safe or vault composed of a bottom formed of a single piece of armor-plate provided with upwardly and inwardly extending marginal flanges, a top formed of a single piece of armor-plate provided with downwardly and inwardly extending marginal flanges, sides and ends built up of sections of armor-plate provided with outwardly-extending flanges at their top and bottom margins fitting within the flanges of the top and bottom pieces and a lining located within the space inclosed by the top, bottom, side and end pieces whereby the casing is restrained against inward collapse.



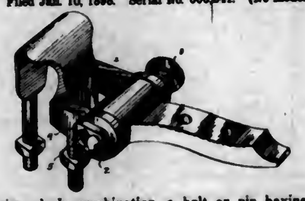
2. A vault comprising an outer casing composed of a bottom formed of a single piece of armor-plate provided with upwardly and inwardly extending marginal flanges, a top formed of a single piece of armor-plate provided with downwardly and inwardly extending marginal flanges, and sides and ends formed of pieces of armor-plate provided with outwardly-extending flanges at their top and bottom margins fitting within the flanges of the top and bottom pieces, the meeting edges of the side and end pieces being tongued and grooved respectively.

3. A vault comprising a casing built up and composed of a bottom formed of a single piece of armor-plate provided with upwardly and inwardly extending marginal flanges, a top formed of a single piece of armor-plate provided with downwardly and inwardly extending marginal flanges, sides and ends formed of pieces of armor-plate provided with outwardly-extending flanges at their top and bottom margins fitting within the flanges of the top and bottom pieces, the meeting edges of the side and end pieces being tongued and grooved respectively, in combination with a lining mounted within the casing whereby the side and end pieces are restrained against inward movement or collapse.

4. In a safe or vault a side piece having a door-opening and formed with a curved or rounded face on the jambs of said opening, and a door formed with a marginal shoulder having a curved inner face fitting closely to the corresponding curved jambs of the end or side pieces.

5. A safe or vault composed of a bottom formed of a single piece of armor-plate provided with marginal flanges, a top formed of a single piece of armor-plate provided with marginal flanges, sides and ends built up of sections of armor-plate and engaging the top and bottom pieces at their top and bottom margins within and interlocking the marginal flanges thereof, and a lining located within the space inclosed by the top, bottom, side and end pieces, whereby the casing is restrained against inward collapse.

604,895. HAND POLISHING DEVICE. JULIUS FIEWEGER, Menasha, Wis. Filed Mar. 27, 1897. Serial No. 629,499. (Model.)

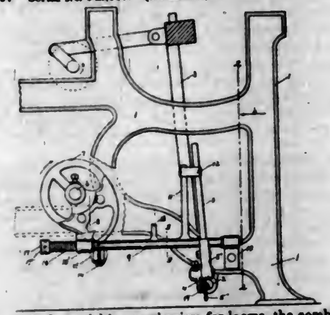


Claim.—1. In a hand polishing device for reciprocation over the work to be smoothed, the combination of the clamps 1 and 2 secured upon opposite ends of the curved bar 3, the strap 4, abrasive strip 5, and the board 6, which latter serves as a backing to said strap and abrasive strip 5, each clamp being provided with a loose follower and the screws *i*, *i*, and the clamp 1 having a screw *b* for moving it toward and from the clamp 2 and thereby giving the proper degree of tension to said strap and abrasive strip, and also, for holding said removable board between said clamps, whereby said board can be easily removed and the abrasive surface changed from a rigid to a flexible one, substantially as set forth.

2. In a hand polishing device having a curved bar adapted to be grasped by the hand of the operator and reciprocated over the work to be smoothed, the combination of two clamps, one upon each end of said bar, fitted to receive and removably hold the end of a strap, and one of said clamps being provided with a screw for giving the proper degree of tension to said strap, and extending from one to the other of said clamps a strap therefor, and removably held between said clamps the board 6, for providing a rigid backing to said strap, whereby said polishing device may be changed from a flexible one to one having a rigid backing at the will of the operator, substantially as set forth.

3. In a hand polishing device having a curved bar adapted to be grasped by the hand of the operator for reciprocation over the work to be smoothed, the combination of two clamps, one upon each end of said bar, fitted to receive and removably hold the end of a strap and strip of abrasive paper, and one of said clamps being provided with a screw for giving said strap and paper the proper degree of tension, and extending from one to the other of said clamps a strip of abrasive paper, and inside of said paper, the strap 4 for providing a support and flexible backing to said paper, substantially as described.

604,896. BOLT-FASTENING. CARROLL GARNETT, Front Royal, Va. Filed Jan. 10, 1898. Serial No. 666,241. (No model.)



Claim.—1. In combination, a bolt or pin having an annular groove forming a reduced portion, and a locking-plate provided with a pair of intercommunicating openings, the passage at the juncture of the openings being less than the diameter of the engaging end of the bolt, and one of the openings having its inner end contracted forming a flange or shoulder to engage with the outer wall of the said annular groove of the bolt, the end portion of the bolt exterior to the groove obtaining a seat in the enlarged end of the opening having its inner end contracted, substantially as set forth.

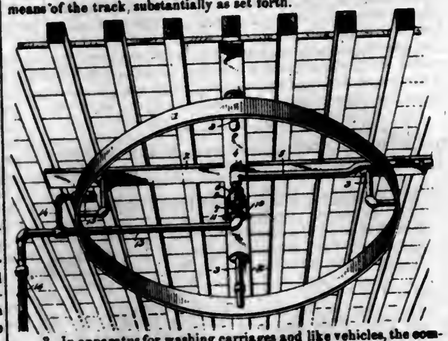
2. In combination, a bolt or pin having an annular groove forming a reduced portion, a locking-plate having a pair of intercommunicating openings, the space at the juncture of the openings being less than the diameter of the openings, and one of the openings having its inner end contracted forming an inner flange or shoulder to receive the reduced portion of the bolt and engage with the outer wall of the annular groove, and a spring arranged to normally move the locking-plate and bolt apart, whereby the engaging end of the bolt is held seated in the enlarged end of the opening having its inner end contracted, substantially as set forth.

3. In combination, a bolt having an annular groove near its outer end, a spring mounted upon the inner end of the bolt and adapted to exert an outward pressure against the head thereof when the bolt is in position, and a locking-plate having intercommunicating openings through one of which the engaging end of the bolt is adapted to be thrust, and the other opening having its inner end contracted forming an inner flange or shoulder to receive the reduced portion of the bolt and engage with the outer wall of the annular groove, the end of the bolt exterior to its reduced portion obtaining a seat in the enlarged end of the opening having its inner end contracted and held in said seat by the aforedescribed spring, substantially as and for the purpose set forth.

4. In combination, a bolt or pin having a shouldered or projecting portion, a locking-plate having intercommunicating openings, one of the openings adapted to have the shouldered end of the bolt or pin thrust therein, and the other opening receiving the said shouldered end by a sliding movement of the locking-plate, and a spring for moving the bolt and locking-plate apart to cause the latter to engage with the shouldered or projecting portion of the said bolt or pin and secure the latter, substantially as set forth.

604,897. PICKING MECHANISM FOR LOOMS. GEORGE GOODLINE, Paterson, N. J., and JOHN A. CLARK, Worcester, Mass., assignors to the Crompton & Knowles Loom Works, Worcester, Mass. Filed June 29, 1897. Serial No. 642,803. (No model.)

Claim.—1. In a picking mechanism for looms, the combination with the picking-cam, and means to operate it, and a picking-shaft having a picking-roll arm secured thereto, of a spring encircling said shaft, and having one end adjustably secured thereto, and the other end secured to a fixed part of the loom-frame, substantially as shown and described.



2. In a picking mechanism for looms, the combination with the picking-cam, and means to operate it, and a picking-shaft having a picking-roll arm secured thereto, of a spring encircling said shaft, and having one end secured thereto, and the other end secured to a fixed part of the loom-frame, substantially as shown and described.

3. In a picking mechanism for looms, the combination with the picking-cam, and means to operate it, and a picking-shaft and bearings therefor, one end of the shaft extending beyond its bearing, and a picking-arm secured to said shaft, of a spring surrounding the extended end of the shaft, and having one end secured to the shaft, and the other end secured to a fixed part of the loom-frame, substantially as shown and described.

604,898. CARRIAGE-WASHER. EDWARD J. GREEN and SCHUYLER C. BROWN, Saratoga Springs, N. Y. Filed Nov. 10, 1897. Serial No. 658,034. (No model.)

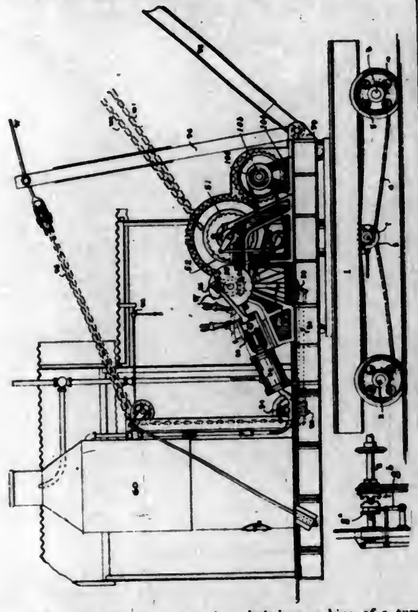
Claim.—1. In apparatus for washing carriages and like vehicles, the combination of an approximately circular track having its opposite portions varying slightly from a true circle, a swivel-joint located centrally of the track and in communication with a water-supply, a delivery-pipe having connection with the swivel-joint, and a roller for supporting the outer end of the delivery-pipe and adapted to travel upon the track and receiving the wear throughout its length, substantially as set forth.

2. In apparatus for washing carriages and like vehicles, the combination of an approximately circular track, a vertical pipe located centrally of the track and in communication with a water-supply, a second pipe slidably within the vertical pipe and rotatable therein, a yoke for supporting the inner pipe, means for detachably connecting the yoke with the said vertical pipe to admit of the inner pipe sliding out therefrom, and a delivery-pipe having its inner end connected with the inner or lower pipe and having its outer end supported by means of the track, substantially as set forth.

3. In apparatus for washing carriages and like vehicles, the combination of an approximately circular track, a vertical pipe disposed centrally of the track and in communication with a water-supply, a second pipe fitted within the vertical pipe so as to turn and of less diameter, whereby a water-space is formed between it and the outer pipe, and having an opening in its side communicating with the lowest point of the said water-space, a yoke connected with the upper pipe and supporting the lower pipe, and a delivery-pipe having connection with the inner or lower pipe and supported at its outer end by means of the track, substantially as set forth.

4. The herein-described apparatus for washing carriages and the like, consisting of an overhead track varying slightly from a true circle, a supply-pipe having a vertical extension, a delivery-pipe having a vertical extension at its inner end fitting within the vertical extension of the supply-pipe and of less diameter so as to provide a water-space, and having an opening in its side communicating with the lowest point of the said water-space, a stuffing-box applied to the outer vertical extension, a yoke having connection with the upper extension and engaging with the extension of the delivery-pipe to maintain the parts in fixed relation, a bent arm applied to the free end of the delivery-pipe, and a roller applied to the bent portion of the said arm to travel upon the track and support the delivery-pipe at its outer end, substantially as described.

604,899. CAR-DOOR. WILLIAM O. HARLOW, Shenandoah, Va., assignor of one-half to L. A. Lohr, same place. Filed Sept. 20, 1897. Serial No. 652,285. (No model.)



Claim.—1. The combination with a car having a door-opening, and a car-door, of a crank-shaft journaled on the car at the top of the door-opening and supporting the car-door and forming a track for the same, said crank-shaft being adapted to be rotated partially to swing the door into and out of the door-opening of the car, means for locking the crank-shaft against rotation, and guides mounted on the car at the bottom of the car-opening and provided with lower inner vertical portions to confine the door in its closed position, and having outer upper vertical portions to receive and guide the lower edge of the door when the latter is swung out of the door-opening, substantially as described.

2. The combination with a car having a door-opening, and a car-door, of a crank-shaft journaled on the car at the top of the door-opening and forming a track, said crank-shaft having the car-door slidingly mounted on it and adapted to swing the same into and out of the door-opening, the guides mounted on the car at the bottom of the door-opening and composed of the lower inner vertical por-

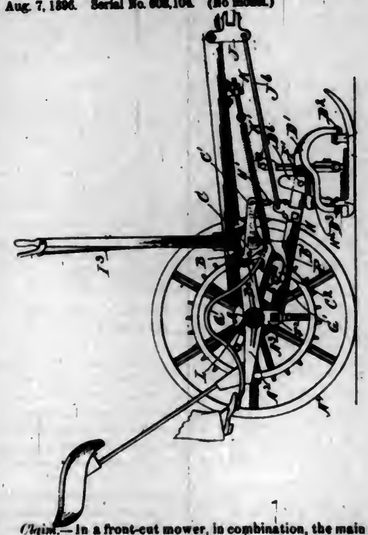
tions adapted to confine the door in its closed position, the outer upper vertical portions forming guides and receiving the bottom of the door when the latter is swung out of the door-opening, and the inclined connecting portions extending from the upper ends of the lower vertical portions to the lower ends of the outer vertical portions and adapted to guide the bottom of the door into the door-opening when the door is being closed, an operating-lever mounted on the car and connected with the crank-shaft, and means for locking the lever, substantially as described.

604,900. HOISTING-MACHINE. JAMES H. LANCASTER, New York, N. Y.. Filed Mar. 11, 1895. Serial No. 541,348. (No model.)

Claim.—1. The combination in a hoisting-machine, of a turn-table platform, a vertically-movable pivoted boom, a rocking frame, a driving-shaft, a truck, a clutch-gearing mechanism on the driving-shaft for rotating the platform in either direction, a friction-driver, a counter-shaft, drums on opposite sides of said driver, a spring for normally holding the same in a disengaged position, extensions extending adjacent to the driving-shaft and adapted to independently throw said drums to engage with the friction-driver, a vertical boom-adjusting mechanism, platform-actuating means and boom-drum-operating devices adapted to be controlled from a point contiguous to that from which the main-drum-operating connections are manipulated, all arranged and combined substantially as and for the purposes specified.

2. The combination in a hoisting-machine, of a turn-table platform carrying a boom and frame at an angle thereto, both being fulcrumed at their lower ends on the same pivots at the front of the platform and connected at their top, a drum operating a cable for adjusting the vertical frame and boom, a drive-shaft on said platform rotating a friction-driver on a counter-shaft upon which loosely turn drums at opposite sides of the driver, connections for throwing either or both of the drums last mentioned into engagement with the driver, means for rotating the platform and clutch-gearing for actuating the same, substantially as set forth

3. The combination in a hoisting-machine, of a turn-table platform carrying a boom and supporting a drive-shaft imparting motion to a friction-driver rotating a counter-shaft; the driver comprising in metal, a central hub provided with an annular series of gear-teeth and an extension at each side thereof, yielding material in said extensions, drums on opposite sides of said driver and normally held by springs in a disengaged position, connections extending adjacent to the drive-shaft and adapted for independently throwing said drums into engagement with the friction-driver, means including clutch-gearing on the drive-shaft for rotating the platform in either direction and for independently driving a third drum controlling the vertical adjustment of the boom, said platform-actuating means and boom-drum-operating devices being adapted to be controlled from a point contiguous to that at which the main-drum-operating connections are manipulated, substantially as set forth.



4. The combination in a hoisting-machine, of the boom-carrying platform supporting a drive-shaft and its controlling means, the former having a toothed pinion meshing with a driver centrally mounted on and rotating a counter-shaft; the driver comprising in metal, a central hub provided with an annular series of gear-teeth and an extension at each side thereof, yielding material in said extensions, together with drums at opposite sides of said driver, connections extending adjacent to the drive-shaft and adapted to independently throw said drums into engagement with the friction driver, means including clutch-gearing on the drive-shaft for rotating the platform, said platform-actuating means being also controllable from a point adjacent to that at which the drum-actuating means are manipulated; said drive-shaft also actuating clutch-gearing for driving the truck-carrying wheels, substantially as set forth.

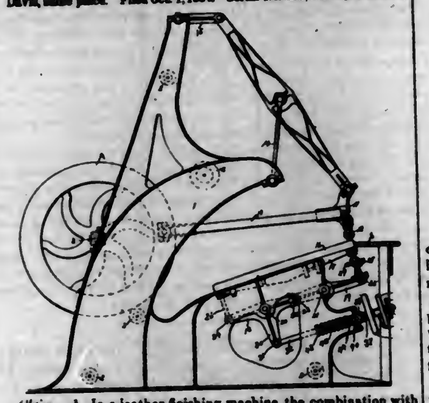
5. The combination in a hoisting-machine, of the boom carrying platform supporting a drive-shaft and its controlling means, the former having a toothed pinion meshing with a driver centrally mounted on and rotating a counter-shaft; the driver comprising in metal a central hub provided with an annular series of gear-teeth and an extension at each side thereof, yielding material in said extensions, together with drums at opposite sides of said driver, connections extending adjacent to the drive-shaft-controlling means for independently operating the drums, a wheel 106, meshing with the driver and loosely mounted on a winch-head shaft 103, to operate the same as specified, and clutch mechanism and its operating means for actuating the shaft 103, substantially as set forth.

6. In a hoisting-machine, the combination with a wheel having contiguous to its periphery, a series of laterally-extending boxes, each including a wall parallel with, and connected to the wheel by a perforated bottom and end walls, the opposing walls of any pair of boxes being separated to afford intervening air-spaces, of a series of radial segments of yielding material within and bearing against the bottoms of said boxes and exposed near the wheel periphery, substantially as set forth.

7. In a hoisting-machine, the combination with a wheel having contiguous to its periphery, a series of laterally-extending boxes, each including a wall parallel with, and connected to the wheel by a perforated bottom portion, of a series of radial segments each of yielding material, within and having an outer portion overlapping the outer wall of its box, and an independent plate or section, interposed between each segment and its box-bottom to take up wear, substantially as set forth.

604,901. MOWER. JAMES MACPHAIL, Blue Island, Ill. Filed Aug. 7, 1896. Serial No. 602,104. (No model.)

Claim.—In a front-cut mower, in combination, the main axle, the main frame mounted thereon, a rack mounted on the main frame and having a spindle projecting therefrom, the finger-bar-lifting device provided with an upwardly and forwardly projecting arm C and a downwardly, and backwardly projecting arm C^2 and mounted on said spindle, the floating frame of the machine, a connection between the free end of the arm C and the floating frame of the machine, and a foot lifting-lever pivotally connected with the free end portion of the arm C^2 of the finger-bar-lifting device and adapted to operate therethrough to raise the floating frame and having its elevation adjustable by means of a set-screw, substantially as and for the purpose specified.

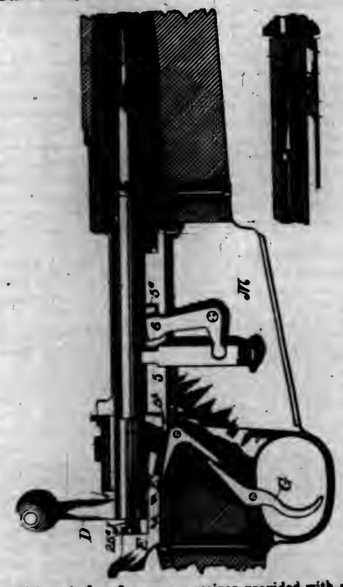


604,902. DRAFT-EQUALIZER. MILES MARTIN, Marshall, Ind. Filed Apr. 29, 1897. Serial No. 634,416. (No model.)

Claim.—1. In a three-horse evener, the combination with the tripletree, and two singletrees connected by links with its ends; of a lever pivoted at its rear end to the center of the tripletree and extending thence obliqaely forward, a link pivoted to the front end of this lever and extending obliquely forward in the opposite direction, an intermediate singletree pivoted to the front end of the link, and pivotal connections between the vehicle and a point on the lever one-third the distance on the latter between its pivot to the tripletree and its pivot to said link, as and for the purpose set forth.

2. The herein-described equalizer attachment, the same comprising a pair of levers having their rear ends adapted to be pivoted to the center of the main tree and extending thence obliqaely forward, a pair of links pivoted to the front ends of the levers and extending thence obliquely forward in the opposite direction, a singletree pivoted between the front ends of said links, and a yoke whose body is adapted to span the main tree, whose rear end is adapted to be connected with the vehicle, and whose front ends are pivoted to said levers at a point one-third the distance from the rear to the front pivots of the latter, as and for the purpose set forth.

604,908. LEATHER-DRESSING MACHINE. EDWARD R. PARKHURST, Woburn, Mass., assignor to James T. Freeman and Henry F. Davis, same place. Filed Oct. 1, 1897. Serial No. 653,730. (No model.)



Claim.—1. In a leather-finishing machine, the combination with a finishing-tool which travels over the surface of the bed, of a bed for supporting the stock while it is being operated upon, levers adjacent the bed and having their contiguous ends adapted to engage with each other, with their remote ends serving to support the bed, and means for yieldingly sustaining the bed under the pressure of the finishing-tool while its parallelism is maintained, substantially as described.

2. In a leather-finishing machine, the combination with a finishing-tool which travels over the surface of the bed, of a bed for supporting the stock while it is being operated upon, levers adjacent the bed and having their contiguous ends adapted to engage with each other, with their remote ends serving to support the bed, and a yielding member connected with the levers to sustain them against the pressure of the finishing-tool upon the bed, substantially as described.

3. In a leather-finishing machine, the combination of a bed for supporting the stock while it is being operated upon, connected sector-levers supporting the bed, a rod engaging one of the said levers, means for adjusting said rod to vary the position of the levers and thereby effect an adjustment of the bed, and a spring on said rod which tends to hold the said bed in its normal position against the pressure of the finishing-tool, and means for adjusting the tension of the said spring, substantially as described.

4. In a leather-finishing machine, the combination with a bed for supporting the stock while it is being operated upon, connected sector-levers for supporting the bed, a rod engaging one of the said levers, a sleeve on said rod, a collar threaded upon the sleeve and pivotally mounted on the frame; means for turning the sleeve within the collar to effect an adjustment of the rod, a spring on the said rod adjacent the said sleeve and an adjusting-nut on the said rod for adjusting the tension of the spring, substantially as described.

604,904. MAGAZINE BOLT-GUN. EDWARD G. PARKHURST, Hartford, Conn., assignor to the Lee Arms Company, of Connecticut. Filed Apr. 20, 1896. Serial No. 588,365. (No model.) Patented in England May 5, 1896, No. 9,570; in France May 9, 1896, No. 256,226; in Belgium May 9, 1896, No. 121,276; in Italy May 9, 1896, LXXXI, 279, and in Austria July 23, 1896, No. 46/3,018.

Claim.—1. In a firearm, a receiver provided with a lug for receiving and temporarily retaining a detachable magazine-filler, the lug having an enlarged retaining-head for engaging with a clasping member of the filler.

2. In a firearm, in combination with the receiver thereof, a supporting-lug provided with a rounded head for temporarily engaging with the clip or clasp of a detachable magazine-filler so as to form a temporary supporting and retaining pivot upon which the emptied filler may be swung backward.

3 In a firearm, in combination with the receiver thereof, a supporting-lug, having an enlarged rounded head for engaging with a cartridge-filler, forming one member of a hinged connection therewith, the lug being recessed upon its rearward side below the rounded head portion to an extent sufficient to allow of a suitable backward inclination of the filler, beyond which the filler is detached by impinging against the lug.

4. In a firearm, a receiver having a filler-receiving recess in the rearward wall of the breech-opening thereof, the side walls of the recess sustaining the cartridge-filler against lateral movement relative to the breech, and the rearward wall being provided with a filler-sustaining lug for engaging with a suitable clasp upon the filler.

5. A magazine for firearms, having the upper portion of its side wall hinged at its forward end, whereby the rearward or cartridge-head end may be swung laterally outward, for the purpose specified.

6. A magazine-mouth closer for firearms, hinged at its forward end and provided with a lateral guiding extension at its rearward end, for the purpose specified.

7. In a firearm of the class specified, the magazine thereof having the upper portion of one of its side walls cut away, and a closer

for the opening thus made, hinged at its forward end, the upper portion of the closer extending into and contracting the upper portion of the magazine-space so as to prevent the passage of the cartridges, the rearward end of the closer being provided with a lateral guiding extension passing transversely through a supporting-slot in the receiver rearwardly of the cartridge-space.

8. In a firearms-magazine, having the upper portion of one of its side walls cut away, a closer for the opening thus made, pivotally mounted upon the side wall, and provided with an inclined cam portion upon its outward surface for forcing the closer to its closed position.

9. In combination with a firearms-magazine, having the upper portion of its side wall cut away, a closer for the opening thus made, pivotally mounted upon the side wall, having an inclined cam-surface upon its outer side, and a correspondingly-inclined lock adjacent to the cam of the closer and engaging therewith to force the closer to its closed position.

10. In a firearms-magazine, having the upper portion of its side wall cut away, a closer for the opening thus made, hinged at its forward end, and provided with an inclined cam-surface, a lock adjacent thereto, having a correspondingly-inclined surface for engaging with the closer, and a spring arranged and operating to normally press the lock toward its locking position with relation to the closer.

11. In a firearms-magazine, having the upper portion of its side wall cut away, a pivotally-mounted closer for the opening thus made, provided with an inclined cam-surface, a lock for the closer pivotally mounted adjacent thereto, and provided with a correspondingly-inclined cam-surface, a key operatively connected with the lock and so disposed in relation to the magazine as to unlock the closer when pushed in a direction opposite to that in which the cartridges enter the magazine, substantially as described and for the purpose specified.

12. In a magazine, a cartridge cut-off pivotally mounted upon the side wall, and a spring operatively engaging therewith and normally operating to press the cut-off out of engagement with the cartridges.

13. In a firearms-magazine, a cartridge cut-off pivotally mounted thereon, having one end extending through the side wall in engaging relation to the uppermost cartridge, a spring operatively engaging therewith and normally operating to press the cut-off out of its cartridge-engaging position, and an operating-key for engaging with and moving the cut-off into its cartridge-engaging position against the pressure of the spring.

14. In a firearms-magazine, in combination with the side wall thereof, a cut-off pivotally mounted thereon, having a curved end extending through the side wall into engaging relation with the uppermost cartridge contained in the magazine, a spring normally pressing the cut-off out of its cartridge-engaging position, and an operating-key therefor having a retaining-recess adapted to engage with the end of the cut-off at the cartridge-engaging position of the latter.

15. In a firearms-magazine, in combination with the side wall, and with a cut-off pivotally mounted thereon, an operating-key for the cut-off fitted to slide in the side wall, and having an inclined face terminating in a transverse recess, the cut-off being provided with a hooked or rounded end engaging with the inclined surface and in the recess, with a spring normally pressing the cut-off into engagement with the key.

16. In a firearm of the class specified, a turning breech-bolt and an extractor therefor arranged for longitudinal movement only, provided at their forward ends with interlocking-ribs for preventing lateral movement of the forward end of the extractor away from the bolt, one of the ribs being extended annularly around the bolt so as to enable them to remain in locking engagement throughout the turning movement of the bolt.

17. In a firearm of the class specified, in combination with the receiver thereof, having a longitudinal extractor-receiving groove therein, a breech-bolt arranged to slide longitudinally and to partially rotate in the receiver, provided with a locking-rib adjacent to its forward end, an extractor sliding in the groove of the receiver, and having a locking-shoulder engaging with the locking-rib of the bolt, so as to prevent lateral movement of the hook of the extractor away from the bolt, the extractor having an extent of longitudinal movement with relation to the bolt sufficient to lock and unlock their engaging portions, whereby the extractor is moved into locked relation with the bolt by the extraction-resisting tendency of the cartridge, and is unlocked therefrom by the action of pushing the cartridge into its chamber.

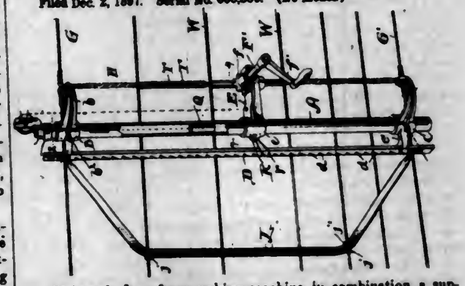
18. A breech-bolt for firearms provided with an annularly-extending extractor-carrying rib, adjacent to the forward end of the bolt, and provided with an annularly-extending locking-rib for locking the extractor laterally to the bolt-head during the retracting movement of the bolt.

19. In a firearm, in combination with the receiver thereof, provided with a longitudinal groove and with an extractor therefor provided with a locking-shoulder at its forward end, a breech-bolt provided with a recessed groove at its forward end to receive the locking-shoulder of the extractor, the groove being extended annularly around the bolt to allow of the turning movement of the bolt with relation to the extractor.

20. Means for uniting a bolt and its head, the former being provided with a transversely-shouldered recess, and the head being provided with a locking-lug entering the recess in the wall of the bolt, and a locking-piece supported by the shoulders of the recess, and preventing opening movement of the bolt-head.

21. Means for uniting a bolt and its head, the latter being provided with a stem having a projecting lug thereon, the bolt being recessed to receive the stem and the lug, and having a transversely-shouldered locking-recess adjacent to the lug with a locking-piece for the recess, all arranged and operating to lock the lug against opening movement.

22. A bolt for firearms chambered to receive a firing-pin, and having a recess in its forward end, substantially in the form of a cross, that bolt-head having a stem fitting the chamber of the bolt, with a lug thereon fitting the upper portion of the cross-shaped recess, and a T-shaped locking-piece for filling the remainder of the recess.



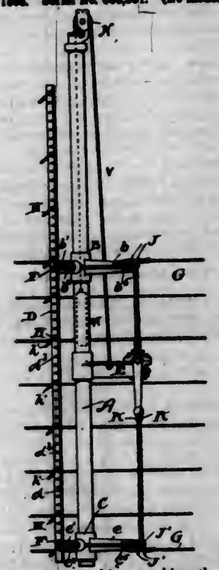
23. In a firearm of the class specified, in combination with the bolt and with the extractor thereof, the bolt being provided with a detachable head having a retaining-lug thereon fitting in the wall of the bolt, a locking-piece fitted in the wall of the bolt against the opening side of the retaining-lug of the bolt-head, and located beneath the extractor, whereby the latter is utilized to retain the locking-piece in its recess.

24. In a firearm of the class specified, in combination with a rotating bolt thereof, and with a non-rotating extractor, the bolt being provided with a detachable head, having a locking-lug fitting in a corresponding recess in the wall of the bolt, a locking-piece located in advance of the retaining lug of the bolt-head, and extending circumferentially around the bolt to an extent sufficient to enable it to be overlaid by the extractor at all of the working positions of the latter.

25. In a firearm, a breech-closing bolt chambered from its forward end to receive the firing-pin and its spring, a firing-pin provided with an enlarged collar near its forward end, the bolt being counterbored therefor to an extent sufficient to allow only of the necessary working compression of the spring, and forming a stop-abutment against excessive retraction of the pin, a detachable bolt-head rigidly locked to and forming the forward end of the bolt, provided with an annular locking-rib at its forward end, and an extractor having a locking-rib at its forward end for engaging with the rib of the bolt-head, so as to prevent lateral movement of the extractor away from the bolt-head, the extractor being arranged for longitudinal as well as rotary movement with relation to the bolt-head whereby their locking-ribs may be moved into and out of engagement.

26. In a firearm, the herein-described means for uniting the firing-pin and its cocking-piece, they being provided with corresponding engaging threads, and having longitudinal thread-interrupting grooves, which allow the cocking-piece to be slipped longitudinally to its seat upon the pin, one of the grooves being extended beyond the threaded portion to an extent sufficient to receive the key, and that groove being adapted to coincide with a corresponding groove in the cocking-piece when the latter is turned to its thread-engaging position upon the pin, whereby the key may be pushed through the groove and thus lock the parts against rotary movement.

604,905. FENCE-MAKING MACHINE. ALBERT E. ROBERTS, Norwalk, Ohio, assignor of one-half to John H. Clauss, Fremont, Ohio. Filed Dec. 2, 1897. Serial No. 660,556. (No model.)



Claim.—1. In a fence-making machine, in combination, a supporting-post, a vertically-movable bracket-arm having a slotted bearing for a twister, a twister consisting of a cylindrical portion which is mounted in said bearing and upon which it revolves, and a geared portion whereby it is revolved, said twister having a longitudinal slot *b'*, and a geared operating-shaft for revolving said twister, a cable fastened to said bracket-arm, a sheave carried by the post over which the cable passes, and a counterbalance-weight secured to the end of the cable, substantially as and for the purpose specified.

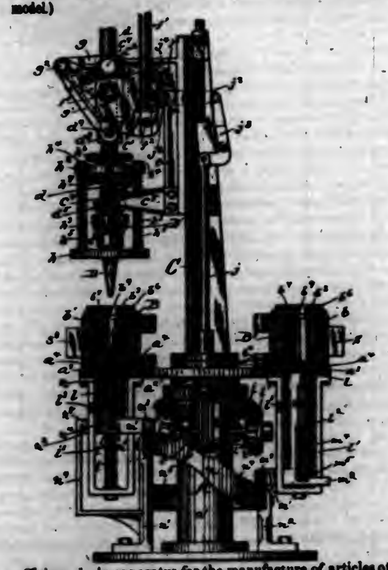
2. In a fence-making machine, in combination, a tubular post, a sheave mounted upon the post, a vertically-movable bracket-arm carried by said post, a weight movable in the post, and a cable connecting said weight and bracket-arm and passing over said sheave, and a stay-twister carried by said bracket-arm, substantially as and for the purpose specified.

3. In a fence-making machine, in combination, a post, two adjustably-fixed collars, each having a curved arm the end of which is adapted to engage with a running wire, a bracket-arm on the post between said collars, and a stay-twister carried by said bracket-arm, substantially as and for the purpose specified.

4. In a fence-making machine, in combination, a post, a collar B adjustably fixed thereto having the curved arm *b* and the oppositely-extended arm *b'*, a collar C adjustably fixed to the post having the curved arm *c* and the oppositely-extended arm *c'*, the vertically-notched guide-bar fixed to the arms *b'* and *c'*, and adapted to engage with the running wires of a fence, the bracket-arm on said post, and stay-twisting mechanism carried by said bracket-arm, substantially as and for the purpose specified.

604,906. FENCE-MAKING MACHINE. ALBERT E. ROBERTS, Norwalk, Ohio, assignor of one-half to John H. Clauss, Cleveland, Ohio. Filed Jan. 11, 1898. Serial No. 666,931. (No model.)

Claim.—1. In a fence-making machine, the combination of a vertical post, a collar B secured thereto having two rigid arms *b* and *b'*, a collar C secured to the post having the two rigid arms *c* and *c'*, and stay-twisting mechanism carried by the post between said collars, with a vertical bar rigidly secured to the two arms *b' c'*, and a plurality of obliquely-disposed hooks H secured to the rear side of said bar for engagement with the running wires, substantially as specified.



2. In a fence-making machine, the combination of a vertical post, a collar B secured thereto having two rigid arms *b* and *b'*, a collar C secured to the post having the two rigid arms *c* and *c'*, and stay-twisting mechanism carried by the post between said collars, with a vertical bar secured to the two arms *b' c'*, a plurality of obliquely-disposed hooks secured to the rear side of said bar for engagement with the running wires, and two hooks pivoted to the arms *b* and *c* respectively and adapted to engage behind the running wires, substantially as specified.

3. In a fence-making machine, the combination with a vertical post, two arms *b* and *c* secured to said post, and stay-twisting mechanism between said arms, with the hooks pivoted respectively to said arms, and adapted to engage behind the running wires with which said arms engage, substantially as specified.

4. In a fence-making machine, the combination of a vertical post, a collar B adjustably secured thereto having two rigid arms *b* and *b'*, and a collar C secured to the post and having the arms *c* and *c'*, with a vertical angle-bar secured to the arm *c'*, and having in one side *d* near its upper end a plurality of holes, and a bolt adapted to pass through the arm *b'* and through any of said holes to fasten said bar to the arm *b'*, substantially as specified.

5. In a fence-making machine, the combination of a vertical post, a collar B adjustably secured thereto having two rigid arms *b* and *b'*, and a collar C secured to the post and having the arms *c* and *c'*, with a vertical angle-bar secured to the arm *c'*, and having in one side *d* near its upper end a plurality of holes, and a bolt adapted to pass through the arm *b'* and through any of said holes to fasten said bar to the arm *b'*, said bar having in its other side *d*³ a plurality of holes, and oblique hook-bolts secured in the last-named holes, substantially as specified.

604,907. APPARATUS FOR MANUFACTURING GLASSWARE. CHARLES E. SCHNURR, Pittsburg, Pa., assignor of one-half to William S. McKee, Allegheny, Pa. Filed Oct. 8, 1897. Serial No. 654,554. (No model.)

Claim.—1. In apparatus for the manufacture of articles of glassware, the combination with a suitable frame, of a mold supported thereon, an upright below said mold and forming a portion of the bottom of same, a sleeve on said upright, the upper portion of said sleeve constituting the walls of press-mold, and mechanism for raising and lowering said sleeve and a locking device for holding said sleeve in its raised position, substantially as set forth.

2. In apparatus for the manufacture of articles of glassware, the combination with a suitable frame, of a press-mold supported thereon, an upright below said mold and forming a portion of the bottom of same, a sleeve on said upright, the upper portion of said sleeve constituting the walls of the press-mold, a bottom for the mold to convert it into a blow-mold surrounding said upright, and mechanism for raising and lowering said sleeve and simultaneously opening and closing said bottom, substantially as set forth.

3. In apparatus for the manufacture of articles of glassware, the combination with a suitable frame, of a mold supported thereon, an upright below said mold and forming a portion of the bottom of same, a sleeve on said upright, the upper portion of said sleeve constituting the walls of press-mold, bottom plates for the blow-mold, and mechanism for raising and lowering said sleeve and simultaneously opening and closing said bottom plates, substantially as set forth.

4. In apparatus for the manufacture of articles of glassware, the combination with a suitable frame, of a mold supported thereon, an upright below said mold and forming a portion of the bottom of same, a sleeve on said upright, the upper portion of said sleeve constituting the walls of press-mold, bottom plates for the blow-mold, levers connected to said bottom plates, and mechanism for raising and lowering said sleeve and operating said levers to advance and withdraw said bottom plates, substantially as set forth.

5. In apparatus for the manufacture of articles of glassware, the combination with a suitable frame, of a mold supported thereon, an upright below said mold and forming a portion of the bottom of same, a sleeve on said upright, the upper portion of said sleeve constituting the walls of press-mold, bottom plates for the blow-mold, levers connected to said bottom plates, said levers having inwardly-projecting arms engaging with grooves in said sleeve, and mechanism for raising and lowering said sleeve, substantially as set forth.

6. In apparatus for the manufacture of articles of glasswkre, the combination with a suitable frame, of a mold supported thereon, an upright below said mold and forming a portion of the bottom of same, a sleeve on said upright, the upper portion of said sleeve constituting the walls of press-mold, bottom plates for the blow-mold, levers connected to said bottom plates, said levers having inwardly-projecting arms engaging with grooves in said sleeve, said arms entering recesses at the upper ends of said grooves, and mechanism for raising and lowering said sleeve, substantially as set forth.

7. In apparatus for the manufacture of articles of glassware, the combination with a suitable frame, of a press and blow mold mounted thereon, an upright below said mold and forming a portion of the bottom of same, the press-mold being mounted on said upright and vertically movable thereon, a stud on said upright entering a guide in said press-mold and forming a bayonet-lock at the lower end of said guide, and mechanism for unlocking same and for raising and lowering said press-mold, substantially as set forth.

8. In apparatus for the manufacture of articles of glassware, the combination with a suitable frame, of a combination press and blow mold mounted thereon, an upright below said mold and forming a portion of the bottom of same, the press-mold being mounted on said upright and vertically movable thereon, a stud on said upright entering a guide in said press-mold and forming a bayonet-lock at the lower end of said guide, a projection on said press-mold, a stop on the frame with which said projection engages, and mechanism for raising and lowering said press-mold, substantially as set forth.

9. In apparatus for the manufacture of articles of glassware, the combination with a suitable frame, of a rotary table, mechanism for rotating said table, a plurality of molds mounted thereon, a plunger, a lever for operating said plunger, a toggle-joint between said lever and plunger, and connections between said lever and mechanism for rotating said table, substantially as set forth.

10. In apparatus for the manufacture of articles of glassware, the combination with a suitable frame, of a rotary table, mechanism for rotating said table, a plurality of molds mounted thereon, a plunger, a lever for operating said plunger, a vertically-movable rod, connections between said rod and said lever, pawls on said rod, a ratchet-wheel, and connections between said ratchet-wheel and gearing mechanism for rotating said table, substantially as set forth.

11. In apparatus for the manufacture of articles of glassware, the combination with a suitable frame, of a rotary table, mechanism for rotating said table, a plurality of molds mounted thereon, a plunger, a lever for operating said plunger, a vertically-movable rod, connections between said rod and said lever, oppositely-arranged pawls on said rod, a ratchet-wheel, and connections between said ratchet-wheel and gearing mechanism for rotating said table, substantially as set forth.

12. In apparatus for the manufacture of articles of glassware, the combination with a suitable frame, of a rotary table, a plurality of molds mounted thereon, a plunger, a lever for operating same, a vertically-movable rod, connections between said rod and said lever, oppositely-arranged pawls on said rod, a ratchet-wheel mounted on a shaft, a bevel-pinion on said shaft, and a like pinion on said table with which said first-mentioned pinion engages, substantially as set forth.

13. In apparatus for the manufacture of articles of glassware, the combination with a suitable frame, of a rotary table, a plurality of molds mounted thereon, a plunger, a lever for operating same, a vertically-movable rod, connections between said rod and said lever, a rotary shaft, mechanism for turning said shaft by the movement of said rod, gearing mechanism between said shaft and said table, and a lock for holding said table against rotation, substantially as set forth.

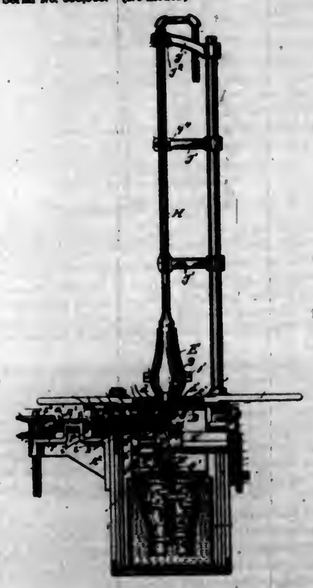
14. In apparatus for the manufacture of articles of glassware, the combination with a suitable frame, of a rotary table, a plurality of molds mounted thereon, a plunger, a lever for operating same, a vertically-movable rod, connections between said rod and said lever, a rotary shaft, mechanism for turning said shaft by the movement of said rod, gearing mechanism between said shaft and said table, and a lock operated by said rod for holding said table against rotation, substantially as set forth.

15. In apparatus for the manufacture of articles of glassware, the combination with a suitable frame, of a rotary table, a plurality of molds mounted thereon, a plunger, a lever for operating same, a vertically-movable rod, connections between said rod and said lever, a rotary shaft, mechanism for turning said shaft by the movement of said rod, a bevel-pinion on said shaft, a like pinion on said table with which said first mentioned pinion engages, a spring-latch engaging a seat in said pinion on said table, said latch being operated by said rod, substantially as set forth.

16. In a partible mold for forming articles of glassware, the combination of a swinging latch mounted on one of the parts of said mold, a freely-removable eccentric-pin mounted to turn in bearings in said mold, the free end of said swinging latch being adapted to engage with a shoulder on the opposite part of the mold, substantially as set forth.

17. In a partible mold for forming articles of glassware, the combination of a swinging latch mounted on one of the parts of said mold, a freely-removable eccentric-pin mounted to turn in the free end of said latch, and a recess in the opposite part of the mold in which the pin is adapted to enter, substantially as set forth.

18. In a partible mold for forming articles of glassware, the combination of a swinging latch mounted on one of the parts of said mold, a freely-removable eccentric-pin mounted to turn in the free end of said latch, a handle secured to said pin, and a recess in the opposite part of the mold in which the pin is adapted to enter, substantially as set forth.



19. In a partible mold for forming articles of glassware, the combination of a swinging latch mounted on one of the parts of said mold, a freely-removable eccentric-pin mounted to turn in the free end of said latch, the opposite part of said mold having a lug with a curved face and a recess beyond said face, substantially as set forth.

20. In apparatus for the manufacture of articles of glassware, the combination with a suitable frame, of a rotary table, means to rotate the table, a plurality of molds mounted thereon, a plunger, a blowpipe, a movable rod in the path of the plunger and lowered thereby, and connections between said rod and said blowpipe, substantially as set forth.

21. In apparatus for the manufacture of articles of glassware, the combination with a suitable frame, of a rotary table, means to rotate the table, a plurality of molds mounted thereon, a plunger, a blowpipe, a lever connected to the upper end of said blowpipe, a rod extending down from said lever, said rod having a projection in the path of said plunger, substantially as set forth.

22. In apparatus for the manufacture of articles of glassware, the combination with a suitable frame, of a rotary table, means to rotate the table, a plurality of molds mounted thereon, a plunger, a blowpipe, a lever connected to the upper end of said blowpipe, a spring-actuated rod extending down from said lever, said rod having a projection in the path of said plunger, substantially as set forth.

604,908. APPARATUS FOR MANUFACTURING ARTICLES OF GLASSWARE. CHARLES E. SCHNURR, Pittsburg, Pa. Filed Oct. 16, 1897. Serial No. 655,385. (No model.)

Claim.—1. In apparatus for forming articles of glassware, the combination with a suitable frame, of a rotary mold-support, a shaft therefor, a partible mold supported on said mold-support, a lever adapted to open and close said mold, bevel-pinions operated by said lever, an arm on one of said pinions, a shaft, a second movable arm, a gear-wheel on said shaft, the said gear-wheel having a stop, a link connecting said arms, said second arm being adapted to engage the stop on said gear-wheel, and a gear-wheel on the mold-supporting shaft with which said first-mentioned gear-wheel meshes, substantially as set forth.

2. In apparatus for forming articles of glassware, the combination with a suitable frame, of a rotary mold-support, a shaft therefor, a partible mold supported on said mold-support, a lever adapted to open and close said mold, bevel-pinions operated by said lever, an arm on one of said pinions, a shaft, a gear wheel on said shaft, a second movable arm, a link connecting said arms, a latch on said second arm adapted to engage a seat formed in said gear-wheel, and a gear-wheel on the mold-supporting shaft with which said first-mentioned gear-wheel meshes, substantially as set forth.

3. In apparatus for forming articles of glassware, the combination with a suitable frame, of a rotary mold-support mounted therein, a gear-wheel on the mold-supporting shaft, a gear-wheel meshing therewith, a lever adapted to open and close the mold, and connections between said lever and the before-mentioned second gear-wheel, whereby an intermittent rotary movement is imparted to said gear-wheel, substantially as set forth.

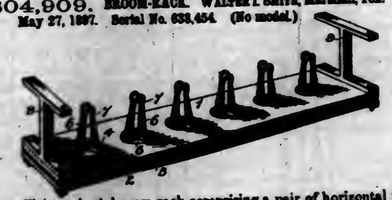
4. In apparatus for forming articles of glassware, the combination with a suitable frame, of a rotary partible mold, mechanism for oscillating said mold, mechanism for closing said mold and connections between said mold-closing mechanism and the mechanism for oscillating said mold, whereby said oscillating mechanism is operated immediately after the closing of the mold, substantially as set forth.

5. In apparatus for forming articles of glassware, the combination with a suitable frame, of a rotary mold-supporting plate, a partible mold mounted thereon, a lever adapted to close said mold, a clutch device, and connections between said lever and clutch for imparting an oscillating movement to said mold-supporting plate, substantially as set forth.

6. In apparatus for forming articles of glassware, the combination with a suitable frame, of a rotary mold-supporting plate, a partible mold mounted thereon, a lever adapted to close said mold, a shaft having a clutch-face, connections between said plate and shaft, a reversing-shaft, a clutch thereon, and connections between said lever and clutch and clutch-face, substantially as set forth.

7. In apparatus for forming articles of glassware, the combination with a suitable frame, of a rotary mold-supporting plate, a partible mold mounted thereon, a reversely-rotatable shaft having a clutch-face, connections between the plate and shaft, a sliding clutch adapted to engage said clutch-face, a lever adapted to close said partible mold, connections between said lever and said sliding clutch, and mechanism for rotating the clutch-shaft in opposite directions, substantially as set forth.

8. In apparatus for forming articles of glassware, the combination with a suitable frame, of a rotary mold-supporting plate and a reversely-rotatable shaft having a clutch-face, a sliding clutch adapted to engage with said clutch-face, a lever adapted to close said mold, a stud on said lever, a movable arm having a curved slot therein with which the stud on said lever engages, connections between said arm and said sliding clutch, and mechanism for rotating the clutch-shaft in opposite directions, substantially as set forth.



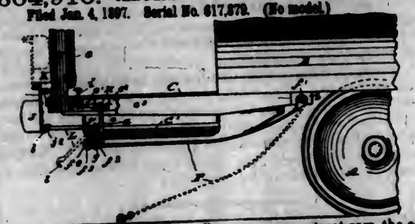
9. In apparatus for forming articles of glassware, the combination with a suitable frame, of a rotary mold-supporting plate, a shaft, connections between said mold-supporting plate and said shaft, a power-driven shaft having cam-disks thereon, said cam-disks engaging said first-mentioned shaft at opposite sides thereof, substantially as set forth.

10. In apparatus for forming articles of glassware, the combination with a suitable frame, of a rotary mold-supporting plate, a shaft, connections between said mold-supporting plate and said shaft, said shaft having a conical friction-head, a power-shaft, cam-disks on said power-shaft adapted to engage said conical head at opposite sides thereof, substantially as set forth.

11. In apparatus for forming articles of glassware, the combination with a suitable frame, of a rotary mold-support mounted therein adapted to revolve in a vertical plane, and having a plurality of mold-supporting faces, rotary mold-supporting plates mounted on said faces, mechanism for rotating said plates, an upright frame adapted to support a pipe in line with the mold supported on the mold-supporting plate, and mechanism for imparting an intermittent rotary movement to said mold-support, whereby the molds are brought successively under said upright frame, substantially as set forth.

12. In apparatus for forming articles of glassware, the combination with a suitable frame, of a rotary mold-support mounted therein adapted to rotate in a vertical plane and having a plurality of rotary mold-supporting faces, mold-supporting plates journaled in said faces and vertical shafts, each of said mold-supporting plates mounted on a vertical shaft, bevel-pinions on said vertical shafts, counter-shafts journaled in said mold-support, bevel-pinions on said counter-shafts meshing with said first-mentioned bevel-pinions, said counter-shafts having clutch-faces, a reversely-rotatable clutch-shaft having a clutch adapted to engage successively with the first-mentioned clutch-faces, and mechanism for rotating said clutch-shaft in opposite directions, substantially as set forth.

604,909. BROOM-RACK. WALTER I. SMITH, Marshall, Tex. Filed May 27, 1897. Serial No. 638,464. (No model.)

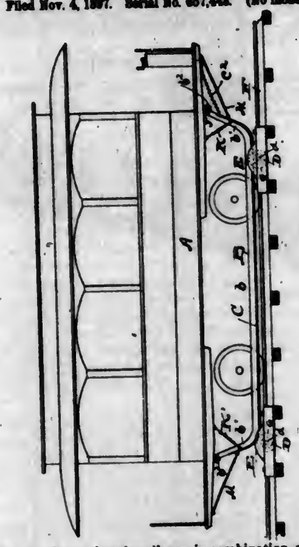


Claim.—1. A broom-rack comprising a pair of horizontal plates or strips arranged one above the other and provided with registering openings, and a pair of substantially U-shaped clamping-jaws arranged within the opening at opposite sides thereof and being slightly tapered and adapted to engage the handle of a broom, each jaw being constructed separate from the other and being rigidly clamped at the inner end of each side of each jaw by the strips or plates, substantially as described.

2. A broom-rack comprising a pair of horizontal strips arranged one above the other and provided at intervals with registering openings, and the substantially U-shaped clamping-jaws arranged in pairs in each of the openings and extending therefrom and disposed substantially vertical, the jaws at each side of the strips being constructed of a single piece of resilient material and being connected by bends forming arms arranged between the strips and clamped by the same, substantially as described.

3. A broom-rack comprising a pair of horizontal strips arranged flat against each other and provided at intervals with registering openings, the substantially U-shaped clamping-jaws arranged in pairs in each of the openings and extending therefrom and disposed substantially vertical, the jaws at each side of the strips being constructed of a single piece of resilient material and being connected by bends forming arms arranged between the strips and clamped by the same, and brackets secured to the strips and extending upward therefrom and adapted to be fastened to a ceiling or other support, said strips being of greater length than the jaws to space the latter from the ceiling or support, substantially as described.

604,910. CAR-FENDER. GEORGE O. GRIMMER, Manchester, N. H. Filed Jan. 4, 1897. Serial No. 617,879. (No model.)



Claim.—1. As a safety appliance to power street-cars, the combination of a transverse frame or buffer pivotally connected forward of the dasher and adapted for adjustment to a position above or below the platform, a screen or frame pivotally connected at one end to a car its free end being provided with a rubber covering and arranged to drop to the ground forward of the wheels, suitable movable arms depending from the car-platform for supporting the free end of said screen frame, and rods pivotally attached to said supporting-arms below their pivotal point and detachably connected to said buffer, substantially for the purpose set forth.

2. In street-cars, the combination of a transverse cushioned frame or buffer pivotally connected forward of the dasher and adapted for adjustment to a position above or below the platform, a screen or frame pivotally connected at one end to a car its free end being provided with a rubber covering and arranged to drop to the ground forward of the wheels, suitable movable arms depending from the car-platform for supporting the free end of said screen-frame, rods

pivotally attached to said supporting-arms below their pivotal point and detachably connected to said buffer, and means substantially as shown whereby the car-operator may disengage the supporting-arms and screen-frame from a point above the car-platform.

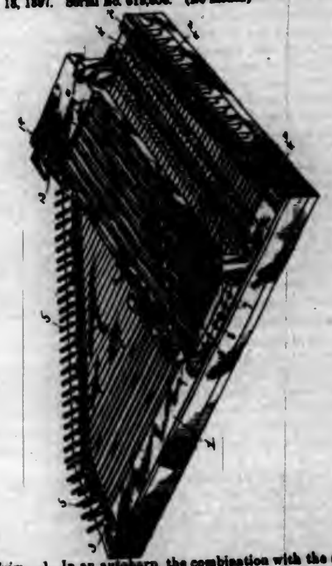
604,911. ELECTRIC RAILWAY. FREDERICK D. SWEET, Elyria, Ohio. Filed Nov. 4, 1897. Serial No. 657,642. (No model.)

Claim.—1. In an electric railway, in combination, a motor-car, a runner flexibly suspended beneath the car and extending longitudinally thereof, the centering-springs K and K', the guy-wires M, and a series of insulated contact devices secured in the road-bed, in position to be engaged by said runner, said contact devices being connected with the source of the electric current, and the distance between them being less than the length of the runner, substantially as specified.

2. In an electric railway, in combination, a motor-car, a runner having a horizontal middle part and ends which are bent upward and then outward into substantially horizontal position, bolts secured beneath the car and passing loosely through holes in the horizontal ends of the runner, springs pressing said runner ends downward, and a series of contact devices connected with the source of electrical current and secured at intervals in the road-bed in a position to be engaged by the horizontal part of said runner, the distance between said contact devices being less than the horizontal length of the runner, substantially as specified.

3. In an electric railway, a box secured in the road-bed and having a slotted top, a contact-roller mounted in said box but insulated therefrom, two disks lying on opposite sides of said roller and movable in the direction of its axis, said disks having recesses in their proximate faces which are adapted to embrace said roller, the disks having beveled adjacent ends, springs acting to force said disks toward each other, substantially as specified.

604,912. BUCKLE. GEORGE N. CLARK, Dry Ridge, Ky. Filed May 12, 1897. Serial No. 636,192. (No model.)



Claim.—A buckle comprising a box having its bottom extended at one end for connection therewith of a strap, and having its sides parallel and outwardly convergent and longitudinally bulged, forming inner guideways adjacent to and parallel with the plane of the bottom, the inner ends of the guideways being contracted, and having its top outwardly and rearwardly inclined to the plane of the bottom, and a wedge of corresponding width to the box and slidable therein through its inner or rear end and having a loop at its inner or rear end and lateral extensions at its smaller or front end which operate in the aforesaid guideways and hold the wedge against the said bottom, and which limit the rearward movement of the wedge by engaging with the inner contracted ends of the guideways, substantially as and for the purpose specified.

604,918. COMBINED HUB CAP AND NUT. JESSE A. CRABDALL, Brooklyn, N. Y., assignor of one-half to Joseph Moss, same place. Filed Feb. 4, 1897. Serial No. 622,036. (No model.)

Claim.—A combined cap and nut comprising an apertured threaded central portion 6 having the lateral flange 7, an inwardly-extending peripheral flange 8 terminating in an outwardly-projecting flange 9 adapted to lie over the outer edge of a hub and recessed to form a series of handhold projections upon the inner edge of the cap portion; substantially as and for the purposes set forth.

604,914. AUTOHARP. JACOB R. BOEHRZ, Marengo, Iowa. Filed Jan. 18, 1897. Serial No. 619,653. (No model.)

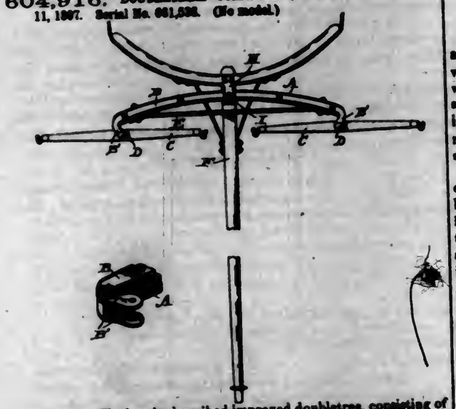
Claim.—1. In an autoharp, the combination with the strings, of rocking damper-bars of cross-sectionally angular or V shape having padded lower wings and angularly-disposed upper wings bearing keys, and return-springs connected respectively with the bars, substantially as specified.

2. In an autoharp, the combination with a body and strings, and stationary guides on the body, of a damper-frame mounted in said guides for sliding movement, and held from vertical movement, and provided parallel with its length with a rack consisting of a series of shallow rounded depressions fitted with padding or clothing, a fixed holding-spring provided at its free end with a pin fitted with an antifriction-roll for permanently engaging the rack, and adapted to slip from one depression to another thereof when longitudinal pressure is applied to the damper-frame, without manipulation of said holding-spring, and also adapted to hold the frame from accidental movement, and damper-bars mounted upon the damper-frame and yieldingly held out of contact with the strings, substantially as specified.

604,915. BED-PAN. ANNIE R. REBERT, Clifton Springs, N. Y. Filed Nov. 20, 1897. Serial No. 659,270. (No model.)

Claim.—1. A bed-pan approximating the form of a seat, comprising a plate having its rear and side portions upwardly deflected and having its front portion extended upwardly, and having an opening leading into the front extension, and a chamber below the plate projecting forward of the aforesaid front extension, substantially as described for the purpose specified.

2. A bed-pan comprising a plate having its front portion extending upwardly, forming a guard, and having an opening extending into the guard, and a shield fitted to the guard for closing the opening therein, substantially as set forth.



3. The combination with a bed-pan having a vertically-disposed guard at its front end provided with an opening, of a shield detachably fitted to the guard and held in place by portions engaging over the edge of the said guard, substantially as set forth.

4. In a bed-pan, the combination of a plate having its front end upwardly deflected, forming a guard, and having an opening extending into the said guard, and a chamber applied to the bottom side of the plate and having its front portion terminating in a spud or horn, and having an opening in its top side opposite the opening in the plate and extending beyond the said guard, substantially as and for the purpose set forth.

5. A bed-pan comprising a plate having its rear and side portions upwardly deflected and upholstered, and having its front end bent upwardly, forming a guard, and provided with an opening extending into the said guard, a shield detachably fitted to the guard and closing the opening therein, a chamber applied to the bottom side of the plate and formed into a spud or horn at its front end, and having an opening in its top side extending beyond the aforesaid guard, and a cap for closing the end of the spud or horn and provided with a tube, substantially as and for the purpose set forth.

604,916. DOUBLETREE. JOHN FINLEY, Granby, Mo. Filed Dec. 11, 1897. Serial No. 661,532. (No model.)

Claim.—The herein-described improved doubletree, consisting of the forwardly-arched bar A, the top and bottom plates B secured thereto and having reduced and extensions bent forwardly and forming clevises for the singletrees, the singletrees hung therein upon center bolts, and the front brace E, substantially as described.

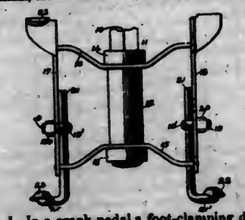
604,917. SHOESTRING-HOLDER. WILLIAM D. HADDOCK, Colleyville, Kans. Filed Aug. 12, 1897. Serial No. 647,997. (No model.)

Claim.—1. In a shoestring-holder, the combination with the supporting-base, of a vertical finger-post supported by the base to receive the middle loop of the shoestring, and a series of spaced vertical posts supported by the base on each side and to the rear of the finger-post, and around which the respective portions of the string extending from the middle loop are looped, substantially as described.

2. In a shoestring-holder, the combination with the supporting-base, of a vertical finger-post supported by the base near one end thereof to receive the middle loop of the shoestring, said finger-post having a groove in its outer face, and a series of spaced vertical posts supported by the base on each side and to the rear of the finger-post, and around which the respective portions of the string extending from the middle loop are looped, substantially as described.

3. In a shoestring-holder, the combination of the casing having its front end wall formed of two sections with a space between them, of a vertical finger-post supported by the base in the said space, to receive the middle loop of the shoestring, and a series of spaced vertical posts supported by the base within the casing to the rear and on each side of the finger-post, and around which the respective portions of the string extending from the middle loop are looped, substantially as described.

4. In a shoestring-holder, the combination of the casing having its front end wall formed of two sections with a space between them, of a vertical finger-post supported by the base in said space to receive the middle loop of the shoestring, a pair of vertical posts supported by the base near its front end to the rear and on each side of the finger-post, and a pair of spaced vertical posts supported by the base near the rear end of the casing, and around which vertical posts the respective portions of the string extending from the middle are looped, substantially as and for the purpose specified.

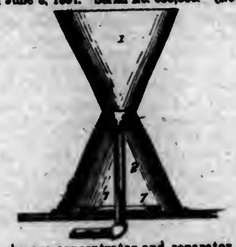


604,918. WHISTLE. JULIUS L. HARMON, Governor's Island, N. Y. Filed Oct. 7, 1897. Serial No. 654,323. (No model.)

Claim.—1. A whistle comprising a bottom casing, a top casing arranged therein and adapted to telescope therewith, means to prevent the separation of said casings, the said top casing being provided with slots or openings in the sides thereof, air-chambers arranged upon said top casing, and provided with openings communicating with the interior of the bottom casing and the top casing, and a spring arranged in the bottom casing for forcing the top casing upwardly, substantially as described.

2. A whistle comprising a bottom casing provided upon its upper edge with inwardly-projecting lugs, a top casing arranged within said bottom casing and adapted to telescope therewith, the said top casing being provided with slots or openings in its sides within which the lugs of the lower casing are guided, air-chambers arranged upon said top casing and provided with openings communicating with the interior of the bottom casing and with the top casing, and a spring arranged in the bottom casing for forcing the top casing upwardly, substantially as described.

604,919. CRANK-PEDAL. CHARLES H. METZ and THOMAS CURLEY, Waltham, Mass. Filed May 3, 1895. Serial No. 547,961. (No model.)

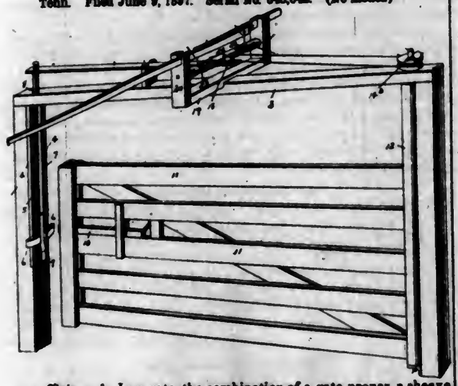


Claim.—1. In a crank-pedal a foot-clamping device or stop consisting of a rotatable shaft laterally movable in its bearings and having an upwardly-extending arm furnished with a button and a device for rigidly securing the shaft when adjusted.

2. The combination with the foot-plate 17 and the looped shanks 19 19 extending through perforations in the plates and furnished with the nuts 20 20, of the bent arms or shafts 21 21 extending through the looped shanks and having the bent ends furnished with the convex buttons 23 22 as described.

3. In a pedal the combination with the hub and lateral supporting-arms extending therefrom, of a vertical plate, rigidly secured to the outer ends of the arms, and having an upwardly-extending stop extending at an angle with the surface plane of said plate, a stop

having a supporting portion mounted to slide laterally in close proximity to said fixed plate, and a clamping device for clamping this supporting portion to the fixed plate.

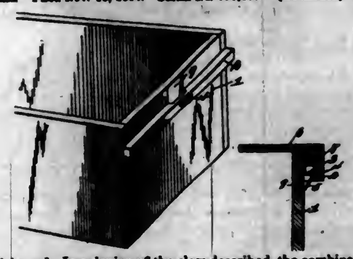


604,920. ORE-CONCENTRATOR. ELMER M. RICH, Silverton, Colo. Filed June 8, 1897. Serial No. 639,886. (No model.)

Claim.—1. An ore concentrator and separator comprising similarly-formed funnel-shaped receptacles inversely disposed and joined at their smaller ends, the subreceptacle having openings in its sides closed by means of a plug and a door, flumes communicating tangentially with the upper end of the topmost receptacle, a pipe for supplying water extending vertically through the subreceptacle and terminating in a flaring nozzle about in the plane of the juncture of the two receptacles, and a tray placed in the subreceptacle and removable therefrom through the opening closed by the door, substantially as described.

2. An ore-concentrator constructed substantially as set forth, comprising funnel-shaped receptacles inversely disposed and joined at their smaller ends, a flume communicating with the upper end of the upper receptacle and disposed tangentially so as to impart a whirling motion to the ore simultaneously with its delivery to the receptacle, a supply-pipe passing vertically through the subreceptacle and terminating in a flaring nozzle about in the plane of the juncture of the two receptacles, and a sectional amalgamated tray composed of similar parts notched in their meeting ends and located in the subreceptacle and fitted about the supply-pipe, substantially as set forth.

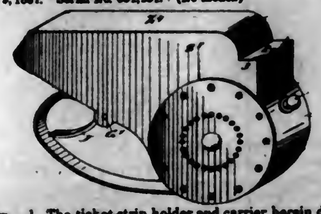
604,921. REVERSIBLE DRIVE-GATE. IRBY M. SMITH, Pasquo, Tenn. Filed June 9, 1897. Serial No. 640,042. (No model.)



Claim.—1. In a gate, the combination of a gate proper, a sheave attached to a portion thereof, a shaft having cams thereon, operating-arms having their inner ends located adjacent to said shaft, ropes, cables or chains attached to the inner ends of said operating-arms, reversely wound on the said shaft, and extended outwardly in the form of a belt to engage the said sheave, a latch-releasing bar having a lever attached to the upper end thereof adapted to be engaged by the said cams, and a spring-actuated latch-bar in connection with the gate, substantially as and for the purposes specified.

2. The combination of a gate having a spring-actuated latch-bar, a vertically-movable latch-releasing bar, a lever attached to the upper end of said bar, a shaft having cams thereon engaging the said lever, and means for operating the said shaft, substantially as and for the purposes specified.

3. The combination of a gate, a sheave keyed to the pivot-bar thereof, a shaft, operating-arms having their inner ends extending over the said shaft, and connected to opposite ends of a rope, cable or chain wound in reverse directions on the shaft and extending in the form of a belt to engage the said sheave, whereby one of the arms will unwind one end of the rope, cable or chain, and wind the opposite end, to thereby turn the gate in different directions, substantially as and for the purposes specified.



604,922. BOX-FASTENER. CHARLES J. STILLWELL, Whitfield, Kans. Filed Nov. 10, 1897. Serial No. 658,166. (No model.)

Claim.—1. In a device of the class described, the combination of a crate provided with a tapering recess 9 extending downward from the upper edge of the crate at one end thereof, the cleat 2 extending across the end of the crate and provided at its inner face with a vertical recess disposed opposite the tapering recess of the crate, the cover, the resilient catch secured thereto and having a lower engaging portion adapted to be depressed into the recess 9, and the horizontal tapering plate 4 embedded in the front wall of the recess of the cleat from the inner side thereof, and having its rear edge terminating short of the rear face of the cleat, said plate being located at a point between the upper and lower faces of the cleat and having its inner or rear portion projecting from the front wall of the recess of the cleat and engaged by the catch, substantially as described.

2. In a device of the class described, the combination of a crate, a horizontal cleat secured to the crate and provided at its inner face with a recess, the outwardly-tapering plate 4, located at a point between the upper and lower faces of the cleat and embedded in the front wall of the recess and having its inner or rear portion projecting from such front wall, and a catch mounted on the cover of the crate and having a lower portion engaging the plate, substantially as described.

604,923. TICKET HOLDER AND REGISTER. PERRY B. TURPIN, Washington, D. C., administrator of Manuel Fortuño, deceased. Filed Sept. 9, 1897. Serial No. 651,131. (No model.)

Claim.—1. The ticket-strip holder and carrier herein described, consisting in the combination with the casing divided into two compartments, each compartment provided with a locking-lid, of the rotating ticket-strip reel within one compartment, and the mechanism for carrying and forcing the strip through and out of the apparatus located in the other compartment and consisting of a plate on which the strip is supported, a sliding plate provided with clamping-arms to clamp the strip and carry it along, and mechanism for moving said sliding plate, said mechanism consisting of a spring-controlled trigger outside of the apparatus, a shaft on which said trigger is mounted, and a spring-controlled lever mechanism mounted on the said shaft and operatively connected to the trigger and to the said sliding plate, substantially as described.

2. The combination with the casing consisting of two separate compartments each provided with a hinged cover and interlocking parts secured to the said covers, of a rotary ticket-strip reel within one compartment, and a feeding device for the strip located in the other compartment, and consisting of a supporting-plate for the strip, a sliding plate provided with clamping-arms to clamp the strip and carry it along, and a lever mechanism for moving said sliding plate, substantially as described.

3. The casing provided with the combination lettered rotary dial-plates, a post connected to each of said dial-plates, each post

being provided with a slot and hole, in combination with the lid of the casing provided with teeth to engage with said slotted posts and lock the casing, substantially as described.

4. In a ticket-strip holder the combination of the supporting-plate, the reciprocating, clamp-carrying slide, and the lever mechanism for actuating said slide, substantially as described.

5. The combination with the casing, of the rotary reel on which the ticket-strip is rolled, a supporting-plate over which the strip is carried, the said casing being provided with a slot in the end opposite the end carrying the reel, a sliding plate provided with clamping-arms to clamp the strip and carry it along at intervals, and a lever mechanism for moving said sliding plate, substantially as described.

6. The combination, with the casing, of the rotary reel adapted to receive the ticket-strip, the plate on which said strip is carried, the reciprocating slide and its actuating mechanism, said slide having clamping-arms and rollers, and the top plate adapted to rest on said rollers for pressing the clamping-arms down on the strip, substantially as described.

7. The casing composed of a cylindrical compartment, the ticket-reel in said compartment, and an elongated compartment, in combination with the trigger pivoted in the bottom of the elongated compartment, a sliding plate carrying clamps and located in said compartment, and a lever mechanism connecting said trigger and said sliding plate, substantially as described.

8. In combination with the casing, the spring-controlled trigger, the shaft on which said trigger is mounted, the levers likewise mounted on said shaft, the ticket-feed device connected with said levers, and the pawl on the trigger to hold and release the lever mechanism, substantially as described.

9. The combination with a casing, the numbered register-wheels and the notched disks on the said wheels, of the pawl provided with teeth of unequal length to engage with and turn said disks, the ticket-feed device in the casing, consisting of the clamp-carrying slide, and the lever mechanism for actuating said slide, and connections between said feed device and the said pawl to actuate the latter, as and for the purpose described.

10. The combination, with the supporting-plate for the ticket-strip, and the feed device, of a top plate pivoted at one end and extending over the supporting-plate, and a blade secured to said plate for cutting the ticket-strip, substantially as and for the purpose described.

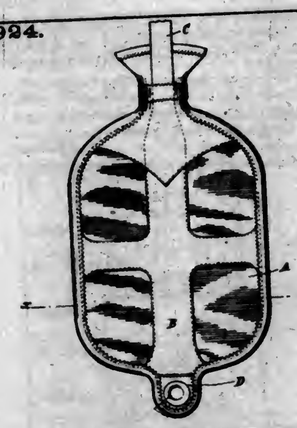
11. The combination, with the plate adapted to support the ticket-strip, and a device for feeding said strip forward, of the movable top plate extending over said supporting-plate, and a longitudinally-adjustable plate on the said top plate, the action of the feed device being controlled by the said top plate and adjustable plate, substantially as described.

12. The combination, with the plate adapted to support the ticket-strip, of the movable top plate extending over said supporting-plate, a slide having reciprocating movement longitudinally of the supporting-plate, and feeding-clamps operatively connected to said slide and provided with guides arranged to pass alternately over and under the top plate to feed and release the ticket-strip, substantially as described.

13. The combination with the supporting-plate for the ticket-strip, of a pivoted and spring-pressed top plate extending over the supporting-plate and provided with a blade, a feed device for the ticket-strip, and means for moving the said top plate to permit of feeding the ticket-strip forward, substantially as described.

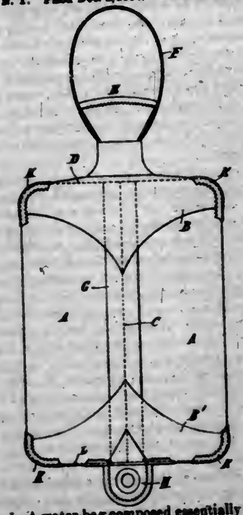
14. The combination of the casing, the ticket-strip reel therein, the supporting-plate for the ticket-strip, the sliding plates provided with arms to clamp the strip and carry it along, and mechanism for operating said sliding plates, substantially as described.

15. The combination with the casing, of the reel on which the ticket-strip is rolled, a supporting-plate for the strip, a sliding plate provided with clamping-arms to clamp the strip and carry it along, a lever mechanism for moving said sliding plate, and a registering device arranged to be operated by the movement of the said lever mechanism, substantially as described.



604,924. INDIA-RUBBER WATER-BAG. ADELBERT H. ALDEN, Lawrence, N. Y. Filed Nov. 26, 1897. Serial No. 659,725. (No model.)

Claim.—1. A water-bag composed essentially of sheet-rubber with a reticulated reinforcement composed of thickened portions of the walls or sides of the bag, as set forth.



2. A water-bag A composed of sheet-rubber having bands or portions B thicker than the remaining portions of the bag, extending across its sides and serving as reinforcements therefor, as set forth.

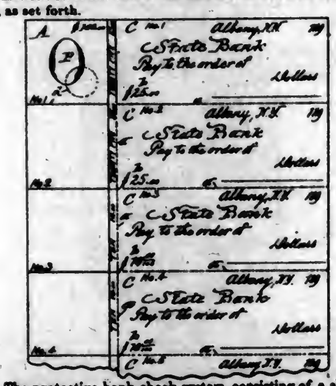
3. A water-bag A composed of sheet-rubber having bands or reinforcing-strips B extending across its sides, the vertical band or strip being extended above the neck of the bag to form a loop or handle C and united below the bag to form a tag D, as set forth.

604,924.

604,925. INDIA-RUBBER WATER-BAG. ADELBERT H. ALDEN, Lawrence, N. Y. Filed Dec. 1, 1897. Serial No. 660,410. (No model.)

Claim.—1. A water-bag composed essentially of a sheet of india-rubber folded upon itself from opposite sides and having its meeting edges joined along a vertical line, so as to form a bag without seam or joint along its side edges, as set forth.

2. A water-bag composed of a sheet of rubber folded upon itself from opposite sides and having its meeting edges joined on a line extending vertically across one side of the bag, and its ends closed by sheets of rubber folded over said ends and united to the sides, as set forth.



3. A water-bag composed of a sheet of rubber folded upon itself from opposite sides and with its meeting edges joined in a central vertical line running across the side of the bag, and having strips or sheets of rubber folded over its ends and united to the sides, and a reinforcing-strip applied over the vertical seam or joint, as set forth.

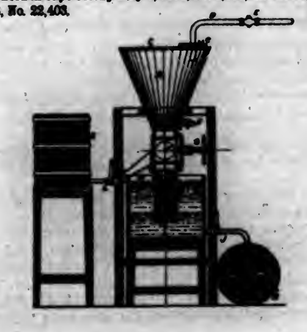
604,926. PROTECTIVE BANK-CHECK SYSTEM. CHARLES L. REESE, Scranton, Pa. Filed Sept. 7, 1897. Serial No. 650,729. (No model.)

Claim.—1. The protective bank-check system, consisting of a sheet containing a series of detachably-united bank-checks, a stub permanently attached to one of said checks and having marked on it the limit of the total amount the series of checks may be drawn for, and a mark of identification of the drawer of the checks applied to said stub.

2. The improved bank-check system, consisting of a sheet containing a series of blank checks detachably united and each having

permanently marked on it the amount for which said check may be drawn, and a stub permanently attached to one of the checks and having marked on it the sum of the amounts marked on the series of checks, as set forth.

3. The protective bank-check system, consisting of a sheet containing a series of blank checks detachably united and each having marked on it the amount for which said check may be drawn, a stub permanently attached to one of said checks and having marked on it the sum of the amounts marked on the series of checks, and a mark of identification of the drawer applied to said stub.



4. The protective bank-check system, consisting of a sheet containing a series of blank checks detachably united, a stub permanently attached to one of said checks and having marked on it the total amount for which the entire series of checks may be drawn, and a photograph or analogous likeness of the drawer of the checks applied to the stub, as set forth.

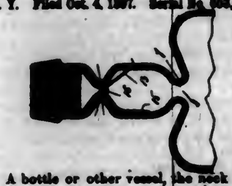
5. The protective bank-check system, consisting of a sheet containing a series of blank checks detachably united, a stub permanently attached to one of said checks and having marked on it the total amount for which the series of checks may be drawn, a photograph or analogous likeness of the drawer applied to the stub and the seal or other private mark of the bank applied to said likeness, as set forth.

6. The protective bank-check system, consisting of a sheet containing a series of blank checks detachably united, a stub permanently attached to one of said checks and having marked on it the total amount for which the entire series may be drawn, a photograph or analogous likeness of the drawer applied to said stub, the signature of the drawer across said picture and the seal or private mark of the bank applied to said likeness and signature, as set forth.

7. The protective bank-check system, consisting of a sheet containing a series of blank checks detachably united and each having marked on it the amount for which the check is to be drawn, a stub permanently attached to one of said checks and having marked on it the sum of the amounts marked on the series of checks, a photograph or analogous likeness of the drawer applied to said stub, the signature of the drawer on said likeness, the seal or other private mark of the bank applied to said likeness and signature, and the signature of the cashier of the bank applied to said stub, as set forth.

604,927. APPARATUS FOR REMOVING SACCHARIN OR OTHER IMPURITIES FROM WINE. JOHN T. BENNETT, Cape Town, Cape Colony. Filed Feb. 15, 1897. Serial No. 623,471. (No model.) Patented in Cape Colony May 7, 1896, No. 1,163, and in England Oct. 19, 1896, No. 22,403.

Claim.—1. An apparatus for separating heavy impurities from wines and spirits, by gravity, comprising the combination of an open vat containing water, a vessel suspended above said vat and provided with an air-tight cover and a valved supply-pipe, an extension from the lower part of the funnel-shaped vessel of reduced diameter and extending into the water in the vat, a cut-off valve between the funnel-shaped vessel and the extension, and a draw-off cock above the cut-off valve, substantially as described.



2. In an apparatus for separating saccharin and other heavy impurities from wines and spirits by gravity, the combination with the vat B open at the top and supplied with water, of the funnel-shaped vessel A having an air-tight cover and provided with a valved inlet-pipe E, an extension from the lower end of the vessel A immersed in the water in the vat, a cut-off valve between the vessel A and the extension, a draw-off cock above the cut-off valve, a water-inlet connection for the vat and an outlet connection therefrom, substantially as described.

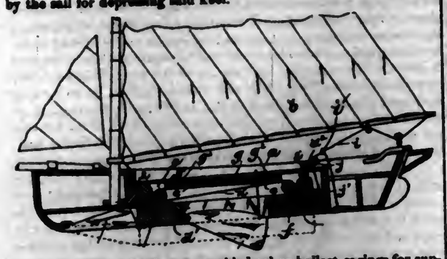
604,928. EYEGLASSES. BYRD F. BRADDOCK, Philadelphia, Pa. Filed Sept. 30, 1897. Serial No. 653,541. (No model.)

Claim.—Eyeglasses having nose-clamps proper, and a nose-bridge consisting of downwardly and outwardly projecting side pieces, the latter being adapted to clamp the sides of the nose of the wearer, said side pieces being connected by a cross-piece which is below the nose-clamps proper and is adapted to rest on the bridge of the nose.

604,929. BOTTLE OR SIMILAR VESSEL. GEORGE A. DIEHM, Newburg, N. Y. Filed Oct. 4, 1897. Serial No. 653,949. (No model.)

Claim.—1. A bottle or other vessel, the neck of which is contracted at the opposite sides thereof so as to form a narrow transverse passage or opening, a stopper which is adapted to be inserted into said neck, and a strip of spring metal which is passed through said stopper, and the ends of which are bent downwardly and adapted to be passed through said narrow transverse passage or opening, substantially as shown and described.

2. A bottle or other vessel, the neck of which is contracted at the opposite sides thereof so as to form a narrow transverse passage or opening, a stopper which is adapted to be inserted into said neck, and a strip of spring metal which is passed through said stopper, and the ends of which are bent downwardly and adapted to be passed through said narrow transverse passage or opening, one end of said strip of metal being wider than the other and provided with a transverse slot or opening, and the other end being adapted to be passed therethrough, substantially as shown and described.



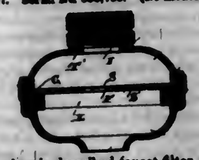
3. A bottle or other vessel, the neck of which is contracted at the opposite sides thereof so as to form a narrow transverse passage or opening, a stopper which is adapted to be inserted into said neck, and a strip of spring metal which is passed through said stopper, and the ends of which are bent downwardly and adapted to be passed through said narrow transverse passage or opening, one end of said strip of metal being wider than the other and provided with a transverse slot or opening, and the other end being adapted to be passed therethrough, said last-named end being also provided with a transverse loop or bend whereby a shoulder is formed which is also adapted to be passed through said slot or opening, substantially as shown and described.

604,930. SAIL-CONTROLLED KEEL. FELIX DOUCET, Malvern, Mass. Filed July 10, 1897. Serial No. 644,697. (No model.)

Claim.—1 A sail-boat, having a movable keel or ballast, and means controlled by the sail for depressing said keel with respect to the hull of the boat.

2. A sail-boat having a movable keel or ballast, and means controlled by the sail for raising and depressing said keel with respect to the hull of the boat.

3. A sail-boat having a movable keel or ballast, means for supporting said keel in a normally-raised position, and means controlled by the sail for depressing said keel.



4. A sail-boat having a movable keel or ballast, springs for supporting said keel in a normally-raised position and means controlled by the drawing of the sail for depressing said keel against the tension of said springs.

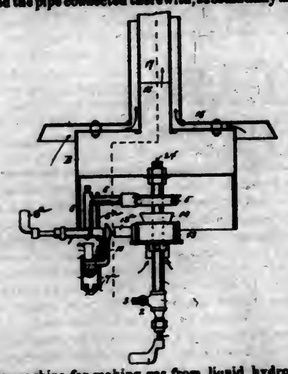
5. A sail-boat having a movable keel or ballast, springs connected therewith and supporting said keel in a normally-raised position, a sail, and a sheet connected with said sail and said keel, and adapted by the pressure of wind upon the sail to depress the keel against the tension of said springs.

6. A sail-boat having a movable keel or ballast, means such as a cord or chain whose drawing will tend to depress said keel, and an adjustable sheet connection between the sail and said keel-depressing means.

604,931. FILTER. SAMUEL D. EBERSBATH, St. Paul, Minn. Filed Oct. 1, 1897. Serial No. 653,730. (No model.)

Claim.—1. The herein-described faucet-filter, the same comprising a shell-like body in two members of substantial cup shape, the upper having an inlet and the lower an outlet, the upper having exterior threads around its mouth, the lower having interior threads at its mouth adapted to receive those on the upper member and also having a shoulder just below said threads, a filter proper consisting of a fabric sheet removably clamped within a metal frame, the latter resting on said shoulder, and a gasket between the lower edge of the upper member and the upper side of the filter-frame, as and for the purpose set forth.

2. In a filter, the combination with a shell-like body in two cup-shaped members detachably connected at their open edges, one member having a shoulder opposite the edge of the other member; of a filter proper consisting of two sheets of silk with an interposed sheet of felt, said sheets being held upon said shoulder by said edge, as and for the purpose set forth.



3. In a filter, the combination with a body having inlet and outlet openings respectively above and below; of a filter proper supported within each body between the openings therein and consisting of a fibrous sheet with silk sheets held close against its opposite faces, as and for the purpose set forth.

4. In a filter, the combination with a hollow body in two members of cup shape detachably connected at their open sides, one member having a shoulder opposite the edge of the other; of a filter proper consisting of a metallic ring L-shaped in cross-section with its upright portion innermost and its foot of a size to rest on said shoulder, a plain metal ring of a size to fit closely around said upright portion, and a fabric filter-sheet passing at its edges over the upright portion and clamped between it and said plain ring, the entire filter with its frame being held between said shoulder and said edge of the body members, substantially as described.

604,932. CARBURETER. JOHN C. FUHR and HENRY J. FUHR, Williamsburg, Ohio. Filed July 26, 1897. Serial No. 646,207. (No model.)

Claim.—1. In an apparatus for making gas from liquid hydrocarbons the combination with the generator, the supply-pipe, the horizontal pipe connected therewith and the valve therein, of the sliding trough, the upwardly-extending spoon-shaped arm, the main burner located below the generator and the pipe connected therewith, substantially as described.

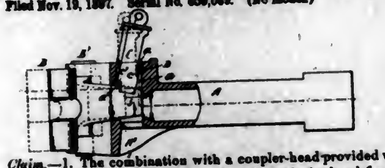
2. In an apparatus for making gas from liquid hydrocarbons, the combination with the supply-pipe, the generator connected therewith, the angle-pipe connected with the generator, and the horizontal pipe connected therewith, provided with a valve of the plate connected with said angle and horizontal pipes, the bracket secured thereto, formed with a longitudinal opening the sliding trough provided with notched lugs working in said opening, the upwardly-extending spoon-shaped arm, the main burner located beneath the generator and the pipe connected therewith, substantially as described.

3. In a machine for making gas from liquid hydrocarbons, the combination with supply-pipe, the generator connected therewith, the angle and horizontal pipes, and the valve, of the plate connected with said angle and horizontal pipes, the bracket secured thereto formed with a longitudinal opening, the sliding trough having downwardly-depending notched lugs engaging with said opening, the upwardly-extending spoon-shaped arm, the plate secured to said bracket having an opening therein, the perforated chimney, the burner located beneath the generator and the pipe connected therewith, substantially as described.

4. In an apparatus for making gas from liquid hydrocarbons, the combination, with the supply-pipe, the generator connected therewith, the angle and horizontal pipes, the valve in the horizontal pipe, and the lateral lugs secured to said horizontal lugs, of the bracket having an opening therein, the sliding trough provided with notched lugs engaging with said openings, the upwardly-extending spoon-shaped arm, the burner located beneath the generator and the pipe connected therewith, substantially as described.

5. In an apparatus for making gas from liquid hydrocarbons, the combination with the cylinders, the supply-pipe, the generator connected therewith, the inclined passage in the generator, the pipe at the upper end of said generator, with which said passage communicates, the valve-stem screw-threaded near its upper end and the needle-valve, projecting into the upper cylinder, substantially as described.

6. The combination with the upper and lower cylinders, the air-pipes connected with the upper cylinder, the escape-pipe provided with a perforated diaphragm, and the cover, of the generator, the supply and escape pipes therefor, the inclined passage leading to the escape-pipe, the screw-threaded valve-stem, the needle-valve projecting into the upper cylinder, the angle-pipe, the horizontal pipe connected therewith provided with a valve, the sliding trough, the upwardly-extending arm, the burner and pipe connected therewith, substantially as described.



604,933. BUFFING OR POLISHING DEVICE. CHARLES R. GRAHAM, Swampscott, Mass., assignor to George H. P. Flagg, trustee, Boston, Mass. Filed Dec. 6, 1897. Serial No. 660,943. (No model.)

Claim.—1. An appliance of the character specified, comprising a rotary hub, a yielding cushion secured to said hub and adapted to be centrifugally maintained, and a seamless tubular laterally-inelastic sheath of fibrous material having a compressible body inclosing said cushion and forming a yielding bed for a working cover.

2. An appliance of the character specified, comprising a rotary hub, a cushion composed of limp annular sections surrounding the hub and closely confined at their inner portions around the hub, their outer portions being free to yield, and a seamless tubular laterally-inelastic sheath of fibrous material having a compressible body inclosing said cushion and forming a yielding bed for a working cover.

604,984. CAR-COUPLING. PHILIP T. HANDIGAN, Detroit, Mich. Filed Nov. 19, 1897. Serial No. 659,069. (No model.)

Claim.—1. The combination with a coupler-head provided with a chamber and with an orifice extending through the head for the reception of a locking-pin, of a swinging knuckle, and a movable locking device mounted in said head projecting through the upper end of said orifice and formed with a supporting-shoulder toward its lower end, said head formed with a fixed support within said orifice to engage said shoulder and support the locking device in unlocked position, said pin in raised position being lifted up so that the projecting shoulder thereon engages on said fixed support above the chamber of the draw-head, for the purpose described.

2. The combination with a coupler-head provided with a chamber to receive the knuckle, and with an orifice therethrough to receive a locking-pin having a fixed support therewithin above said chamber, of a swinging knuckle, a vertically-movable locking-pin passing through said orifice in the head provided with a supporting-shoulder toward its lower end, a lifting device connected with the upper end of said pin, and a fulcrum at one side the locking-pin above said chamber to tilt the locking device when in raised position and seat the supporting-shoulder of the pin upon said fixed support, whereby the pin may be automatically held in an uncoupled position, said pin in raised position being lifted up so that the projecting shoulder thereon engages on said fixed support above the chamber of the draw-head, substantially as set forth.

3. The combination with a coupler-head formed with a chamber and with an opening through the head, of a swinging knuckle, and a vertically-movable locking-pin mounted in said orifice and projecting through the upper end thereof, said head constructed with a fixed support projecting inward within said opening, and said locking-pin constructed with a supporting-shoulder toward its lower end to engage said ledge, said pin in raised position being lifted up so that the projecting shoulder thereon engages on said fixed support above the chamber of the draw-head, substantially as set forth.

4. The combination of a coupler-head provided with an orifice therethrough for the reception of a locking-pin and having a fixed support within said orifice, of a swinging knuckle, and a locking-pin provided with a supporting-shoulder toward its lower end to engage the support within said orifice to support the pin in raised position upon the fixed support within said orifice in position for uncoupling, the inner end of said knuckle by its opening movement tripping the locking device from off said support and throwing said supporting-shoulder upon the upper surface of the knuckle into position to drop into locked position at the closing movement of the knuckle, for the purpose set forth.

5. The combination with a chambered coupler-head, formed with an orifice extending therethrough to receive a locking device, of a swinging knuckle, a vertically-movable locking-pin passing through said orifice and provided with a supporting-shoulder toward its lower end, and a fulcrum at the rear of the locking-pin above the chamber in said head, said head formed with a fixed support projecting inward on the front wall of said orifice intermediate the ends of said opening to engage said shoulder and support said pin, said pin in raised position being lifted up so that the projecting shoulder thereon engages on said fixed support above the chamber of the draw-head, for the purpose described.

6. The combination with a coupler-head provided with a chamber and with an opening through the head to receive a locking-pin, of a swinging knuckle, a vertically-movable locking-pin provided with a supporting-shoulder on one side thereof toward its lower end, and with an additional shoulder on the opposite side thereof, a fulcrum at one side the locking device above the chamber in the head, and a fixed support on the opposite side the locking device within said opening above the chamber in the head to engage the corresponding shoulder of the locking device and support the pin in unlocked position, said pin in raised position being lifted up so that the projecting shoulder thereon engages on said fixed support above the chamber of the draw-head, substantially as set forth.

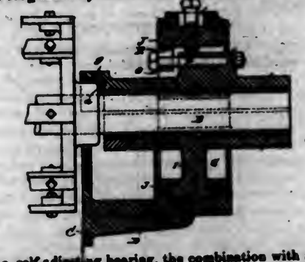
7. The combination with a coupler-head provided with an orifice therethrough for the reception of a locking-pin and having a fixed support within said orifice, of a swinging knuckle provided with a shoulder at its inner end, and a locking device provided with a supporting shoulder toward its lower end to engage said fixed support in position for uncoupling, said locking device projecting below said supporting-shoulder, the inner end of said knuckle by its opening movement tripping the locking device and throwing the supporting-shoulder off said fixed support and upon the shoulder of the knuckle into position to permit the locking device to drop into locked position at the closing movement of the knuckle, for the purpose set forth.

8. The combination with a chambered coupler-head provided with an orifice therethrough for the reception of a locking-pin and having a fixed support within said orifice above the chamber of the head, of a swinging knuckle provided with a shoulder projecting inward and outward at its inner end, and a locking device provided with a supporting-shoulder toward its lower end to engage said fixed support in position for uncoupling, and having its lower end projecting below said supporting-shoulder, the inner end of said knuckle by its opening movement contacting with the lower end of the locking device and tripping the locking device throwing the supporting-shoulder off from said fixed support and upon the upper face of the shoulder of the knuckle into position to permit said latter shoulder riding out from in under said supporting-shoulder in the closing movement of the knuckle, whereby the locking device may drop into locked position in front of the shoulder of the knuckle, substantially as set forth.

9. The combination with a coupler-head provided with a chamber and with an opening through the head to receive a locking device, and with a fixed support within said opening, of a swinging knuckle, a vertically-movable locking device in said opening provided with a supporting-shoulder toward its lower end to seat upon said fixed support in uncoupled position, a fulcrum at one side the locking device serving as a stop to limit the upward movement of the locking-pin, and also serving to seat the supporting-shoulder of the locking device upon said fixed support in uncoupled position, said pin in raised position being lifted up so that the projecting shoulder thereon engages on said fixed support above the chamber of the draw-head, substantially as set forth.

10. The combination with a coupler-head provided with an orifice extending therethrough for the reception of a locking-pin, and constructed with a fixed support within said orifice, of a swinging knuckle, and a movable locking-pin mounted in said head projecting through the upper end of said orifice, said locking-pin formed with a supporting-shoulder c' to seat upon said fixed support, and with a portion C' at the lower end of the pin projecting downward below said supporting-shoulder, said knuckle formed with a shoulder B^2, said latter shoulder by the opening movement of the knuckle contacting with the portion C' of said pin to trip the pin from off said fixed support and throw the supporting-shoulder of the pin upon the upper surface of the shoulder of the knuckle into position to drop into locked position at the closing movement of the knuckle, substantially as set forth.

11. The combination with a coupler-head provided with an orifice extending therethrough for the reception of a locking-pin, and formed with a fixed support within said orifice, of a swinging knuckle, and a movable locking-pin mounted in said head projecting through the upper end of said orifice, said locking-pin formed with a supporting-shoulder c', with a portion C' projecting below said supporting-shoulder, and with a cut-away portion c^3, said knuckle formed with a shoulder B^2, and with a cut-away portion b to contact with the cut-away portion c^3 of the pin in the opening movement of the knuckle to trip the locking device from off the fixed support and throw the supporting-shoulder of the pin upon the upper surface of the shoulder of the knuckle into position to drop into locked position at the closing movement of the knuckle, for the purpose set forth.



604,985. INHALER. WILLIAM B. HIDDEN, Boston, Mass. Filed May 13, 1897. Serial No. 636,405. (No model.)

Claim.—An inhaler, consisting of an elongated shell, of greater diameter at the center than at the ends, having tubes extending from the opposite ends inwardly to the larger diameter, the inner ends of said tubes being curved in opposite directions, substantially as described.

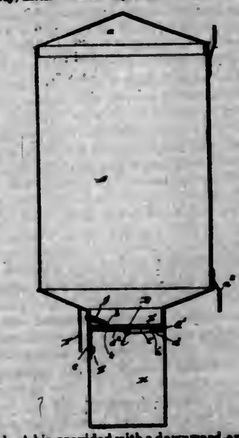
604,986. SELF-ADJUSTING JOURNAL-BEARING. EDWARD HUBER, Marion, Ohio. Filed Dec. 20, 1897. Serial No. 662,531. (No model.)

Claim.—1. In a self-adjusting bearing, the combination with a support, of a box so mounted within the support as to form a joint permitting of universal adjustment, a cap for the box and means carried by the box to clamp down on the cap, and other means to adjust the cap longitudinally and in turn the shifting of the shaft.

2. In a self-adjusting bearing, the combination with a support, of a box so mounted within the support as to form a joint permitting of universal motion, a cap for the box, a clamping-screw mounted in the box and clamping upon the cap and an adjusting-bolt engaging with the box and cap to shift the latter longitudinally.

3. In a self-adjusting bearing, the combination with a support having a curved seat, of a box having a globular exterior fitted to said seat, a cap for said box extending within the upper half of said box, and a clamp-screw carried by the box and adapted to engage with said cap, whereby the cap is held within the box, substantially as shown and described.

4. In a self-adjusting bearing, the combination with a support and a curved seat, of a box having a globular exterior mounted in said seat, a lug and a bolt extending through the lug, and a cap for the box having a boss through which the bolt extends for adjusting the cap longitudinally.



5. In a self-adjusting bearing, the combination with a support having a slot, of a box having a screw extending through said slot and a cap on the box against which the screw clamps.

6. In a self-adjusting bearing, a box having a lug, a bolt extending through it, and a cap on the box and having a boss with which said bolt engages.

7. In a self-adjusting bearing, the combination with a frame or casing and a support secured thereto and having a curved seat, of a box having a globular exterior mounted in said bearing and a shaft mounted in the box.

8. In a self-adjusting bearing, the combination with a frame or casing, of a support secured to the frame or casing and encircling the shaft, and having a curved seat, a box having a globular exterior mounted in said seat, a cap for the box, means carried by the box to clamp down on the cap, and means for adjusting the cap longitudinally and with it said shaft with respect to the box.

604,987. BIN FOR POWDERED MATERIAL. CHARLES IRISH, Traverse City, Mich. Filed May 10, 1897. Serial No. 636,897. (No model.)

Claim.—1. A bin provided with a downward-extending neck having a perforated bottom plate, a perforated plate pivoted to the bottom plate, a spring arranged to normally hold the pivoted plate so that the holes through the bottom plate and the pivoted plate do not register, a cup adapted to engage with the neck with both a sliding and a twisting motion, and a lug on the cup adapted to engage an arm on the pivoted plate and rotate said plate, substantially as described.

2. A bin provided with a downward-extending neck having a perforated bottom plate, a perforated plate pivoted to the bottom plate, a cup adapted to engage with the neck with both a sliding and twisting motion, a lug on the cup, and an arm on the pivoted plate adapted to engage and cause the plate to rotate with the cup, substantially as described.

3. A bin provided with a downward-extending neck having a spiral guide on the wall thereof and closed by a perforated bottom plate, a rotative perforated plate pivoted to the bottom plate and having a projecting arm thereon, a cup having a guide adapted to engage the spiral guide, and a lug adapted to engage the projecting arm on the pivoted plate, whereby as the cup is pushed onto the neck it is caused to turn, and turns the pivoted plate, substantially as described.

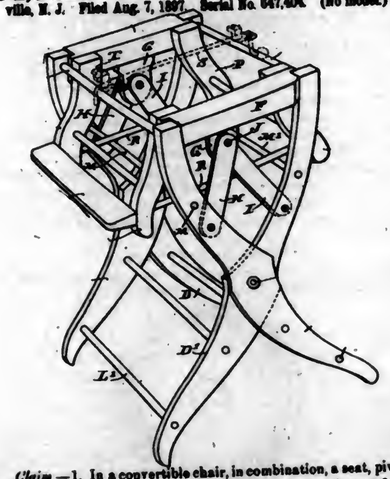
604,988. DISPLAY HAT-TOP. EDWARD LESER, Chicago, Ill. Filed June 24, 1897. Serial No. 642,081. (No model.)

Claim.—1. A display hat-top, consisting of a cup-shaped head, provided with border-flange having apertures therethrough at intervals, and the elastic tubing, woven through said apertures and forming cushion bearing-sections, substantially as described.

2. The combination with a display hat-top, consisting of a cup-shaped head, provided with a number of apertures around the edge, of a soft cushioning-cord, woven through said apertures and forming yielding bearing-surfaces disposed in sections, substantially as described.

604,989. EXTENSION-TABLE. CHRISTIAN MARKEL, Corry, Pa. Filed Sept. 27, 1897. Serial No. 653,276. (No model.)

Claim.—In an extension-table, the combination, with a stationary table-top section; of a slidable end section E, a depressible table-top section hinged to the said end section and provided with a downwardly-projecting plate at its outer end, and a slidable catch carried by the said end section and engaging with the said plate, substantially as set forth.

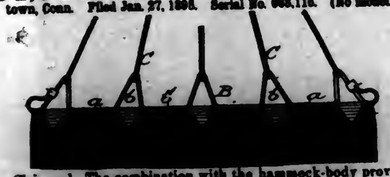


604,940. PROTECTIVE COVERING FOR SHIPS' ARMOR. JOHN L. MATTHEWS, Baltimore, Md. Filed Sept. 4, 1897. Serial No. 650,634. (No model.)

Claim.—A protective covering for armor, which consists in the combination of an exterior plate of Babbitt metal, a body of rubber applied to the inner surface of the said metal, and a spring backing

secured to the armor and forming a support for the rubber and its outer covering of Babbitt metal, substantially as specified.

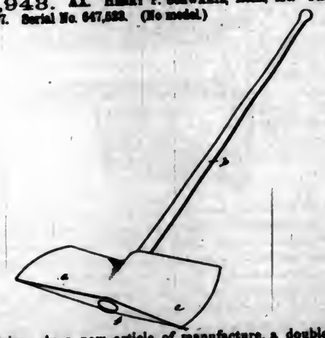
604,941. CONVERTIBLE CHAIR. HENRY H. PAINE, Merchantville, N. J. Filed Aug. 7, 1897. Serial No. 647,404. (No model.)



Claim.—1. In a convertible chair, in combination, a seat, pivoted cross-legs the inner under sides of which are so curved as to form a rocker when the chair is lowered, rounds uniting each pair of legs, sills to which the seat is adapted to be secured, hangers depending from said sills, links pivoted upon each side of said hangers and the lower ends of which are pivotally attached to the legs of the chair, means for securing the upper ends of said legs when the chair is in an elevated position, and means for causing said seat to maintain its horizontal position when elevated or depressed and while being elevated or depressed.

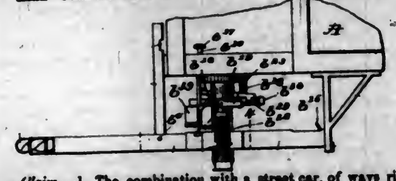
2. In a convertible chair, in combination, a seat, pivoted cross-legs the inner under sides of which are so curved as to form a rocker when the chair is lowered, rounds joining each pair of legs, a rod passing from front to back of and secured in bearings carried by the under part of said seat, the ends of said rod being bent down and adapted to pass over the upper rounds joining said legs, sills to which the seat is adapted to be secured, hangers depending from said sills, links pivoted upon each side of said hangers and the lower ends of which are pivotally attached to the legs of the chair, and means for causing said seat to maintain its horizontal position when elevated or depressed and while being elevated or depressed.

3. In a convertible chair, in combination, a seat, pivoted cross-legs the inner under sides of which are so curved as to form a rocker when the chair is lowered, rounds joining each pair of legs, sills to which the seat is adapted to be secured, hangers depending from said sills, links pivoted upon each side of said hangers and the lower ends of which are pivotally attached to the legs of the chair, means for preventing said legs from opening when the chair is in its elevated position, legs depending from said sills, and rounds carried by said legs adapted to engage the tops of one pair of rounds carried by said legs, all substantially as and for the purposes set forth.



604,942. HAMMOCK-SPREADER. ISAAC B. PALMER, Middletown, Conn. Filed Jan. 27, 1898. Serial No. 668,116. (No model.)

Claim.—1. The combination with the hammock-body provided at its end with a hem, of a spreader consisting of alternate straight and loop portions, the loop portions projecting at intervals through the bight of the hem for the reception of suspension-cords and the bight of the hem being engaged in sections with the straight portions of the spreader intermediate of the loop portions, substantially as set forth.



2. The hammock-spreader, comprising a rod developed into loops at intervals throughout its length and having its ends turned to form loops at the opposite ends of the spreader, one of the ends of the rod being returned to the opposite end of the spreader and engaged with the portions of the spreader intermediate of the loops, substantially as set forth.

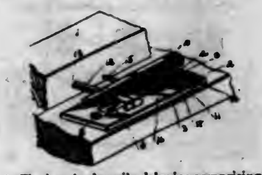
604,948. AX. HENRY P. SCHWARZE, Rolla, Mo. Filed Aug. 9, 1897. Serial No. 647,553. (No model.)

Claim.—As a new article of manufacture, a double-bitted ax composed of the bits *a*, and *c* having their body portions united and provided with an eye to receive a helve, said bit *c*, and the front edge of said bit *a*, being arranged in the same plane with the helve and the rear and cutting edges of said bit *a*, offset from said plane substantially as described.

604,944. STREET-CAR FENDER. GEORGE H. SMITH, Lowell, Mass. Filed Jan. 12, 1898. Serial No. 666,400. (No model.)

Claim.—1. The combination with a street car, of ways rigidly mounted beneath the car, a fender reciprocable in said ways, said fender having pivoted intermediate its length an apron automatically held turned up against the front of the car, and holding the fender yieldingly forward in projected position, and springs normally holding said apron forcibly in its upright position, substantially as described.

2. The combination with a street-car, of ways rigidly mounted beneath the car, a fender reciprocable in said ways, said ways being open at their under sides, cut away at their rear upper ends and provided with bottom ledges opposite said cut-away portions, guards being provided opposite said ledges, and removable means adjacent the forward ends of said ways for normally sustaining said fender and permitting it to drop when desired, whereby said fender at its rear end in dropping is caused to turn on said bottom ledges and abut against said guards, as and for the purpose described.



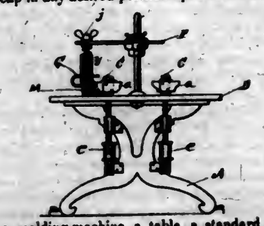
3. The combination with a street-car, of ways rigidly mounted beneath the car, a fender reciprocable in said ways, said fender having pivoted intermediate its length an apron adapted to be turned up against the front of the car, and springs normally holding said apron forcibly in its upright position, said apron having notches in its upper edge adjacent its free end, and a device rigidly mounted beneath the forward end of the car to be engaged by said notches when the fender is in retracted position as and for the purpose described.

4. The combination with a street-car, of a support for a fender, a fender carried by said support, depending posts adjacent the front end of the car, shafts rotatably mounted in said posts, said shafts having lateral arms at their lower ends provided with antifriction-rollers, springs engaging said posts, and said shafts tending to maintain said arms normally turned outward, levers projecting from said shafts, a trip-lever mounted beneath the car, connections between said levers and said trip-lever whereby the latter operates the former and said shafts, a dog adapted to engage said trip-lever when the latter is in position to turn said arms inwardly beneath and to support said fender, and means for disengaging said dog to permit said springs to turn said arms from supporting engagement with the fender, substantially as described.

5. The combination with a street-car, of ways, a fender reciprocable therein and when in projected position being capable of dropping therefrom at its forward end, vertical posts pivotally mounted adjacent the forward ends of said ways, said posts having lateral arms provided with friction-rollers adapted to be turned inwardly beneath the fender, said fender being supported by and freely movable on said rollers, springs normally tending to turn said arms and their shafts away from each other out of supporting engagement with said fender, means for holding said arms in said supporting engagement against the action of said springs, and releasing means therefor, substantially as described.

6. The combination with a street-car, of ways, a fender reciprocable therein and when in projected position being capable of dropping therefrom at its forward end, vertical posts pivotally mounted adjacent the forward ends of said ways, said posts having lateral arms provided with friction-rollers adapted to be turned inwardly beneath the fender, said fender being supported by and freely movable on said rollers, springs normally tending to turn said arms and their shafts away from each other out of supporting engagement with said fender, means for holding said arms in said supporting engagement against the action of said springs, and releasing means therefor, said fender having an apron pivoted thereto, springs normally holding said apron in upright position, notches near the forward end of the apron, and a device carried beneath the forward end of the car to be engaged by said notches and thereby retain the fender when in retracted position, substantially as described.

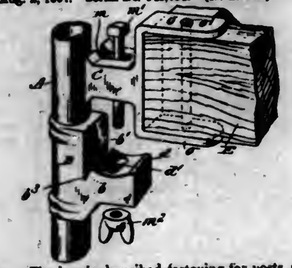
604,945. STORM-WINDOW FASTENER. ARTHUR P. SPILLER, Manchester, N. H. Filed Aug. 23, 1897. Serial No. 649,867. (No model.)



Claim.—1. The herein-described device comprising a plate having an elongated slot therein open at one end, said plate being adapted to be secured to the sash of the storm-window, a bolt maintained in said slot and adapted to slide vertically therein, said bolt being provided near its lower end with a laterally-extending lug, a spring-arm secured to the plate and provided with a shoulder adapted to engage said lug and hold the sliding bolt in elevated position, a laterally-extending bolt upon the window-frame adapted to be engaged by the spring-arm to cause the same to release the sliding bolt and permit the same to move downwardly across the laterally-extending bolt, substantially as described.

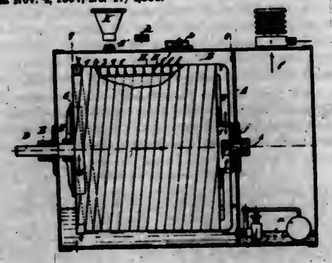
2. The herein-described device comprising a plurality of plates having elongated slots therein open at one end and adapted to be secured to the sash of the storm-window, said plates being provided with beveled under sides approximate to the slots, sliding bolts provided with beveled shoulders adapted to fit snugly against the inclined under edges of the plates, laterally-extending flanges integral with the shoulders and adapted to rest upon the upper sides of the plates approximate to the slots, said bolts being provided with downwardly-extending portions having inclined under sides, laterally-extending bolts provided upon the inner edges of the window-frame, lateral projections upon the vertically-sliding bolts, spring-arms secured to the plates and having shoulders thereon adapted to engage the lateral projections, said spring-arms being adapted to engage the laterally-extending bolts to permit the sliding bolts to fall across the laterally-extending bolts, substantially as described.

3. In the herein-described device, the combination with the portion adapted to be secured to the frame of the storm-window and comprising sliding bolts having inclined under sides, of longitudinally-sliding bolts situated within laterally-extending recesses in the window-frame to which the storm-window is to be applied, said bolts being provided with heads and situated to engage said inclined under sides of the storm-window bolts, and means for limiting the longitudinal movement of said bolts, substantially as described.



604,946. GUIDE AND GUARD FOR VARIETY MOLDING-MACHINES. ABBOTT L. STODDARD, Providence, R. I. Filed June 3, 1897. Serial No. 639,229. (No model.)

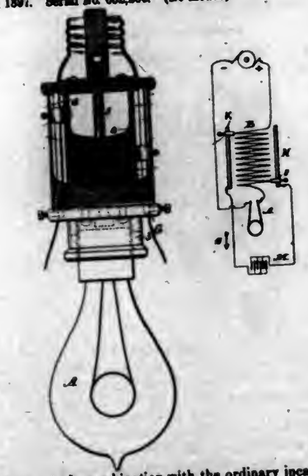
Claim.—1. In a molding-machine, the table, the standard rigidly secured thereto, the block *s* adjustably secured to the standard and provided with a recess in its top, a second larger block also adjustably clamped to the standard, and rabbeted to the lower one, and provided with a recess in its top, combined with a slotted arm which is horizontally adjustable in relation to the standard and which arm supports at its outer end the slotted guide and its attachments, a cap placed upon the top of the arm, and suitable clamping-bolts for securing the cap in any desired position upon the arm, substantially as shown.



2. In a molding-machine, a table, a standard rigidly secured thereto, and a horizontal arm adjustably secured upon the standard, combined with a screw-rod *j* which is square at that portion where it passes through the slot in the upper end of the arm, suitable washers applied to the arm, a thumb-screw, a spring applied to the rod below the arm, a foot having a tubular portion to receive the lower end of the rod and the spring, and an adjustable slotted guide secured to the foot, substantially as set forth.

604,947. BEDSTEAD. FRANCIS M. TINKHAM, Springfield, Mass. Filed Aug. 2, 1897. Serial No. 646,751. (No model.)

Claim.—The herein-described fastening for posts and side rails of metal bedsteads consisting of a rail-support cast on said post having thereon a vertical wall *h'*, a horizontal projection *h*, integral therewith, and a V-shaped groove *h²*, at the base of said vertical wall; a lug for attaching a side rail to one of said posts, a vertical end on said lug terminating in a V-shaped projection at the base thereof and having a horizontal portion adapted to rest on said projection *h*, of said support; an elongated slot in said projection parallel with said V-shaped groove, a slot *w* in said lug, a binding-bolt passing therethrough and through said elongated slot, said slot *w* lying at right angles to said elongated slot whereby on the tightening of said bolt and the engagement of said V-shaped projection on said lug with said V-shaped groove, the end of said lug may be free to move toward the vertical wall *h'*, on said support, substantially as described.

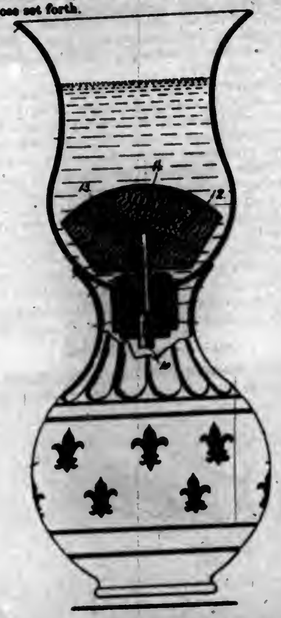


604,948. CARBURETER. ADOLPHE I. VAN VRIELAND, Paris, France. Filed Aug. 13, 1897. Serial No. 648,155. (No model.) Patented in France July 8, 1897, No. 268,556; in Belgium July 16, 1897, No. 129,503; in Switzerland July 16, 1897, No. 14,710; in England July 17, 1897, No. 16,907; in Luxemburg July 17, 1897, No. 2,904; in Hungary Aug. 5, 1897, No. 10,445; in Italy Aug. 28, 1897, No. 45,386, and Sept. 30, 1897, No. 33; in Spain Sept. 10, 1897, No. 21,282, and in Austria Nov. 4, 1897, No. 47/4,563.

Claim.—1. In a carbureting and compressing apparatus, the combination with a cylinder divided by a partition into two chambers, of a rotary drum mounted in one of said chambers, a series of conduits helically wound adjacent to each other around said drum, a box arranged at the end of the drum, said conduits opening at one end into the drum-chamber and at the other end into said box, a passage between said box and the second chamber, an air-inlet valve and a supply-opening in the drum-chamber, and a gas-outlet valve in the second chamber, and a valved passage connecting the lower part of said chambers for the return of the surplus hydrocarbon, substantially as set forth.

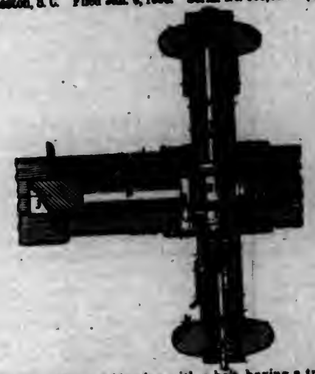
2. In a carbureting and compressing apparatus, the combination with a cylinder divided by a partition into two chambers, of a rotary drum mounted in one of said chambers, a series of conduits helically wound around said drum, a box arranged at the end of the drum, radial conduits leading into said box, said helically-wound conduits communicating at one end with the drum-chamber and at the other end with said radial conduits, a passage between said box and the second chamber, an air-inlet valve and a supply-opening in the drum-chamber and a gas-outlet valve in the second chamber, substantially as set forth.

604,949. RHEOSTAT FOR ELECTRIC LAMPS. REINHOLD H. WAPPLER and FREDRICK H. WAPPLER, New York, N. Y. Filed Sept. 20, 1897. Serial No. 652,266. (No model.)



Claim.—1. In combination with the ordinary incandescent electric lamp, two heads of insulating material, a socket connection upon one head for the incandescent lamp, and a socket connection on the other head for the socket or electric-lamp fixture, a rheostat-coil between the insulating-heads, a bar also between the heads, a sliding contact in the electric circuit and upon the bar and resting upon the rheostat-coil and having a knob or head by which it is adapted to be moved toward one head or the other for varying the resistance in the lamp-circuit, and a casing of sheet metal multiperforated and surrounding the rheostat and bar to protect the same and allow a free circulation of air, the casing being slotted for the knob or head of the sliding contact, substantially as set forth.

2. The combination in an electric circuit, of a rheostat composed of a metal tube with enamel or similar insulating material upon the surface thereof, and naked wire having an oxidized surface closely wound upon the insulating-surface of the metal tube, and a sliding contact in the electric circuit resting on the convolutions of the wire, for varying the resistance in the circuit, substantially as set forth.



3. The combination with a source of electric energy and with an incandescent electric lamp, of a rheostat composed of a coil of wire in the closed circuit containing the lamp, two stationary bars each having a slider thereupon in contact with the rheostat-coil, and a shunt or derived circuit connected with the slider-bars and containing a transforming device, for varying the resistance in the lamp-circuit and the current diverted into the shunt-circuit, substantially as set forth.

604,950. FILTER. ARTHUR C. WILLATS, Buffalo, N. Y. Filed Aug. 14, 1897. Serial No. 648,309. (No model.)

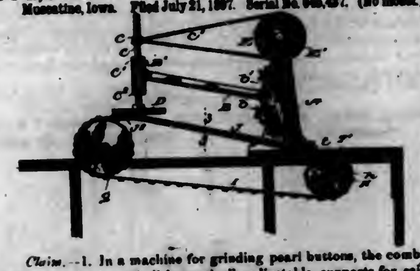
Claim.—The herein-described filtering device, the same comprising a receiving vessel having an opening in its bottom, a tube passing through said opening, means for closing the latter around the tube, and a filtering-block rounded on its upper side and provided with a cylindrical recess extending part way into its body from the lower side and mounted on the upper end of said tube, the recess being of such depth and the block of such size and shape that the latter stands out of contact with all parts of the device except said tube, as and for the purpose set forth.

604,951. LOCK. ELBERT I. ANDERSON and OSCAR M. MORRILL, Charleston, S. C. Filed Jan. 6, 1898. Serial No. 665,809. (No model.)

Claim.—1. The combination with a bolt having a transversely-arranged passage, of a longitudinally-movable spring-pressed spindle having a lateral rigidly-attached lug for entering said passage to actuate the bolt, a device for holding the spindle with its lug out of engagement with the bolt, and means for releasing said holding device to permit the spring acting on the spindle to actuate the latter and move the lug into engagement with the bolt, substantially as described.

2. The combination with a bolt having a transversely-arranged passage, of a knob-carrying tube, a tubular spindle arranged in the knob-carrying tube, rotating therewith and movable longitudinally independent thereof, a lug rigidly secured to and projecting laterally from the tubular spindle to enter the said passage of the bolt, a spring for moving the spindle in one direction, a device for holding the spindle against the tension of the spring, and means for operating said device to release the spindle and permit its spring to operate and cause the lug to enter the said passage, substantially as described.

3. A tube or housing having a lip, a spindle having a catch for engaging the lip, a lug on the spindle, and a bolt, said spindle being made longitudinally movable to carry the lug into and out of engagement with the bolt and said catch being made rotatable to clear or move to one side of the lip substantially as described.



4. A tube or housing having a lip, a longitudinally-movable spindle having a catch for engaging the lip, a lug on the spindle, a bolt adapted to be engaged by the lug, a rotary stem in the spindle and to which the catch is connected, and a button or handle at one end of the spindle for rotating said stem, the other end of the spindle being adapted for the insertion of a key substantially as described.

5. A tube or housing having a lip, a longitudinally-movable spindle having a catch for engaging the lip, a lug on the spindle, a bolt adapted to be engaged by the lug, a rotary stem in the spindle for supporting the catch, a button or handle for the stem, and a key-block forked for the respective engagement of the catch and of a key substantially as described.

6. A tube or housing having a lip, a spindle having a catch for engaging the lip, a lug on the spindle, and a bolt adapted to be engaged by the lug, said tube being slotted and said spindle having a handle or trigger extended through the slot substantially as described.

7. A door having a mortise, a bolt in the mortise, a spindle, and a lug on the spindle adapted to engage the bolt, said door having a slot or seat for the lug and said spindle being longitudinally movable to carry the lug from the slot to the bolt substantially as described.

604,952. BUTTON-GRINDING MACHINE. CHARLES L. AFTER, Muscatine, Iowa. Filed July 21, 1897. Serial No. 645,427. (No model.)

Claim.—1. In a machine for grinding pearl buttons, the combination of a horizontal disk, vertically-adjustable supports for said disk, and means for rotating it; with a vertically-disposed and upwardly-inclined endless button-carrier located below and extending beneath and to one side of the disk, adapted to carry button-blanks placed on its upper side to, under and against the disk, part of said carrier directly under the disk being arranged parallel with the surface of said disk, substantially as and for the purpose described.

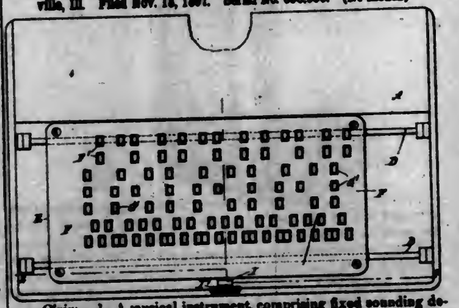
2. In a button-grinding machine, the combination of a feed-table, a standard thereon, an arm attached to said standard having a sleeve on its outer end, a vertically-adjustable shaft journaled in said sleeve, means for rotating said shaft, and a horizontally-disposed abrading-disk secured on the lower end of said shaft: with an endless button-carrier extending from the table to the disk, the supporting-wheels for said carrier respectively located below the table and disk, said carrier being adapted to carry buttons from the table to the disk, for the purpose and substantially as described.

3. In a button-grinding machine, the combination of the table, a horizontal abrading-disk attached to the lower end of a vertical shaft journaled in the support attached to said standard, a wheel below said disk, a wheel below the table, an endless upwardly-inclined button-carrier running over said wheels, a guide for the upper portion of said carrier adapted to assist in guiding and retaining button-blanks thereon, said guide having its upper end extending parallel with the lower surface of the disk, and means for rotating said disk and said wheels, substantially as described.

4. In a button-grinding machine, the combination of an endless carrier, and a grinding-disk rotating in a plane at right angles to the plane of the carrier and adapted to operate upon the button-blanks as they are moved thereunder by the carrier and a guideway for the upper portion of said carrier extending under said disk, for the purpose and substantially as described.

5. In a button-grinding machine, the combination of the table, the standard mounted thereon, the adjustable arm attached to said standard having a sleeve on its outer end; and a vertical shaft mounted in said sleeve, and means for rotating said shaft; with a horizontal abrading-disk secured on the lower end of said shaft, a wheel below the disk, a wheel below the top of table, an endless carrier supported by said wheels and a guide extending along the upper part of said carrier from the table to the disk, all substantially as and for the purpose described.

604,958. READING ATTACHMENT FOR METERS. CAMILO L. ANDRUS, San José, Cal. Filed Dec. 1, 1897. Serial No. 660,572. (No model.)



Claim.—1. A reading attachment for meters provided with an apertured plate, and a ring-shaped dial mounted to turn on the plate concentric with the aperture in the plate, to permit of viewing the meter-dial, and setting the said ring-shaped dial according to the position of the pointer on the meter, substantially as shown and described.

2. A reading attachment for meters provided with a revoluble ring-shaped dial formed with a point or projection for registering with the pointer on the dial on which the attachment is to be used, said pointer coinciding with the zero-mark on the ring-shaped dial, substantially as shown and described.

3. A reading attachment for meters comprising a plate having apertures for viewing the dials on the meters on which the attachment is to be used, and ring-shaped dials mounted to turn on the said plate, concentric with the said apertures, each movable dial being formed with a numeral graduation from zero upward, substantially as shown and described.

4. A reading attachment for meters comprising a plate having apertures for viewing the dials on the meters on which the attachment is to be used, and ring-shaped dials mounted to turn on the said plate, concentric with the said apertures, each movable dial being formed with a numeral graduation from zero upward, and each movable dial being provided with a fixed point projecting inward from the zero-mark, substantially as shown and described.

604,954. MUSICAL INSTRUMENT. BENJAMIN C. AUTER, Princeville, Ill. Filed Nov. 18, 1897. Serial No. 658,989. (No model.)

Claim.—1. A musical instrument, comprising fixed sounding devices, actuating devices for the same, keys for manipulating the said actuating devices, a slidable carriage containing the said keys and the said actuating devices, and a top plate for the said carriage, and having apertures through which project the heads of the said keys, the said apertures being arranged in rows indicating chords and scales, substantially as shown and described.

2. A musical instrument, comprising fixed sounding devices, actuating devices for the same, keys for manipulating the said actuating devices, a slidable carriage containing the said keys and the said actuating devices, a top plate for the said carriage, and having apertures through which project the heads of the said keys, the said apertures being arranged in rows indicating chords and scales, and means for shifting the said carriage to set the instrument to any desired key, as set forth.

3. A musical instrument provided with a slidable carriage, keys fulcrumed on the carriage and having their finger-pieces or heads arranged in rows indicating chords and scales, actuating devices pivotally connected with the said keys, and fixed sounding devices, substantially as described.

4. A musical instrument, comprising a box, sounding devices contained in said box, actuating devices for the same, keys for manipulating the said actuating devices, a carriage mounted to slide and containing the said keys and the said actuating devices, a top plate for the said carriage having apertures through which project the heads

of the said keys, the said apertures being arranged in rows indicating and chords and scales, a shaft journaled in bearings in the box and provided with a gear-wheel in mesh with a rack on the carriage, a ratchet-wheel on the said shaft, and a spring-pressed pawl attached to the box and engaging the ratchet-wheel, substantially as set forth.

5. A musical instrument, comprising sounding devices, actuating devices for the same, a slidable carriage containing the said actuating devices, and keys for manipulating the actuating devices, the said keys being fulcrumed in the carriage and pivotally connected at their lower ends with the said actuating devices, substantially as shown described.

604,955. BICYCLE-SADDLE. FREDERICK C. AVERY, Toledo, Ohio. Filed Apr. 7, 1898. Serial No. 676,554. (No model.)

Claim.—1. A bicycle-saddle consisting of a seat portion, a cantle, a pommel-clip, and an intermediate bearing-plate connected to said seat portion, means for connecting the intermediate plate to the cantle to support the rider, and means for connecting the intermediate bearing-plate with the pommel-clip in a yielding manner said intermediate plate being practically rigid substantially as and for the purpose described.

2. A bicycle-saddle having a central bearing-plate and a cantle-plate supports connecting the two, an independent pommel part, and a spring connecting the pommel or front part to the rigid part of the saddle and made adjustable substantially as shown and described.

604,956. LETTER-BOX. PETER S. BATES, York, Pa., assignor of three-fourths to Edwin W. Loucks, same place. Filed Nov. 23, 1897. Serial No. 659,003. (No model.)

Claim.—1. A mail-box comprising the two front compartments arranged side by side and provided with suitable openings, a compartment in rear of and coextensive with said front compartments, said rear compartment being open at top and bottom, and flaps closing said open top and bottom, substantially as described.

2. A mail-box comprising two compartments with openings thereto, an indicator for each compartment, a movable slide covering enlarged openings in each compartment, a movable bottom-plate and connection therefrom to the indicator, substantially as described.

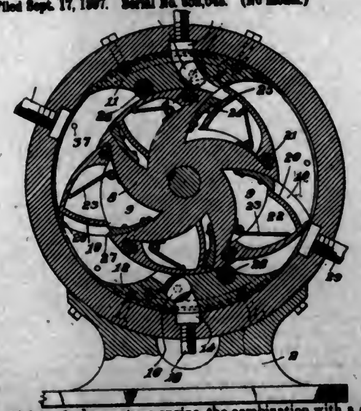
604,957. ELEVATOR SAFETY DEVICE. WALTER R. BENNETT, Carbondale, Pa., assignor to the Hendrick Manufacturing Company, Limited, same place. Filed May 20, 1897. Serial No. 637,372. (No model.)

Claim.—In a safety device for elevators, having the operating rope on the latch side of the hoistway-door, the combination of a car, a bell-crank lever attached thereto, a roller on one end of said bell-crank lever adapted to roll upon the hoistway-door when said door is moved, a lever upon the opposite side of the car, said lever having a clutch for the operating-rope at one end thereof, and an adjustable connection between the ends of said levers, substantially as set forth.

604,958. PESSARY. LORENZ F. RISSMEYER, Westphalia, Mo. Filed Jan. 4, 1898. Serial No. 665,880. (No model.)

Claim.—1. In a pessary, the combination of a tubular stem, a cup removably mounted on the upper end thereof, wings extending laterally from said stem and having shanks extending into the latter, and a spring-supported plunger externally operated through said stem for adjusting the wings, substantially as described.

2. A pessary having a stem, a cup removably mounted on the upper end thereof, a pair of wings pivoted to said stem below the cup, a yielding plunger, a divided plunger-rod, a spring interposed between the parts of said rod, and means for adjusting the tension of said spring, substantially as described.

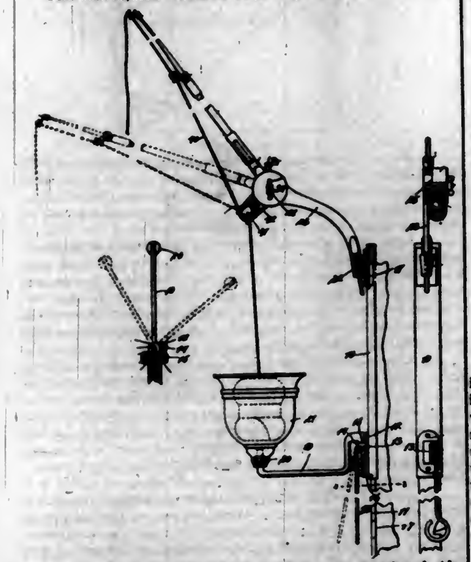


3. A pessary comprising a tubular stem, a cup removably connected with the upper end thereof, wings pivoted in a transverse opening in said stem and provided with hollow extensions or shanks adapted to pass by each other, a spring-actuated plunger acting upon said shanks, and means for adjusting the tension of said spring, substantially as described.

604,959. MANUFACTURE OF GLASSWARE. GEORGE W. BLAIR, Pittsburg, Pa. Filed Mar. 27, 1897. Serial No. 630,505. (No model.)

Claim.—The method of making glass articles, which consists in forming a blank with a neck portion and a body portion by pressing, expanding the body portion by blowing, and then cutting off the said neck portion and an adjacent part of the blown body portion, and from the remainder of the body portion constituting the finished article, substantially as described.

604,960. ROTARY ENGINE. PIERRE J. BOBIN, Boston, Mass. Filed Sept. 17, 1897. Serial No. 652,048. (No model.)



Claim.—1. In a rotary engine, the combination with a cylinder, a shaft, a rotary piston on the latter, of a series of pivoted heads carried by the said piston, diametrically-disposed abutments within the cylinder having curved steam-passages therein running in reverse directions, valves controlling the said steam-passages, cams for operating the said valves, means carried by the said piston for actuating the valves and cams, and diametrically-opposed exhausts situated intermediate the said abutments.

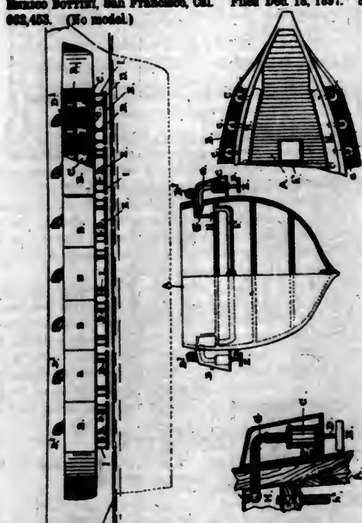
2. The combination with a cylinder provided with ingress and exhaust ports, of a shaft, a rotary piston on said shaft provided with a series of pivoted piston-heads, valves controlling the ingress-ports, valve-cams connected to said valves, independently-pivoted cut-off cams connected to said valve-cams, and means carried by the said piston for actuating the valves and valve-cams automatically in alternation, substantially as specified.

3. The combination with a cylinder provided with diametrically-opposed abutments having steam-passages therein running in reverse directions therethrough and adapted to be alternately opened and closed, antifrictional rollers carried by the said abutments, and valves controlling the said steam-passages, of a rotary piston consisting of circular plates movable upon the opposite sides of the abutments, a cylindrical head-carrier intermediate the plates, a series of spring-actuated pivoted heads on the said head-carrier adapted to be automatically forced outwardly and moved inwardly by the said abutments, and pins or rollers on the said plates for operating the said valves, substantially as specified.

4. The combination with a cylinder provided with ingress-ports and exhaust-ports, of rotary controlling-valves in the ingress-ports, valve cams connected thereto independently-pivoted cut-off cams in advance of the valve-cams, linkage intermediate of the cut-off valve-cams, a rotary piston and means carried thereby for successively actuating the valve and cut-off cams, substantially as specified.

604,961. TWINE-HOLDER. FRANK BENSON, Ellensburg, Wash. Filed June 25, 1897. Serial No. 642,220. (No model.)

Claim.—1. The combination of a disk having a ratcheted side flange with a break therein, a rod passed and movable through the break in the flange, a pin carried by the disk and pivotally mounting the rod on the disk, a cap having a projection capable of engaging with the ratchet-teeth of the flange on the disk whereby to adjustably hold the cap on the disk, and a spring coiled around the pin of the disk and connected with the cap and with the rod.



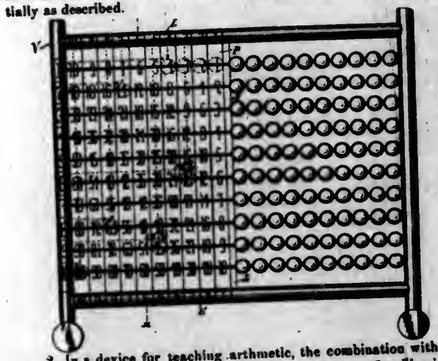
2. The combination of a carriage-plate, capable of sliding vertically to adjust the position thereof, a lever mounted on the carriage-plate and movable to lock and release the carriage-plate, the carriage-plate having two sockets therein, the sockets being located respectively at the upper and lower portions of the carriage-plate, an arm mounted to swing in the lower socket, a twine-cup carried on the arm, and a tension device mounted to swing in the upper socket and overhanging the twine-cup.

3. The combination of a carriage-plate, a tension device supported by the upper portion of the carriage-plate, a block attached to the lower portion of the carriage-plate and having a recess therein, and a lever fulcrumed within the recess and supported by the carriage-plate, the lever having a long arm and a short arm, such arms running parallel with each other, and the short arm forming a locking-pin capable of holding the carriage-plate stationary.

4. A tension device having a plate provided with a ratcheted peripheral flange, one side of which flange is broken away, a pin rigidly secured to the plate and centrally with reference to the flange, an arm mounted to swing on the pin, a cap engaging the flange of the plate and held from turning by the ratchet-teeth thereof, the cap also having connection with the pin, and a spring coiled around the pin and having connection with the swinging arm and with the cap.

5. The combination of a plate having a circular flange, and having a pin central with reference to the flange, the flange having a break therein, an arm mounted to swing on the pin and extended to the break in the flange, a cap engaging the flange to inclose the pin, and a spring inclosed between the cap and plate, the spring having connection with the arm whereby to actuate the same.

604,962. AIR-COMPRESSING APPARATUS FOR VESSELS. BENICO BOTTINI, San Francisco, Cal. Filed Dec. 18, 1897. Serial No. 662,453. (No model.)

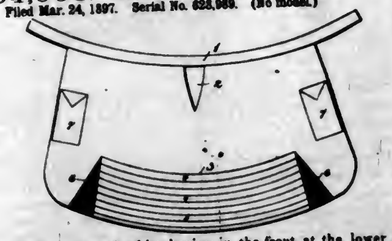


Claim.—1. The combination in and with a vessel, of air-receiving compartments arranged exteriorly on the hull and communicating with the atmosphere; air-pumps in said compartments provided with inlet-ports and pressure or discharge ports and having piston-rods extending through the bottoms of the compartments; floats beneath said compartments having rising-and-falling movements under the impact of the waves from beneath, said floats being connected to the piston-rods; storage tanks within the vessel and air-conductors connecting the discharge-ports of the pumps with said tanks, and check-valves in said connections, constructed for operation as set forth.

2. In an air-compressing apparatus for vessels, the combination of a compartment located exteriorly of the hull having communication with the atmosphere; an air-pump in said compartment provided with inlet-ports and discharge-ports; a storage-tank; an air-conductor connecting the discharge-port of the pump with the storage-tank and having a check-valve; and a float beneath the pump-containing compartments connected to the piston-rods of the pump, and adapted to rise and fall under the impact of the waves acting against said float from beneath, substantially as described.

604,963. APPARATUS FOR TEACHING ARITHMETIC. ANTON R. BERNE, Gratitz, Austria-Hungary. Filed Nov. 1, 1897. Serial No. 657,092. (No model.)

Claim.—1. In a device for teaching arithmetic, the combination with a frame, of ten wires carried thereby, each of said wires being provided with ten adjustable balls, a numerical table attached to the back of the frame and having figures, the products of the numbers



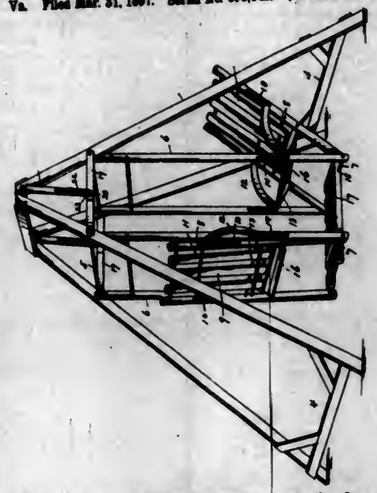
from "1" to "10," arranged thereon in ten horizontal and ten vertical rows, the top and bottom bars of the frame having numbers from "10" to "1" arranged thereon opposite the ends of the vertical rows of figures on the table, and the side bar V of the frame having numbers from "1" to "10" arranged thereon opposite the ends of the horizontal rows of figures on the table, said horizontal and vertical rows of figures on the numerical table, showing at their points of intersection, the products of the figures opposite their ends on the side bar V and end bars, respectively, of the frame, to which points of intersection the balls on the wires are adapted to be moved, substantially as described.

2. In a device for teaching arithmetic, the combination with a frame, of a numerical table attached to the back thereof and having a series of numbers arranged thereon in vertical and horizontal rows, and a series of numbers arranged on the bars of the frame opposite the ends of the vertical and horizontal rows of numbers on the numerical table, said vertical and horizontal rows of numbers on the numerical table being the products of the numbers opposite their ends on the bars of the frame, substantially as described.

3. In a device for teaching arithmetic, the combination with a frame, of a numerical table attached to the back thereof and having a series of numbers arranged thereon in vertical and horizontal rows, a series of numbers arranged on the bars of the frame opposite the ends of the vertical and horizontal rows of numbers on the numerical table, said vertical and horizontal rows of numbers on the numerical table being products of the numbers on the bars of the frame, and a writing-tablet attached to the back of the numerical table, substantially as described.

604,964. UNDERSKIRT. SARAH CAIN, Huntington, W. Va. Filed Mar. 24, 1897. Serial No. 628,969. (No model.)

Claim.—An underskirt having in the front at the lower part thereof a series of parallel, horizontally-extending pockets or compartments, strips of thin, flat, resilient material secured therein, and an elastic gusset at each end of said series of pockets, for the purpose and substantially as described.



604,965. COMBINATION POTATO-MASHER, KETTLE-CLEANER, AND VEGETABLE-FORK. ALONZO H. CARTWRIGHT, Amy, Wis. Filed May 11, 1897. Serial No. 635,963. (No model.)

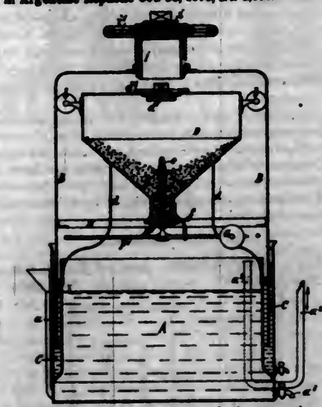
Claim.—1. A combined implement of the character set forth, comprising a sleeve, a combined potato-masher and kettle-cleaner adapted to be removably attached to one end of the sleeve, and a fork detachably inclosed within the said sleeve and inserted and withdrawn through the opposite end thereof, said sleeve serving both as a sheath for the fork and as a handle for the potato-masher, substantially as and for the purposes specified.

2. In a device of the character set forth, the combination with a sleeve, of a fork removably mounted therein and having a portion of the handle adapted to lie flush with the said sleeve, and a combined masher and scraper having a shank or stem adapted to be inserted and secured in the opposite end of the sleeve, substantially as and for the purposes specified.

604,966. PORTABLE SWING. WIRT A. CRISTERMAN, Richmond, Va. Filed Mar. 31, 1897. Serial No. 630,048. (No model.)

Claim.—1. In a swing, a pivotally-supported swing-frame, a back for the seat pivoted to the swing-frame, a seat pivoted to the back and slidingly connected to the swing-frame, and arms pivoted to the forward end of the seat and slidingly connected at opposite ends to the swing-frame and back respectively.

2. In a swing, a pivotally-supported swing-frame having elongated slots therein, a back for the seat pivoted to said frame, and having elongated slots therein, a seat pivoted to the back, arms for the seat, a rod pivotally connecting the said arms with said seat, and adapted to move in the elongated slots in the swing-frame, and a similar rod connecting the opposite ends of said arm and adapted to move within the slots in said back.



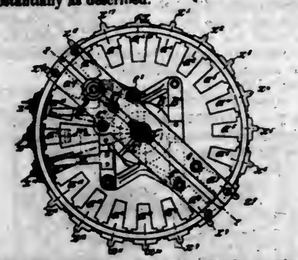
3. A portable swing, comprising supporting-standards, adapted to be folded together, swing-frames pivoted to said standards and depending therefrom, backs pivoted at their lower ends to the swing-frames, seats pivoted to the backs at one and and slidingly mounted upon the swing-frames at their opposite ends, arms pivoted at one end to the seats, and at their opposite end slidingly connected to the backs, and means for connecting the swing-frames so that they move together, substantially as set forth.

4. A portable swing comprising supporting-standards adapted to be folded together, swing-frames pivoted between said standards and provided with longitudinal slots adjacent their lower ends, backs having their side pieces pivoted to the swinging frames at their lower ends and formed with longitudinal slots adjacent their upper ends, seats pivoted at one end to the backs, rods movable in the slots of the swinging frames to which are attached the opposite ends of the seats, arms pivoted to the rods, rods movable in the slots of the backs to which the opposite ends of the arms are pivoted, and means for detachably connecting the swing-frames whereby they move together, substantially as set forth.

5. A portable swing comprising standards adapted to be folded together, swing-frames pivoted between the standards and having their side pieces formed with longitudinal slots adjacent their lower ends, backs having their side pieces pivoted to the swing-frames at their lower ends and having longitudinal slots adjacent their upper ends, rods movable in the slots of the side pieces of the backs, arms pivoted to said rods, rods movable in the slots of the swing-frames to which the opposite ends of the arms are pivoted, seats pivoted between the side pieces of the back at one end and attached to the rods, connecting the arms to the swing-frames, and a platform pivoted to the lower end of one of the swing-frames and adapted to engage the opposite swing-frame, substantially as set forth.

6. A portable swing comprising supporting-standards adapted to be folded together, arms pivoted at one end to the standards and provided with slots adjacent their ends, brace-rods pivoted to the standards, bolts movable in the slotted arms and uniting the opposite brace-rods, whereby when the standards are folded the brace-rods move upon the slotted arms, swing-frames pivoted between the standards, and swings carried thereby, substantially as set forth.

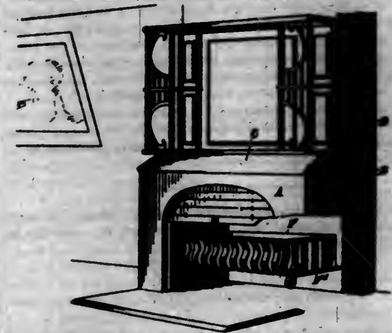
604,967. ACETYLENE-GAS APPARATUS. DANIEL H. CHIVERS, Neuilly-sur-Seine, France. Filed Sept. 19, 1896. Serial No. 606,236. (No model.) Patented in France Feb. 1, 1896, No. 253,680, and Aug. 19, 1896, No. 254,894; in Belgium Apr. 7, 1896, No. 120,742; in England Aug. 22, 1896, No. 19,050; in Austria Aug. 31, 1896, No. 46/3964; in Hungary Sept. 3, 1896, No. 7,168; in Italy Sept. 4, 1896, No. 42,441; in Spain Sept. 5, 1896, No. 19,608; in Portugal Sept. 26, 1896, No. 2,315, and in Argentine Republic Oct. 30, 1896, No. 1,957.



Claim.—1. In an apparatus for producing acetylene gas comprising a water-reservoir and a bell or gasometer covering said reservoir in an air-tight manner and including a fixed container for crushed carbid, the combination therewith of a valve E in the form of a cupel and arranged and guided in the discharge-orifice of the container and operated by means of a hinged and counterweighted lever F, the end of which lever is adapted to be engaged by an annular projection or strip H on the interior of the bell, substantially as hereinbefore described and shown.

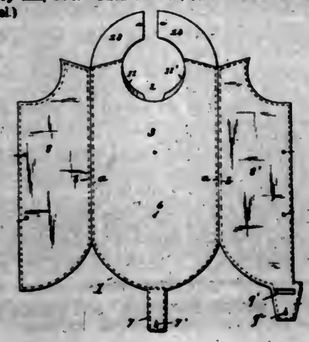
2. In an apparatus for producing acetylene gas comprising a water-reservoir, a bell or gasometer covering said reservoir in an air-tight manner and including a fixed container for crushed carbid, the combination therewith of a movable chamber I by means of an air-tight joint in an opening formed in the bell above the filling-orifice of the container in such a way as to form when lowered a tight joint on the said reservoir and of the stoppers *i*, *d'*, adapted to the said chamber and container respectively for the introduction of the crushed carbid into the container, substantially as hereinbefore described and shown.

3. In an apparatus for producing acetylene gas, a water-reservoir A, a bell or gasometer B covering the said reservoir, a container D for crushed carbid fixed to the reservoir A and having rollers *b* for guiding the bell, a valve E guided by a sheath or socket *e* arranged vertically in the center of the orifice for discharging the carbid, a chamber I screw-threaded at the top of the bell to form an air-tight joint at the top of the container and stoppers *i*, *d'*, arranged in the chamber I and container D respectively, substantially as described and shown.



604,968. AUTOMATIC CURRENT-DISTRIBUTER FOR ELECTRIC RAILWAYS. JEAN CLARET and OLIVIER VEILLEUX, Paris, France. Filed May 4, 1897. Serial No. 636,057. (No model.) Patented in France June 8, 1896, No. 248,015, and Nov. 18, 1896, No. 251,782; in Germany Nov. 27, 1896, No. 93,856; in Switzerland Dec. 2, 1896, No. 11,712, and in Spain Feb. 4, 1896, No. 18,698.

Claim.—1. A distributer for an electric railway having a series of switches to be connected to the spaced contacts of the railway contact-arms, such as *m*, *n* and *n'*, to contact with said switches, the spacing of the axes of these contact-arms being less than the spacing of the axes of said switches, and an electric motor to move said arms, the motor-armature having a commutator provided with fingers electrically connected with the coils of the electromagnets of the motor, and contacts for the said fingers electrically connected with the arms *n n'*, all substantially as described.



2. A distributer for an electric railway, having a series of switches to be connected to the spaced contacts of the railway, contact-arms, such as *m*, *n* and *n'*, to contact with said switches, the spacing of the axes of these contact-arms being less than the spacing of the axes of said switches and an electric motor whose armature has a commutator provided with fingers electrically connected with the coils of the electromagnets of the motor in combination with contacts for said fingers electrically connected with the arms *n* and *n'*, a toothed driving-wheel to move the contact-arms and pawls to act on the wheel and acted on by the commutator from the motor, substantially as described.

604,969. FIREPLACE-GRATE. SAMUEL L. COOK, Jacksonville, Fla. Filed June 2, 1897. Serial No. 639,103. (No model.)

Claim.—The combination with a fireplace provided with a stationary shelf or bracket G on its rear face, with the rollers H and H' journaled on pins projecting from the sides of the fireplace, the roller H being located above and slightly inside of the roller H', and the grate-basket provided with laterally-projecting bottom flanges having curved front ends, the rear portion of the grate-basket being shaped to rest upon the brackets G, and the curved portion of the flanges to rest between the rollers H and H', located as aforesaid, for the purpose set forth.

604,970. DETACHABLE SHIRT-BOSOM. JOHN W. COOPER, Cherry Hill, N. J. Filed Nov. 10, 1897. Serial No. 658,058. (No model.)

Claim.—A false or detachable shirt-bosom, consisting of a body portion in the form of a bosom-front and provided at its lower end with a tongue having a buttonhole, and side flaps adapted to be folded over upon the face of the body portion, one of said flaps being provided at its lower end with a tongue having a buttonhole and an opening through which the tongue on the said body portion is adapted to be passed, substantially as described.

604,971. PACKING-AUGER. JOHN B. CORNWALL, Moline, Ill., assignor to the Barnard & Leas Manufacturing Company, same place. Filed Jan. 27, 1898. Serial No. 668,216. (No model.)

Claim.—1. A rotary packing-auger having a packing-blade provided with a plurality of packing-surfaces on its under side substantially as described.

2. A packing-auger having a spirally-inclined packing-blade, provided with a secondary packing-surface on its under side intermediate its ends, substantially as described.

3. A rotary packing-auger consisting of a single spiral having a feed-opening at one side only and a plurality of packing-surfaces on its under side substantially as described.

4. A single continuous spiral packing-auger having two packing-surfaces on its under face, the lower edges of said surfaces being diametrically opposed, substantially as described.

5. A packing-auger having a single incline on its upper face and a plurality of packing-surfaces on its under face, substantially as and for the purpose described.

6. A packing-auger having a single incline on its upper face and a plurality of packing-surfaces on its under face and only one feed-mouth, substantially as and for the purpose described.

7. A packing-auger having a single incline on its upper face, diametrically opposite packing-surfaces on its under face, and one feed-mouth, substantially as and for the purpose described.

8. The combination of the packing-tube and a rotary shaft; with a single-mouth spiral packing-auger on said shaft having a single incline on its upper face and two inclines or packing-surfaces on its lower face, substantially as described.

604,972. WIRE-FENCE TOOL. HUGH W. DENISON, Gebhart's, Pa., assignor of one-half to J. C. Lowry, Somerset, Pa. Filed Mar. 28, 1896. Serial No. 675,463. (No model.)

Claim.—1. A wire-fence tool having a shank, a head carried thereon, and two angular lugs projecting from one face of the head and arranged in proximity with each other, the lugs having portions cut away at their corners to produce plane surfaces, by which angles may be formed in the wire as the wire is crimped by the action of the tool.

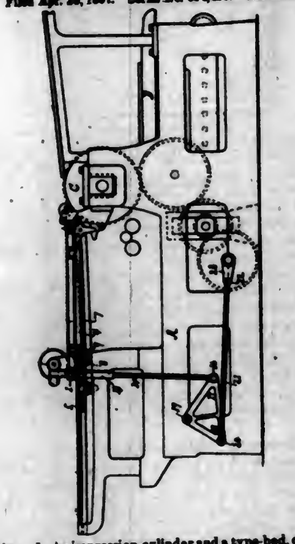
2. A wire-fence tool having a head, a shank carrying the head, the head being provided with a slot extending through to one edge thereof, a splicing-lug projecting from one side of the head adjacent to the inner end of the lug and having an undercut portion, and two crimping-lugs projecting from the opposite side of the head, the crimping-lugs being angular in general contour and having their edges cut away to produce plane surfaces.

3. A wire-fencing tool having a shank, a head attached to one end of the shank and two angular crimping-lugs located rigidly on one face of head and adjacent to each other.

4. A wire-fencing tool having a shank, a head attached to one end of the shank and having a slot therein, a splicing-lug attached rigidly to one face of the head adjacent to the slot and two angular crimping-lugs attached rigidly to the opposite face of the head.

604,978. GRIPPING MECHANISM. ALVA C. DERRY, Munhall, Pa. Filed Feb. 23, 1897. Serial No. 624,628. (No model.)

Claim.—1. The combination with an element having at one end an open-ended socket, of a movable bar having a head arranged to move endwise directly into the socket, and a locking mechanism arranged to rigidly connect the bar and socket.

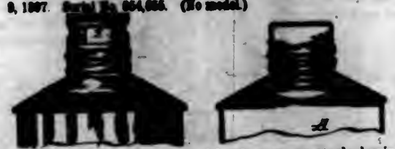


2. The combination with an element to be operated, having at one end an open-ended socket with inclined inner faces, of a bar movable endwise directly into the socket and having a head provided with inclined faces arranged to slide over the inclined faces of the socket and fit therein, a locking mechanism arranged to rigidly lock the head to the socket, and means for unlocking the head in any position of the element.

3. The combination with an element, having at one end an open-ended socket, of a bar having a head movable endwise directly into the socket, locking-levers in the head arranged to engage recesses in the sides of the socket and rigidly lock the head therein and means for positively moving said levers to lock or unlock the head in any position of the element.

4. The combination with a charging-box, having at one end an open-ended socket provided with inclined inner faces, of a charging-bar having a head provided with inclined outer faces arranged to fit within the socket, locking-levers pivoted within the head and arranged to enter recesses in the socket and rigidly lock the head therein, and means for positively moving said levers in any direction in any position of the box.

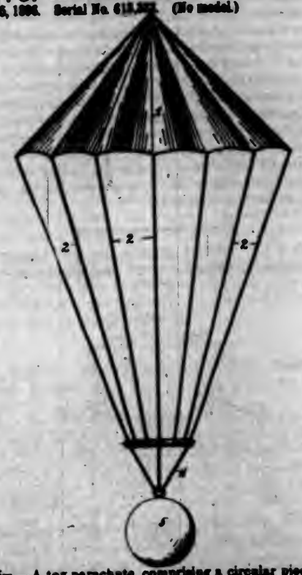
604,974. PRINTING-PRESS. GEORGE P. FISHER, New London, Conn. Filed Apr. 20, 1897. Serial No. 634,436. (No model.)



Claim.—1. An impression-cylinder and a type-bed, combined with a tape-carriage, and a sectional track or way for the carriage, one of the track-sections comprising rails fixed at a distance from the cylinder and the other track-section comprising rails slidably mounted alongside the fixed rails and of a length greater than the space between said fixed rails and the cylinder, so that when the movable rails are run to the cylinder said movable rails partly overlap or are held by said fixed rails, and said carriage having wheels arranged to run, respectively, on the fixed and movable rails, so that when the carriage has been run away from the cylinder, the movable rails can be moved along under the carriage away from the cylinder without disturbing such carriage, substantially as described.

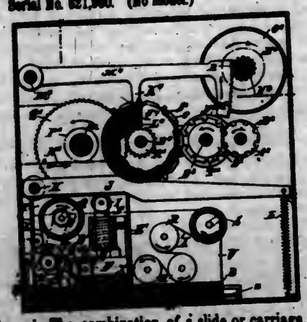
2. An impression-cylinder and a type-bed, combined with a tape-carriage, a hooked actuating-rod for the carriage, an actuating-lever having a stud provided with a head and made to receive said rack-hook between said head and lever, a sleeve slidably mounted on the head and adapted to move toward and clasp the rack-hook when the latter engages the stud, and a fastening-screw on said head made to engage the sleeve, substantially as described.

3. An impression-cylinder and a type-bed, combined with stop-fingers, a carriage made to pass from the cylinder under the fingers and beyond the latter, and tapes actuated by the carriage so as to be extended from the impression cylinder under and beyond the fingers and to receive a sheet fed from the cylinder and then to carry said sheet into position for delivery from the tapes, said stop-fingers being made to dip between the tapes after the latter have been extended under and beyond the fingers, and arranged to arrest a sheet on the tapes after each sheet has been fed from the impression-cylinder and prior to its advance into position for delivery from the tapes, substantially as described.



604,975. BOX OR CAN. ALAN R. FERGUSON, Baltimore, Md., assignor to Henry P. Miller and George Miller, same place. Filed Oct. 9, 1897. Serial No. 654,685. (No model.)

Claim.—1. The combination with a box or receptacle having a restricted neck, of a measurer mounted in said neck so as to be capable of longitudinal movement therein, said measurer being hollow and closed at both ends and having a slot in its wall adapted to communicate with the interior of the box or receptacle and terminate within the neck when said measurer is closed, and to extend beyond the neck and close communication with the interior of the box or receptacle when the measurer is open, said measurer being constructed to so cooperate with the neck as to limit the extent of movement of the former in both directions.



2. The combination with a receptacle and a screw-threaded neck thereon, of a measurer having a corrugated or screw-threaded wall adapted to mesh with the screw-threaded neck, said measurer closed at both ends and having a slot in said corrugated or screw-threaded wall, the neck and measurer being so proportioned relatively to each other that when the measurer is screwed outwardly the slot will project beyond the end of the neck and so that when screwed inwardly the outer end of the slot will be closed and the inner end be in communication with the interior of the receptacle, substantially as set forth.

604,976. PARACHUTE. CARRIE G. FISHER, Fulton, Ohio. Filed Nov. 26, 1896. Serial No. 613,372. (No model.)

Claim.—A toy parachute, comprising a circular piece of flexible fabric, cords attached to the edge thereof at suitable intervals, a ring to which the opposite ends of the cords are attached, a solid ball or sphere of heavy material suspended from the ring by cords, and a small ring on the ball or sphere to which the suspending-cords are attached and through which the peak of the fabric is passed when the device is rolled or wrapped around the ball, as herein shown and described.

604,977. APPARATUS FOR COPYING, REGISTERING, CHECKING, AND ADDING. JULES FEYDMANN, Paris, France. Filed Feb. 4, 1897. Serial No. 621,980. (No model.)

Claim.—1. The combination of a slide or carriage, a board or holder having movable projections or plates for operating the carriage, and a registering apparatus operated by those plates which have been moved out of their normal position, substantially as described.

2. The combination of the slide or carriage, the board for operating the carriage and having a series of movable plates, a controlling device, a registering device, and an adding device operated by those plates which have been moved out of their normal position, substantially as described.

3. The combination of the board having pivoted plates, the slide or carriage constructed to receive said board, a movable frame and rods carried by said frame and arranged to project into the path of the said plates when the latter are moved out of their normal position, substantially as described.

4. The combination of the operating-board having projections, the carriage constructed to receive said board, the movable frame, the rods carried by said frame, the incline arranged to effect a downward movement of the frame when the carriage is moved inward, bars provided with inclined guideways and carried along by the said rods when the latter are operated by engagement with the projections on the operating-board, substantially as described.

5. The combination of the carriage, the movable frame, the rods carried thereby, the bars engaged by the rods, the racks connected to said bars, pinions engaging said racks, a controlling device and an adding device operatively connected to said pinions, substantially as described.

6. The combination of the carriage, the longitudinally-movable shaft shifted by the forward movement of the carriage, wheels loosely mounted on said shaft, a parallel shaft carrying wheels in the form of a Maltese cross, the wheels on said parallel shaft being moved into or out of engagement by the longitudinal movement of the first-named shaft, and an adding device connected to the wheels on the second-named shaft, substantially as described.

7. The combination of the carriage, the frame operated thereby, the rods carried by said frame, the board having projections for engaging said rods, mechanism operated by the rods, and a stop secured to the said frame and adapted to engage the said board for the purpose of preventing its withdrawal until after the completion of the operation, substantially as described

8. The combination of the carriage and apparatus operated thereby with an operating-board having movable projections, and yielding stops or levers secured to the frame of the apparatus and adapted to engage said projections the stops yielding in one direction only and being adapted to shift the projections back to their original position upon the withdrawal of the board, substantially as described.

9. The combination of the carriage, the board carrying a pad and movable projections or plates, a copying-head adapted to be fed over the pad, a compressor adapted to press said head upon the pad, and a numbering and dating stamp adapted for engagement with the said head and with the pad, substantially as described.

10. The combination of the carriage and the adding device operated thereby, said device comprising wheels consisting of disks divided into segments of different diameters and forming steps, each step being prolonged laterally by a portion of equal diameter and

levers engaged by said wheels and adapted to move the numbered disks, substantially as described.

11. The combination of the carriage and the adding device operated thereby, said adding device comprising step-wheels, levers operated by said wheels, controlling-disks actuated by the levers, impression-rollers rigid with said controlling-disks, and a registering-band upon which said rollers are adapted to print, substantially as described.

12. The combination of the carriage and the adding device operated thereby, said adding device having impression-rollers, a registering-band on which said rollers are adapted to print, and a lever receiving its movement from the carriage and operatively connected to the said band to feed it forward and to the impression-rollers to bring them against said band, substantially as described.

13. A recording apparatus comprising copying, recording, checking and indicating mechanism, and an actuating-board constructed to be inserted from the exterior of the apparatus, substantially as described.

14. A recording apparatus comprising copying, recording, checking, indicating and adding devices, and an actuating-board for operating the apparatus, said board having a plurality of plates or projections pivoted thereon and capable of actuating the mechanism, substantially as described.

15. The combination with a casing, of a movable rod-carrier, a plurality of rods slidable in the rod-carrier, and recording mechanism actuated by the rod, substantially as described.

16. The combination with a casing, of a carriage slidable thereon, a plurality of rods slidably mounted on the carriage, a rack-bar capable of being operated by the rods, and recording mechanism operated from the rack-bar, substantially as described.

17. The combination with a casing, of a carriage slidable thereon, a plurality of rods mounted to move independently on the carriage, a sliding rack-bar, and operating devices connected to the rack-bar and having a detent capable of being engaged by the rods, and recording mechanism operated from the rack-bar, substantially as described.

18. The combination with a casing, of a carriage slidably mounted on the casing, a plurality of rods mounted to move independently on the carriage, a rack-bar slidably mounted on the casing, an operating device in connection with the rack-bar and having a detent adapted to be engaged by the rods, the operating device moving in diagonal guides, and recording mechanism operated from the rack-bar, substantially as described.

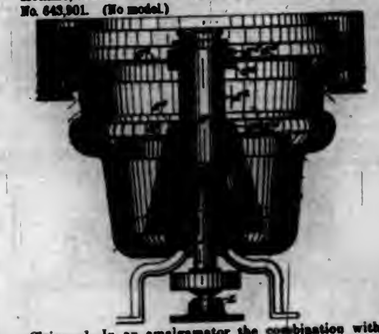
19. The combination with a casing, of a carriage slidably mounted on the casing, a series of independently-movable rods carried by the carriage, a rack-bar slidably mounted on the casing, mechanism driven from the rack-bar, and an operating device slidable with the rack-bar and movable transversely independently of the rack-bar, the operating device having transversely-slidable connection with the rack-bar and being capable of being operated by engagement with the rods, substantially as described.

20. The combination of a slidable rack-bar, an operating device slidable with the rack-bar and moving transversely independently of the rack-bar, the operating device having transversely-slidable connection with the rack-bar, and means for sliding the said operating device, substantially as described.

21. The combination of a slidable rack-bar, an operating device having a diagonal slot therein and having transversely-slidable connection with the rack-bar, a stationary member coacting with the slot of the operating device to move the operating device transversely independently of the rack-bar, and means for moving the operating device, substantially as described.

22. A recording apparatus operated by an actuating-board with movable projections, the recording apparatus having means for returning the projections for operating said apparatus to a normal position upon the withdrawal of the board from the apparatus, substantially as described.

23. The combination with a recording apparatus, of a carriage movable therein and carrying operative parts, a spring tending to normally draw the carriage to an inactive position, and means for holding the carriage in an active position during the operation thereof, substantially as described.



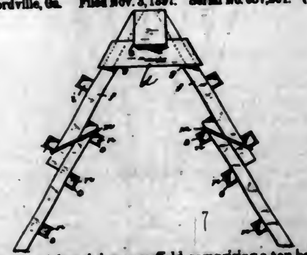
24. The combination with a casing, of a carriage slidable therein and having the parts movable thereon, a pivoted cam member adapted to have the movable parts of the carriage engaged therewith, and a spring holding the cam member in a normal position and permitting a yielding of the cam member, substantially as described.

25. The combination of a lever, a sector carried thereon, gearing engaged with and driven by the sector, and a disk provided with a series of cammed surfaces serving to operate the lever, substantially as described.

26. The combination of a lever, a sector at the end of the lever, gearing engaged with and driven by the sector, and a cam the periphery of which is formed with a series of graduated cams such cams being capable of operating the lever to various extents, substantially as described.

604,978. CENTRIFUGAL AMALGAMATOR AND SEPARATOR.

CHARLES L. GARLAND, Sydney, and JOHN MURRAY and SAMPSON R. MURRAY, Cowra Creek, New South Wales. Filed July 6, 1897. Serial No. 643,901. (No model.)



Claim.—1. In an amalgamator the combination with a bowl mounted on a central, hollow shaft having a feed-hopper, emptying into its upper end, the lower portion of said shaft having slots for the passage of the material, of a part mounted on said hollow shaft and having the shape of a truncated hollow cone, an amalgamating-plate upon the inner face of said part, and one or more circular plates, or disks, mounted on said hollow shaft above the cone-shaped part, and having their edges projecting into a corresponding number of catch-grooves, or traps, formed of the wall of the bowl which projects outward beyond the normal diameter of the latter, substantially as described.

2. In an amalgamator the combination with a hollow shaft having slots near its lower end and a feed-hopper communicating with its upper end, of a bowl mounted on and rotating with the shaft, a part mounted on said shaft and having the form of a hollow truncated cone, the closed truncated end lying above the slots in the hollow shaft, an amalgamated plate upon the inner face of said part, the lower edge of the latter being above the bottom of the bowl, and a disk, or circular plate, mounted on said shaft and projecting at its edge into a catch-groove, or trap extending beyond the outer surface of the bowl and entirely around the same, substantially as described.

3. In an amalgamator, the combination with a vertical hollow shaft having slots at its lower end and a feed hopper at the upper end, of a bowl mounted on said shaft below the slotted end, a part having the form of a hollow truncated cone having its truncated closed end mounted on the shaft above the slots in the lower end, an amalgamating-plate on the inner face of said part, the lower open end of the latter being above the bottom of the bowl one or more disks or circular plates on said shaft above the said truncated end, the outer edge or edges thereof lying in one or more circular catch-grooves or traps in said bowl which project outward, a splash-ring mounted on the lower face of each of said disks at a little distance from the inner face of the bowl and a circular launder, or trough surrounding and partly inclosing the upper edge of the bowl, and the upper catch-groove, substantially as described.

604,979. COMBINATION-SCAFFOLD.

JAMES V. GARRETT, Crawfordville, Ga. Filed Nov. 3, 1897. Serial No. 657,361. (No model.)

Claim.—1. A knockdown scaffold comprising a top beam having converging transverse slots, a block having a recess adapted to receive the beam, slots formed in the block registering with those of the beam, and legs passed convergingly through the slots of the block into those of the beam.

2. A knockdown scaffold comprising a top beam having converging transverse slots, a block having a recess in its upper face adapted to receive the beam, slots formed in the block registering with those of the beam, and legs passed convergingly through the slots of the block into those of the beam, said legs having shoulders engaging the under side of the block.

3. A knockdown scaffold comprising a top beam having converging transverse slots in its opposite sides, a block having a recess in its upper face adapted to receive the beam, converging slots formed in the block registering with those of the beam, and legs in pairs passed through the slots of the block into those of the beam.

4. A knockdown scaffold comprising a top beam having converging slots on opposite sides, a block having a recess in its upper face adapted to receive the beam, converging slots formed in the block registering with those of the beam, legs in pairs passed through the slots of the block and into those of the beam, rungs secured to each pair of legs, supplemental legs arranged in pairs and connected through the medium of rungs, and straps passed above a rung of each pair of supplemental legs, round said legs and round the corresponding main legs below a rung thereof.

604,980. GOLD-WASHER.

CHARLES GEISER, Rapid City, S. D. Filed June 12, 1896. Serial No. 595,329. (No model.)

Claim.—1. In a gold-washer, a gold-pan comprising an outer body or rim, a flat bottom of smaller diameter than the body and situated in a higher plane than the bottom edge of the latter, and an inclined flange located inside the rim or body and connecting the bottom with the lower edge of said body, said flange being provided with vertically-disposed slots.

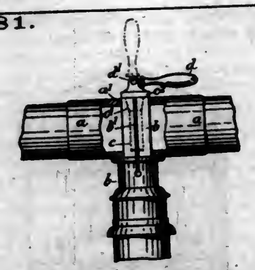
2. In a gold-washer, the combination with a support, of a tub on the support, a foldable crane-post connected to the support and adapted to retain the tub on the latter, a crane connected to the post, and a gold-pan suspended from the crane, substantially as described.

3. In a gold-washer, the combination with a support, of a tub thereon, a crane-post hinged to the support, a crane detachably connected to the crane-post, a gold-pan suspended from the crane, and a gold-pan support connected to the tub, substantially as described.

4. In a gold-washer, the combination with a tub and a removable tailings-pan therein, of a movable crane, and a gold-pan suspended from the crane over the tailings-pan, substantially as described.

5. In a gold-washer, the combination with a tub, of a draining-box rest comprising a support having curved pieces straddling the edge of the tub and a leg hinged to the support, of a draining-box resting on the support and adapted to drain into the tub.

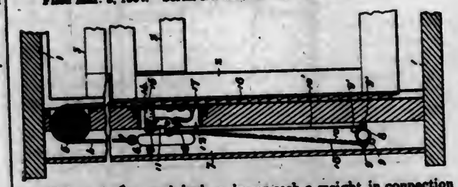
6. In a gold-washer, the combination with a tub, of a draining-box rest comprising an inclined support having curved pieces straddling the edge of the tub, a leg hinged to the support and terminating in a foot, and a draining-box resting on the support and adapted to drain into the tub.



7. The herein-described draining-box having a bottom, and sides that converge, being also provided with an end at the converged portions of the sides, which end has its lower edge cut away into notches constituting draining-openings.

604,981. HANDLE-BAR FOR CYCLES.

FREDERICK R. GUY, London, England. Filed July 19, 1897. Serial No. 645,093. (No model.)

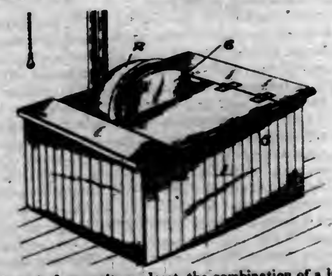


Claim.—In a reversible handle-bar for cycles, the combination with a steering-head having a split plug *b* of angular shape in cross-section, provided with a centrally-threaded aperture having a tapered upper portion, of a handle-bar having angular holes extending transversely therethrough at right angles to each other and into either one of which the split angular plug may pass, a screw *c* having a tapered portion *c'* and a head *c²*, said screw being tapped into the threaded aperture in the plug for the purpose specified, and a handle *d* pivoted in ears upon the top or head of the screw whereby the handle may assume a vertical position to allow of the handle-bar being slipped from the plug without removing the screw.

604,981.

604,982. SASH-LOCK.

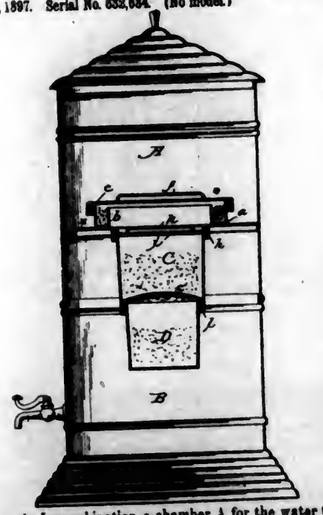
EDWARD W. HABERMAAS, St. Louis, Mo. Filed Mar. 9, 1897. Serial No. 626,641. (No model.)



Claim.—1. In a sash-lock, a lower sash a weight in connection with the same, and heavier than said sash, an upper sash a weight in connection with same and lighter than said sash, a series of teeth carried by each of said sashes a bell-crank tripping lever for each of said sashes and located in proximity to the latter, a latch pivoted to one arm of each of the tripping levers and having respectively upwardly and downwardly inclined locking ends coöperating with said teeth springs coöperating with the bell-crank levers, a rocking or rotatable spindle, means for rotating the spindle, and cords connecting the periphery of the spindle with the bell-crank tripping levers, whereby the rocking of the spindle in either direction will release either one of the latches from its locked position allowing the upper sash to fall automatically, or the lower sash to automatically move upward.

2. In a sash-lock, a suitable spindle, a socket for the same, radiating depressions at the outer end of the socket, a collar carried by the periphery of the spindle, a terminal flange surrounding the outer end of the socket, a casing carried by the frame and having a tubular reduced extension embracing the spindle between the collar and the terminal flange, said socket and depressions being adapted to receive the shank and processes of a key, respectively, for rotating the spindle, substantially as set forth.

604,983. SANITARY BOWL.



HERBERT R. HALL, Brooklyn, N. Y. Filed May 4, 1897. Serial No. 635,064. (No model.)

Claim.—1. In a sanitary closet, the combination of a bowl provided at its upper rear portion with a hood or cover, a seat for said closet having an opening therein adjacent to the opening in the hood, and a cover hinged to swing laterally and adapted to close the mouth of the bowl.

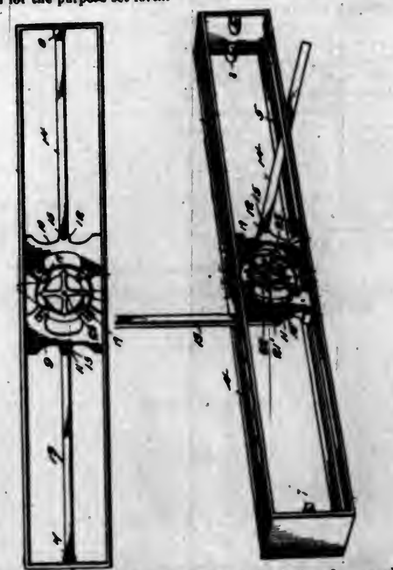
2. In a sanitary closet, the combination of a bowl having an angular mouth, one side of which is vertical and the other horizontal, a seat extending across the horizontal side and having its opening facing the vertical side, the said bowl extending above the seat upon its rear side and forming a forwardly-projecting hood, and a cover hinged to swing laterally and provided with a segmental projection adapted to close the mouth of the bowl.

604,984. FILTER. ARTHUR J. HARDER, Williamsport, Pa. Filed Apr. 17, 1897. Serial No. 632,684. (No model.)

Claim.—1. In combination, a chamber A for the water to be filtered, a diaphragm *a* therein, a circular opening centrally of said diaphragm, two vertical circular flanges *b* and *c* concentric with said opening, filtering-space *d* between said flanges, a removable imperforate cap *e* fitting imperviously over flange *c* by means of screw-threads, contracted spaces for the passage of the water beneath flange *c*, removable filtering-chamber C depending from said diaphragm, beneath the opening therein, and connected thereto by means of a screw-threaded flange *h*, a removable perforated disk *i* resting upon a ledge in the mouth of said chamber, removable filtering-chamber D depending from chamber C and connected thereto by a screw-threaded flange *l*, pervious bottom in chamber C and perforated bottom in chamber D, and chamber B to act as a receptacle and cooler for the filtered water, all so coacting as to produce the unitary result, substantially as described.

2. In combination with a chamber A to receive the water to be filtered, a diaphragm *a* therein, a circular opening centrally of said diaphragm, a circular screw-threaded flange *h* extending downwardly from said diaphragm concentric with said opening, a removable filtering-chamber C depending and supported from flange *h* by means of screw-threads, a screw-threaded flange *l* extending downwardly from the bottom of filtering-chamber C, a second filtering-chamber D depending and supported from flange *l* by means of screw-threads, both chambers having pervious or perforated bottoms for the passage of the water, substantially as described.

3. In combination with the chamber A, the diaphragm therein having a central opening, a circular flange depending downward from the diaphragm concentric to the opening, a filtering-chamber removably supported from said concentric flange, a second chamber depending from and removably connected to the first chamber, and perforated bottoms for both said chambers, substantially as described.



4. In a water-filter, a chamber for the water to be filtered, a diaphragm therein having an opening in the center, a concentric flange having a plurality of openings at the base thereof, an imperforate cover removably secured to said flange, and an inner imperforate flange of less height than the outer flange, substantially as described.

5. In combination, a water-chamber A, a diaphragm *a*, an opening centrally thereof, filtering-chambers depending from and removably connected with said diaphragm, a removable perforated disk covering the opening in the diaphragm, a filtering-space arranged concentric of the perforated disk with a water-passage to said space and a removable cover for said filtering-space, substantially as described.

604,985. SPIRIT-LEVEL. JOHN HARTFORD, San Francisco, Cal. Filed Jan. 25, 1897. Serial No. 620,575. (No model.)

Claim.—1. In a spirit-level, the combination with an open body or frame, of gage-bars located within the frame and independently pivoted upon opposite sides of the central portion, and clamping pivot-screws upon which said bars are mounted, whereby either bar may be held in any desired position, independently of the other, substantially as shown and described.

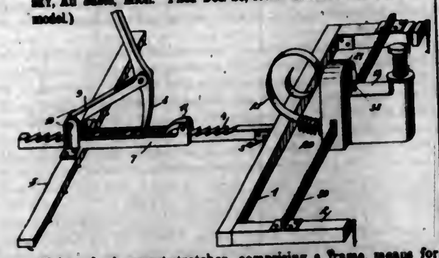
2. In a spirit-level, the combination with a body, of clamp-sections secured thereto for holding in place an annular spirit-tube, the ends of said clamp-sections being provided with grooves, and a gage having radially-extending, pointed arms to fit within said grooves, as and for the purpose set forth.

3. In a spirit-level, the combination with a body, of an annular spirit-tube fitted in said body, clamp-sections for securing said tube which have grooves, and a gage extending diametrically of the tube and pivoted centrally thereof, which also serves as a guard for the tube and has its ends adapted for reception in the grooves aforesaid when it is not in use.

4. In a spirit-level, the combination with a body, of an annular spirit-tube connected thereto and exposed on both sides, gages consisting of a plurality of arms extending diametrically of the tube and located on opposite sides thereof, and a bolt or pin passing through the center parts of said gages, the latter also serving as protectors for the tube.

5. In a spirit-level, the combination with a body, of an annular spirit-tube fitted therein and exposed at both sides, and gages located on opposite sides of the said tube and which consist of bowed-out braces having pointed ends bearing against the tube, and a bolt passing through the center parts of said gages and through the open space of the tube, said gages serving as protectors for said tube.

604,986. FILING-CASE. CHARLES O. HITCOCK, Ridgeway, Mich. Filed Mar. 12, 1897. Serial No. 627,180. (No model.)



Claim.—1. The combination of the file-case G, with the two lids A, and B, of a continuous rod F, bent to form two parallel posts connected by a curved portion securely fastened in a stationary manner to the inside bottom of the box G, and whose free ends touch the lid B, for the double purpose of holding in place the series of receptacles C, and supporting the lids A, and B, substantially as described.

2. In a filing-case, in combination with a containing-box, a post rigidly secured to the bottom of said box projecting upward and having a blunt terminal parallel with one side thereof, a narrow lid hinged to one side of the box adapted to fold over and rest on said post, and a broad lid hinged to the other side of said box and adapted to fold over the first-mentioned lid and carrying a fastening member H located above the posts when the lid is closed, substantially as described.

3. In a filing-case, in combination with a box adapted to hold receptacles, posts secured to the bottom of the box extending parallel with one side thereof and having blunt terminals, a narrow lid secured to one edge of said box adapted to extend over, engage with, and be supported by said posts, a wide lid secured to the other edge of said box adapted to engage over and rest on first-mentioned lid, and means for securing the two lids together, substantially as described.

604,987. CARPET STRETCHER AND TACKER. CYRIL M. JANSEY, An Sable, Mich. Filed Dec. 28, 1897. Serial No. 663,882. (No model.)

Claim.—1. A carpet-stretcher, comprising a frame, means for securing said frame to a floor, a stretching-bar for engaging with the carpet, means for moving said stretching-bar toward the frame, a tacking or staple-driving device mounted on said frame, and means for imparting a step-by-step motion to said device longitudinally of the frame, substantially as specified.

2. A carpet-stretcher, comprising a frame having means for removably securing it to a floor, a stretching-bar, means for moving said stretching-bar toward the frame, a tack or staple driving mechanism comprising a vertically-movable plunger, a casing in which said plunger is arranged, a rack on the carpet-stretcher frame passing through said casing, a spring-operated gear in the casing engaging with said rack, and means operated by a downward movement of the plunger for releasing the spring to allow it to move the tack or staple driving mechanism longitudinally of the frame, substantially as specified.

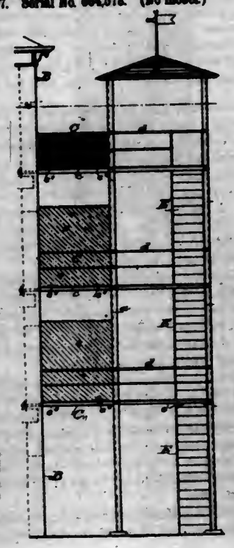
3. A carpet-stretcher, comprising a frame adapted to be removably secured to a floor, means connected with said frame for stretching a carpet toward the same, a rack extended longitudinally of said frame, a driving mechanism comprising a vertically-movable plunger, a casing in which said plunger is arranged, a gear-wheel in the casing engaging with the rack, a shaft upon which said gear-wheel is loosely mounted, a spring connected at one end with said shaft and at the other end with the gear-wheel, a stop-pin extended from the gear-wheel, a swinging detent-bar with which said stop-pin is designed to engage, and a tappet on the plunger for engaging with said detent-bar, to move it out of engagement with the pin upon the downward movement of the plunger, substantially as specified.

4. The combination with a carpet-stretcher comprising a frame adapted to be removably secured to a floor, of a driving mechanism comprising a casing, a plunger operating vertically in said casing and having a cutting edge for severing staples from a strip, means operated in one direction by the plunger for feeding the strip, a spring-operated gear-wheel in the casing, a rack on the carpet-stretcher frame with which said gear-wheel engages, stop-pins extended forward from said gear-wheel, a detent-bar mounted to swing in the casing and adapted to be engaged by either one of the stop-pins, and a tappet on the plunger for engaging the said detent-bar to move it out of engagement with the stop-pin, substantially as specified.

604,988. BICYCLE TOOL-CASE. LOUIS H. KNOPPEL, New York, N. Y. Filed Sept. 14, 1897. Serial No. 651,612. (No model.)

Claim.—1. A tool-case for bicycles, formed in two halves each half comprising a metallic frame, consisting of a band or bar and forming the outline thereof, and a sheet of fabric fastened thereto, hinges connecting the two halves at their bottom edges, clamps connected with the upper part of the metallic frame of one of the halves of the case and arranged to connect said half to the bicycle-frame, the fastening means for the said clamps being controlled from the inside of the tool-case, and means for supporting the other half of the case in a horizontal position when opened, substantially as described.

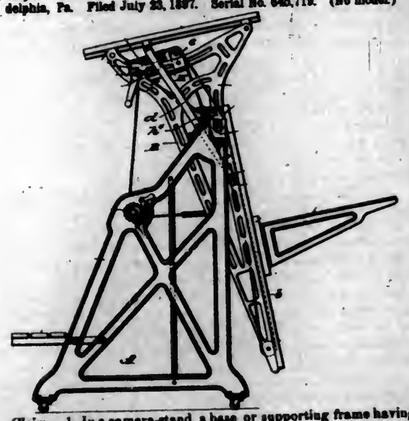
2. A tool-case for bicycles formed in two halves each half comprising a metallic frame forming the outline thereof, and a fabric sheet secured thereto forming the sides of the case, a pocket for one side or half of said case comprising a sheet of fabric having a fabric strip or band secured to its bottom and end edges, a second strip or band lying parallel with the rim of said half and secured to the first strip or band, and a metal strip secured to the frame and between which and the frame the latter fabric strip and the fabric sheet forming the outer side of the case are clamped, substantially as described.



3. A clamp for bicycle tool-cases, comprising a strap having a bent or curved portion to fit about a tube, and straight portions extending from the ends of the curved portions, the free ends of the straight portions being bent sharply inward, one of said inwardly-extending ends being perforated to receive a locking-bolt, and the other inwardly-extending end having a slot formed therein extending from the end longitudinally of the band, the tips of each half thereof turning upward, for the purpose set forth.

4. The combination with a tool case for bicycles, of a clamp consisting of a metal strap or band bent to fit about a tube, and having its ends bent inward at right angles to the body thereof, one of said inwardly-bent ends being perforated and the other end having a longitudinal slot formed therein and extending from the end thereof, the extreme ends of the halves formed by said slot being turned upward for the purpose set forth, a bolt adapted to extend through the perforation and slot in the ends of the band, and through the frame of the tool-case to the inside thereof, and means located inside the tool-case for locking the bolt to hold the clamp in position, substantially as described.

5. A clamp for embracing tubes and similar cylindrical forms comprising a band embracing the tube and having its ends at a short distance apart bent outward in substantially a radial direction and then toward each other in a tangential direction, the ends overlapping each other, the outer end at its extremity being bent inwardly or toward the center and engaging the angle or bend of the other end, and a radial bolt passing through the tangential parts of each end, substantially as described.



6. A clamp for embracing tubes and similar cylindrical forms comprising a band embracing the tube and having its ends at a short distance apart bent outward in substantially a radial direction and then toward each other in a tangential direction, the ends overlapping each other, the outer end at its extremity being bent inwardly or toward the center and engaging the angle or bend of the other end, the tangential portion of one end having a hole therethrough, and of the other end having a slot extending to the end and a radial bolt passing through the tangential parts of each end, substantially as described.

604,989. FIRE-ESCAPE. MAX KOLMERN, Chicago, Ill. Filed Dec. 20, 1897. Serial No. 664,578. (No model.)

Claim.—In a fire-escape, a fixed metal tower, a series of floors therein, each floor provided with an opening, a series of ladders depending from said floors, the lowermost ladder being hinged to its floor, a series of bridges secured to said tower adjacent the floors, and wire screens hinged to said bridges substantially as and for the purpose set forth.

604,990. PHOTOGRAPHIC-CAMERA STAND. MAX LEVY, Philadelphia, Pa. Filed July 23, 1897. Serial No. 645,719. (No model.)

Claim.—1. In a camera-stand, a base or supporting frame having spring-sustained boxes or bearings, in combination with an adjustable frame journaled to the boxes or bearings, a camera-platform pivotally attached to the adjustable frame on one side of its supporting means and an object-support longitudinally movable upon the adjustable frame the same being positioned on the other side of the supporting means, for the purpose set forth.

2. In a camera-stand, the combination with a base or supporting-frame having spring-supported bearings or boxes, of a frame held in pivotal engagement with the base and engaging with the bearings or boxes, said frame carrying on one side of its support a longitudinally-adjustable object-support and on the other side a camera-platform which is pivotally attached to the frame, arms movably secured to the camera-platform and studs or pins with which the free ends of the arms may be placed in engagement said pins being carried by the base, substantially as shown and for the purpose set forth.

3. In a camera-stand, the combination with a base, of a frame pivotally connected thereto, an object-support carried by the frame so as to be movable to and from the pivotal connection between the frame and base, a flexible connection the ends of which are attached to the pivotal frame, a shaft carried by the base and provided with a drum over which the flexible connection passes, ratchet-wheels carried by the shaft, and pawls pivoted to the base so as to engage with the ratchet-wheels, substantially as shown and for the purpose set forth.

4. In a camera-stand, the combination with a base having movable shaft-bearings, a shaft carried by an adjustable frame for engagement with said shaft-bearings, and a flexible connection attached to the adjustable frame and engaging with a drum on a shaft journaled in the base, substantially as shown and for the purpose set forth.

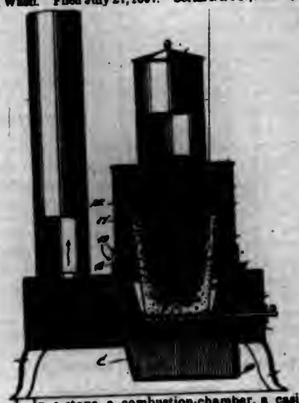
5. In a camera-stand, the combination with a base, of a platform carried thereby, and in pivotal connection therewith, the platform having a shaft which engages shaft-bearings, said bearings being spring-supported so as to insulate the platform from the base as to vibrations, for the purpose set forth.

6. In a camera-stand, the combination with a base and a platform or supporting-frame pivotally connected thereto and provided at the points of pivotal connection with means for insulating the parts as to vibrations, of an object-support carried by the platform, and a camera-platform pivotally attached to the supporting-frame, substantially as shown and for the purpose set forth.

7. In a photo-copying camera-stand, the combination with a camera-platform and an object-support carried by an adjustable frame, a base to which said frame is pivotally connected, a shaft carried by the base, a drum mounted on said shaft, a flexible connection attached to the adjustable frame an intermediate portion thereof engaging with the drum, and means for moving the shaft to effect a change of position of the adjustable frame with respect to the base, for the purpose set forth.

8. In a photo-copying camera-stand having a pivotally-supported frame which is insulated from its base, an object-support carried by the frame so as to be adjustable longitudinally thereon, and a camera-platform pivotally attached to said frame and provided with means for changing its position or angle with respect to the object-holder, substantially as shown and for the purpose set forth.

9. In a photo-copying apparatus the combination of a pivotally-supported frame connected to a supporting-base, means embodying flexible connections, guides therefor, a drum over which the flexible connection passes, means for turning said drum attached to the pivotally-supported frame, and an object-support mounted on the pivotally-supported frame the flexible connection engaging with said object-support to effect a longitudinal movement thereof upon the frame when the drum is turned, for the purpose set forth.



10. In a photo-copying apparatus, the combination with a base or main supporting-frame, of a frame pivotally connected thereto and insulated therefrom, means for moving the frame upon its pivot embodying a flexible connection the ends of which are attached to the movable frame, a shaft mounted on the base and provided with a drum about which the flexible connection is wound, and means for holding the shaft against rotation, substantially as shown and for the purpose set forth.

11. In a camera-stand, the combination of a base having spring-supported journal-boxes, a shaft journaled between the side pieces of the base, ratchet-wheels mounted on said shaft, pawls carried by the base, a drum mounted on the shaft between the side pieces of the base, of a frame which engages with the journal-boxes, a flexible connection which is attached thereto and engages with the drum on the shaft hereinbefore mentioned, an object-support and a camera-holder carried by the pivoted frame, substantially as shown so that the angle of the pivoted frame may be varied by disengaging one of the pawls from its ratchet-wheel, for the purpose set forth.

12. In a camera-stand the combination with a base having spring-supported or insulated journal-boxes, a frame having a shaft which engages with said journal-boxes, a shaft journaled to the base and provided with a drum, means for holding said shaft against rotation; together with a flexible connection which passes over the drum the ends thereof being connected to the frame carried by the base, an object-support, and a camera-platform connected to the frame, substantially as shown and for the purpose set forth.

13. In a photo-copying apparatus a camera-platform and an object-support mounted upon a frame, said frame being pivotally connected to and insulated as to vibrations from its supporting-base, means for connecting the camera-platform to the frame so that it may be positioned parallel with or at right angles to the object support, and means for moving the frame to which the camera-platform and object-support are attached with respect to the base, substantially as shown and for the purpose set forth.

604,991. STOVE. CHARLES T. LITCHFIELD and JOSEPH T. BAUGHER, Spokane, Wash. Filed July 27, 1897. Serial No. 646,067. (No model.)

Claim.—1. In a stove, a combustion-chamber, a casing on the combustion-chamber and having a closed top and draft-openings in its lower portion, a fire-box having its lower portion projecting into the combustion-chamber and provided at its upper end with an extension, said fire-box and its extension forming with the casing a heating-space, and a feeder or magazine projecting through the top of the casing and extending into the upper end of the fire-box, said magazine forming with the extension of the fire-box an annular chamber through which the air from the heating-space passes to the fire-box, substantially as described.

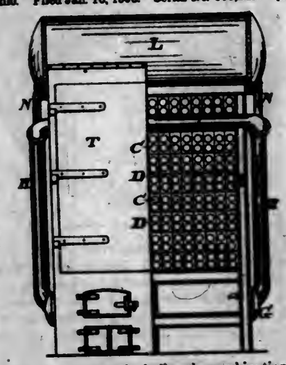
2. In a stove, the combination with a base having a combustion-chamber from which leads a smoke-pipe, of a casing secured upon the top of the combustion-chamber and having a closed top and draft-openings in its lower portion, a fire-box supported upon the top of the combustion-chamber with its lower portion projecting into the same, a jacket secured to the upper portion of the fire-box, the fire-box and its jacket being spaced from the casing to form an annular air-space, a feeder or magazine projecting through the top of the casing and extending into the jacket and upper portion of the fire-box, the said feeder being of less diameter than the upper end of the fire-box and its jacket to form therewith an annular chamber and having its end flared outwardly, and a grate in the combustion-chamber below the lower end of the fire-box, substantially as described.

3. In a stove, the combination, with a base having a chamber therein, a smoke-pipe connected with the said chamber, a fire-pot attached to the base and extending downward into the chamber, the portion of the fire-pot in the chamber being slotted, forming a series of fingers, and a grate in the said chamber below the end of the fire-pot, of a jacket attached to the upper portion of the fire-pot, a casing on the base and extending above the said jacket and surrounding it and the upper portion of the fire-pot to form an annular air-space, the said casing being provided with openings at its bottom, a draft-slide located at the apertured portion of the casing, and a magazine or feeder passed through the upper portion of the casing and also through the jacket to the upper portion of the fire-pot, the lower end of the magazine or feeder being outwardly flared, and a space being provided between the magazine or feeder and said jacket, as specified.

604,992. CULTIVATOR. PETER R. LITTLE, Dayton, Ohio, assignor to the Ohio Rake Company, same place. Filed Nov. 10, 1897. Serial No. 658,607. (No model.)

Claim.—1. In a cultivator, the combination, with the seat-bar and automatic laterally-adjustable cultivator-frames therefor, with means for attaching same to the seat-bar, of two pairs of similar rotary disks, with similar means for adjustably securing same to the cultivator-frames, whereby said disks may be interchangeable, the one pair attached to the front bar of said frame, the other pair attached to the rear bar, and each pair adjustable to throw the dirt in opposite directions, with respect to the cultivated plants, substantially as shown and described.

2. In a cultivator, the combination, with seat-bar, and automatic laterally-adjustable cultivator-frames therefor, with means for attaching same to the seat-bar, and two pairs of similar rotary disks, with similar means for adjustably securing same to the cultivator-frames, whereby said disks may be interchangeable, the one pair attached to the front bar of said frame, the other pair attached to the rear bar, and each pair adjustable to throw the dirt in opposite directions, with respect to the cultivated plants, with adjustable shields attached to the runner-frames opposite said rear disks, substantially as shown and described.



3. In a cultivator, provided with rotary cultivating-disks, a hanger therefor, with coupling-block for securing same to the frame, and journal-bearing for the disk, said hanger being provided with ratchet-plates at each end, and corresponding ratchet-plates on said coupling-block and disk-journal meshing therewith, substantially as shown and described.

4. In a cultivator, provided with concavo-convex rotary cultivating-disks, a hanger therefor, with coupling-block for securing same to the frame and antifriction journal-bearings for the disks mounted on the convex side thereof, said hanger being provided with ratchet-plates at each end and corresponding ratchet-plates on said coupling-block and disk-journal meshing therewith, substantially as shown and described.

5. In a cultivator, provided with rotary cultivating-disks, a rotatable and longitudinally-adjustable hanger, coupling-block for securing same to the frame, and journal-bearing for the disk, said hanger being provided with ratchet-plates at each end, and corresponding ratchet-plates on said coupling-block and disk-journal meshing therewith, whereby universal adjustment may be had for said disks, substantially as shown and described.

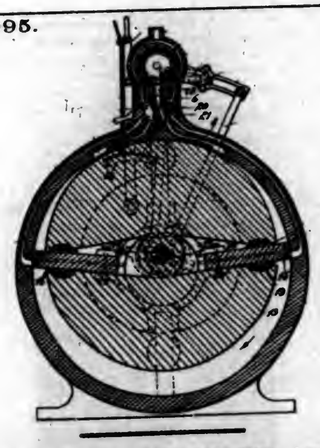
6. In a cultivator, provided with rotary cultivating-disks, a hanger therefor with coupling-block for securing same to the frame, said block being provided with a ratchet-plate, and a corresponding ratchet-plate meshing therewith, strap encircling said hanger and passing through said plates for securing same, said hanger being provided with a rib and the intermediate ratchet-plate being recessed and grooved to receive said rib and prevent the hanger from turning, substantially as shown and described.

604,993. WATER-TUBE BOILER. WILLIAM A. LLOYD, Ashtabula, Ohio. Filed Jan. 10, 1898. Serial No. 666,249. (No model.)

Claim.—1. In a water-tube boiler, the combination with the tubes B of the headers D, having double tubular chambers, caps C for closing said chambers, annular beveled grooves *d* in said caps and in the ends of said chambers, tapering packing-rings *e* in said grooves, and the bolts E, nuts *f* and cross-pieces F, substantially as described.

2. In a water-tube boiler, the combination with the tubes B, headers D connecting said tubes at the front and rear, and the mud-drum G, connected with the rear end of lower row of water-tubes, the outside diagonal pipes H H, attached to the ends of mud-drum, and the upper cross-pipe I connected with the upper tubes B, substantially as described, of the steam-drum L connected at its rear side by pipes M with the upper rear headers D, and its ends connected by branch pipes N with the diagonal pipes H H, substantially as described and for the purpose set forth.

604,994. PEANUT-VENDING CASE. CLARENCE O. LUCE, Plainfield, Wis. Filed Aug. 6, 1897. Serial No. 647,334. (No model.)



Claim.—A peanut-vending case consisting of a casing having transparent front and sides and an open top, a door fitted in said top, a back terminating above the bottom, converging partitions extending from the back toward the front and terminating a short distance from the front, a heater fitted snugly to the bottom of the case and having a door in its rear side to admit an oil-stove or lamp.

604,995. ROTARY ENGINE. FRED J. MACEY, Ontonagon, Mich. Filed June 21, 1897. Serial No. 641,062. (No model.)

Claim.—A rotary engine comprising a cylinder having exhaust-ports leading from a head on the cylinder and extending through the peripheral wall of the cylinder and communicating with the interior of the cylinder at about its center, the said peripheral wall also having inlet-ports, the inlets being at the upper portion of the cylinder, a reversing-valve, a hollow rocking valve for controlling admission of steam, a piston-disk eccentrically mounted in the cylinder, and radially-movable piston-wings carried by the piston-disk, substantially as specified.

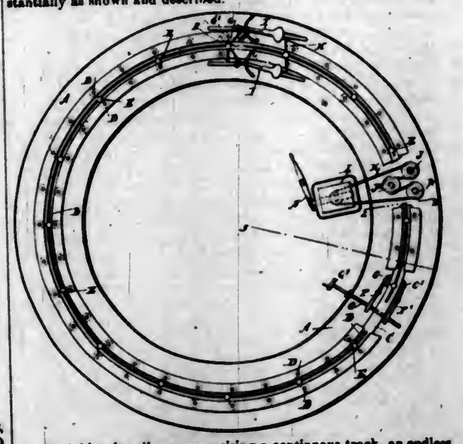
604,995.

604,996. PROCESS OF PURIFYING SPIRIT. LOUIS MAICHE, Paris, France. Filed Apr. 26, 1897. Serial No. 634,006. (No specimens.)

Claim.—The process herein described of purifying spirit, consisting in diluting crude spirit with several times its volume of water, distilling at a low temperature *in vacuo*, thereby eliminating impurities, and finally concentrating the dilute spirit by distillation in the usual manner.

604,997. SOFA-BED. ALEXANDER MANDL, New York, N. Y., assignor to Moses Stiefel, same place. Filed Aug. 27, 1897. Serial No. 649,697. (No model.)

Claim.—The combination with a main frame, having an upholstered seat-section and flattened portions at its ends, side pieces having flat bottoms and provided with recesses at the inner corners of the rear ends, means for connecting said side pieces with the ends of the main frame, a back upholstered at its upper part and along a portion of its sides and provided with a recessed lower part, and a folding mattress-section, the ends of which are inserted in the corner recesses of the side pieces, whereby said mattress-section is retained in the recessed lower part of the back, substantially as set forth.



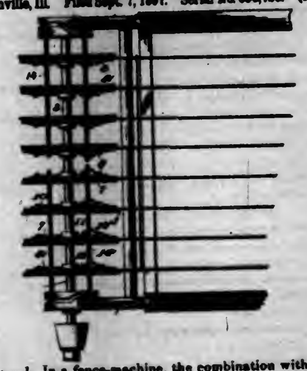
604,998. BICYCLE-RAILWAY. WILLIAM F. MANGELS, Brooklyn, N. Y., assignor of one-half to William S Smith, same place. Filed Sept. 29, 1897. Serial No. 653,494. (No model.)

Claim.—1. A bicycle-railway, comprising a continuous track, guide-wheels, an endless band of rigid material adapted to travel on the said guide-wheels, and a rigid support erected on the said band and connected with the bicycles arranged to travel on the track, substantially as shown and described.

2. A bicycle-railway, comprising a continuous track, a duct on the said track, an endless band of rigid material mounted to travel in the said duct, posts erected at intervals on the said band, frames carried by the said posts and connected with the bicycles traveling on the said track, and a brace arranged above the said band and connecting the several posts with each other, as set forth.

3. A bicycle-railway, comprising a continuous track, an endless band of rigid material movable in a duct in the said track, posts erected at intervals on the said band, frames provided with transverse rods or bars connecting adjacent posts with the axles of the front and rear wheels of the bicycles respectively, and a brace connecting the several posts with each other, substantially as specified.

4. A bicycle-railway, comprising a continuous track, an endless movable band, posts erected at intervals on the said band, frames provided with transverse rods or bars connecting adjacent posts with the axles of the front and rear wheels of the bicycles respectively, and a brace extending above the said band and connecting the said posts, the said brace being depressed between adjacent posts, substantially as shown and described.



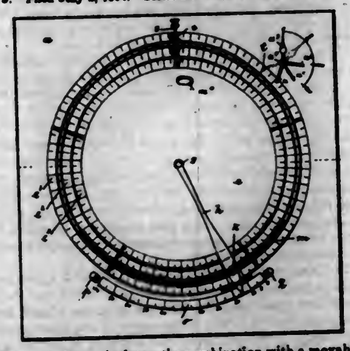
5. A bicycle-railway, comprising a continuous track, an endless band of rigid material movable in a duct on the said track, means for connecting the band with the bicycles arranged to travel on the said track and a device for clamping the said band to stop the same, substantially as shown and described.

6. A bicycle-railway provided with a continuous track, guide-wheels, an endless band traveling on the said guide-wheels, posts erected at intervals on the said band, frames provided with transverse rods or bars connecting adjacent posts with the axles of the front and rear wheels of the bicycles respectively, a brace connecting the several posts with each other, an auxiliary starting device for imparting a traveling motion to the said band, and a stopping device for said band, substantially as shown and described.

7. A bicycle-railway, comprising a continuous track, an endless movable band of rigid material, means for connecting the band with the bicycles traveling on the track, and a stopping device for the said band comprising jaws adapted to clamp the edge of the band on opposite sides, and means for moving the jaws in or out of engagement with the band, substantially as set forth.

8. A bicycle-railway, comprising a continuous track, a duct on the said track, guide-wheels journaled in the walls of said duct, an endless band of rigid material arranged to travel on the said guide-wheels, means for connecting the band with bicycles mounted to travel on the track, and an auxiliary driving device for the said band comprising pulleys arranged for frictional engagement with the edges of the band, and means for driving the said pulleys, substantially as shown and described.

604,999. CLAMP FOR FENCE-MACHINES. ELISHA C. MATHEWS, Jacksonville, Ill. Filed Sept. 7, 1897. Serial No. 650,732. (No model.)



Claim.—1. In a fence-machine, the combination with the wire-supporting spools, of clasping-arms mounted on the spools and adapted to press the wires against the edges of the same.

2. In a fence-machine, the combination with the wire-supporting spools, of clasping-arms mounted on the sides of the same and adapted to press the wires against the edges of the spools, and means for forcing said arms upon the wires.

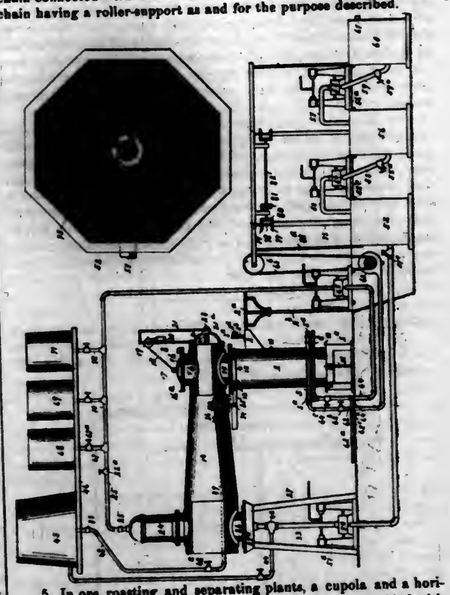
3. In a fence-machine, the combination with the wire-supporting spools, of clasping-arms carried by the said spools, toggle-levers fulcrumed on the spools and engaging the said arms, and means for operating the said levers.

4. In a fence-machine, the combination with the wire-supporting spools, of clasping-arms carried thereby and adapted to engage the wires, toggle-levers fulcrumed on the spools and engaging the arms, reciprocating rods pivotally joined to the toggle-levers, and cam-disks adapted to operate said rods.

605,000. CALCULATING DEVICE. LEVY MAYBAUM, Newark, N. J. Filed July 2, 1897. Serial No. 643,195. (No model.)

Claim.—1. In a calculator, the combination with a movable indicating element provided with a rack, of a pointer pivotally movable with reference to a fixed scale and provided with laterally-projecting supporting-arms secured at its free end and with a pin having a deflected end and adapted to engage the teeth of said rack, substantially as described.

2. In a calculator, the combination with the frame or bed plate, of a revoluble disk provided with graduated indices and having ball-bearings arranged in said frame, a stationary scale arranged concentrically to said disk on said frame, an operating hand or pointer for said disk pivoted on the pivot thereof and movable independently thereof, flexible supporting-arms for the free end of said pointer, an annular rack-bar carried by said disk, a pin secured to the free end of said hand or pointer and having a deflected end adapted to engage the rack-rod, stops for said pointer, a pointer *s* arranged on the frame at a point remote from the stationary scale, a depression s^0 in said plate, a pin *t* carried by said disk, and an auxiliary indicating mechanism adapted to be operated by said disk and consisting of a dial and a pointer therefor having a series of arms adapted to be successively engaged by said pin *t*, substantially as described.



605,001. PROCESS OF AND APPARATUS FOR ROASTING AND SEPARATING ORES. WAITMAN M. MORGAN and FRANCIS E. PARKER, Kansas City, Mo. Filed Oct. 9, 1894. Serial No. 608,571. (No model.)

Claim.—1. The herein-described process of treating refractory ores in ore-roasting furnaces consisting first in roasting the ores with a flux and simultaneously drawing air through the heated ores, and separating the sulfur and arsenic and also the sulfids and arsenids from the ores, and then investing the slag containing the metal with a separate mineral after the separation in the furnace.

2. The herein-described process of treating refractory ores in ore-roasting furnaces consisting first in roasting the ores with a flux, simultaneously drawing air through the heated ores, and separating the sulfur and arsenic, then fluxing the arsenids and sulfids beneath the ores, and then investing the silicious slag containing the metal with a salt, within the furnace.

3. The herein-described process of treating refractory ores in ore-roasting cupola-furnaces, consisting in roasting the ores with a flux, and simultaneously drawing air through the heated ores, thereby separating the sulfur and arsenic, fluxing the arsenids and sulfids beneath the ores, drawing lime through the heated ores and then investing the silicious slag containing the metal with salt and pulverized granite.

4. In ore roasting and separating plants a cupola, a horizontal detachable fume-arresting case having one end supported by the said cupola, separate openings in said end, a pivotal support at the other end of said case, a hinged cover to one of the separate openings, a chain connected with said cover and a weight upon said chain, said chain having a roller-support as and for the purpose described.

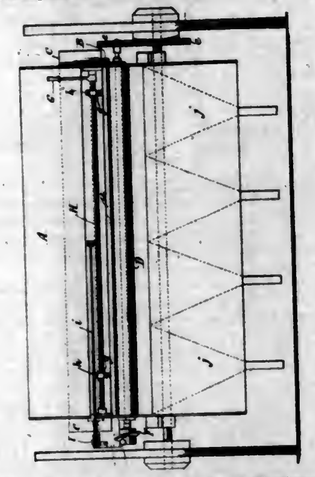
5. In ore roasting and separating plants, a cupola and a horizontal, detachable fume-arresting case, having one end provided with an opening and supported by said cupola, a pivotal support at the other end of said case, and a fume-discharging pipe connected with said case as and for the purpose described.

6. In ore roasting and separating plants a cupola, a horizontal detachable fume-arresting case, having an opening for the entrance of the fumes at one end, and supported by said cupola, a pivotal support at the other end of said case, a discharge-pipe for the fumes, connected with the pivotal end of said case, a fume-precipitating perforate pipe within said case, and a fluid-supply pipe connected with the said perforate pipe, said fume-arresting case, having its bottom inclined downwardly at an angle to its support and in the direction of the said fume-discharging pipe as and for the purpose described.

7. In ore roasting and separating plants, a series of ore-roasting cupolas in a circuit, a scaffold within the series of the cupolas and equidistant from each cupola, a horizontally-extending fume arresting case or flue, having an opening in its vibrating end extending over one of said cupolas, a fume-discharging pipe, a plate upon said scaffold having antifriction devices, and an extension in said case having a flange bearing upon said antifriction device as and for the purpose described.

8. In ore roasting and separating plants the combination with one or more ore roasting and separating cupolas in a circuit, of a scaffold within the series of cupolas and equidistant from each cupola, a horizontally-extending fume-arresting case or flue, having an opening in its vibrating end extending over one of said cupolas, a discharge-pipe for the said fumes, a pivotal support for said case upon said scaffold, a circular track-rail with the series of cupolas, and beneath the vibrating end of said case, a support for said rail, rollers on said case and resting on said rail, and eccentric axis to said rollers as and for the purpose described.

9. An ore roasting and separating cupola having vertical passages between the lining to the cupola and its outer casing, and a perforate lining to each of said passages as and for the purpose described.



10. In fume-arresters for ore roasting and separating plants, a case for the fumes, having a vibrating outer end, and a pivotal inner end, an extension to said case having a flange and a supporting-plate beneath said flange, having pockets and antifriction-rollers in said pockets, and adjusting-bolts in said pockets beneath said rollers, as and for the purpose described.

11. In separating plants for ores, &c., a settling-tank, a supply-pipe and a discharge-pipe connected with said tank, separate perforate disks in said tank, a shaft connected with one of said disks and a concentric pipe or tube connected with the other disk and power-conveyers connected with said shaft and pipe as and for the purpose described.

12. In a separating plant for ores, &c., a settling-tank, a supply-pipe and a discharge-pipe connected with said tank, a vertical shaft and a concentric pipe or tube within said tank, a perforate convex disk on the lower end of the respective shaft and tube, separate miter-gear on the upper end of the respective shaft and tube, a power-conveying shaft and a miter-gear on said shaft meshing with the miter-gear on the said shaft and tube as and for the purpose described.

13. In a separating plant for ores, &c., a settling-tank, a pipe having its lower end extending within said tank, a convex wire disk on the said end of said pipe, a miter-gear upon its upper end, a shaft within said pipe and a convex wire disk upon the lower end of said shaft, a miter-gear upon its upper end, a power-conveying shaft, a miter-gear on said shaft meshing with said miter-gear on the upper ends of the respective shaft and tube carrying said disks, a supply-pipe to the settling-tank having its inner end extending to a position beneath the wire disk, and a discharge-pipe in the side of said tank as and for the purpose described.

605,002. MANURE-DISTRIBUTER. THOMAS H. MOTLEY, Grainthorpe, England, assignor of one-half to William Haddon Owen, Louth, England. Filed Dec. 24, 1897. Serial No. 663,343. (No model.) Patented in England Nov. 2, 1896, No. 24,443.

Claim.—1. In a manure-distributer, the combination with a suitable hopper, of slides mounted in the lower portion thereof and adapted to form a discharge-opening between them, a pivoted lever mounted upon the hopper and connected at its ends with the said slides, and means for reciprocating one of the slides, the construction being such that upon one slide being reciprocated it will by means of the lever communicate a reciprocating movement to the other slide, substantially as described.

2. In a manure-distributer, the combination with a suitable hopper, of slides mounted therein and adapted to form a discharge-opening between them, a lever pivoted to the said hopper and connected directly to one of the said slides at one end, a link for connecting the other end of the said lever to the central portion of the other slide, and means for reciprocating one of the slides whereby motion is communicated to both through the said lever, substantially as described.

3. In a manure-distributer, the combination with a suitable hopper, of slides mounted therein and adapted to form a discharge-opening between them, a lever pivoted to said hopper and connected directly to one of the said slides at one end, a link for connecting the other end of the said lever to the central portion of the other slide, and means for raising and lowering the latter slide whereby the size of the discharge-opening may be enlarged or diminished as required, the construction being such that the slides will be caused to reciprocate with respect to each other when in their different adjusted positions, substantially as described.

4. In a manure-distributer, the combination with a suitable hopper, of slides mounted in the lower portion thereof and forming a discharge-opening between them, means for reciprocating the said slides, and means for adjusting one of said slides upon a longitudinal rod whereby the said slide may be raised or lowered to increase or diminish the discharge-opening between the two slides and may still be capable of a longitudinal movement with respect to the hopper, substantially as described.

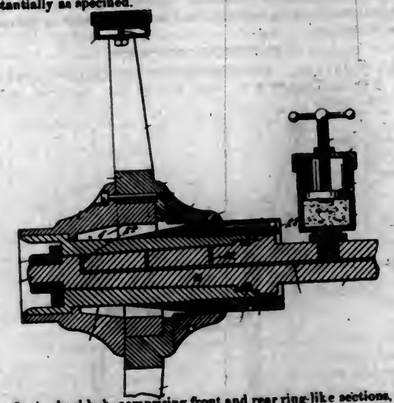
5. In a manure-distributer, the combination with a suitable hopper, of reciprocating slides mounted in the lower portion thereof and adapted to form a discharge-opening between them, means for reciprocating the said slides, a roller mounted below the said discharge-opening for assisting in the distribution of the contents of the hopper, and means for revolving the said roller, substantially as described.

6. In a manure-distributer, the combination with a suitable hopper, of reciprocating slides mounted therein and adapted to form a discharge-opening between them, a roller mounted below the said discharge-opening, means for rotating the said roller, means connected with the said roller and engaging one of the slides for reciprocating the said slide, a lever pivotally mounted upon the said hopper and engaging the said slide at one end, and means for connecting the opposite end to the other slide, the construction being such that the slides will reciprocate oppositely with respect to each other, substantially as described.

7. In a manure-distributer, the combination with a suitable hopper, of reciprocating slides controlling the discharge from the said hopper, a roller arranged below the said discharge, gearing for connecting the roller with the shaft of the distributer whereby upon the distributer being moved forward the motion from the wheels will be communicated to the said roller, a cam-disk formed upon the shaft of the said roller, friction-rollers upon one of the said slides and adapted to engage said cam-disk whereby a reciprocating movement may be imparted to the said slide, and a lever mounted upon the hopper and engaging the said slide at one end and connected with the other slide at the other end, the construction being such that the slides will be caused to reciprocate in opposite directions with respect to each other, substantially as described.

8. In a manure-distributer, the combination with a suitable hopper, of slides mounted therein and adapted to control the discharge from the said hopper, means for reciprocating one of said slides, a lever mounted upon the hopper and engaging the said actuated slide, a link connected to the said lever and engaging the other slide for communicating motion thereto, links for supporting the latter slide, arms for supporting the said links, the said arms being movably secured upon a shaft transversely mounted in the frame of the distributer, and a lever secured to the said shaft, the construction being such that the height of the latter slide may be regulated by the said lever in order to increase or diminish the discharge-opening between the slides, substantially as described.

9. In a manure-distributer, the combination with a suitable hopper, of slides controlling the discharge therefrom, one of the said slides forming a movable bottom for the hopper, means for adjusting the other slide vertically, an overhanging apron mounted interiorly of the hopper for preventing the material in the hopper from clogging the movement of the latter slide, and means for reciprocating the said slide, substantially as described.



10. In a manure-distributer, the combination with a suitable hopper, of slides mounted in the lower portion thereof and adapted to form a discharge-opening between them, a cam arranged upon the said hopper and adapted to engage one of said slides for reciprocating the same, and means for connecting the said slide to the other slide whereby a reciprocating movement is also imparted to the second slide, substantially as described.

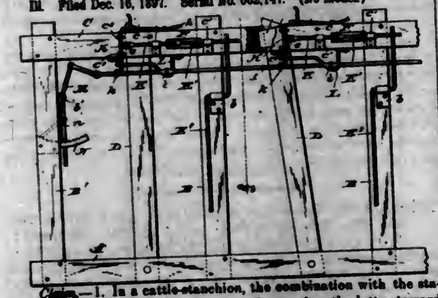
11. In a manure-distributer, the combination with a suitable hopper, of slides mounted in the lower portion thereof and adapted to form a discharge-opening between them, a cam arranged upon the said hopper and adapted to engage one of said slides for reciprocating the same, means for rotating the said cam, friction-rollers upon one of said slides and adapted to engage the said cam whereby a reciprocating movement is imparted to one of said slides, and means for connecting the said slides to the other slide whereby a reciprocating movement is also imparted to the second slide, substantially as described.

605,008. VEHICLE-WHEEL. ROBERT G. MCDOWELL, Anaconda, Mont. Filed Dec. 13, 1897. Serial No. 661,741. (No model.)

Claim.—1. A wheel-hub, comprising a front ring-like portion having inwardly-extending wedge-shaped projections to engage between spokes, a ring having forwardly-extended wedge-shaped projections to engage between spokes at the outer side of the first-named projections, a ring-shaped inner portion for the hub, means for securing the two sections of the hub together, a box, a tapered sleeve having an exterior screw-thread engaging with an interior screw-thread of the inner section of the hub, and means for securing said sleeve to the box, substantially as specified.

2. In a wheel, a hub, comprising inner and outer ring-shaped sections, means for securing the two sections together, a box, a tapered sleeve movable on said box for forcing the wheel-spokes outward, the said tapered sleeve having screw-thread engagement with the inner section of the hub, and a ring having a screw-thread engagement with the box and engaging against the end of the sleeve, substantially as specified.

3. A wheel-hub, comprising front and rear ring-like sections, the said sections having wedge-shaped projections to engage the sides of spokes, means for securing the sections together, a box, a tapered sleeve movable on the box to force spokes outward, and means for holding said sleeve in position, substantially as specified.



605,004. HANDLE FOR SHEET-METAL VESSELS. JAMES R. MCLAUGHLIN, Clifton Springs, N. Y., assignor of one-half to Thomas W. Martin, same place. Filed Sept. 7, 1897. Serial No. 650,742. (No model.)

Claim.—1. The combination, with a sheet-metal vessel, of arms or brackets secured thereto, a handhold part arranged between said arms or brackets at or near the outer ends thereof, caps or ferrules upon each end of said handhold part, means securing said handhold part to said arms and said caps having convex surfaces at the ends of said handhold part to nest with similar surfaces on said arms or brackets, substantially as described.

2. The combination, with a sheet metal vessel, of supporting arms or brackets secured thereto, a handhold part arranged between said arms, caps or ferrules 11 provided upon the opposite ends of said handhold part and having convex surfaces 12, said arms having curved surfaces 7 to nest with said surfaces 12 and a rod 9 extending through said handhold part and the convex surfaces of said caps and said arms whereby the parts are rigidly secured together, substantially as described.

605,005. CATTLE-STANCHION. GEORGE L. NICHOLS, De Kalb, Ill. Filed Dec. 16, 1897. Serial No. 662,147. (No model.)

Claim.—1. In a cattle-stanchion, the combination with the stationary and movable bars, and means for moving the latter toward the former, of stops limiting this movement, sliding stop-pins for holding the movable bar at an inclination with respect to the stationary bar, and a bail engaging the movable bar when the same is moved into position closing the stanchion, substantially as shown and described.

2. In a cattle-stanchion, the combination with the stationary and movable bars, and means for moving the latter toward the former, the movable bar having a beveled upper end, of sliding stop-pins for holding the movable bar at an inclination with respect to the stationary bar, and a pivoted bail adapted to ride over the end of the movable bar and engage the same, substantially as shown and described.

3. In a cattle-stanchion, the combination with the stationary and movable bars and means for moving the latter toward the former, the movable bar having its upper end beveled, of sliding stop-pins engaging the movable bar to hold the same at an inclination with respect to the stationary bar, means automatically moving the stop-pin into such engagement, and a pivoted bail adapted to ride over the end of the movable stanchion-bar and engage the same, substantially as shown and described.

4. In a cattle-stanchion, the combination with the stationary and movable bars and means for moving the latter toward the former, the movable bar having its upper end beveled, means for engaging and releasing the movable bar, and a pivoted locking-bail adapted to ride over the end of the movable bar and engage the same, the ends of said bail being extended and bent to limit its upward movement, substantially as shown and described.

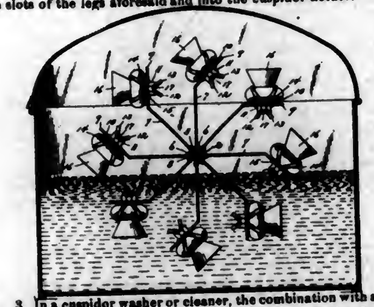
5. In a cattle-stanchion, the combination with the stationary and movable bars and means for moving the latter toward the former, of a sliding stop-pin engaging the movable bar to hold the same at an inclination with respect to the stationary bar, a pivoted lever connected to said stop-pin, and a spring moving the stop-pin into engagement with the movable stanchion-bar; together with means for locking said stanchion-bar in a closed position, substantially as shown and described.

6. In a cattle-stanchion the combination with the stationary and movable bars and means for moving the latter toward the former, of a sliding stop-pin engaging the movable bar to hold the same at an inclination with respect to the stationary bar, a lever consisting of two pivoted sections connected to each other, one of the sections being connected to the stop-pin, an operating-lever engaging the other section, and a flat spring bearing against the sectional lever to project the stop-pin into engagement with the stanchion-bar; together with means for locking said stanchion-bar in a closed position, substantially as shown and described.

7. In a cattle-stanchion, the combination with the stationary and movable stanchion-bars and means for moving the latter toward the former, bails engaging the movable bars when closed, a sliding rod engaging said movable bars to move them away from the stationary bars, the rod having a vertical movement, rods connected to said sliding rod and engaging the bails, and means for holding the sliding rod, substantially as shown and for the purpose set forth.

8. In a cattle-stanchion, the combination with the stationary and movable bars and means for moving the latter toward the former, the movable bars having their upper ends beveled, of bails engaging the upper ends of the movable bars, a sliding rod having arms which engage said movable bars to move them away from the stationary bars, and means actuated by the sliding rod to lift the bails out of engagement with the stanchion-bars, substantially as shown and for the purpose set forth.

9. In a cattle-stanchion, the combination with the stationary and movable bars and means for moving the latter toward the former, of bails engaging the upper ends of the movable bars, a sliding rod having arms which engage the movable bars to move them away from the stationary bars, guide-rails engaging the arms to move the sliding rod vertically, and means actuated by the vertical movement of the sliding rod to lift the locking-bails, substantially as shown and for the purpose set forth.



10. In a cattle-stanchion, the combination with the stationary and movable bars and means for moving the latter toward the former, of bails engaging the upper ends of the movable bars, a sliding rod having arms which engage the movable bars to move them away from the stationary bars, guide-rails engaging the arms to move the sliding rod vertically, rods connected to the sliding rod and engaging the locking-bails, being extended above the same, a lever for operating the sliding rod, a pawl pivoted to the lever, and a rack-bar with which the pawl engages, substantially as shown and for the purpose set forth.

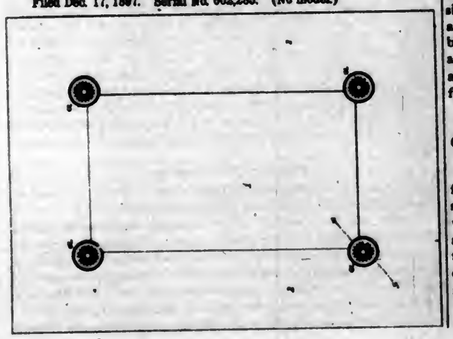
605,006. CUSPIDOR-CLEANER. JOHN F. HOLAN, Chicago, Ill. Filed Dec. 4, 1897. Serial No. 660,808. (No model.)

Claim.—1. In a cuspidor washer or cleaner, the combination with a fluid-receptacle, of a rotary cuspidor-holder within said receptacle, and cuspidor-clamps located at different points of the holder and consisting of substantially U-shaped clamp members adapted to embrace the body of the cuspidor on opposite sides thereof and being relatively adjustable, and means for securing said clamp members.

2. In a cuspidor washer or cleaner, the combination with a fluid-

receptacle, of a rotary cuspidor-holder within said receptacle, cuspidor-clamps comprising substantially U-shaped clamp members having slotted legs, the cross-pieces of said clamp members being adapted to embrace the body of the cuspidor and having their slotted legs crossing each other, and thumb-screws whose shanks pass through the slots of the legs aforesaid and into the cuspidor-holder.

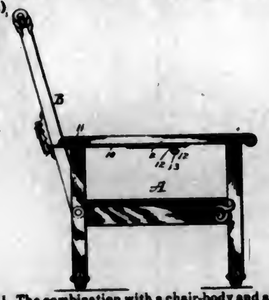
3. In a cuspidor washer or cleaner, the combination with a washing-receptacle, of a shaft journaled therein, arms radiating from said shaft and provided with tangentially-disposed platform portions having depending ears, cuspidor-clamps for each arm which consist of duplicate clamp members of U shape having slotted legs which cross each other and lie against the respective ears aforesaid and thumb-screws which pass through the slotted portions of the crossed legs and into the ears.



4. In a cuspidor washer or cleaner, the combination with a washing-receptacle, of a rotary cuspidor-holder located therein, and cuspidor-clamps carried by said holder each consisting of auxiliary clamp members having fingers or projections adapted to engage the upper portion of the body of the cuspidor, and retaining and securing devices to engage the cuspidor-mouth, and main clamp members connecting the auxiliary clamp members to the cuspidor-holder.

5. In a cuspidor washer or cleaner, the combination with a washing-receptacle, of a rotary cuspidor-holder located therein, and cuspidor-clamps carried by said holder consisting of auxiliary clamp members having devices for engaging the body of the cuspidor, retaining-hooks adapted to engage the upper edge of the cuspidor-cover, and adjustable securing devices to engage the lower portion of said cover, and main clamp members which afford a connection between the auxiliary clamp members and the cuspidor-holder.

6. In a cuspidor washer or cleaner, the combination with a washing-receptacle, of a rotary cuspidor-holder therein and cuspidor-clamps carried by said holder consisting of auxiliary clamp members having portions adapted to engage the sides of the cuspidor-body, retaining-hooks adapted to engage the upper part of the cuspidor-cover, and adjustable securing devices to engage the lower portion of the rim of the cover, and main clamp members connecting the auxiliary clamp members to the cuspidor-holder.



7. In a cuspidor washer or cleaner, an auxiliary clamp for cuspidors having removable covers consisting of a body having a retaining-hook at its upper end, a curved base-piece, fingers, said clamp member having a slot, a retaining-screw whose shank is movable in the slot, and means for securing said screw.

605,007. CARD-MOUNT. ALBERT M. ODGERS, Philadelphia, Pa., assignor to the A. M. Collins Manufacturing Company, same place. Filed Dec. 17, 1897. Serial No. 662,283. (No model.)

Claim.—A photographic-card or picture mount having formed in its face a series of depressions or recesses each having secured in it a button with an unconfined portion forming a pocket for the reception of the card.

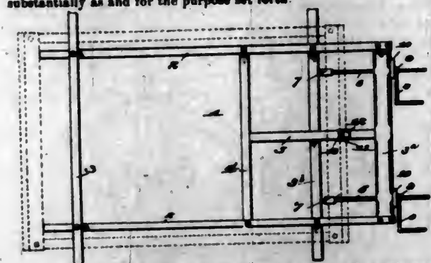
605,008. ADJUSTING DEVICE FOR CHAIRS. WILLIAM H. O'KEEFE, Lockport, N. Y. Filed July 29, 1897. Serial No. 646,397. (No model.)

Claim.—1. The combination with a chair-body and a back hinged thereto, of a ratchet-bar secured to the chair-body at each side thereof, ratchet-bars secured to the chair-back at each side thereof and a yoke extending across said back, engaging the ratchet-bars thereon and having teeth at the free ends of its side bars adapted to engage the ratchet-bars secured to the chair-body, substantially as set forth.

2. The combination with a chair-body and a back hinged thereto, of ratchet-bars secured to the chair-body, ratchet-bars secured to the chair-back, a yoke extending across the chair-back and engaging the ratchet-bars thereon, teeth at the free ends of the side bars of said yoke to engage the ratchet-bars on the chair-body and clips secured to the chair-body, through which the side bars of the yoke pass, substantially as set forth.

3. The combination with a chair-body and a back hinged thereto, of slotted brackets secured to the chair-back, a ratchet-bar in each slotted bracket, a yoke extending across the chair-back, passing through said slotted brackets and engaging said ratchet-bars and means for adjustably and removably connecting the side bars of said yoke to the chair-body, substantially as set forth.

4. The combination with a chair-body and a chair-back hinged thereto, of ratchet-bars secured to the under face of the side rails of the chair-body, ratchet-bars secured to the upright rails of the chair-back at points which are normally in line with the side rails of the chair, rods connected with the ratchet-bars on the back and with the ratchet-bars on the side rails and clips through which said rods loosely pass, said clips being secured to the under faces of the side rails of the chair, substantially as set forth.

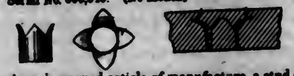


5. The combination with a chair-body and a back hinged thereto at points below the side rails of the chair, of ratchet-bars secured to the side rails, brackets having slots and ratchet-bars therein, secured to the chair-back, a yoke extending across the chair-back, passing through the slots in said brackets and engaging the ratchet-bars therein, teeth at the free ends of the parallel bars of said yoke adapted to engage the ratchet-bars secured to the side rails, handles or knobs on said side bars of the yoke and clips secured to the rear bars of the chair through which said side bars of the yoke pass, substantially as set forth.

6. The combination with a chair-body and a back hinged thereto, of slotted brackets having ratchet-bars, secured to the chair-back, slotted boxes having ratchet-bars, secured to the side rails of the chair, a yoke passing through the slotted brackets and engaging the ratchet-bars therein, teeth at the free ends of the parallel bars of the yoke, said free ends of the parallel bars being adapted to enter said boxes and the teeth to engage the ratchet-bars therein, and knobs at the free ends of said teeth, substantially as set forth.

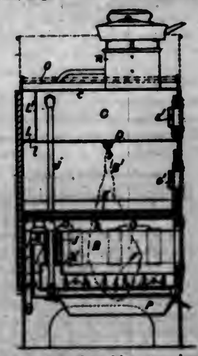
605,009. BED-SPRING STRETCHER. JAMES F. PHAGAN, Cheyenne, Wyo. Filed Oct. 21, 1897. Serial No. 655,933. (No model.)

Claim.—1. A stretching device for bed-springs, comprising a frame composed of two side bars and two end bars, screw-threaded shafts or rods extending through one of the end bars and provided with hooks adapted to embrace the end bar of the bed-spring frame, and cranks provided with internally-screw-threaded portions adapted to be screwed upon said screw-threaded shafts, whereby the said shafts are drawn through the end bar when the cranks are turned, substantially as and for the purpose set forth.



2. A stretching device for bed springs, comprising two end bars and two side bars, the ends of the side bars at one end of the frame extending beyond the end bar and adapted to bear against the cross-bar of the bed-spring frame, screw-threaded shafts extending to the cross-bar at the opposite end of the bed-spring frame, and cranks provided with screw-threaded portions adapted to be screwed upon said shafts to draw them through the end bar of the stretcher-frame, substantially as and for the purpose set forth.

3. The combination with the end bar and side bars, of a transverse bar having its ends connected to the side bars, a horizontal bar connected to said transverse bar at one end, and having its other end connected with the end bar, a runner secured to said horizontal bar and provided with a clamp adapted to embrace the cross-bar of the bed-spring frame and to be secured thereto by a set-screw, and screw-threaded rods extending through said end bar and provided with means for attachment to the bed-spring frame, substantially as and for the purpose set forth.

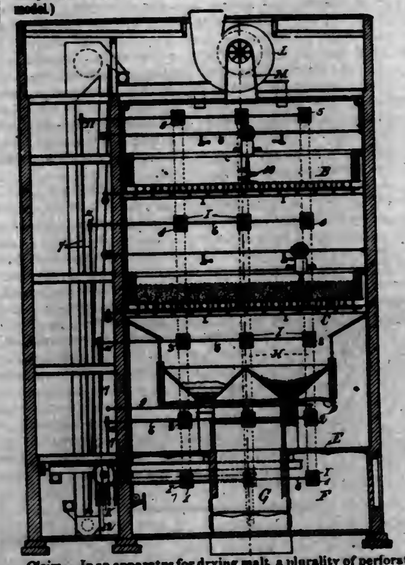


4. A stretching device for bed-springs, consisting of a frame including in its structure a longitudinally-extending bar, means on said frame for elongating the bed-spring frame, and a runner slidingly mounted on said bar and adapted to be clamped to the bed-spring frame, as and for the purpose set forth.

605,010. HOLLOW STUD OR RIVET. RICHARD POSER, London, England, assignor to Lionel Cuthbert Cropper, same place. Filed Dec. 2, 1897. Serial No. 660,515. (No model.)

Claim.—As an improved article of manufacture, a stud struck up from a single piece of metal and having a hollow body portion and a series of teeth formed thereon, the said teeth being curved or flared outwardly, whereby upon driving the stud into a material which it is to reinforce, the teeth will be caused to spread by the resistance offered thereto so as to form a retaining head embedded within the material, the said material incised by the said stud being crowded more compactly to form with the body portion of the stud a durable wearing-surface, substantially as described.

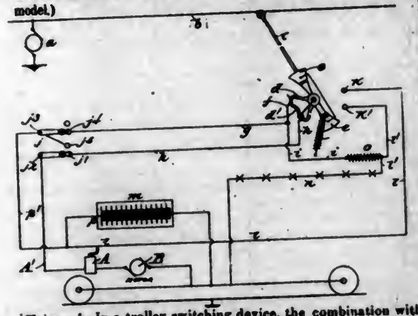
605,011. GAS-STOVE FOR COOKING PURPOSES, &c. ROBERT PRIDGIN, London, England. Filed Aug. 26, 1897. Serial No. 649,304. (No model.)



Claim.—1. A gas-heated cooking-stove having a casing comprising a roasting-space, a door at the front of the roasting-space, an air admission and heating chamber surrounding the remaining sides of the roasting-space and located at the lower part thereof, the upper part of the air-heating chamber being offset or inwardly projecting and being traversed by vertical flues leading from the space beneath to the roasting-space above, burners in the space beneath the air-heating chamber but not directly beneath the flues, air-inlets outside of a baffle rising within the chamber and directing the incoming air against the flues, and a depending baffle or curtain inclosing a downcast passage opening to the combustion-chamber at or below the level of the burners therein, substantially as specified.

2. A gas-heated cooking-stove having a casing, comprising a roasting-space, a door at the front of the roasting-space, an air admission and heating chamber surrounding the remaining sides of the roasting-space and located at the lower part thereof, the upper part of the air-heating chamber being offset or inwardly projecting and being traversed by vertical flues leading from the space beneath to the roasting-space above, burners in the space beneath the air-heating chamber but not directly beneath the flues, air-inlets outside of a baffle rising within the chamber and directing the incoming air against the flues, and a depending baffle or curtain inclosing a downcast passage opening to the combustion-chamber at or below the level of the burners therein, and an inner curtain depending within the line of the burners so as to separate the upper part of the combustion-space from the inclosed roasting-space to such an extent as to prevent the flames being deflected inward and the products of combustion from passing up through the roasting-chamber, while permitting direct radiation of the heat from the flames to the roasting-space, substantially as specified.

3. A gas-heated cooking-stove having a casing, comprising a roasting-space having a door at the front of the roasting-space, an air admission and heating chamber surrounding the remaining sides of the roasting-space and located at the lower part thereof, the upper part of the air-heating chamber being offset or inwardly projecting and being traversed by vertical flues leading from the space beneath to the roasting-space above, burners in the space beneath the air-heating chamber but not directly beneath the flues, air-inlets outside of a baffle rising within the chamber and directing the incoming air against the flues, and a depending baffle or curtain inclosing a downcast passage opening to the combustion-chamber at or below the level of the burners therein, an inner curtain depending within the line of the burners so as to insure the passage of the products of combustion through the flues alone while permitting of direct radiation from the flames to the roasting-space, and a grating dividing the roasting-space into a lower space heated only by radiation and an upper space heated mainly by convection-currents from the flues discharging therein, substantially as specified.



605,012. APPARATUS FOR DRYING MALT. WILLIAM H. PRINZ, Austin, Ill., assignor to the Saladin Pneumatic Malting Construction Company, Chicago, Ill. Filed July 10, 1897. Serial No. 644,141. (No model.)

Claim.—In an apparatus for drying malt, a plurality of perforated drying-floors situated one above the other, a heating-chamber below

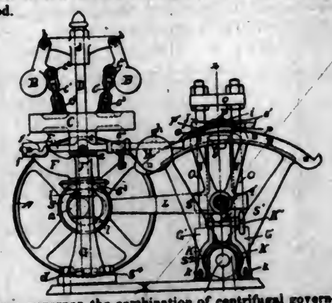
the lowermost of said floors, a chamber around said heating-chamber adapted to deliver air to the heater, flues in the walls of said apparatus connecting at their lower ends with said chamber around said heating-chamber, between their ends with the spaces underneath said drying-floors, and at their upper ends with a suction-chamber, and valves controlling said connection, whereby hot, cold or mixed hot and cold air can be passed through the malt on any one, or all of said floors, or avoid all of said floors, substantially as described.

605,013. SWITCHING DEVICE AND CIRCUIT ARRANGEMENT FOR ELECTRICALLY-PROPELLED VEHICLES. EMIL B. W. REICHEL, Berlin, Germany, assignor to the Siemens & Halske Electric Company of America, Chicago, Ill. Filed Jan. 10, 1896. Serial No. 666,126. (No model.)

Claim.—1. In a trolley switching device, the combination with the trolley-arm *c*, contact-piece *d* electrically connected with and actuated by said trolley-arm, and contact part *f* adapted to be electrically engaged by said contact-piece only when the trolley-arm is in engagement with the trolley-conductor, substantially as described.

2. In a trolley switching device, the combination with the trolley-arm *c*, contact-piece *d* electrically connected with and actuated by said trolley-arm, contact part *f* adapted to be electrically engaged by said contact-piece only when the trolley-arm is in engagement with the trolley-conductor, and contact *e* also actuated by the trolley-arm and adapted to close a second circuit when said trolley-arm is in a position of rest, substantially as described.

3. The combination with a trolley-arm for electrically-propelled vehicles, of a conductor connected with said trolley-arm having included therein suitable circuit-controlling apparatus extending to the motor of said vehicle, a contact part connected with a secondary circuit of said vehicle, and a contact-piece actuated by said trolley-arm to engage the contact part only when the trolley-arm is in engagement with the trolley-conductor, substantially as described.



4. In an electrically-actuated vehicle, the combination with a trolley-arm adapted to engage the trolley-conductor, of a motor-circuit connected therewith, a lamp-circuit and an accumulator, a contact part connected therewith, and a contact-piece actuated by the trolley-arm to move into engagement with said contact part when the said trolley-arm is connected with the trolley-conductor, substantially as described.

5. In an electrically-actuated vehicle, the combination with a trolley-arm adapted to engage the trolley-conductor, of a motor-circuit connected therewith, a lamp-circuit and an accumulator, a contact part connected therewith, a contact-piece actuated by the trolley-arm to move into engagement with said contact part when the said trolley-arm is connected with the trolley-conductor, a switch *j* adapted to connect said accumulator with the motor-circuit, and a contact *e* actuated to close the accumulator-circuit by the movement of the trolley-arm to its position of rest, substantially as described.

6. The herein-described circuit arrangement for electrically-actuated vehicles, consisting of motor, accumulator and lamp circuits, a switching or trolley arm adapted to be connected with an external source of power and the motor-circuit, a contact-piece connected therewith, a contact part adapted to be engaged by the contact-piece and insure the electrical continuity of the remaining circuits when said arm is connected with the source of power, a switch *j* controlling these two circuits and a contact part *e* actuated by said switching-arm to close the lamp-circuit when said arm is in a position of rest, substantially as described.

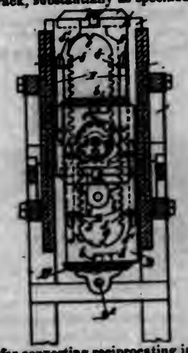
605,014. SPEED-GOVERNOR. MARK A. REPLOGLE, Akron, Ohio. Filed Jan. 30, 1897. Serial No. 619,882. (No model.)

Claim.—1. In a governor of the kind described having centrifugal weights adapted to set into and out of operation power increasing and decreasing mechanisms, the combination of the cam *e*, the rocking lever L *g g* pivoted to the sliding bracket O′ with an eccentric sector provided with the eccentric flange *r′* adapted to slide in the groove *o′* of the said bracket for the purpose set forth substantially as specified.

2. In a governor, the combination of centrifugal governor-balls and a fly-wheel suspended therefrom revolving on a vertical axis, the lever operated thereby, the said lever being provided at its one end with the curved strip *c′* and fulcrumed at the other end, and intermediate of the fulcrumed and curved ends aforesaid attached to the neck of a fly-wheel adapted to be raised and lowered by the said centrifugal balls aforesaid substantially as specified and for the purpose set forth.

3. In a governor, the combination of an eccentric sector adapted to control the supply of power, by turning the shaft to which it is keyed, the said sector being provided with curved racks and an eccentric flange, which flange slides in a groove on a sliding bracket, carrying a rocking lever having a pawl vibrated thereby and the said pawl adapted to engage with the racks of the eccentric sector and operate it so as to turn off, or turn on the supply of power substantially as shown and set forth.

4. In a governor of the kind described, the combination of a sliding bracket having a rocking lever pivoted thereto, the one end of the said rocking lever being adapted to be operated by a cam, and the other end thereof being furnished with a pawl adapted to be vibrated over a pair of curved racks, which racks when moved in one direction raise the said sliding bracket and rocking lever therewith, and when moved in the opposite direction lower the said sliding bracket and rocking lever by means of the eccentric flange slid in a groove on the side bracket substantially as specified and for the purpose set forth.



5. In a governor of the kind described an eccentric sector provided with a flange also eccentric therewith and the said sector being also provided with racks R and *r* having their teeth disposed in opposite directions; the double-acting pawl P adapted to engage with either of said racks, means for vibrating the pawl and means for tilting it into engagement with either one or the other of said racks according as the governor is affected by increased or decreased speed together with the sliding bracket O′ adapted to be raised or lowered by the eccentric flange aforesaid for the purpose of throwing the pawl out of reach of engagement, substantially as specified.

6. In a speed-governor the combination of vertical sliding rods O O having the sliding frame or bracket O′ adapted to slide upward or downward thereon with a rocking lever pivoted to the said bracket and said rocking lever carrying a vibrating and double-acting pawl and said rocking lever carrying a vibrating and double-acting pawl adapted to operate the mechanism by which the said bracket is lifted or lowered, means for vibrating said rocking lever and means for throwing into and out of engagement said pawl according as the speed of the governor increases or subsides substantially as specified and for the purposes set forth.

605,015. MECHANICAL MOVEMENT. EDWARD C. RIDDLE, Browning, Mo. Filed Nov. 9, 1897. Serial No. 657,937. (No model.)

Claim.—1. A device for converting reciprocating into rotary motion and the contrary, comprising a frame having two sets of parallel guideways therein, two reciprocating frames or guides sliding longitudinally in said guideways and provided with lateral guides, a rack mounted to slide laterally in said guides, said frame and rack being provided with stops limiting said lateral movement, said racks consisting of two bars connected at their ends and having the inner or opposed surfaces of the side bars toothed, ribs fixed to each of the side bars upon the side facing the other rack and adapted to slidingly engage each other, a single tooth upon the cross-bars at each end of the racks, and a pinion mounted upon a shaft and engaging opposite sides of each rack, substantially as specified.

2. A device for converting reciprocating into rotary motion and the contrary, comprising a frame having two sets of parallel guideways therein, two reciprocating frames or gates sliding on said guideways and provided with lateral guides, a rack mounted to slide in said lateral guides, said frame and rack being provided with stops limiting said lateral movement, said rack consisting of two bars connected at their ends and having the inner or opposed surfaces of the side bars toothed, ribs fixed to each bar upon the side facing the other rack and adapted to slidingly engage each other, said ribs being secured by bolts passing through laterally-extending slots so as to be laterally adjustable, a single tooth upon the cross-bars at each end of the racks, and a pinion mounted upon the shaft and engaging opposite sides of each rack, substantially as specified.

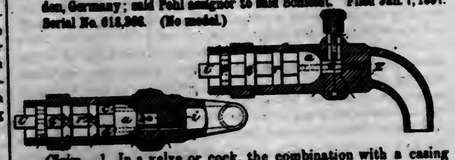
3. A device for converting reciprocating into rotary motion and the contrary, comprising a frame having two sets of parallel guideways therein, two reciprocating frames or gates sliding in said guideways and provided with lateral guides, a rack mounted to slide in said lateral guides, said frames and racks being provided with stops to limit said lateral movement consisting of a lug upon the gate entering a recess upon the rack, said racks consisting of two bars connected at their ends and having inner or opposed surfaces of the side bars toothed, ribs fixed to each bar upon the side facing the other rack and adapted to slidingly engage each other, and of such length as to pass by each other at the limit of their stroke, means for laterally adjusting said ribs, a single tooth upon the cross-bars at each end of the racks, and a pinion mounted upon the shaft and engaging opposite sides of each rack, substantially as specified.

605,016. DISPLAY-RACK. EDWARD S. ROBBINS, Parker, S. D. Filed May 19, 1897. Serial No. 637,206. (No model.)

Claim.—1. In a display-rack, separable sections, one section being provided with a sleeve and the other section with skeleton tongues at angles to each other and a skeleton base constructed of diverging members connecting the two tongues, either of said tongues being adapted to enter the said sleeve.

2. A display-rack constructed in separable sections, each section being constructed of spaced members, one section being provided with a sleeve at one of its ends and a loop at its opposite end, the other section being provided with tongues at angles to one another, and a base formed of diverging members connecting the two tongues, for the purpose set forth.

3. A display-rack constructed of a rod or bar bent upon itself to form a base having diverging arms and two tongues at angles to each other and connected by the said base, one tongue being at a decided angle to the base, the other tongue being practically in alinement with a portion of the base as specified.



4. A display-rack consisting of two sections constructed of a rod material, said sections being detachably connected, one section comprising a loop, a body and a sleeve carried by the body, the other section comprising two tongues at angles to one another, and arms constituting continuations of said tongues, being at an angle to one of the tongues and extending outwardly in opposite directions therefrom, for the purpose set forth.

605,017. CENTRIFUGAL MACHINE. OTTO W. SCHAUM, Philadelphia, Pa. Filed Nov. 12, 1897. Serial No. 658,284. (No model.)

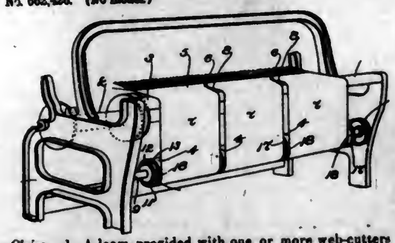
Claim.—In a hydro-extractor, the combination with a movably-suspended curb or casing, an inwardly-projecting bracket secured to the top edge thereof, bearings in the free end of said bracket, an inwardly-projecting arm mounted on said bracket, electromagnets and a pair of horizontally extending fields carried by said arm, the latter being arranged above the bearings, a bridge connecting said fields and suitably-mounted and arranged brushes and commutators, of a vertical jointed shaft stepped in said curb or casing and journaled in said bearings and in the bridge, a basket carried by the lower member of said shaft and having an inclined top flange and an armature carried by the upper member of said shaft between said fields and a brake for said basket consisting of a horizontally and longitudinally movable rod penetrating said bracket and provided at its outer end with a handle and at its inner end with a brake-block adapted to wipe on said flange, substantially as described.

605,018. COCK. ADAM SCHLEIDT and WILHELM PFEIL, Wiesbaden, Germany; said Pfeil assignor to said Schleidt. Filed Jan. 7, 1897. Serial No. 618,908. (No model.)

Claim.—1. In a valve or cock, the combination with a casing provided with inlet and discharge openings, and an intermediate wall, said wall being formed with a conical seat, a passage, a central socket, and a cavity intersecting the socket and extending to the exterior of the casing, a conical valve upon the inside of the wall adapted to the seat thereof for controlling the passages of the wall, said valve having a stem which extends into the socket, a ring encircling and adapted to turn upon the casing, and devices within the cavity of the wall connecting the valve-stem and ring, substantially as described.

2. In a valve or cock, the combination with a casing provided with inlet and discharge openings, and an intermediate wall, said wall being formed with one or more passages, a central socket and a cavity intersecting the socket and extending to the exterior of the casing, a rotary valve for controlling the passages of the wall, provided with one or more ports adapted to aline with the passages of the wall and with a stem which extends into the socket of said wall, a ring encircling and adapted to turn upon the casing, and devices within the cavity of the wall connecting the valve-stem and ring, substantially as described.

3. In a valve or cock, the combination with a hollow casing provided with an exterior annular groove and a dividing-wall within the chamber of the casing formed with one or more passages, a socket and a cavity intersecting the socket and the exterior annular groove, a rotary valve for controlling the passages of the wall provided with a stem which extends into the socket of said wall, a ring adapted to turn within the annular groove and connections within the cavity between the ring and valve-stem, substantially as described.

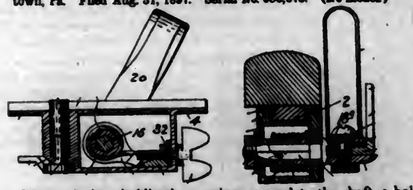


4. A cock or faucet provided with interior longitudinal passages leading to the discharge, and provided with a cavity having convergent sides, and with a longitudinal socket leading to said cavity, a rotary valve having a stem turning in the socket, and formed with ports to register with the passages, a pin working in the cavity and connecting with the stem, and a two-part ring turning in a groove in the shell and provided with the semicircular projections *k*, *k′*, embracing the outer end of the pin, and the knob or button, substantially as described.

5. A cock or faucet provided with interior longitudinal passages

leading to the discharge, a rotary valve having ports adapted to register with said passages, and the disks arranged to the rear of the valve, and provided respectively with the straight and diagonal passages, substantially as described and for the purpose set forth.

6. In a valve or cock, the combination with a casing provided with inlet and discharge openings, a rotary valve within the casings intermediate the said openings, a ring upon the exterior of the casing having separated ends, means for securing the ends of the ring together and connections intermediate the ring and valve extending through the casing, for operating said valve, substantially as described.



605,019. LOOM. JOHN W. SHERRY, Crompton, R. I., assignor to the Crompton Company, Providence, R. I. Filed Dec. 18, 1897. Serial No. 662,426. (No model.)

Claim.—1. A loom provided with one or more web-cutters or knives whereby to divide longitudinally into narrower webs the web which is woven in the loom, a take-up shaft, a plurality of take-up beams mounted on said shaft, independent sets of beam-driving connections interposed between the said shaft and beams comprising toothed wheels and pawls engaging the said wheels, whereby by disengagement of the pawls from the toothed wheels the independent letting back and adjustment of the respective narrow webs is facilitated, and warp-supplying devices permitting of separate adjustment of the warp-threads of each narrow web, whereby to obviate the necessity for picking out the weft-threads of more than the narrow web in whose width a mispick occurs.

2. A loom provided with one or more web-cutters or knives whereby to divide longitudinally into narrower webs the web which is woven in the loom, a take-up shaft, a plurality of take-up beams mounted on said shaft, one of them fast and the others free to turn thereon, the toothed wheels fast with said shaft, the pawls connected to the free beams and engaging said toothed wheels, whereby to facilitate independent letting back and adjustment of the respective narrow webs, and the separate yarn beams supplying the warp-threads pertaining to the respective narrow webs, all contributing to obviate necessity for picking out the weft-threads of more than the narrow web in whose width a mispick occurs.

605,020. ADJUSTABLE HOLDBACK. FERDINAND SIER, Allentown, Pa. Filed Aug. 31, 1897. Serial No. 650,073. (No model.)

Claim.—1. In a holdback, a casing secured to the shaft, a bolt having a limited rotation transversely projected through the casing and formed with lugs extending at the side of the casing, a breeching, means to hold the bolt in adjusted position against rotation, a lever-bar in the end of the breeching and formed with a laterally-extending lug to set between the lugs on the bolt, and a fastening-bolt in the casing and the breech-lever bar.

2. In a holdback, a casing adapted to be secured to the shaft of a road-vehicle, a bolt extended transversely through the casing, a breech-carrier connected to the bolt, a metal sleeve on the bolt formed with an arm, and a spiral spring on the sleeve having one end lodged on the said arm and the other end lodged in the casing.

3. In a holdback, a casing adapted to be secured to the shaft of a road-vehicle, a bolt extended transversely through the casing, a breech-carrier connected to the bolt, a metal sleeve on the bolt formed with an arm, a spiral spring on the sleeve having one end lodged on the end of the said arm and the other end lodged in the casing, and a movable block in the casing to engage under the arm of the sleeve and adjust the position of the breech-carrier.

4. A holdback, comprising a casing adapted to be secured to the shaft of a road-vehicle, a bolt extended transversely through the casing, a breech-carrier connected to the bolt whereby the bolt may be turned with its connections, a trace carrier and guide on the bolt, a metal sleeve on the bolt within the casing, a spiral spring on the sleeve against the torsional force of which the bolt and sleeve have a limited rotation, a movable cam-block to hold the sleeve and bolt in adjusted position, and a swiveled screw to move the cam-block.

605,021. PNEUMATIC TIRE. FREDERICK R. SIMMS, London, England. Filed June 1, 1897. Serial No. 639,081. (No model.) Patented in England July 22, 1896, No. 16,261, and in France Dec. 26, 1896, No. 262,573.

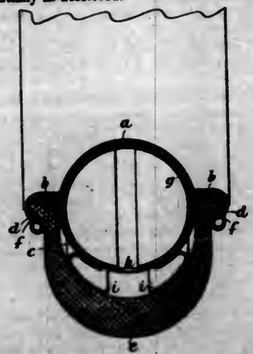
Claim.—1. In a vehicle-wheel, the combination with the rim, of a pneumatic cushion surrounding the same, secured to said rim and having separate flanges or edges along its periphery, a tread portion surrounding said cushion, and fastening devices separate from the tread and cushion for positively securing the said tread portion to said edges or flanges, substantially as described.

2. In a vehicle-wheel, the combination with the rim, of a pneumatic cushion surrounding the same, secured to said rim and having separate flanges or edges along its periphery, a tread portion surrounding said cushion, and fastening devices extending transversely through said flanges and a portion of said tread, substantially as described.

3. In a vehicle-wheel, the combination with the rim, of a pneumatic cushion secured to and surrounding the rim, and a tread portion surrounding and secured to said cushion, said rim and tread having, the one, guiding devices, adapted to engage the other to prevent lateral play of the tread and rim with respect to each other, substantially as described.

4. In a vehicle-wheel, the combination with the rim, of a pneumatic cushion secured to and surrounding the rim, and a tread secured to and surrounding said cushion, said rim and tread having the one, projections, engaging recesses in the other, for preventing the lateral movement of said rim and tread with respect to each other, substantially as described.

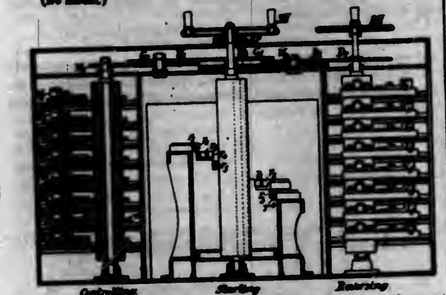
5. In a wheel the combination of a rim having lateral grooves or recesses, of a pair of india-rubber or other rings having outer peripheral flanges and lateral flanges to enter the said grooves or recesses, of a pair of metal rings forming an outer casing and of a tread having a central rib, which passes up between the outer peripheral flanges and is provided with a groove or holes (or with sockets to receive balls having holes) into which enter the ends of the spokes of the wheel which project from the rim, substantially as described.



6. In a vehicle-wheel, the combination with the rim, of a pneumatic cushion secured to and surrounding the rim, said cushion being open along its periphery forming peripheral flanges or edges, a tread surrounding said cushion and having a portion adapted to enter between said edges or flanges, said rim and the inwardly-extending portion of said tread being provided the one, with projections, and the other with guiding-recesses to receive said projections, to prevent the lateral movement of said rim and tread with respect to each other, substantially as described.

7. In a vehicle-wheel the combination with the rim, of a pneumatic cushion secured to and surrounding said rim, said cushion being open at its periphery forming peripheral flanges or edges, a tread surrounding said cushion and provided with portions adapted to enter between the edges of said cushion and retaining devices passing transversely through said edges of the cushion and the inwardly-extending portion of the tread, substantially as described.

8. In a vehicle-wheel, the combination with the rim having a deep central groove and having its edges provided with lateral annular grooves, of a pneumatic cushion engaging said central groove and provided on each side with an annular rib to engage one of said lateral grooves in said rim, said cushion being open along its periphery and forming peripheral edges, a tread surrounding said cushion and engaging said peripheral edges, fastening devices extending transversely through said edges of the cushion and through said tread, and fastening devices extending transversely through the lateral grooved portions of said rim and through the lateral ribs of the cushion, substantially as described.



605,022. WHEEL FOR MOTOR-CARS OR OTHER VEHICLES. FREDERICK R. SIMMS, London, England. Filed Dec. 28, 1897. Serial No. 664,067. (No model.)

Claim.—1. In a pneumatic tire, the combination of a rim having lateral flanges, of an auxiliary or supplementary rim perforated around its periphery and having lateral flanges or recesses, of an outer covering having lateral flanges to engage in the lateral recesses of the auxiliary rim, of strips of suitable material cemented at one end to the outer surface of the auxiliary rim and of an inner air-tube arranged between the two rims and split around its outer periphery, substantially as described.

2. The described pneumatic tire and rim for the wheels of motor-cars, velocipedes and other vehicles consisting of the rims *a* and *c*, tire proper *c*, split inner or air tube *g* and valve flaps or strips *i*, *i*.

605,023. ELECTRIC SWITCH FOR USE WITH ELECTRICALLY-PROPELLED VEHICLES OR LOCOMOTIVES, &c. ALBION T. SNELL and CHARLES R. GROVE, London, England, assignors of one-third to Arnold Frank Hills, same place. Filed Oct. 8, 1897. Serial No. 654,882. (No model.)

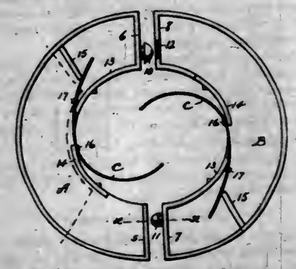
Claim.—1. The combination with a switch for opening and closing an electric circuit, of a second switch carrying two or more series of contacts for the purpose of distributing the current flowing through the said circuit in various manners through subsidiary circuits, and of a third switch having contacts for reversing the direction in which the current flows through the circuits connected with it, the last-mentioned switch being interlocked with the first-mentioned switch in such a manner that it can only be moved when the latter is in the "off" position while the second switch is designed to receive its motion from the first switch through gearing in such a manner that when the first switch is in a position to allow the passage of a current through it the second switch is in position to distribute the current through one or other of its sets of contacts, substantially as described.

2. A compound switch comprising among its members, a starting-switch and a controlling-switch for coupling the motors in different relations, and mechanism for imparting an intermittent movement to the controlling-switch from the starting-switch, substantially as described.

3. A compound switch comprising among its members, a starting-switch, a controlling-switch for coupling the motors in different relations, mechanism for imparting an intermittent movement to the controlling-switch from the starting-switch, and a reversing-switch independent of the controlling-switch and interlocked with the starting-switch, substantially as described.

4. A compound switch comprising among its members, a starting-switch provided with a series of sets of resistance-contacts, a controlling-switch for coupling the motors in different relations, and mechanism for imparting an intermittent movement to the controlling-switch from the starting-switch while the latter is passing from one set of contacts to another, substantially as described.

5. A compound switch comprising among its members, a starting-switch provided with a series of sets of contacts, a controlling-switch for coupling the motors in different relations, mechanism for imparting an intermittent movement to said controlling-switch from the starting-switch, while the latter moves from one set of contacts to another, and a reversing-switch independent of the controlling-switch and interlocked with the starting-switch, substantially as described.

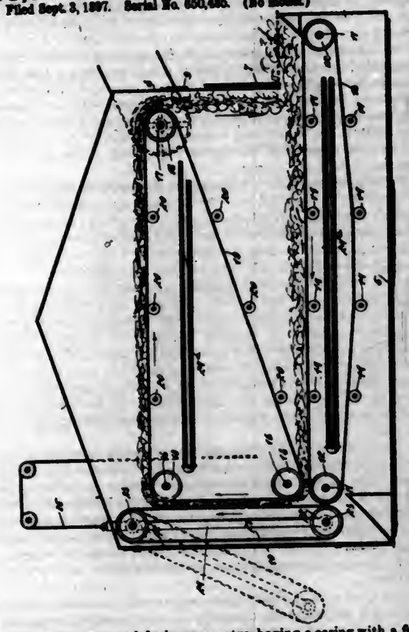


6. A compound switch comprising among its members, a starting-switch provided with a series of contacts, a gear-disk having concentric rests and operating-teeth, and a controlling-switch provided with a series of sets of contacts and with a gear-disk having inwardly-curved portions to engage the said concentric rests and recesses to engage the said operating-teeth, substantially as described.

7. A compound switch comprising among its members, a starting-switch provided with a series of contacts, and a driving-shaft having a driving-disk provided with concentric rests and operating-teeth, a controlling-switch for coupling the motors in different relations having a gear-disk provided with inwardly-curved faces to engage said concentric rests and recesses to engage said operating-teeth, a reversing-switch provided with a segmental locking-recess, and a locking-disk operatively connected with the shaft of the starting-switch provided with a segmental locking-recess, substantially as described.

8. A compound switch comprising among its members, a starting-switch provided with a plurality of sets of contacts arranged in a circle, with an "off" space between adjacent sets, a controlling-switch provided with a plurality of sets of contacts for coupling the motors in different relations, and gearing operatively connecting said starting-switch with the controlling-switch and so constructed that the controlling-switch will be moved from one set of contacts to another while the starting-switch is in one of its off positions, substantially as described.

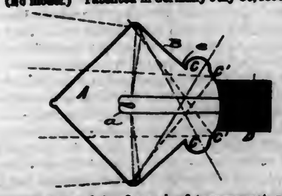
9. A compound switch comprising among its members, a starting-switch provided with a plurality of sets of contacts arranged in a circle, with an "off" space between adjacent sets, a controlling-switch provided with a plurality of sets of contacts for coupling the motors in different relations, and gearing operatively connecting said starting-switch with the controlling-switch and so constructed that the controlling-switch will be moved from one set of contacts to another while the starting-switch is in one of its off positions, and means for preventing the reversing of the direction of movement of said starting-switch, substantially as described.



605,024. FLOOR AND CEILING PLATE. LYMAN H. SNYDER and WILLIAM G. CHRISTIAN, Rocky Hill, Conn.; said Christian assignor to said Snyder. Filed Nov. 9, 1897. Serial No. 657,953. (No model.)

Claim.—1. A two-part floor or ceiling plate the two parts of which are provided with end walls at their confronting ends, the end walls at one side of the plate having the hooked projection on one part and the hole 9 on the other part for receiving said hooked projection, the end walls at the opposite side of the plate having respectively on the two parts the headed projection and open notch or recess for engaging each other, substantially as described.

2. In a floor and ceiling plate, the combination of the parts having the spaced walls at their inner edges, the oppositely-projecting pins on said walls at the opposite sides of the space between them, a stud or post as at 15 adjacent to one of said walls and pins, and the slotted spring bearing against said stud or post, extending through the space between said walls with the opposite ends of its slot engaging said pins and with one end of the spring projecting from the inner edge of the plate, substantially as described.

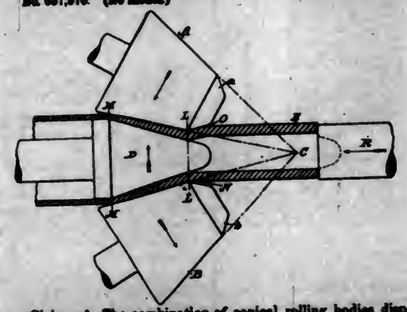


605,025. WOOL-DRIER. JAMES W. SPENCER, Providence, R. I. Filed Sept. 3, 1897. Serial No. 650,495. (No model.)

Claim.—1. A wool-drying apparatus, having a casing with a forwardly-projected lower portion, the top of which is open to form a feed-orifice, an endless apron having two horizontal runs mounted in the lower portion of the casing and extending into the forwardly-projected portion beneath the feed-orifice, a second endless apron mounted in the casing above the first apron, and having three runs, representing each the side of a triangle, one run extending vertically perpendicular to the first-named apron, and the uppermost run of the second apron extending horizontally to the front of the casing, and a third endless apron extending vertically at the rear of the other aprons, the vertical run of the third apron passing into immediate proximity with the vertical run of the second apron, so that the wool will be conveyed in an endless course horizontally along the first apron, then vertically between the second and third aprons, and finally forwardly over the uppermost run of the second apron, from which the wool is dropped back to the first apron.

2. A wool-drying apparatus, having a casing, a horizontal endless apron arranged in the lower portion thereof and capable of carrying the wool in a horizontal plane, a second endless apron mounted above the first apron and within the casing, and having three runs describing a triangular form, one run extending upward from the first apron, the second run extending horizontally, and the third run extending diagonally between the first and second runs, and a third endless apron extending parallel and in proximity with the vertical run of the second apron.

605,026. GLOBE FOR INCANDESCENT LAMPS. VICTOR DE SPRUNER-MERTZ, Brussels, Belgium. Filed Nov. 16, 1897. Serial No. 658,916. (No model.) Patented in Germany July 30, 1896, No. 92,154.



Claim.—1. A lamp-globe formed of transparent material and consisting of a double conical portion truncated at one end, a narrow conical portion, and an intermediate annular portion integrally connecting the two first-named portions, the said conical portion and the adjacent member of the double conical portion being lined with reflecting material, and the source of light being adapted to be situated between the annular portion and the extreme end or tip of the globe, substantially as described.

2. A lamp-globe formed of transparent material and consisting of a double conical portion truncated at one end, a narrow conical portion, and an intermediate bulging and annular portion integrally connecting the two first-named portions, the walls of the truncated member of the double conical portion and the conical portion being lined with reflecting material and being substantially parallel and the source of light being adapted to be situated between the annular portion and the extreme end or tip of the globe, substantially as described.

3. A globe for incandescent electric lamps formed of transparent material and consisting of a double conical portion truncated at one end and having the meeting ends of its members joined in a curved surface, a narrow conical portion, and an intermediate bulging and annular portion integrally connecting the two first-named portions, the wall of the double conical portion being lined with reflecting material from its truncated end to and somewhat beyond the line of junction of the members of said portion, the wall of the conical portion being likewise lined with reflecting material and arranged substantially parallel to the wall of the truncated member of said double conical portion, and the source of light being adapted to be situated between the annular portion and the extreme or tip end of the globe, substantially as described.

4. A globe for incandescent electric lamps formed of transparent material and consisting of a double conical portion truncated at one end and having the meeting ends of its members joined in a curved surface, a bulging portion adjoining said truncated end of the double conical portion, a narrow conical portion, and an annular portion, all integrally connected together in the order named, the wall of the double conical portion being lined with reflecting material from its truncated end to and somewhat beyond the line of junction of the members of said portion, the wall of the conical portion being also lined with reflecting material and arranged parallel to the wall of the truncated member of said double conical portion, and the source of light being adapted to be situated approximately in the plane of the line of junction of said members of the double conical portion, substantially as described.

605,027. MECHANISM FOR EXPANDING OR ENLARGING METALLIC TUBES. RALPH C. STEPHS, Elwood City, Pa., assignor to the Shelby Steel Tube Company, Pittsburg, Pa. Filed May 24, 1897. Serial No. 637,970. (No model.)

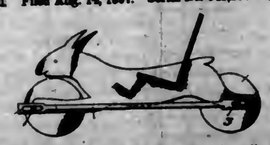
Claim.—1. The combination of conical rolling bodies disposed to form a pass between them the sides of which converge toward the entrance end, the diameters of the rolling bodies diminishing progressively in the same direction and in the same ratio as the width of the pass with a mandrel located in said pass, substantially as set forth.

2. The combination of conical rolls disposed to form a pass between them, the sides of which converge toward its entrance end, a mandrel located in said pass the working surfaces of which converge toward the entrance end more rapidly than do the sides of the pass, the diameters of the rolls diminishing progressively in the same direction and in the same ratio as the width of the pass, substantially as set forth.

3. The combination of conical rolls disposed to form a pass between them the sides of which converge toward its entrance end, a conical mandrel located in said pass the working surfaces of which converge toward the entrance end more rapidly than do the sides of the pass, the axes of the opposed rolls and the lines of their working faces substantially converging in a common point on the axial line of the pass substantially as set forth.

4. The combination of conical rolling bodies disposed to form a pass between them, the sides of which converge toward its entrance end, a conical mandrel located in said pass, the working surfaces of which converge toward the entrance end more rapidly than do the sides of the pass, the axes of the opposed rolling bodies intersecting the plane of the pass and diverging therefrom and means for forcing hollow billets or blanks endwise into the pass and against the mandrel, substantially as set forth.

5. The combination of conical rolls disposed to form a pass between them the sides of which converge toward its entrance end, a conical mandrel located in said pass the working surfaces of which converge toward the entrance end more rapidly than do the sides of the pass, the axes of the opposed rolls intersecting the plane of the pass and diverging therefrom, and means for forcing hollow billets or blanks endwise into the pass and against the mandrel substantially as set forth.



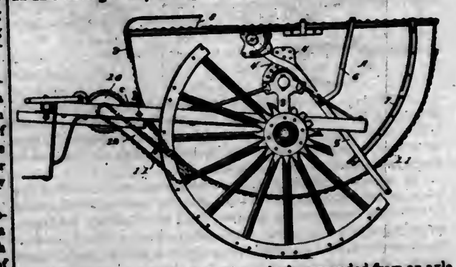
6. The combination of conical rolls disposed to form a pass between them the sides of which converge toward its entrance end, a conical mandrel located in said pass the working surfaces of which converge toward the entrance end more rapidly than do the sides of the pass, the diameters of the rolls diminishing in the same ratio as the width of the pass diminishes, with means for forcing hollow billets or blanks endwise into the pass and against the mandrel substantially as set forth.

7. The combination of conical rolls disposed to form a pass between them the sides of which converge toward its entrance end, a conical mandrel located in said pass, the axes of the opposed rolls and the lines of their working surfaces converging toward a common point on the axial line of the pass, the rolls being adjustable toward or away from each other by swinging about an axis passing through the said common point and at right angles to a common plane of the axes of the roll and of the pass substantially as set forth.

8. The combination of conical rolls disposed to form a pass between them the sides of which converge toward its entrance end, a conical mandrel located in said pass, the axes of the opposed rolls and the lines of their working surfaces converging toward points on a common line drawn through the axis of the pass at a right angle to a plane through the axis of the pass and through the straight line which intersects the center of the pass at a right angle and also the axes of the rolls, the rolls being adjustable toward or away from each other by swinging about an axis on said common line as set forth.

9. The combination of conical rolls disposed to form a pass between them the sides of which converge toward its entrance end, a conical mandrel located in said pass the working surfaces of which converge toward the entrance end more rapidly than do the sides of the pass, the axes of the opposed rolls being oppositely inclined relatively to the plane of the pass and their axes and the lines of their main working surfaces converging toward points on a common line drawn through the axis of the pass at a right angle to its said plane, with the additional surfaces *a*, and *b*, on the small ends of the rolls outside of the narrowest part of the pass substantially as and for the purpose set forth.

605,028. FOOT-PROPELLED VEHICLE. GEORGE STERKER, Chicago, Ill. Filed Aug. 14, 1897. Serial No. 648,200. (No model.)



Claim.—1. In a device of the character described, the combination with a series of wheels and crank-pins on the inner sides thereof, of a body loosely mounted upon said pins, and a connection between the crank portions of the pins having a sliding engagement with one of said crank portions, substantially as described.

2. In a device of the character described, the combination with a series of wheels, of crank-pins having their crank portions disposed oppositely, a body loosely mounted upon said pins, and a reach-rod connecting the crank portions of the pins, and having a limited sliding movement thereon, substantially as set forth.

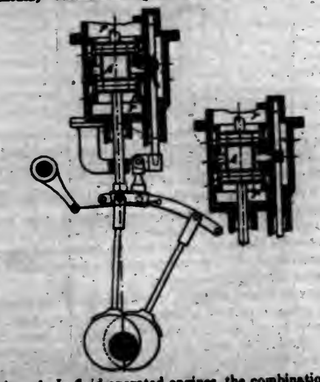
3. In a device of the character described, the combination with a series of wheels, of crank-pins connecting said wheels in pairs, a body loosely mounted thereon, and a rod loosely connected at one end to the crank portion of one of said pins and slotted at its opposite end to receive the crank portion of the opposite pin, substantially as set forth.

605,029. DUMPING-CART. JAMES W. TAYLOR, Herndon, Va., assignor to the United States Sanitary Company, of Virginia. Filed June 6, 1894. Serial No. 513,602. (No model.)

Claim.—1. In a dumping-vehicle having a body provided with a tube extending from side to side and suspended from an axle the combination of such body, a bearing-piece attached to the body and an axle having a cooperating bearing-face substantially as described.

2. In a dumping-vehicle having a body suspended from an axle, the combination of such body, a flanged plate attached to the body, and an axle having a collar outside the body upon which the flanged plate rests to support the body as set forth.

3. In a dumping-vehicle the combination of a body, a swinging lid, a lever pivoted to one side of the body, and extending downwardly to be operated from the ground, and a link connecting the lever and the lid, substantially as described.

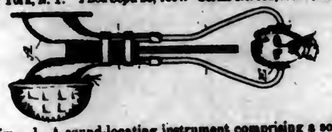


4. In a dumping-vehicle the combination of a body, a swinging lid or cover for said body, a lever alongside the body, and stops or catches alongside the body for holding the lever and the lid in desired positions, substantially as described.

5. In a dumping-vehicle the combination of a swinging body a swing-lid, a lever arranged alongside the body connected with the lid, and a notched segment on the side of the body for holding the lever and lid in desired positions, substantially as described.

6. In a dumping-vehicle the combination of a body, a lever arranged to project downward by the side of the body, a lid connected with the lever and means attached to the side of the body for holding the lid in a closed position under tension, substantially as described.

7. In a dumping-vehicle, the combination of an eccentrically-swinging body, a chain extending around the lower side of said body, a windlass and a take-up, substantially as described.



605,080. VALVE MECHANISM FOR ENGINES. COURTNAY W. THOMPSON, London, England. Filed Oct. 24, 1896. Serial No. 609,936. (No model.) Patented in England Apr. 16, 1896, No. 8,049.

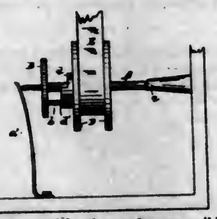
Claim.—1. In fluid-operated engines, the combination of a cylinder, with the main valve or valves, and the cut-off valve, having a cushioning-space located between the main and cut-off valve-faces and adapted to receive compression alternately from both ends of the cylinder, and mechanism for operating said valves, whereby the exhaust and cushioning conditions are controlled independently of the control of the variable expansion, substantially as described.

2. In fluid-operated engines, the combination of a cylinder, with the main valve or valves, and the cut-off valve, having a cushioning-space located between the faces of the main and cut-off valves and adapted to receive compression alternately from both ends of the cylinder and to alternately place the ends of the cylinder in communication, and mechanism for operating said valves, whereby the exhaust and cushioning conditions are controlled independently of the control of the variable expansion, substantially as described.

605,081. SOUND-LOCATING INSTRUMENT. LEVI E. THORNE, New York, N. Y. Filed Sept. 23, 1897. Serial No. 652,719. (No model.)

Claim.—1. A sound-locating instrument comprising a sound-receiver of funnel or trumpet shape, the mouth of which is provided with a flat flange projecting outward in a plane substantially transverse to the axis of the receiver at its mouth, substantially as and for the purposes hereinbefore set forth.

2. A sound-locating instrument, comprising two receivers of funnel or trumpet shape whose mouths point in substantially opposite directions, the mouth of the receivers being provided with flat flanges extending outward in planes substantially transverse to the axes of the receivers at their mouths, substantially as and for the purposes hereinbefore set forth.



3. In a sound-locating instrument, a receiver for collecting the sound, the outer flaring portion of which is bellied on its rear part adjacent to the mouth, substantially as and for the purposes hereinbefore set forth.

4. The combination with the receiver of a sound-locating instrument, of a wind-screen supported across and covering the edges of the mouth of the receiver, substantially as and for the purposes hereinbefore set forth.

5. The combination with the receiver of a sound-locating instrument, of a frame supported directly by the receiver and arranged over the mouth thereof, and a wind-screen drawn over the frame, substantially as and for the purposes hereinbefore set forth.

6. In combination with a receiver of a sound-locating instrument, of a funnel or trumpet shape, of a wind-screen of flexible material, and means for stretching the screen across the open end or mouth of the receiver, and over the edges thereof and for securing it directly thereto, substantially as and for the purposes hereinbefore set forth.

605,082. TYPE-WRITING-MACHINE RIBBON-SPOOL. HENRY H. UHL, Philadelphia, Pa. Filed Feb. 11, 1890. Serial No. 340,055. (No model.)

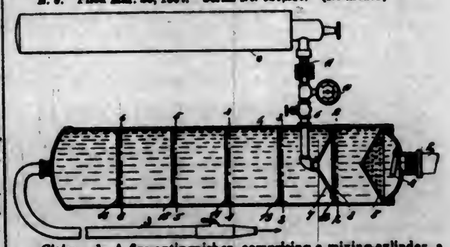
Claim.—1. As a new article of manufacture, a ribbon-spool provided with a step or projection adapted to coact with a fixed stop on the machine for locating the position of the ribbon on the spool with reference to the point of impact of the type.

2. As a new article of manufacture, a ribbon-spool provided with two or more steps or projections at its head, said steps projecting different extents and adapted to coact with a fixed step or projection on the machine to locate the position of the ribbon with reference to the printing-point of the type and to vary the position of the ribbon with reference to said printing-point.

3. In a type-writing machine, in combination, a ribbon-spool provided with a step or projection at its head, and a stop upon the machine adapted to rest upon the step or projection to locate the position of the ribbon with reference to the printing-point of the type and to vary the position of the ribbon with reference to said printing-point.

4. In a type-writing machine, in combination, a ribbon-spool, provided with two or more projections or steps at its head, said steps projecting different extents, and a stop upon the machine adapted to rest against the steps upon the ribbon-spool.

5. In combination, a ribbon-spool shaft, a disk upon said shaft, a pin projecting from said disk, a ribbon-spool upon said shaft, and a projection or step upon the head of said spool, adjacent to the said disk.

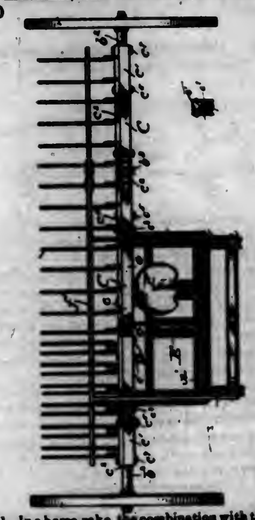


6. In combination, a ribbon-spool shaft, a disk upon said shaft, a pin projecting from said disk, a ribbon-spool upon said shaft, and two or more projections or steps upon the head of said spool, adjacent to the said disk, said steps projecting different extents from the body of the head.

7. In combination, a ribbon-spool shaft, a driving ratchet-wheel upon said shaft, a projection from said ratchet-wheel, a ribbon-spool upon said shaft and a projection or step upon the head of said spool adjacent to the said ratchet-wheel.

8. In combination, a ribbon-spool shaft, a driving ratchet-wheel upon said shaft, a pin projecting from said ratchet-wheel, a ribbon-spool upon said shaft, and projections or steps upon the head of said spool adjacent to the ratchet-wheel, said steps projecting different extents from the body of the head.

9. In combination, a ribbon-spool shaft, a spring substantially as described upon said shaft, a ribbon-spool retained upon said shaft by said spring, projections or steps upon the head of said spool, a driving ratchet-wheel upon said shaft and a pin projecting from said ratchet-wheel.



605,088. FIRE-EXTINGUISHER. ABRAM H. VAN RIPER, Nutley, N. J. Filed Mar. 25, 1897. Serial No. 630,290. (No model.)

Claim.—1. A fire-extinguisher, comprising a mixing-cylinder, a water-inlet therefor, a perforated conical disk forward of the inlet, an outlet-pipe, a cylinder for containing gas, a pipe leading from said gas-containing cylinder into the mixing-cylinder and having a perforated disk outlet discharging in the direction of the inlet of the first-named cylinder, and means for mixing the gas and water in the first-named cylinder, substantially as specified.

2. A fire-extinguishing apparatus, comprising a mixing-cylinder, a water-inlet therefor, a water-outlet therefor, a cylinder for containing gas under pressure, a pipe leading from the gas-cylinder to the interior of the mixing-cylinder and having a funnel-shaped nozzle, a perforated diaphragm secured to the nozzle, and a series of perforated partitions in the mixing-cylinder, the perforations through said partitions being variously placed, the perforations of one partition relatively to those of another, substantially as specified.

605,084. FOLDING HAY-RAKE. JAMES R. VAUGHN and MCHENRY JENKINS, Walnut Shade, Tenn. Filed Dec. 15, 1896. Serial No. 615,705. (No model.)

Claim.—1. In a horse-rake, the combination with the draft-frame, of a telescopic axle having a slotted tubular central portion pivotally connected with said frame, axle end portions adjustable lengthwise in said tubular central portion, means for holding said end portions at the desired adjustment, a sectional folding rake bar or head mounted upon said axle and having its central portion rigidly connected to the axle to rock with it and its hinged and folding end sections provided each with pendent legs adapted to straddle and engage the telescoping end sections of the axle between them, and means mounted upon the draft-frame for rocking the rake-head and axle, substantially as described.

2. In a horse-rake, the combination with the draft-frame, of the telescopic axle, comprising the central tubular longitudinally-slotted portion and end extension portions mounted to slide in the tubular portion, securing-screws moving in the slots of the central tubular portion to engage and lock said extension portions in adjusted position, and a sectional folding rake-bar secured to said axle to rock with it, and having its folding end portions provided with pendent legs adapted to engage the telescoping end portions of the axle on opposite sides thereof, for the purpose and substantially as described.

605,085. FOUNTAIN-PEN. JOHN WEEKS, Brooklyn, N. Y., assignor of three-fourths to John H. Marsh, same place. Filed June 30, 1897. Serial No. 642,991. (No model.)

Claim.—1. In a fountain-pen, a barrel having a valve-seat, a plunger held to travel in the barrel, a valve controlled by the plunger, adapted for engagement with the said seat, and means for operating the plunger, substantially as described.

2. In a fountain-pen, a plunger, and a valve connected therewith, located within the barrel of the pen, the plunger being arranged to draw the ink from the nib or to force the ink in direction thereof, the valve controlling the supply of ink to the nib, as specified.

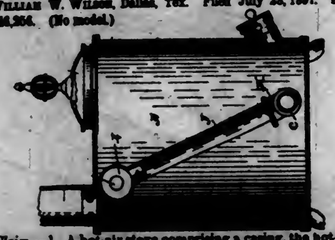
3. In a fountain-pen, the combination with a barrel, of a plunger movable longitudinally within the barrel of the pen, and a valve connected with the said plunger and located within the barrel of the pen, the said plunger when moved in one direction drawing the ink from the nib and when moved in the opposite direction forcing the ink toward the nib, the said valve controlling the supply of ink to the nib, substantially as specified.

4. In a fountain-pen, the combination with a barrel having its lower end provided with a chamber communicating by a contracted opening with the interior of the barrel, and a valve controlling the passage of material from the body of the barrel to the said chamber, the said valve having a rod extending upward into the barrel, of a plunger connected with the upper end of said valve-rod, and means for imparting movement to said plunger longitudinally of the barrel, substantially as set forth.

5. In a fountain-pen, the combination with a barrel having its lower end provided with a chamber communicating with the interior of the barrel, and a valve controlling the passage of material from the body of the barrel to the said chamber, of a stem arranged to turn in the upper portion of the barrel and held against end movement, the said stem being capable of being operated from the outside of the barrel and having its inner or lower end threaded, and a plunger arranged to travel on the threaded portion of said stem when the stem is turned, said plunger being connected with the said valve, substantially as described.

6. In a fountain-pen, the combination with a barrel, and a stem extending through an opening in the top of the barrel and fitted to turn therein, the outer end of the stem being provided with a knob by which the stem may be turned, the said stem being provided inside the barrel with a collar to prevent end movement and the lower portion of the stem within the barrel being provided with an exterior thread, of a plunger held to travel upon the lower threaded portion of the stem, the said plunger having a tubular extension at its lower portion of less diameter than the plunger, a nose arranged to carry a pen-sleeve at its lower end and screwing into the lower end of the barrel, the said nose being formed with a chamber and having a contracted opening in its top connecting said chamber with the interior of the barrel, and a valve arranged to control the passage of material from the body of the barrel to the said chamber, the said valve being provided with a rod extending upward in the barrel and connected at its upper end to the tubular extension of the plunger, substantially as shown and described.

605,086. CURTAIN-HOLDER. EDWARD F. WILKINSON, New York, N. Y. Filed Jan. 12, 1898. Serial No. 666,429. (No model.)



Claim.—1. In a curtain-holder, the combination with a hollow ring having slots in its outer circumference; of a pair of similar curved rods extending through opposite sides of said hollow ring and projecting at their ends from said slots; gripping-jaws formed upon one pair of corresponding ends of said curved rods; thumb and finger grips formed upon the other pair of corresponding ends of said curved rods; and a spring interposed between said thumb and finger grips, substantially as described.

2. In a curtain-holder, the combination with a ring provided with passages upon opposite sides thereof; of a pair of curved rods passing through said passages, and bent outwardly at their ends; gripping-jaws formed upon one pair of corresponding ends of said curved rods; thumb and finger grips formed upon the other pair of corresponding ends thereof, and a spring interposed between said thumb and finger grips, substantially as described.

3. In a curtain-holder, the combination with a ring provided with passages upon opposite sides thereof; of a pair of semicircular rods passing through said passages upon opposite sides of said ring; one pair of corresponding ends of said rods being bent outwardly and carrying rigid gripping-jaws, and a spring acting upon said rods and tending to hold said gripping-jaws closed, substantially as described.

605,087. AIR-TIGHT HEATING-STOVE. JOHN W. WILSON and WILLIAM W. WILSON, Dallas, Tex. Filed July 23, 1897. Serial No. 645,264. (No model.)

Claim.—1. A hot-air stove comprising a casing, the hot-air drum and tubes situated therein and having external and internal communications, and a regulating member adapted to control the said interior and exterior communications, the parts operating in the manner substantially as described.

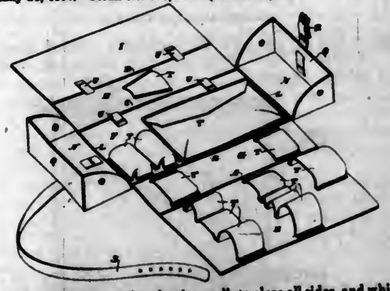
2. A hot-air stove comprising a casing, a hot-air drum extending across the upper portion thereof and having communication with the atmosphere outside of the casing, depending tubes connected therewith and within the said casing, and tubes extending transverse the lower end of the depending tubes, the said transverse tube having internal and external communications, and means for controlling the said communications of the transverse tube, substantially as described.

3. A hot-air stove comprising a casing; a hot-air tube or drum situated therein and having an external communication, a tube having internal and external communications at the lower portion of the stove, and communicating with the hot-air tube or drum, and a member for controlling the internal and external communications of said tubes, substantially as described.

4. A hot-air stove comprising a casing, a hot-air tube or drum extending transverse the upper portion of the stove and having communication with the atmosphere outside of the stove-casing, tubes extending downward near the ends of the air-tube and within the casing, and tubes extending transverse the lower ends of the downwardly-extending tubes, the said transverse tubes having internal and external communications or openings, and valves situated within the tubes for closing the internal or external openings, substantially as described.

5. A hot-air stove comprising a hot-air drum and tubes forming a U in shape, the transverse portion of the U being at the upper portion of the casing, and the lower ends or extremities of the U provided with internal and external communications, and means for controlling the said communications, substantially as described.

6. In a hot-air stove, the combination of a hot-air drum or tube extending across the upper portion of the casing and having external communication, tubes extending downward from the said air-tube and having transverse internal screw-threaded sockets, external screw-threaded tubes passing through the said sockets, and external clamps placed upon the outer ends of the transverse tubes and clamping them in position, substantially as described.



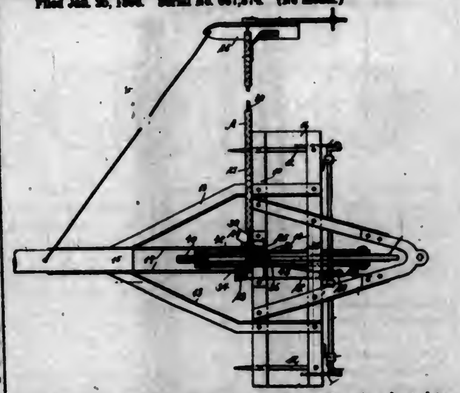
7. A hot-air stove comprising a hot-air drum spanning the upper portion thereof and having exterior communications, tubes depending from said drum to the lower portion of the stove, transverse screw-threaded tubes at the lower ends of the depending tubes, the screw-threaded tubes passing through the stove, and screw-threaded clamping-caps upon the projecting ends of the screw-threaded tubes, the caps having openings, substantially as described.

8. A hot-air stove comprising a casing, a hot-air tube or drum extending across the upper portion thereof and communicating with the atmosphere, and a tube extending downward therefrom within the casing, the lower end of the tube having an interior and exterior communication, substantially as described.

9. A hot-air stove comprising a casing, a hot-air drum and tubes forming substantially a U in shape, the transverse portion of the U extending across the casing and having its ends communicating with the atmosphere, the tubes having one end communicating with the drum and their opposite ends having interior and exterior communications, substantially as described.

10. A hot-air stove comprising a casing, a drum and tubes forming substantially a U in shape, the drum extending across the casing and communicating with the atmosphere, the tubes having one end communicating with the drum and their opposite ends communicating with the atmosphere, substantially as described.

605,038. BAG OR BOX. JOHN L. WIRT, Washington, D. C. Filed May 26, 1897. Serial No. 636,251. (No model.)



Claim.—1. A bag or box having walls to close all sides, and which are hinged or flexibly connected together, two of which, forming opposite ends of the box, being hinged on lines that intersect the lines on which the other walls are hinged, and having each portions that are rigidly held in fixed relation thereto, that overlap the ends of all of the other walls, except the one to which it is hinged, when the box is in a closed position, to hold or restrain the same from opening on their flexible connections, substantially as and for the purpose specified.

2. A bag or box having all of its walls connected in one piece, the walls that form the four sides of the bag or box being flexibly connected on parallel lines, and the two walls that form the ends of the same being flexibly connected on lines at right angles to the others, and having each rigid portions that overlap three of the box or bag sides, substantially as and for the purpose specified.

3. A bag or box having walls that are flexibly connected on parallel lines, and walls that are flexibly connected on lines at right angles to the connections of the others, and swing in opposite directions to each other, and having portions to overlap other walls to hold the same in a closed position, said two sets of walls, forming all of the sides of the box and a strap connecting said holding-walls to secure them in holding position, substantially as and for the purpose specified.

4. A bag or box formed of a single piece of material having the shape of a parallelogram with prolongations on opposite sides, the parallelogram being scored on parallel lines, and the prolongations being each scored on lines at right angles to, and lines parallel with said other scores, the parts of each prolongation being folded on certain of said scores to bring their free edges together, said edges being fastened together to hold the parts in fixed relation, substantially as and for the purpose specified.

605,089. CORN-PLANTER. SAMUEL M. WILSON, Marcus, Iowa. Filed Jan. 25, 1896. Serial No. 577,574. (No model.)

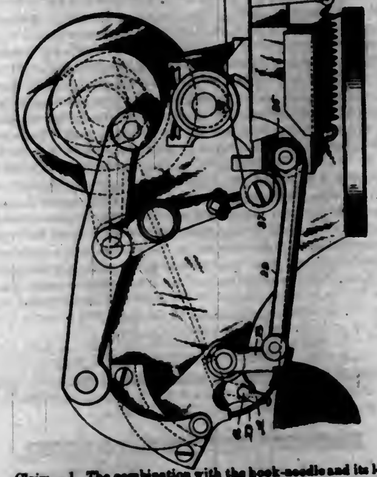
Claim.—1. In a planter, a marker consisting of a tube adapted to be pivoted to a support, a runner attached to the tube, and a shaft extending loosely through the tube and through the runner, the shaft being provided with a crank-arm parallel with the runner and arranged to receive a hoe, as and for the purpose set forth.

2. In a planter, the combination, with a seed-drop mechanism, of a marker consisting of a pivoted tube, a rock-shaft within the said tube, provided with a crank-arm at its outer end, and a hoe carried by the said crank-arm of the shaft, substantially as described.

3. In a planter, the combination, with a seed-dropping mechanism, of a marker consisting of a tube pivotally attached to the machine, a runner attached to the outer end of the tube, a rock-shaft loosely mounted in said tube and extending through said runner, the shaft at its outer end being provided with a crank-arm parallel with the runner, a hoe adjustable upon the said crank-arm, and a connection, substantially as described, between the said shaft and the seed-dropping mechanism of the planter, as and for the purpose specified.

4. In a planter, the combination, with the seed-dropping mechanism thereof, and wheels mounted in the frame on the said planter, one near the rear and the other near the front, of an endless check-belt passed over the said wheels, projections from the check-belt adapted for engagement with the ground, offsets formed at intervals on the said check-belt, a connection between the crank-shaft and the seed-dropping mechanism, a marker pivoted to a support of the said machine, the marker consisting of a tube carrying a runner, a shaft loosely mounted in the said tube, a hoe carried by the said shaft, and a crank-and-link connection between the said marker and the seed-dropping mechanism, as and for the purpose specified.

5. In a seed-planter, the combination with a frame, of a check-belt mounted to run on the frame and driven by contact with the ground, a rock-shaft, a post attached to the rock-shaft and engaged by the belt to turn the rock-shaft, a seed-drop shaft having connection with the rock-shaft and mounted on the frame, a tube attached to the frame and outrunning laterally therefrom, a runner attached to the outer end of the tube, a rock-shaft extending through the tube and having connection with the said drop-shaft, and a hoe carried at the outer end of the rock-shaft.



6. In a seed-planter, the combination with a frame of a tube pivotally mounted thereon and outrunning laterally therefrom, a rock-shaft extending through the tube, a runner attached to the outer end of the tube, means for operating the rock-shaft, and a hoe carried at the outer end of the rock-shaft.

7. In a seed-planter, the combination with the frame, of a tube mounted thereon and outrunning laterally therefrom, a rock-shaft extending through the tube, means for turning the rock-shaft, and a hoe carried at the outer end of the rock-shaft and periodically engaged with the ground by the movement of the rock-shaft.

8. In a seed-planter, the combination with a frame, of a check-belt mounted thereon and driven in unison with the movement of the planter, a checking device mounted on the frame and running out laterally therefrom, and means engaged by the check-belt for periodically operating said checking device.

9. In a seed-planter, the combination with a frame, of a check-belt mounted thereon and driven in unison with the movements of the planter, and a checking device mounted on the frame and driven from the check-belt, the checking device being run out laterally beyond the frame to mark the earth at the check-row contiguous to that on which the planter is traveling.

605,040. SEWING-MACHINE. FRANK CHASE, Malden, Mass., assignor to Walter Shaw, trustee. Filed May 22, 1895. Renewed Aug. 12, 1896. Serial No. 602,562. (No model.)

Claim.—1. The combination with the hook-needle and its looper, of a loop-keeper, located on that side of the work to which the loop is pulled by the needle, having a movement to and from the work with an intermediate period of rest during its loop-rendering movement, and actuating mechanism therefor, timed in their movements relatively to, and operating in connection with, the needle substantially as described, and means by which the slack or surplus of the old loop rendered by the loop-keeper before it attains its intermediate position of rest is drawn back to the side of the stock on which the needle takes its loops before the needle pulls the new loop through the stock; all substantially as hereinbefore set forth.

2. The combination with the hook-needle and its looper and the take-up for tightening the stitch, of a loop-keeper, located on that side of the work to which the loop is pulled by the needle, having a movement to and from the work with an intermediate period of rest during its loop-rendering movement, and actuating mechanism therefor, timed in their movements relatively to the needle and take-up substantially as described, whereby the loop-keeper retains that portion of the old loop needed to furnish the requisite supply of thread to one leg of the new loop, and at the same time takes the strain occasioned by the action of the take-up in setting the stitch, as set forth.

605,041. MUSICAL INSTRUMENT. THOMAS H. DOHERTY, Forsyth, Mont. Filed Nov. 27, 1896. Serial No. 613,809. (No model.)

Claim.—1. In a musical instrument of the character described, the combination with the instrument proper, of a rod or bar extending longitudinally of the body part on the under side of the head, a mute having a pair of arms surrounding said bar and a spring for holding said arms in frictional contact with said bar, whereby said mute may be adjusted back and forth or up or down, substantially as described.

2. In a musical instrument of the character described, the combination with a body part having the usual head and an opening in its under side, a neck secured to said body part, a rod or bar extending longitudinally of the body part on the under side of the head, of a mute having a pair of arms surrounding said bar and a spring for holding the said arms in frictional contact therewith.

3. In a musical instrument of the character described, the combination with a body part having the usual head and an opening in its under side, a neck secured to said body part, a rod or bar extending longitudinally of the body part on the under side of the head, of a mute made up of a single strip of metal having a flat upper surface and two arms projecting rearwardly therefrom and a spring for holding said arms in frictional contact with said bar.

4. In a musical instrument of the character described, the combination with the body part thereof, a head secured in said body part and a neck attached to said body, of a tailpiece made up of a single sheet of metal, bent at one point, one part thereof fitting against the rear end of said body part and formed with slots for the purpose described, and the other part bent forwardly and provided with end pieces having hooks substantially as described.

5. In a musical instrument of the character described, the combination with the body part thereof, a head secured in said body part and a neck attached to said body, of a tailpiece made up of a single sheet of metal, bent at one point, one part thereof fitting against the rear end of said body part and formed with loops for the purpose described, and the other part bent forwardly and provided with notches therein through which the strings of the instrument pass and a pivoted cap connected to said loops, substantially as and for the purpose set forth.

605,042. MINERAL WOOL. DAVID P. DEAN, St. Louis, Mo., assignor to the Missouri Smelting Company, same place. Filed May 20, 1897. Serial No. 637,459. (Specimens.)

Claim.—1. A mineral wool containing in chemical combination, silica, iron, lime, aluminium and lead.

2. A mineral wool containing in chemical combination, silica from thirty to forty per cent., iron from fifteen to twenty-five per cent., lime from thirty to forty per cent., and aluminium and lead from ten to fifteen per cent.

605,043. PIN OR PEG FOR STRINGS OF MUSICAL INSTRUMENTS. CHARLES GITTUS, London, England, assignor of one-third to Charles Gittus, Jr., and Louis C. Gittus, Golden Gate, Cal. Filed Dec. 29, 1897. Serial No. 664,461. (No model.)

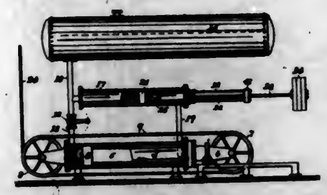
Claim.—1. In a stringed musical instrument, a double-acting apparatus of the nature described consisting of a screw-plug having an

external thread and an internal thread in opposite directions, a string-holding pin provided with a screw-thread adapted to engage in the interior screw of the said plug, and a wrest-plank with a suitable hole into which the plug is screwed and wherein it may be turned either forward or backward so the pin and string will be moved with it at the same time and in the same direction by its opposite threads, substantially as set forth.

2. In an apparatus of the nature described, a string-holding pin made with a double-spiral groove the channels of which are suitably joined and in which the string may be coiled in opposite directions, substantially as set forth.

3. In a stringed musical instrument, a device for the purpose described comprising a screw-plug having an external thread engaging a screw-threaded hole in the wrest-plank, a string-holding pin provided with a screw-thread engaging a screw-thread on said screw-plug running in opposite direction to the first-mentioned external thread, said string-holding pin being provided with a spiral groove, substantially as set forth.

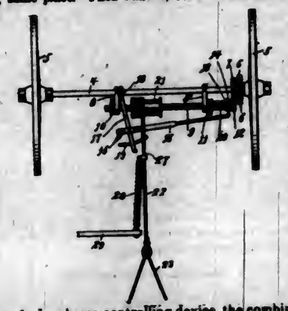
4. In an apparatus of the nature described, a pin having a hole cut obliquely from a point at its circumference toward its center and in the direction of its axis and a recess or slot forming a continuation thereof, and having a spiral groove combined with a string one end of which is passed through the said hole and recess or slot and thence wound about the said pin in said spiral groove, and a wrest-plank into which the pin is driven at an angle to the direction of the main part of the string and having a sloping way or passage through which is led the end of the string that is attached to the pin, substantially as set forth.



5. In an apparatus of the nature described, a wrest-plank provided with a screw-threaded hole, combined with a spirally-grooved pin inserted therein, a string coiled in the groove of said pin, a screw-plug engaging in the said hole, and means connecting the said pin and screw-plug whereby the same may be driven in and out of the wrest-plank together, substantially as set forth.

6. In an apparatus of the nature described, the combination of a wrest-plank having a suitable hole, a socket provided with a circumferential groove and packing therein that will take cement whereby the same may be firmly secured in the said hole, and a string-holding pin arranged to enter the said socket, substantially as set forth.

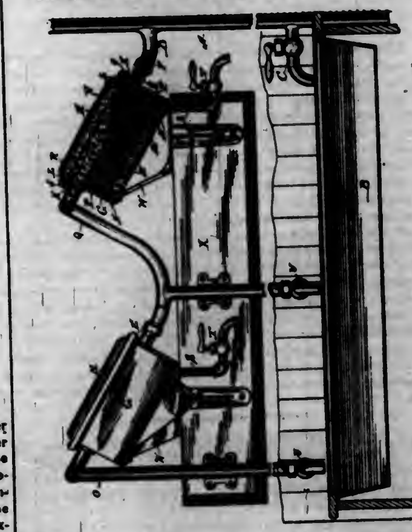
7. In an apparatus of the nature described, a wrest-plank having a suitable number of pin-holes and string-holding pins provided with means whereby said pins can be driven at a variable depth therein, combined with covers or cases of uniform height or length bearing on the face of the wrest-plank about the holes thereof and covering the heads of the several pins, substantially as shown.



8. In a stringed musical instrument, a double-acting apparatus of the nature described consisting of a screw-plug having an external thread and an internal thread in opposite directions, a string-holding pin provided externally with a spiral groove and also provided with a screw-thread adapted to engage in the interior screw-thread of the said plug, and a wrest-plank with a suitable hole into which the plug is screwed and wherein it may be turned either forward or backward so that the pin and string will be moved with it at the same time and in the same direction.

605,044. APPARATUS FOR OPERATING ELEVATORS. CORBAN I. HALL, San Francisco, Cal., assignor to the Cahill & Hall Elevator Company, same place. Filed Apr. 29, 1897. Serial No. 634,428. (No model.) Patented in England Jan. 17, 1894, No. 1,040, and in France Jan. 17, 1894, No. 235,580.

Claim.—In apparatus to operate elevators, a hydraulic cylinder and a piston therein, said cylinder in communication with a receiver containing fluid under pressure communicating with one side of the hydraulic piston to counterbalance a predetermined load on an elevator to which the apparatus is attached, a second hydraulic cylinder, and a piston in communication with the receiver and with the other side of the main hydraulic piston so that movements of the auxiliary piston produce or permit like movements of the main piston, in combination with an electric motor or other power connected to the second or auxiliary piston, substantially as specified.



605,045. HORSE-CONTROLLING DEVICE. GEORGE A. HIDDEN, Phœnix, Ariz., assignor of two-thirds to A. H. Lawrence and Enoch Hidden, same place. Filed June 9, 1897. Serial No. 639,905. (No model.)

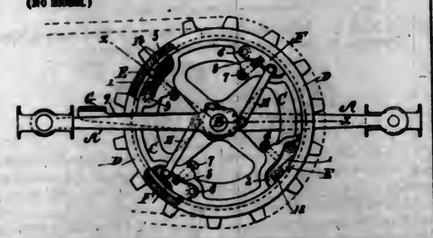
Claim.—1. In a horse-controlling device, the combination, of the driving-wheels of a vehicle, a gear wheel rotatable with the driving-wheels, a shaft having a pinion slidable thereon and normally out of mesh with the gear-wheel, a lever engaging the pinion and extending parallel with the shaft of the pinion, said lever adapted to throw the pinion into and out of mesh with the gear-wheel, a pivoted operating arm at an angle to and intersecting the inner end of the lever and pivoted at an intermediate point to said lever, the outer end of the arm having an upturned vertical handle portion, a segment over which the horizontal portion of the operating-arm works and is adapted to engage, so as to be held in adjusted position, a drum mounted on the shaft, and a controlling-strap connected at one end to the drum.

2. In a horse-controlling device, the combination, of vehicle driving-wheels, a winding-drum, a gearing between the driving-wheels and the drum, for imparting rotation to said drum, means for throwing said gearing out of connection to prevent the rotation of the drum by the gearing, a controlling-strap secured at one end to the drum and connected at its opposite end to the harness, and a coiled spring secured at one end to an intermediate point of the controlling-strap and having its opposite end secured to a fixed part, said spring adapted, when the drum is not rotated by the gearing, to cause a pull on the strap and an independent rotation of the drum, and a consequent unwinding or slackening of the controlling-strap.

605,046. FILTER. LYSANDER JOHNSTON, Chicago, Ill., assignor of one-half to Gustine I. Ladd and Henry A. Buell, same place. Filed Nov. 1, 1897. Serial No. 657,089. (No model.)

Claim.—1. A filter comprising the filter-plate having the inclined upper surface, the layer of abrading material thereon, the supply-pipe having the nozzle directed upward upon the upper surface of the filter-plate and into said layer of abrading material, one or more exhaust-pipes opening into the filter above said filter-plate, and the filter discharge-pipe opening into the filter at the under side of said filter-plate, substantially as shown and described.

2. A filter comprising the filter-plate having an inclined upper surface, a layer of coarse abrading material thereon, the supply-pipe opening into the filter just above the lowest portion of the surface of the plate and having the contracted nozzle directed thereon, the exhaust-pipe opening into the filter just above the highest portion of the plate, and the filter discharge-pipe opening into the filter at the under side of said plate, substantially as shown and described.



3. A filter comprising the filter-plate having an inclined upper surface, a layer of coarse abrading material thereon, the supply-pipe opening into the filter just above the lowest portion of the surface of the plate and having the contracted nozzle directed thereon, the exhaust-pipe opening into the filter just above the highest portion of the plate, screens to prevent the escape of the abrading material from the filter, and the filter discharge-pipe opening into the filter at the under side of said plate, substantially as shown and described.

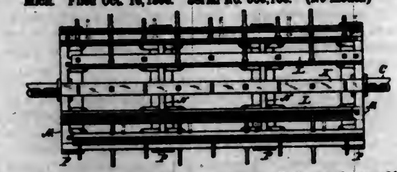
4. A filter comprising the body portion set in an inclined position, the filter-plate thereon having the inclined upper surface, a layer of coarse abrading material thereon, the supply-pipe having the nozzle directed upon the upper surface of the filter-plate and into the abrading material, the exhaust-pipe opening into the filter just above the filter-plate, and the filter discharge-pipe opening into the lowest angle of the filter at the under side of said plate, substantially as shown and described.

5. A filter comprising a layer of solid filtering material, with the layer of abrading material thereover, the supply pipe having a contracted nozzle directed upon the surface of said filtering material and into the abrading material for reciprocating the abrading material over the surface of said plate, the discharge-pipe, and the cock, C, for drawing off the water located between the head of water and the filter, substantially as described.

6. A filtering system comprising the cock, C, located in the supply-pipe, the contracted nozzle, E connected to said supply-pipe and opening into the filter, the inclined filter-plate, O, having the abrading material, V, thereon, the discharge-pipe, Q, opening into the filter just above the upper surface of the filter-plate, O, the discharge-cock, U, and the outlet, S, for the filtered water opening into the filter beneath the plate, O, all cooperating substantially as and for the purpose described.

605,047. BICYCLE-BRAKE. HERMANN A. KLEMM, New York, N. Y., assignor of three-fourths to John Mottauer, same place, and F. R. Gintz, Brooklyn, N. Y. Filed June 24, 1896. Serial No. 596,730. (No model.)

Claim.—1. In a bicycle propelling and brake mechanism, the combination of pedal-cranks, a rotary driving part, and a rotary driven part, and a clutch having balls with inclined seats in one of said parts, and bearing on the other said part, adapted to positively engage by the forward propelling motion of the pedal, and spring-pressed shoes on the one said part in constant engagement with the other said part, and adapted to act as a brake when the pedals are retarded substantially as set forth.



2. In a bicycle propelling and braking mechanism, the combination of pedal-cranks, a rotary driving part, and a rotary driven part, clutch-balls having inclined seats upon the one said part and bearing upon the other said part, the inclined part of said seats being adjustably pivoted, spring-pressed brake-shoes in constant engagement between the driving and driven parts, and means for adjusting the tension of the springs, substantially as set forth and shown.

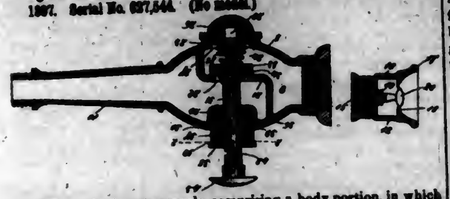
3. In a bicycle, the combination of pedal-cranks and a rotary shaft to which said cranks are fixed, of an auxiliary brake-pedal loosely mounted upon said shaft in movable relation to said cranks and rotative therewith and located adjacent to a crank-pedal in a position accessible to the foot of the rider without removing said foot from said crank-pedal, a rotary brake shoe bearing part fixed to said crank-shaft and brake-shoes mounted thereon, an independently rotary driven part mounted on said bearing part, and operative connection between said brake-pedal and said brake shoes, all arranged whereby the pedal-cranks may be arrested while the bicycle is in motion and the brake-shoes may then be pressed with friction upon said driven part by the application of the foot of the rider to said brake-pedal.

4. In a bicycle propelling mechanism, the combination of pedal-cranks, a rotary brake-shoe bearing part fixed to the crank-shaft carrying a driven part independently rotary, the brake-shoes, a toggle mechanism substantially as described, and an auxiliary pedal connected to said toggle and located on or near the pedal-crank accessible to the foot of the rider.

5. In a bicycle propelling and brake mechanism, the combination of pedal-cranks, a rotary driving part, a rotary driven part, clutch-balls having inclined seats in the one said part and bearing on the other said part, said seats consisting in pivoted shoes and adjusting-screws arranged to regulate the pressure of said shoes on the driven part, substantially as and for the purposes described.

605,048. THRESHING-MACHINE. MYRON H. HASE, Vicksburg, Mich. Filed Oct. 16, 1896. Serial No. 609,109. (No model.)

Claim.—1. In a threshing-machine a cylinder made up of heads M, M, having elongated ears with a series of holes therein, and intermediate supporting-plates N, with ears N', thereon containing a series of holes, bars K, carrying cylinder-teeth and extending the length of the cylinder to serve as a permanent support for the same and bars L, adjacent to said bars K, of less length than the cylinder and bearing cylinder-teeth and capable of adjustment lengthwise on the cylinder to vary the rows of teeth around the cylinder to change the same from a grain to a bean thresher and vice versa as specified.



2. In a threshing-machine a cylinder made up of heads M, M, having elongated ears with a series of holes therein, and intermediate supporting-plates N, with ears N', thereon containing a series of holes, bars K, carrying cylinder-teeth to serve as a permanent support for the same, and bars L, adjacent to said bars K, of less length than the cylinder and bearing cylinder-teeth and capable of adjustment lengthwise on the cylinder to vary the rows of teeth around the cylinder and suitable bands P, P, P, around the cylinder to retain the bars in place to change the same from a grain to a bean thresher and vice versa as specified.

3. In a bean-threshing machine the combination of a suitable cylinder with teeth in rows around the same the teeth in rows alternating with each other; and a concave supported in suitable side plates D, and consisting of plate E, to the front with teeth thereon a single tooth to each row of cylinder-teeth positioned alternately toward the front and rear of the plate E, and the plate F, with a pair of teeth set a little to each side midway between the path of the cylinder-teeth and plate G, with teeth-plate F, only closer to the path of the cylinder-teeth and the plate H, with heavy teeth I, bearing ridges *a*, *a'*, corresponding to the rows of cylinder-teeth, the said concave containing large openings *s*, along the path of the cylinder-teeth and spaces *r*, between the plates, coacting as specified.

4. In a threshing machine the combination of a suitable cylinder with teeth in rows around the same the teeth in the rows alternating with each other; and a concave supported in suitable side plates D, and consisting of plate E, to the front with teeth thereon a single tooth to each row of cylinder-teeth positioned alternately toward the front and rear of the plate E, and the plate F, with a pair of teeth to each row of cylinder-teeth set a little to each side midway between the path of the cylinder-teeth and plate G, with teeth-like plate F, only closer to the path of the cylinder-teeth the said concave containing large openings *s*, along the path of the cylinder-teeth and spaces *r*, between the plates coacting as specified.

5. In a bean-thresher the combination of a cylinder with teeth separated into regular rows the teeth in the rows alternating with each other; a concave provided with irregular rows of teeth beginning with single alternate teeth to each row of cylinder-teeth and increased in number toward the rear of the concave and varied in position in an increasing ratio from side to side toward the rear of the concave till the last teeth are in close proximity to the path of the cylinder-teeth the concave being suitably perforated for the passage of the beans as specified.

605,049. NOZZLE. RUDOLF HEINTZMANN, New York, N. Y., assignor of one-half to Edwin Farris, Montclair, N. J. Filed Mar. 15, 1897. Serial No. 627,544. (No model.)

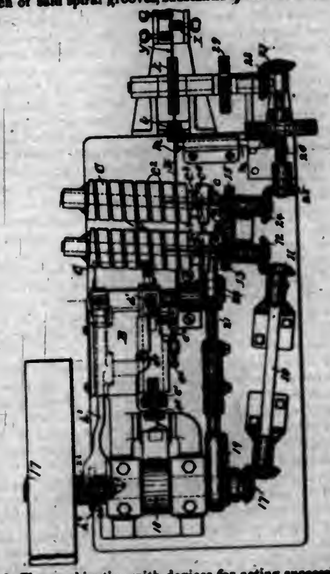
Claim.—1. A water-nozzle, comprising a body portion, in which is formed an enlarged chamber and one end of which is provided with means for securing it to a flexible tube or pipe, and the other end with an extension to which the discharge-nozzle proper is secured, said chamber being provided centrally thereof, with a longitudinal partition-plate which is provided with a central opening through which passes a spring-operated shaft which is provided with a valve which is adapted to close said opening, said shaft being projected through an opening in said chamber at one side thereof, which is closed by a screw-threaded plug, in which is formed a transverse slot or groove, in which is mounted a spring-operated lever, and said shaft being provided with an annular groove in connection with which said lever operates, substantially as shown and described.

2. A nozzle, comprising an enlarged body portion, at one end of which is a head by means of which the nozzle may be connected with a tube or pipe, the other end of said body portion being provided with an extension adapted to receive a discharge-nozzle proper, said enlarged body portion being provided with a chamber, in which is a partition-plate provided with a central opening, said body portion being also provided at one side with an opening which is closed by a screw-threaded plug in which is formed a cavity or recess, and at the opposite side with a tubular inwardly-directed casing, and a spring-operated shaft passing through said chamber, one end of which enters the cavity or recess in said screw-threaded plug, and the other end of which passes through said tubular casing, and through a screw-threaded plug mounted therein, said last-named screw-threaded plug being provided at one side with a transverse slot or groove in which is placed a spring-operated lever, and said shaft being provided with an annular groove in connection with which said lever operates, and with a valve by which the opening in the partition-plate is closed, substantially as shown and described.

3. A discharge-nozzle, comprising an enlarged portion 16, bell-shaped mouth 17, flange 18, bar 19 and disk 20, substantially as and for the purpose set forth.

4. A nozzle provided with an enlarged body portion, in which is formed a partition which is provided with a central opening, and a transversely-movable spring-operated shaft which is provided with a valve adapted to close said opening, and means for locking said shaft and said valve in an opening position, consisting of a screw-threaded plug mounted in one side of the body portion of the nozzle through which said shaft passes, said plug being provided with a spring-operated lever, and said shaft with a groove in which said lever operates, substantially as shown and described.

605,050. MACHINE FOR MAKING METAL SPOKES. WILLIAM G. ALLEN, Hartford, Conn. Filed May 9, 1893. Serial No. 590,944. (No model.)



Claim.—1. In a machine for making wire spokes, the combination of devices for forming a head on one end of the spoke, devices for bending the headed end to form a shoulder, and feed mechanism for feeding the blanks to said devices in succession, substantially as described.

2. In a machine for making wire spokes, the combination of devices for forming a head on one end of the spoke, devices for bending the headed end to form a shoulder, and feed mechanism for feeding the blanks to said devices in succession, the action of the heading devices and bending devices taking place simultaneously upon different blanks, substantially as described.

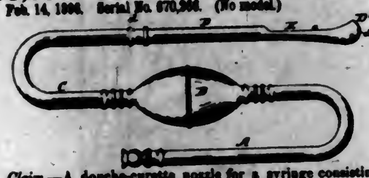
3. The combination of the heading devices, the bending devices, feed mechanism for presenting the blanks successively to the heading devices and bending devices, and automatically-operated gripping devices for holding the blanks during the heading and bending operations, and for releasing the same upon the completion thereof, substantially as described.

4. The combination with heading and bending devices arranged to act successively upon each spoke, and simultaneously upon different spokes, of means for feeding the blanks to said devices in a direction transverse to the length of the blanks, by an intermittent movement, substantially as described.

5. The combination with heading and bending devices arranged to act successively upon the spoke-blanks, of rotary feed-cylinders having spiral grooves thereon in which the blanks are laid, means for moving the cylinders forward longitudinally, whereby the spoke-blanks are advanced by an intermittent movement, and means for gradually returning the cylinders by a movement commensurate with the pitch of said spiral grooves, substantially as described.

6. The combination with devices for acting successively upon a wire-blank, of feeding mechanism for the blanks comprising horizontal rollers movable lengthwise of their supporting-shafts and having spiral peripheral grooves, means for rotating said rollers, and means for imparting to them an intermittent forward motion and for returning them at a speed corresponding with the pitch of the spiral grooves, substantially as described.

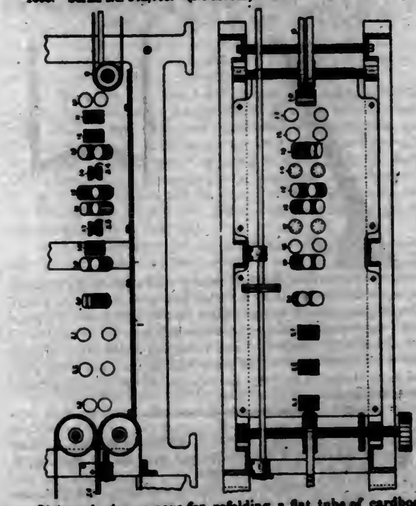
605,051. BICYCLE-SADDLE. HENRY A. CHENEY, Jackson, Mich. Filed Apr. 17, 1897. Serial No. 632,646. (No model.)



Claim.—1. As a new article of manufacture, a metallic saddle seat or top consisting of a main body portion formed with a sunken portion or recess in its upper surface at each side of its seat portion to receive a cushion or pad, and having its marginal portion or outer edge turned down so as to form an integral pendent marginal flange extending around and overhanging the edge of the seat, and having also a centrally-disposed recess or depression in its upper surface extending longitudinally thereof from a point between said sunken portions to near its front pendent edge, substantially as described.

2. As a new article of manufacture, a solid metallic saddle seat or top formed in a single piece having convex sides which merge into a shortened-up or truncated horn and a sunken portion or recess at each side, and having a centrally-disposed recess or depression formed in its upper surface extending longitudinally thereof from a point between said sunken portions to a point adjacent to the terminus of said horn, together with an integral pendent flange or skirt extending around and overhanging the outer edge of the seat, substantially as described.

3. As a new article of manufacture, a solid metallic saddle seat or top formed in a single piece having convex sides which merge into a shortened or truncated horn, and a sunken portion or recess at each side, and having a centrally-disposed recess or depression formed in its upper surface extending longitudinally thereof from a point between said sunken portions to a point adjacent to the terminus of said horn, together with an integral pendent flange or skirt extending around and overhanging the outer edge of the seat and the sides and end of the horn, substantially as described.



4. A metallic saddle seat or top formed of a single piece of metal having convex sides which merge into a shortened-up or truncated horn and having its upper surface formed with a sunken portion or recess at each side of its seat portion to receive a cushion or pad and with a centrally-disposed recess or depression extending longitudinally thereof from a point between said sunken portions to a point adjacent to the terminus of said horn, together with an integral pendent flange or skirt extending around and overhanging the edge of the seat, said flange having its pendent edge turned up against itself or "seamed," substantially as described.

605,052. SYRINGE. HORATIO R. COOK, Lake City, Fla. Filed Feb. 14, 1898. Serial No. 670,266. (No model.)

Claim.—A douche-curette nozzle for a syringe consisting of a tube D having a douche-point D^2 of larger diameter than the body of said tube and provided with small perforations, and in the rear of said point D^2 a semicylindrical opening, about one-third the length of the nozzle, the edges of said opening being sharpened substantially as described.

605,053. MACHINE FOR REFOLDING PAPER TUBES. HENRY R. CORNELL, Jr., Rochester, N. Y. Original application filed Apr. 1, 1895, Serial No. 544,083. Divided and this application filed Dec. 20, 1895. Serial No. 572,763. (No model.)

Claim.—1. As a means for refolding a flat tube of cardboard, previously creased longitudinally, a die composed of a series of plain-faced cylindrical positively-driven rollers with their axes of rotation disposed at various angles around the longitudinal axis of the die, said die changing in shape from front to rear, from approximately a line to rhomboidal, then rectangular and then rhomboidal again with the angles reversed from the previous one and then approximately a line, substantially as described.

2. As a means for refolding a flat tube of cardboard, previously creased longitudinally, a die composed of a series of plain-faced cylindrical positively-driven rollers with their axes of rotation disposed at various angles around a longitudinal axis, said die changing in shape from front to rear, from approximately a line to rhomboidal, then rectangular, then rhomboidal again with the angles reversed, then approximately a line, and a series of other cylindrical driven rollers having their surfaces approximately at right angles to the longer axis of the last rhomboidal shape of the die, for flattening the blank to first position, substantially as described.

3. As a means for refolding a flat tube of cardboard previously creased longitudinally, a die composed of a series of plain-faced cylindrical positively-driven rollers with their axes of rotation disposed at various angles around the longitudinal axis of the die, said die changing gradually in shape from approximately a line to rhomboidal, then rectangular, then rhomboidal again with the angles reversed, then approximately a line, and two pairs of rollers intermediate the length of the die having grooves formed therein, the walls of which are at a lesser angle than the portions of the tube with which they contact, whereby the tube will be refolded and the corners protected from direct contact with the rollers when moving to and from a right angle, substantially as described.

4. As a means for folding or "breaking back" a flat cardboard tube, the opposite sides of which have been previously creased longitudinally near opposite edges, a die having four moving sides, composed of plain-faced cylindrical rollers, with their axes of rotation disposed at various angles to and extending gradually around the longitudinal axis of the die, two of said sides at the entrance being close together, and two separated, and the two separated ones gradually approaching and the two close together gradually separating until the die is of rectangular form, and then the two previously-separated ones approach and the two formerly close together separate again to normal width, and two pairs of rolls with their axes in a plane approximately at right angles to the plane of the exit end of the die, the rolls of the first pair being more widely separated than those of the second pair, the whole arranged and operating to bend the tube in rectangular form, then flatten it, bending it on the creased lines, and finally flatten it again in the form in which it entered the die, substantially as described.

605,054. PROTECTIVE SEAL FOR BICYCLES. CHARLES W. DAVISON, Minneapolis, Minn., assignor to Freeman P. Lane, same place. Filed May 5, 1897. Serial No. 636,167. (No model.)

Claim.—1. The combination, in a protective seal for bicycles, of a casing, with means for securing the same to the frame of a bicycle, a device within said casing for securing the said means, and a frangible cap or seal internally locked in said casing and covering said device, substantially as described.

2. The combination, in a protective seal for bicycles, of a casing, with means for securing the same to a bicycle, a lock provided within said casing, a frangible seal arranged in said casing and secured therein by said lock, and said seal having identification-marks, substantially as described.

3. The combination, in a protective seal for bicycles, of a casing, with means for securing the same to a bicycle, a lock provided within said casing, and a frangible seal arranged in said casing, secured therein by said lock, and, covering the same, and also covering the means for securing the casing, substantially as described.

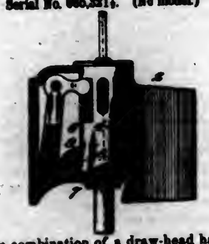
4. The combination, with the casing and means for securing the same to the bicycle or other article, said casing being provided with a recess, of a lock or latch within said recess, and a hollow internal shouldered seal secured in said recess by said lock or latch and provided with identification-marks, substantially as described.

5. The combination, with the casing to be secured to the frame of a bicycle and having a recess or opening, of a hollow internally-shouldered glass cap or seal, provided in said recess, a lock or latch in said recess to engage the shoulder of said seal, and identification-marks provided upon the inside of said seal and visible through the top thereof, substantially as described.

6. The combination, with the casing, of the clamp having one end within said casing, a nut for securing the parts together, means to prevent the turning of the nut, and a seal to cover said nut and having identification-marks, substantially as described.

7. The combination, in a protective seal for bicycles, of the ring or clamp made of hardened material, with the casing secured thereby and also made of hardened material, and a frangible seal secured to said casing, as and for the purpose specified.

8. The combination, with the ring parts 4 and 5, of the casing, said parts being of hardened steel, means for locking the ends of said parts 4 and 5, and a frangible seal provided in said casing substantially as described.



9. The combination, of the ring parts 4 and 5, one provided with a hook and the other with an eye to receive the same, and the opposite ends of said parts 4 and 5 forming a screw, with the casing covering said screw, the nut thereon and within the casing, a lock within the casing, and a frangible seal secured within the casing by said lock, substantially as described.

10. In a protective seal for bicycles, the combination, of the clamp and the casing secured thereby, both made of hardened steel, with the glass cap provided in said casing and removable only after

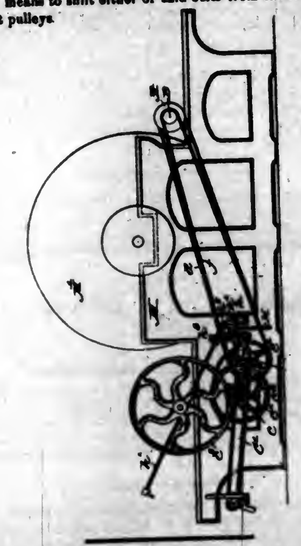
the cap is broken, and the marked paper provided within the seal and visible through the top thereof, substantially as described.

11. The combination, with the ring or clamp parts 4 and 5, of the casing, the nut for securing said clamp parts, the lock or latch held by said nut within said casing, means to prevent the movement of the lock, a filling to prevent the turning of the nut, and a transparent frangible seal secured in the casing by said lock and having marks within it, substantially as described.

605,055. CAR-COUPLING. THOMAS M. GALLAGHER, St. Louis, Mo., assignor to the Shickle, Harrison & Howard Iron Company. Filed Jan. 3, 1898. Serial No. 666,321. (No model.)

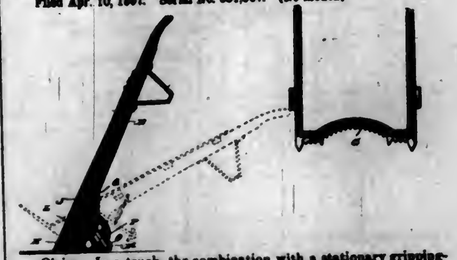
Claim.—The combination of a draw-head having an opening, a knuckle having a tail formed with a downwardly and inwardly inclined surface at its inner end, and a pin formed with a curved recess at the lower end of the body, so formed as to permit the lower end of the body of the pin at the side where the tail bears, to rest on the bottom wall of the opening in the draw-head, and also with an upwardly and inwardly inclined surface extending from the lower end of the body of the pin and receiving the inclined surface of the tail of the knuckle; substantially as described.

605,056. ABRADING-SHOE FOR TRUING UP CAR-WHEELS. WILLIAM M. HOUFNAR, Detroit, Mich., assignor to Judson M. Griffin, same place. Filed Mar. 1, 1897. Renewed Mar. 17, 1898. Serial No. 674,262. (No model.)



Claim.—1. An abrading-shoe adapted to be used for truing up car-wheels, having in combination a metallic shell and a filling of abrading material and provided with clearance-holes, substantially as described.

2. In an abrading-shoe adapted to be used for truing up car-wheels, the combination of a shell provided with a plurality of cavities adapted to be filled with abrading material, blocks of abrading material set therein, cavities intermediate the blocks, provided with openings whereby accumulated material may be discharged, substantially as described.

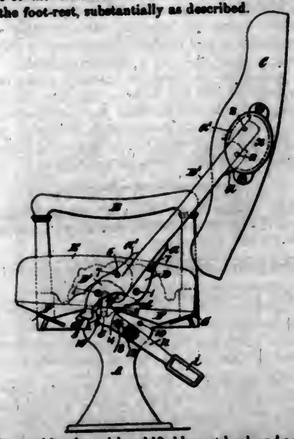


3. In an abrading shoe adapted to be used for truing up car-wheels, the combination of a shell, abrading material set therein, and clearance-holes between adjacent portions of the abrading material, substantially as described.

605,057. DOFFER-DRIVING MECHANISM FOR CARDING-ENGINES. WILLIAM HOPKINSON and RICHARD TYACK, Accrington, England, assignors to the Howard & Bullough Machine Company, Limited, of England. Filed Mar. 25, 1897. Serial No. 629,148. (No model.)

Claim.—In a carding-engine, the doffer-lever, a stud fast thereon, a fast pulley rotatably mounted on said stud and provided with an extended sleeve-like hub having an attached pinion, the doffer connections between it and the pinion attached to said fast pulley, and loose pulleys one at each side of said fast pulley and mounted rotatably on the hub thereof, combined with fast and slow speed driving-belts, and means to shift either of said belts from the loose pulleys to the fast pulleys.

605,058. TRUCK. HENRY W. HORTON, Wilkesborough, N. C. Filed Apr. 10, 1897. Serial No. 631,567. (No model.)



Claim.—In a truck, the combination with a stationary gripping-plate secured to the front of the truck and provided with a central concaved portion, said gripping-plate formed with teeth of various sizes, of a swinging gripping member comprising a rod pivoted to the truck adjacent its handle end and extending forwardly to a point adjacent the forward end of the truck, said forward end being bifurcated at its extremity to form downwardly-curved prongs, substantially as set forth.

605,059. CAR-SEAT. JOHN S. JOHNSTON, New York, N. Y., assignor to the Pettler & Stymus Company, same place. Filed Apr. 16, 1896. Serial No. 677,793. (No model.)

Claim.—1. The combination with a shiftable seat-back and a pair of back-shifting arms pivoted to the seat-frame, of a lever carrying a foot-rest bar and mounted to swing the rest-bar from one side of the seat to the other into position for use at the rear of the seat, and extensions on said arms below the frame-pivots by which the lever is rocked in opposite directions when the back is shifted and the pressure on the rest-bar supported during use, said extensions and lever being constructed and arranged to transmit the pressure on the rest-bar to the supporting extension in a direction substantially radial to the arc of movement of the extension, substantially as described.

2. The combination with a shiftable seat-back and a pair of back-shifting arms pivoted to the seat-frame, of a lever carrying a foot-rest bar and mounted to swing the rest-bar from one side of the seat to the other into position for use at the rear of the seat, extensions on said arms below the frame-pivots and on opposite sides of the lever for rocking the lever in opposite directions when the back is shifted, and stops on the frame for limiting the movement of the foot-rest in both directions, substantially as described.

3. The combination with a shiftable seat-back and a pair of back-shifting arms pivoted to the seat-frame, of a foot-rest mounted to swing from one side of the seat to the other into position for use at the rear of the seat, and extensions on the arms below the frame-pivots for actuating the foot-rest in opposite directions when the back is shifted and arranged to engage the foot-rest when in position for use by one of the extensions with the other extension out of contact with the foot-rest, substantially as described.

4. The combination with a shiftable seat-back and a pair of back-shifting arms pivoted to the seat-frame, of a foot-rest mounted to swing from one side of the seat to the other into position for use at the rear of the seat, and extensions on the arms below the frame-pivots for actuating the foot-rest in opposite directions when the back is shifted and arranged to support the pressure on the foot-rest in use by one of the extensions in a direction substantially radial to the arc of movement of the extension and with the other extension out of contact with the foot-rest, substantially as described.

5. The combination with a shiftable seat-back and a pair of back-shifting arms pivoted to the seat-frame, of a foot-rest mounted to swing from one side of the seat to the other into position for use at the rear of the seat, extensions on the arms below the frame-pivots for actuating the foot-rest in opposite directions when the back is shifted and arranged to engage the foot-rest when in position for use by one of the extensions with the other extension out of contact with the foot-rest, and stops on the frame at opposite sides of the foot-rest, substantially as described.

6. The combination with the seat frame and back and reversing-arms pivoted to said seat frame and back and each having two stops thereon adapted to arrest the movement of and support the other arm, of a foot-rest mounted to swing from one side of the seat to the other into position for use at the rear of the seat, and extensions on the arms below the frame-pivots to actuate the foot-rest and arranged to engage the foot-rest when in position for use by one of the extensions with the other extension out of contact with the foot-rest, substantially as described.

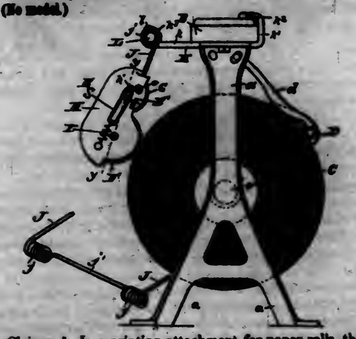
7. The combination with the seat frame and back and reversing-arms each pivoted to the seat frame and back on opposite sides of the vertical center, the portions of said arms between the seat and back lying in parallel planes and overlapping each other and being of such width as to avoid separation at their inner edges during the reversing operation, of a foot-rest mounted to swing from one side of the seat to the other into position for use at the rear of the seat, and extensions on the arms below the frame-pivots to actuate the foot-rest and arranged to engage the foot-rest when in position for use by one of the extensions, with the other extension out of contact with the foot-rest, substantially as described.

8. The combination with a seat frame and back and reversing-arms each pivoted to the seat frame and back on opposite sides of the vertical center and having two stops thereon on opposite sides of the line of intersection with the other arm adapted to arrest the movement of and support the latter, the portions of said arms between the seat and back lying in parallel planes and overlapping each other and being of such width as to avoid separation at their inner edges during the reversing operation, of a foot-rest mounted to swing from one side of the seat to the other into position for use at the rear of the seat, and extensions on the arms below the frame-pivots to actuate the foot-rest and arranged to engage the foot-rest when in position for use by one of the extensions with the other extension out of contact with the foot-rest, substantially as described.

9. The combination with a shiftable seat-back and back-shifting arms pivoted to the seat-frame and having extensions *d*, *d'* below the frame-pivots, of levers H having heads *h* engaged by said extensions *d*, *d'* to swing the levers from one side of the seat to the other and toward the rear of the seat as the back is shifted and a foot-rest actuated by said levers H, said extensions *d*, *d'* and heads *h* being provided with concave and convex surfaces 3, 4, forming extended bearing-surfaces for the swinging and support of the foot-rest, substantially as described.

10. The combination with a shiftable seat-back and back-shifting arms pivoted to the seat-frame and having extensions *d*, *d'* below the frame-pivots, of levers H carrying a rest-bar and having heads *h* engaged by said extensions *d*, *d'* to swing the rest-bar from one side of the seat to the other and into position for use at the rear of the seat, said extensions *d*, *d'* and heads *h* being formed with curved surfaces forming extended bearing-surfaces for the support of the foot-rest and by which the pressure of the foot-rest is supported in a direction substantially radial to the arc of movement of the extensions, substantially as described.

11. The combination with a shiftable seat-back and back-shifting arms pivoted to the seat-frame and having extensions *d*, *d'* below the frame-pivots, of levers H carrying a rest-bar and having heads *h* engaged by said extensions *d*, *d'* to swing the rest-bar from one side of the seat to the other and into position for use at the rear of the seat, said extensions *d*, *d'* and heads *h* being formed with bearing-surfaces by which the pressure of the foot-rest is supported in a direction substantially radial to the arc of movement of the extensions, substantially as described.



12. The combination with a shiftable seat-back and back-shifting arms pivoted to the seat-frame and having extensions *d*, *d'* below the frame-pivots, of levers H carrying a rest-bar and having heads *h* engaged by said extensions *d*, *d'* to swing the rest-bar from one side of the seat to the other and into position for use at the rear of the seat, said extensions *d*, *d'* and levers H being constructed and arranged for engagement of the heads *h* by only the extension *d* or *d'* on the rear side of the seat when the foot-rest is in position for use, substantially as described.

13. The combination with a shiftable seat-back and back-shifting arms pivoted to the seat-frame and having extensions *d*, *d'* below the frame-pivots, of levers H carrying a rest-bar and having heads *h* engaged by said extensions *d*, *d'* to swing the rest-bar from one side of the seat to the other and into position for use at the rear of the seat, said extensions *d*, *d'* and levers H being constructed and arranged for engagement of the heads *h* by only the extension *d* or *d'* on the rear side of the seat when the foot-rest is in position for use, and stops 10, engaging the opposite sides of the heads from the extensions, substantially as described.

605,060. COMPOSITION FOR IMPREGNATING WOOD AND FIBER. EUGENE KLEIN, Grand Rapids, Mich., assignor to Pauline Klein, same place. Filed Apr. 26, 1897. Serial No. 634,015. (No specimens.)

Claim.—The herein-described composition of matter consisting of gum-amber, with soda, lime, and water, substantially as and for the purpose set forth.

605,061. PRINTING ATTACHMENT FOR PAPER-ROLLS. ALBERT R. MARTIN, Beaver Falls, Pa., assignor to the Automatic Roller Printer Company, same place. Filed Apr. 12, 1897. Serial No. 631,853. (No model.)

Claim.—1. In a printing attachment for paper-rolls, the combination with the frame which supports the paper-roll, of the spring-carrier, means for securing it to the roll-frame and the printing mechanism vertically adjustably secured to the spring-carrier, substantially as set forth, whereby it can be held in a higher or lower position.

2. In a printing attachment for paper-rolls, the combination with

the frame which supports the paper-roll, of the spring-carrier having downward-extending projections, means for securing the spring-carrier to the frame, the printing-roll, the inking-roll, and the holder for the rolls having guides for adjustably receiving the said downwardly-extending projections of the spring-carrier, substantially as set forth.

3. In a printing attachment for paper-rolls, the combination with the frame which supports the paper-roll, of the printing mechanism, the spring-carrier for the printing mechanism having the coils *j j* and the abutment part *j'* integral with and situated between the coils, the spring-gripper detachably fastened to the roll-frame and provided with eyes, and the rod or mandrel L passing through the spring-coils *j* and the said eyes, substantially as set forth.

4. In a printing attachment for paper-rolls, the combination with the frame which supports the paper-roll, of the printing mechanism, the spring-actuated carrier connected to the printing mechanism, and the holder for the spring-actuated carrier, having the arms *k*, the legs *k'* and the elastic gripper k^3 connected to both legs *k'* and adapted to engage the supporting-frame all formed from a single piece of wire and detachably connected to the spring-carrier, substantially as set forth.

5. In a printing attachment for paper-rolls, the combination with the frame which supports the paper-roll, of the printing mechanism having the printing-roll, the inking-roll and the housing which holds said rolls, the carrier for said housing having the legs *J*, the coils *j*, and the abutment-arms *j'* all formed of a single piece of wire, and the holder K having the arms *k*, the eyes k^3, the legs *k'* and the gripper k^3 all formed from a single piece of wire, and means for detachably fastening together the said holder and carrier, substantially as set forth.

6. In a printing attachment for paper-rolls, the combination with the frame which supports the paper-roll, of the printing mechanism, the holder formed of best elastic metal, of relatively low flexibility, providing a clutch detachably engaging with the roll-frame, and a carrier for the printing mechanism having a best elastic wire or rod of relatively high flexibility, and a connecting device for detachably connecting together the said carrier and the holder which engages with the frame, substantially as set forth.

7. In a printing attachment for paper-rolls, the combination with the frame which supports the paper-roll, of the printing mechanism, the holder, K, formed of a rod, of relatively low flexibility, best to form an elastic friction-clutch, detachably engaging with the roll-frame, and a carrier for the printing mechanism having a wire or rod of relatively high flexibility, and a hinging device interposed between the carrier of the printing-frame and the holder secured to the roll frame, whereby the carrier and the holder can move freely relatively to each other, substantially as set forth.

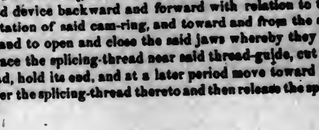
605,062. THREAD-GUIDE. JAMES H. NORTHROP, Hopedale, Mass., assignor to the Draper Company, same place and Portland, Me. Filed Oct. 18, 1897. Serial No. 655,563. (No model.)

Claim.—1. In a yarn-guide, the combination with a fixed jaw, of a movable jaw, a pivotal connection between them, and means on said pivotal connection to adjust the movable jaw with relation to the fixed jaw.

2. In a yarn-guide the combination with a fixed jaw, of a movable jaw pivoted thereto by means of a rotatable stud, said stud being provided with means serving to adjust the pivoted jaw with relation to the fixed jaw.

3. In a yarn-guide, the combination with a fixed jaw, of an opposing jaw adapted to be moved transversely to said fixed jaw, and a rotatable support upon which the movable jaw is pivotally mounted, rotation of said support varying the distance between the jaws in a plane substantially perpendicular to the plane of said transverse movement.

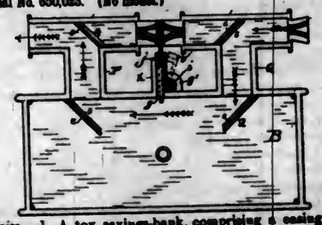
4. In a yarn-guide, a fixed jaw, a movable jaw pivoted to move transversely thereto, means to attach the yarn-guide to its support, independent means to move the movable jaw bodily toward or from the fixed jaw, the movable jaw having a shoulder to limit its outward movement, and means to keep the jaws normally in alinement with each other.



5. In a yarn-guide, a fixed jaw, an eccentric adjusting-stud, and a movable jaw pivoted on said stud.

6. In a yarn-guide, a fixed jaw, a movable jaw normally in alinement with the fixed jaw, whereby movement of one jaw will not materially change the width of the space between the jaws while exposing the edge of the movable jaw to be readily cleaned, an eccentric pivot upon which the movable jaw is mounted, and means to normally retain said jaws in alinement.

7. In a yarn-guide, a fixed jaw, an eccentric adjusting-stud mounted parallel thereto and provided with a shoulder, a weighted movable jaw pivoted on said stud and held thereon by the said shoulder, and means to clamp the stud in adjusted position.

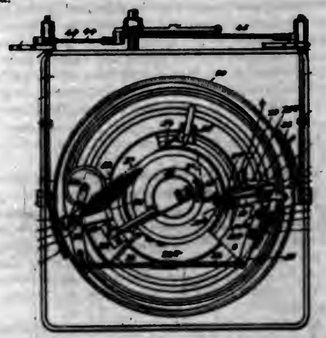


8. In a yarn-guide, two jaws, an eccentric pivotal support for one of them, whereby said jaws have an operative relation to each other to present a slot of definite width between them by which to clean a strand of yarn passed therethrough, and means to permit a restricted movement of one relatively to the other, without appreciably changing the width of the slot between them.

605,068. FARM-GATE. JACOB W. PARLER, Williamsville, Ill., assignor of one-half to G. G. Council, same place. Filed Mar. 19, 1896. Serial No. 674,483. (No model.)

Claim.—The combination of a gate; a swinging frame to which the gate is attached, and which has a vertical notched pintle-rod at its outer end; a clevis engaging on the pintle-rod affording both a vertical and a horizontal movement, and connected to the gate, and thus attaching the gate to the swinging frame; a spring attached to the clevis, its unattached end forked and straddling the pintle-rod and pressing against said rod and adjusted to fit into the notches on the pintle-rod substantially as and for the purposes described and set forth.

605,064. TOY SAVINGS-BANK. CHARLES SMITH, Dayton, Ohio, assignor of one-half to Lena Hyman, same place. Filed Aug. 30, 1897. Serial No. 650,023. (No model.)



Claim.—1. A toy savings-bank, comprising a casing having a slot in its upper side, and provided with upwardly-projecting hollow extensions F and G, terminating in horizontal sight-tubes B and C, the latter having an intervening space between their inner ends in line with said slot, and a trigger mounted above said slot and adapted to support a coin in position between the inner ends of said sight-tubes, and to permit said coin to drop into the interior of the case, through the slot *g* when said trigger is pressed downward, as herein shown and described.

2. In a toy savings-bank, a casing having a coin-slot in its upper side, and hollow extended portions projecting from said upper side and terminated in horizontal sight-tubes having space between their inner ends, sight-deflectors located in the casing on inclines below the said hollow extensions, and in the sight-tubes above said hollow extensions, and a spring-pressed trigger adapted to normally close the coin-slot in the casing, and to support a coin between the inner ends of the sight-tubes, all arranged substantially as and for the purposes specified.

605,065. KNITTING-MACHINE. CHARLES TERROT, Cannstadt, Germany, assignor to Moritz Boas, St. Hyacinthe, Canada. Filed Oct. 8, 1894. Renewed Dec. 28, 1897. Serial No. 664,111. (No model.) Patented in England Apr. 6, 1894, No. 6,573.

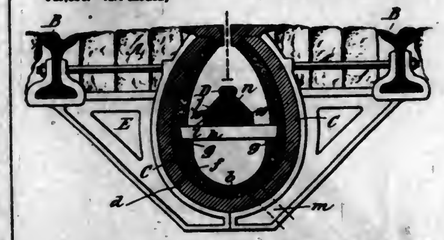
Claim.—1. The combination with a circular series of needles, a needle-actuating cam-ring, and a splicing-thread guide, of a splicing-thread-introducing device having jaws, means to move said splicing-thread device backward and forward with relation to the direction of rotation of said cam-ring, and toward and from the series of needles, and to open and close the said jaws whereby they are made to embrace the splicing-thread near said thread-guide, cut the splicing-thread, hold its end, and at a later period move toward said needles, deliver the splicing-thread thereto and then release the splicing-thread preparatory to returning to the said thread-guide, substantially as described.

2. In a circular-knitting machine, a circular series of latched needles, a needle-actuating cam-ring, a splicing-thread-introducing device mounted on said ring, a splicing-thread guide, means to move the said thread-introducing device at predetermined intervals in a direction opposite the rotation of a needle-actuating cam-ring to introduce the thread to the needles at a distance from the said thread-guide, and when taken by the needles, to retire from the splicing-thread and return to its starting-point near the said thread-guide, and means to thereafter cause the thread-introducing device to regrasp, cut and hold the said splicing-thread, substantially as described.

3. In a splicing apparatus for circular-knitting machines, a device provided with jaws for introducing the thread to the needles and holding it until it is engaged thereby, and means for moving the said device back again into the track of the thread, and means for opening and closing the jaws to regrasp and sever the thread in the manner described, substantially as described.

4. In a circular-knitting machine, a series of circularly-arranged latched needles, a splicing-thread guide, a needle-actuating cam-ring, and a splicing-thread-introducing device mounted thereon and having jaws, combined with a splicing cam-track having eccentric surfaces and with mechanism interposed between said track and said thread-introducing device to actuate the latter and cause it to travel back and forth from the needles to the spacing-thread guide, substantially as described.

5. In a knitting-machine, a splicing-thread-introducing device adapted to present its thread directly to the needles of the machine, two splicing-thread cam-tracks, actuating mechanism operated by the latter to cause the thread-introducing device to grasp and present the thread to the needles, and retire from the thread, and means to cause the said thread-introducing device to cut and reclamp the same, combined with devices to raise and lower said actuating mechanism to be operated by one or the other of said cam-tracks to determine the part of the tubular fabric to receive the splicing-thread, substantially as described.



6. In a splicing apparatus for circular-knitting machines, a splicing-thread device for introducing a splicing-thread to the usual machine-needles, two splicing-thread cam-tracks and an interposed circular ring, a lever having one end cooperating with one of said tracks, mechanism interposed between the said lever and the said splicing-thread device to actuate the latter, and means for automatically moving the said lever into and out of contact with the said tracks for the purpose described.

7. In a splicing apparatus for circular-knitting machines, a device for introducing a splicing-thread to the needles, splicing-thread cam-tracks, mechanism interposed between them and the said splicing-thread device to actuate the latter, combined with a cam-slide for causing the said interposed mechanism to be actuated by one or other of the said cam-tracks as desired, substantially as described.

8. In a splicing apparatus for circular-knitting machines, a splicing-thread device for introducing the thread to the needles, cam-tracks and mechanism interposed between them and the said splicing-thread device to actuate the latter, slides having cams for placing the said interposed mechanism in and out of contact with one of said cam-tracks, a pattern-chain, and devices between it and the slides having cams to operate the latter, substantially as and for the purpose described.

9. In a circular-knitting machine, a thread-introducing device composed of jaws to grasp the splicing-thread, means to move said thread-introducing device in the direction of travel of the needle-actuating cam-ring and present said thread to the needles, means to open said jaws to release the thread, means to move said device back to its starting-point in opposition to the movement of the said needle-actuating cam-ring, and means to grasp and sever the said splicing-thread near the thread-guide, substantially as described.

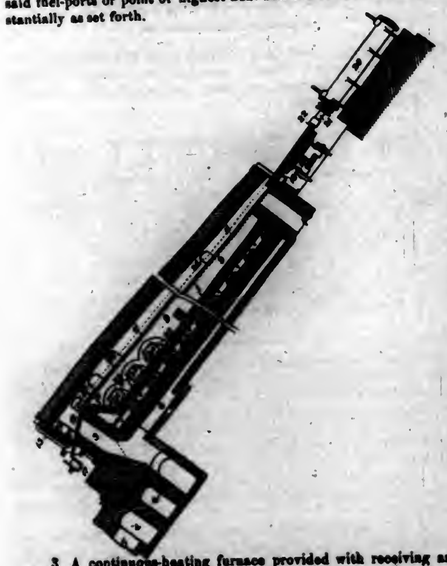
605,066. THIRD-RAIL UNDERGROUND ELECTRIC-RAILWAY SYSTEM. LOUIS B. WALKINS, Springfield, Mass., assignor of one-half to Francis W. Dickinson, same place. Filed Aug. 21, 1897. Serial No. 649,088. (No model.)

Claim.—1. In a third-rail electric-railway system, the combination with the track-rails and the top-slotted conduit, of the cross-ties supported within the conduit above the base thereof, the trough *i* of wood, mounted on said ties and longitudinally extending, the rail D set in the trough, and the filling of insulating material provided in the trough and covering the base and neck of the rail, the upper portion of said rail extending above said filling of insulating material which is downwardly and outwardly inclined from its junction with the exposed portion of the rail, substantially as and for the purpose set forth.

2. In a third-rail electric-railway system, in combination, the track-rails B B and the underground top-slotted conduit C, of cement, comprising the inner wall thereof composed of a solidified insulating substance and molded with the rests or ledges *g g*, the wooden cross-ties A A, supported on said ledges above the base of the conduit, the trough *i* of wood having its top edges downwardly and outwardly inclined, and the third-rail conductor supported in the trough and having its top portion extending higher than the side walls of said trough, the cement or concrete filling covering the base and neck of the rail having the upper portion thereof exposed, which filling together with said trough edges by being downwardly and outwardly inclined constitute a watershed and guard for the rail, substantially as described and shown and for the purposes set forth.

3. In combination with a rail conductor, a trolley or shoe having terminals or binding-posts, a holder-plate for the shoe, on which the same is vertically yieldingly supported, arms for the holder-plate, whereby the same may be supported from the motor car or truck, and wires running to connection with the binding-posts of the shoe, independent of the holder-plate and its supporting-arms, substantially as described.

4. In combination with the third-rail conductor of the shoe 24, having the squared shank 25, and stem 25a, and having the connection-posts or terminals 33, the arms 30, and holder-plate 23, having the pillars 26 and top plate 27, the squared shank of the shoe playing through a socket therefor in the holder-plate and having its stem guided through the top plate, the spring 29, between the top plate and said collar, and an independent current-conductor running to one of said connection-posts, substantially as described.



REISSUES.

11,666. HEATING-FURNACE. ALEXANDER LAUGHLIN, Sewickley, and JOSEPH REBLEAUX, Wilkinsburg, Pa.; said Reblaux assignor to said Laughlin. Filed Nov. 19, 1897. Serial No. 659,102. Original No. 582,476, dated May 11, 1897.

Claim.—1. A continuous-heating furnace provided with receiving and discharge openings at or near the ends of the furnace, supports extending from the receiving to the discharge opening, mechanism for pushing the billets along the supports to or adjacent to the fuel-ports or point of highest heat, and means independent of the pushing mechanism for more quickly moving the billets past said fuel-ports or point of highest heat and out of the furnace, substantially as set forth.

2. A continuous-heating furnace provided with receiving and discharge openings at or near the ends of the furnace, supports extending from the receiving to the discharge opening, mechanism for pushing the billets along the supports to or adjacent to the fuel-ports or point of highest heat, and means independent of the pushing mechanism for effecting a quicker automatic movement of the billets past

said fuel-ports or point of highest heat and out of the furnace, substantially as set forth.

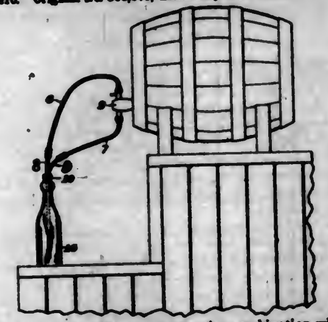
3. A continuous-heating furnace provided with receiving and discharge openings at or near the ends of the furnace, supports extending from the receiving to the discharge opening, the supports adjacent to the discharge-opening being inclined to cause the automatic movement of the billets past the fuel-ports or point of highest heat through the discharge-opening and mechanism for pushing the billets along the supports to the point of automatic discharge, substantially as set forth.

4. A continuous-heating furnace provided at its opposite end walls with receiving and discharge openings, and having in combination a series of flues or ports through which the combustibles enter the heating-chamber, arranged adjacent to the rear or discharge opening of the furnace and transversely thereto, supports for the articles to be heated extending from the receiving-opening to points adjacent to the flues, mechanism for pushing the articles along the supports, and bridge-pieces adapted to receive the article from said supports and support it while passing over the flues to the discharge-opening, said bridge-pieces being sufficiently inclined to cause the automatic movement of the article over the flues and through the discharge-opening, substantially as set forth.

5. A continuous-heating furnace, having in combination a series of flues or ports through which the combustibles enter the heating-chamber adjacent to the rear or discharge end of the furnace, supports for the article to be heated, extending from the front end to points adjacent to the rear end of the furnace, and supplemental supports arranged parallel, or approximately parallel, with the main supports, but in different planes, and extending from the rear ends of the main supports over the flues, substantially as set forth.

6. A continuous-heating furnace having in combination a series of flues or ports through which the combustibles enter the heating-chamber arranged adjacent to the rear or discharge end of the furnace, supports for the article to be heated, extending from the front end to points adjacent to the rear end, supplemental supports extending from the main supports to and over the flues at the rear end of the furnace, the rear ends of the main supports being raised above the adjacent parts of the supplemental supports, thereby forming a drop for the article being heated, substantially as set forth.

7. A continuous-heating furnace having in combination a series of flues or ports through which the combustibles enter the heating-chamber arranged adjacent to the rear or discharge end of the furnace and transversely thereof, supports extending from the front end of the furnace to points adjacent to said flues, and supplemental supports or bridge-pieces extending from the main supports over the flues, said supplemental supports being inclined, substantially as set forth.



8. A continuous-heating furnace having in combination continuous piers or supporting-walls extending longitudinally from the front toward the rear end of the furnace, one or more piers arranged transversely of the furnace between the bridge-wall and the ends of the longitudinal piers, and bearing-pieces or supports for the billets, &c., arranged on the longitudinal and transverse piers, substantially as set forth.

9. The combination of a continuous-heating furnace having openings in its opposite ends, supports for the billets, &c., extending through the furnace from the discharge to the receiving opening, the supports adjacent to the discharge-opening being sufficiently inclined to cause the automatic movement of the article past the fuel-ports through said opening, a fore-plate arranged at the front end of the furnace on or approximately on a level with the billet-supports, a truck movable into line with the fore-plate and having its bed or platform on or approximately on a level with the fore-plate, and mechanism for pushing the billets, &c., from the truck into and through the furnace, substantially as set forth.

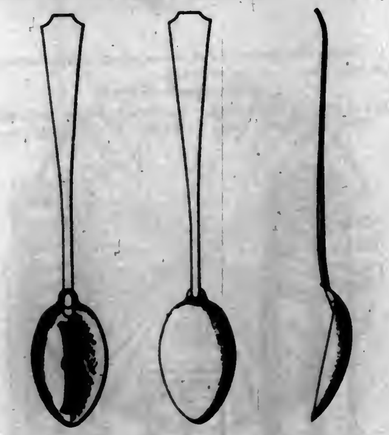
10. A continuous-heating furnace having receiving and discharge openings at or near the ends of the furnace, and pipes or supports for the billets extending from the receiving or charging opening toward the discharge-opening, and provided with one or more cinder-pockets arranged adjacent to and below the rear ends of the pipes or billet-supports and extending below the latter, and openings through the side walls of the furnace into said pockets, thereby permitting of the removal of the cinder during the operation of the furnace, substantially as set forth.

11. A continuous-heating furnace having in combination continuous piers or supporting-walls extending longitudinally from the front toward the rear end of the furnace, pipes or billet-supports arranged on the longitudinal piers and extending beyond the ends of said piers toward the rear end of the furnace, thereby forming a cinder-pocket in the rear of the piers and below the pipes or supports, substantially as set forth.

11,667. BOTTLE-FILLING APPARATUS. HENRY SEARS and CASPER DURNEY, Allegheny, Pa., assignors, by mesne assignments, to Thomas McKeaon, Pittsburg, Pa. Filed Aug. 24, 1897. Serial No. 649,410. Original No. 580,070, dated May 13, 1896.

Claim.—1. In bottling apparatus, the combination with a plug arranged to be driven into the tapping bung-hole of the keg or barrel, and having separated channels therein which open at the inner portion of the plug so as to be below the level of the liquid in the barrel, of a bottle-stopper having similar separate channels therethrough, connections between the corresponding channels in the plug and stopper, and valve mechanism arranged to control the flow of liquid through the bung or plug.

2. In bottling apparatus, a spigot having separated passages formed in its body, said passages extending through projecting nozzle portions of the spigot and opening at the inner portion of the same so as to be below the level of the liquid in the keg or barrel, flexible tubes connected to the nozzles and a bottle-stopper having separate passages therethrough to which the flexible tubes lead.



3. In bottling apparatus, a spigot-plug having separate passages opening at the inner end of the same so as to be below the level of the liquid in the keg or barrel and connecting with similar passages in a way-cock located in the plug, a bottle-stopper, and tubes extending from the channels of the way-cock through the stopper.

4. In a device of the character described, a spigot having longitudinal air and liquid passages and an exterior shoulder, a turn-plug having an air-passage in its top, a liquid-passage in its bottom and provided with a lug to engage the shoulder of the spigot, said passages in the plug being separated by a partition, tubes connecting with the air and liquid passages and in combination, a stopper having a central aperture to receive a pipe having an interior tube, the pipe conveying liquor into the bottle and the interior tube conveying the air from the bottle, the tubes of the spigot being connected with the pipe and tube of the stopper, as and for the purpose described.

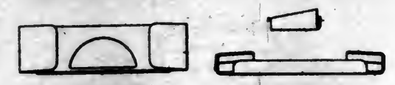
5. In a bottling device, a spigot having longitudinal ways to convey liquid and air, a turn-plug having an opening at the top communicating with the air-passage, and an opening in its bottom communicating with the liquid-passage, the openings at the top and bottom being separated, a lug on the turn-plug to engage the shoulder of the spigot, tubes connecting with the top and bottom passages of the turn-plug, and in combination, a stopper having a central aperture, a pipe extending through the aperture and adapted to convey liquid, an internal tube cast with the pipe, said tube protruding above the stopper and having an opening through the wall of the pipe below the stopper to convey air from the bottle to the air-tube of the spigot, as and for the purpose described.

DESIGNS.

28,719. SPOON. EDWARD TODD, Jr., New York, N. Y., assignor to Edward Todd & Co., same place. Filed Apr. 16, 1898. Serial No. 677,894. Term of patent 7 years.

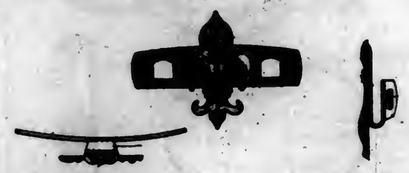
Claim.—The design for a spoon, substantially as herein shown and described.

28,720. BRACELET OR SIMILAR ARTICLE. FRANK H. LA FIEGRA, East Orange, N. J. Filed Apr. 21, 1898. Serial No. 678,208. Term of patent 7 years.



Claim.—The design for a bracelet or similar article as herein shown and described.

28,721. THIMBLE. JOHN F. SIMMS, Philadelphia, Pa., assignor to himself and THOMAS MADDOCK, same place, FREDERIC H. SIMMS, Swarthmore, Pa., and EDGAR G. SIMMS, Orange, N. J. Filed May 2, 1898. Serial No. 679,548. Term of patent 14 years.



Claim.—The design for a thimble substantially as described and shown in the accompanying drawings.

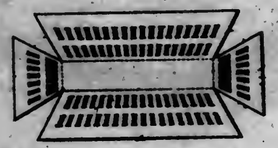
28,722. BUCKLE-PLATE. JAMES FLEMMING, New York, N. Y. Filed Apr. 13, 1898. Serial No. 677,602. Term of patent 14 years.

Claim.—The design for a buckle-plate, substantially as herein shown and described.

28,723. BELT-HOOK. IDA M. FIELD, New York, N. Y. Filed Mar. 28, 1898. Serial No. 675,182. Term of patent 7 years.

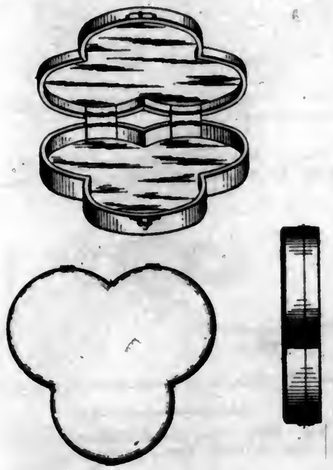
Claim.—The design for a belt-hook herein shown and described.

28,724. HOOK. PETER HEATON, Allegheny, Pa. Filed Apr. 16, 1898. Serial No. 677,892. Term of patent 3½ years.



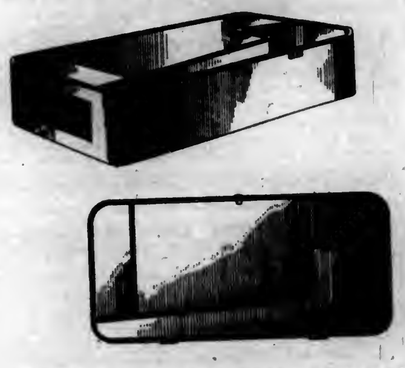
Claim.—The design for a hook, as herein shown and described.

28,725. CUFF-HOLDER. HERBERT C. FRANK, New York, N. Y. Filed Apr. 8, 1898. Serial No. 676,908. Term of patent 14 years.



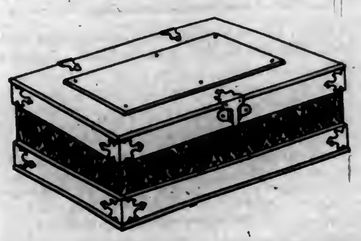
Claim.—The design for a cuff-holder, substantially as herein shown and described.

28,726. PIN OR NEEDLE CARD. ROBERT HEISS, Aachen, Germany. Filed Feb. 12, 1898. Serial No. 670,149. Term of patent 7 years.



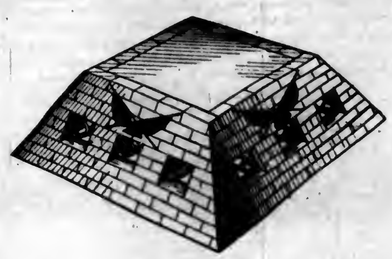
Claim.—The design for a pin or needle card as herein shown and described.

28,727. BOX. THEODORE W. FOSTER, Providence, R. I. Filed Mar. 31, 1898. Serial No. 676,001. Term of patent 3½ years.



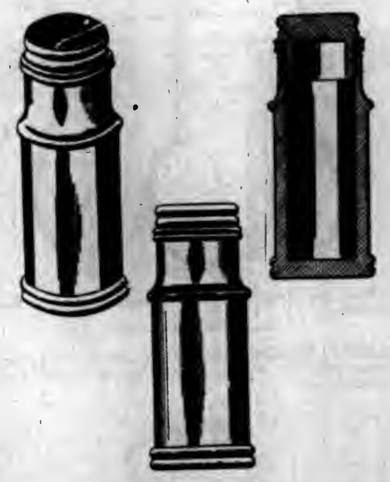
Claim.—The design for a box for manicure or similar articles herein shown and described.

28,728. BOX. MERRITT M. TANNER, Hawkinsville, N. Y. Filed Apr. 2, 1898. Serial No. 676,250. Term of patent 14 years.



Claim.—The design for a box, substantially as shown and described.

28,729. CIGAR-BOX. ADAM H. HIRDING, Cleveland, Ohio. Filed Jan. 29, 1898. Serial No. 668,488. Term of patent 14 years.

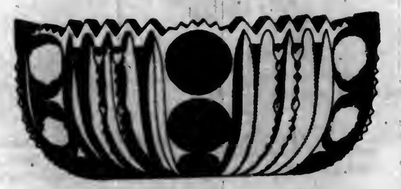


Claim.—The design for a cigar-box, as herein shown and described.

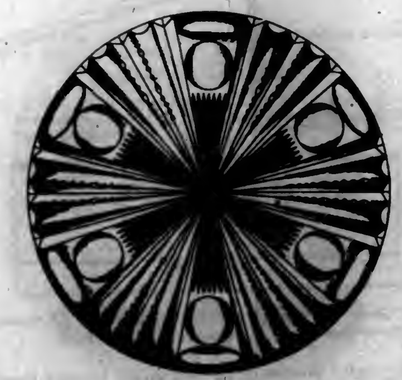
28,730. PAPER BOX. PHINEAS R. MYERS, New York, N. Y. Filed Apr. 27, 1898. Serial No. 679,044. Term of patent 3½ years.

Claim.—The design for a paper box, substantially as herein shown and described.

28,731. PILL-BOTTLE. MATTHEW J. BOGERT, Demarest, N. J. Filed Apr. 30, 1898. Serial No. 679,404. Term of patent 7 years.



Claim.—The design for a pill-bottle herein shown and described.



28,732. LOVING-CUP. LEWIS P. COOK, New York, N. Y. Filed Apr. 20, 1898. Serial No. 678,209. Term of patent 3½ years.

Claim.—The design for a loving-cup as herein shown and described.

28,733. BOWL OR VESSEL. BENJAMIN DAVIES, West Hoboken, N. J., assignor to L. Straus & Sons, New York, N. Y. Filed Mar. 28, 1898. Serial No. 675,508. Term of patent 7 years.

Claim.—The design for a bowl or vessel having the decorations thereon, substantially as shown and described.

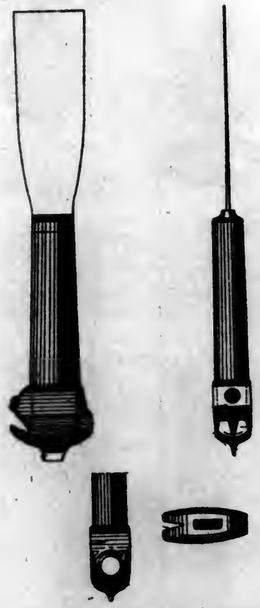
28,734. LAMP-HOLDER. HERMANN O. MÜLLER, New York, N. Y. Filed Oct. 30, 1897. Serial No. 656,970. Term of patent 14 years.

Claim.—The design for an ornamental lamp-holder, substantially as shown and described.

28,735. LAMP-BODY. WILLIAM A. RAYNER, Taunton, Mass., assignor to the Reed & Barton Corporation, same place. Filed Mar. 7, 1898. Serial No. 673,012. Term of patent 14 years.

Claim.—The design for a lamp-body as herein shown and described.

28,736. DRY MEASURE. JOSEPH A. DIEFFENBACHER, York, Nebr. Filed May 11, 1897. Serial No. 636,111. Term of patent 14 years.



Claim.—The unitary design for a dry measure, herein shown and described.

28,737. HOLDER FOR CURLING-TONGS HEATERS. LYMAN H. SNYDER, Bristol, Conn. Filed Apr. 21, 1898. Serial No. 678,393. Term of patent 7 years.

Claim.—The design for a holder for curling-tongs heaters as herein shown and described.

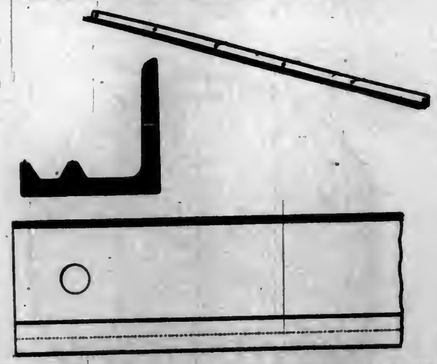
28,738. TIP FOR TOOL-HANDLES. JOHN HENRY HAHLIN, Salt Lake City, Utah. Filed Apr. 26, 1898. Serial No. 678,918. Term of patent 7 years.

Claim.—The design for a tip for tool-handles herein shown and described.

28,739. HANDLE FOR PUNCHES. JAMES W. IVORY, Philadelphia, Pa. Filed July 6, 1897. Serial No. 643,663. Term of patent 14 years.

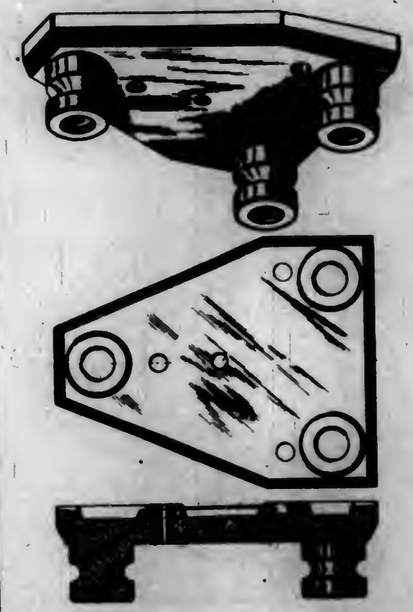
Claim.—The design for the handle of a punch substantially as shown and described.

28,740. PUNCH. JOHN H. HUBER, St. Louis, Mo. Filed Oct. 22, 1897. Serial No. 656,106. Term of patent 7 years.



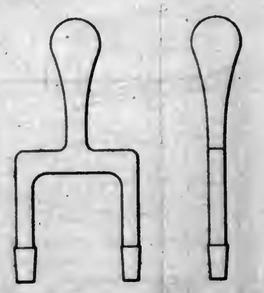
Claim.—The design for a punch, substantially as herein shown and described.

28,741. TRACE-FASTENER. WORTHINGTON BROWN, Hannibal, Mo. Filed Apr. 26, 1898. Serial No. 678,914. Term of patent 7 years.



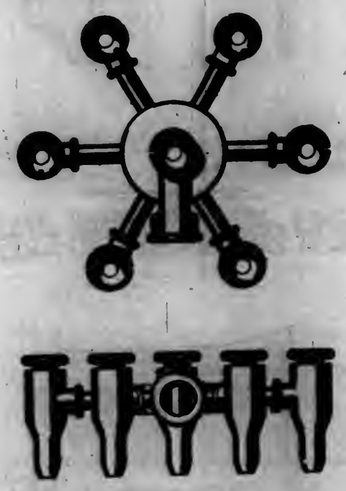
Claim.—The design for a trace-fastener, substantially as herein shown and described.

28,742. CAR-DOOR TRACK. EDWARD S. MARSHALL, St. Louis, Mo., assignor to the Missouri Railway Equipment Company, same place. Filed Apr. 4, 1898. Serial No. 676,466. Term of patent 14 years.



Claim.—The design for a car-door track, substantially as herein shown and described.

28,743. INSULATOR-PLATE. WILLIAM B. MCDONALD, Chicago, Ill. Filed Dec. 18, 1896. Serial No. 616,199. Term of patent 7 years.

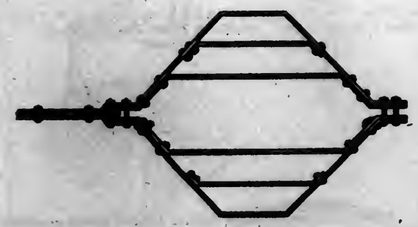


Claim.—The design for an insulator-plate for electric lamps as herein shown and described.

28,744. PLUG FOR ELECTRICAL PURPOSES. MIRAM PERRY MAKER, Hartford, Conn. Filed Apr. 9, 1898. Serial No. 677,006. Term of patent 14 years.

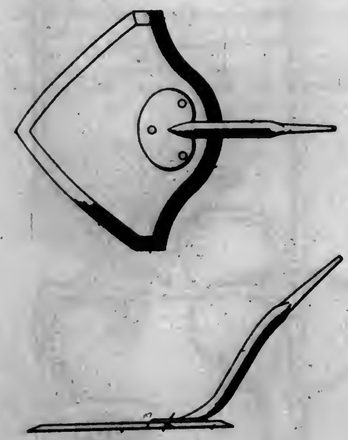
Claim.—The design for a plug for electrical purposes, substantially as shown and described.

28,745. CASING FOR STEAM-JET BLOWERS. BENJAMIN K. VAN BOSKERCK, Underhill, N. J. Filed Nov. 17, 1897. Serial No. 658,570. Term of patent 7 years.



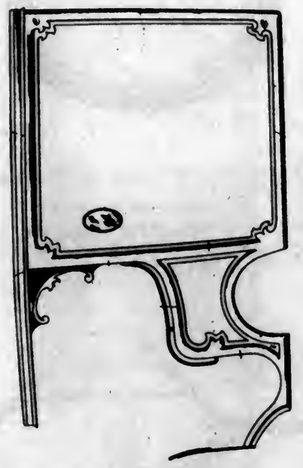
Claim.—The design for a casing for steam-jet blowers, substantially as herein shown and described.

28,746. BARREL-CLOSURE RING. EDWARD BLOUNT, Herron, Ga., assignor to Duncan J. McEachern, same place. Filed Apr. 18, 1898. Serial No. 678,063. Term of patent 14 years.



Claim.—The design for a barrel-closure ring substantially as herein shown and described.

28,747. GANG-FRAME FOR CULTIVATORS. CHARLES WOOD DAVIS and MORTON B. DAVIS, Pontiac, Kans. Filed May 27, 1897. Serial No. 638,476. Term of patent 14 years.

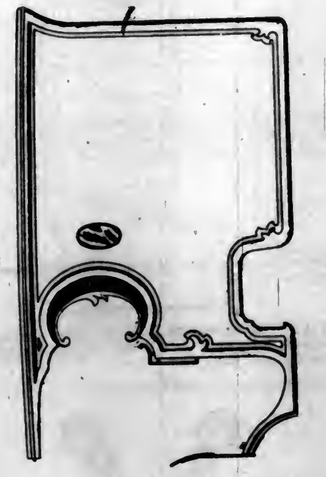


Claim.—The design for a gang-frame for cultivators substantially as herein shown and described.

28,748. GRASS AND WEED CUTTER. JESSE K. PALMER, Julesburg, Colo. Filed Apr. 27, 1898. Serial No. 678,048. Term of patent 7 years.

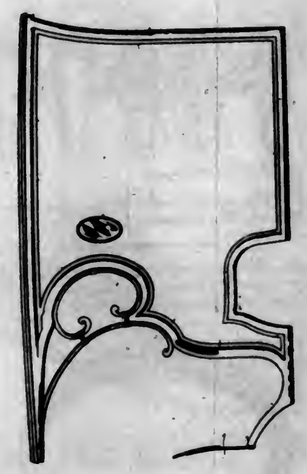
Claim.—The design for the grass and weed cutter, herein shown and described.

28,749. BODY FOR DELIVERY-WAGONS. JOHN C. KOEHAR, New York, N. Y., assignor to Clarence Wainright Wood, same place. Filed Feb. 19, 1898. Serial No. 670,975. Term of patent 7 years.



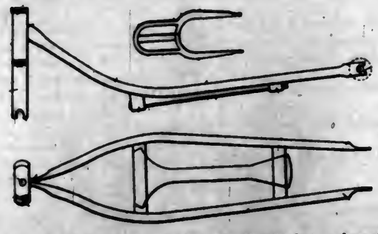
Claim.—The design for the body of a delivery-wagon, substantially as shown and described.

28,750. BODY FOR DELIVERY-WAGONS. JOHN C. KOEHAR, New York, N. Y., assignor to Clarence Wainright Wood, same place. Filed Feb. 19, 1898. Serial No. 670,976. Term of patent 7 years.



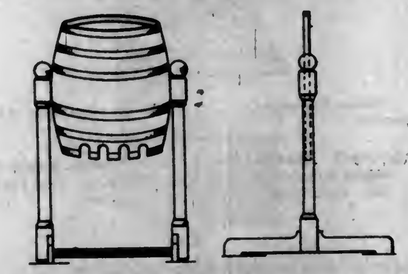
Claim.—The design for the body of a delivery-wagon, substantially as shown and described.

28,751. BODY FOR DELIVERY-WAGONS. JOHN C. KOEHAR, New York, N. Y., assignor to Clarence Wainright Wood, same place. Filed Feb. 19, 1898. Serial No. 670,977. Term of patent 7 years.



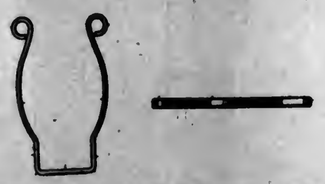
Claim.—The design for the body of a delivery-wagon, substantially as shown and described.

28,752. BODY FOR DELIVERY-WAGONS. JOHN C. KOEHAR, New York, N. Y., assignor to Clarence Wainright Wood, same place. Filed Feb. 19, 1898. Serial No. 670,978. Term of patent 7 years.



Claim.—The design for a body for delivery-wagons, substantially as shown and described.

28,753. FRAME OR BODY FOR BICYCLE-SKATES. STANLEY W. FISH, Washington, D. C. Filed Mar. 11, 1898. Serial No. 673,898. Term of patent 14 years.

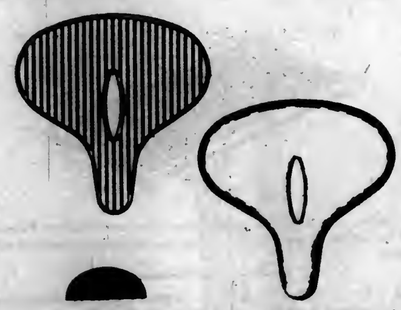


Claim.—The design for the body of a bicycle-skate, substantially as shown and described.

28,754. BICYCLE-STAND. ALBERT G. BOOKHOW, Saginaw, Mich. Filed Jan. 6, 1898. Serial No. 665,895. Term of patent 3½ years.

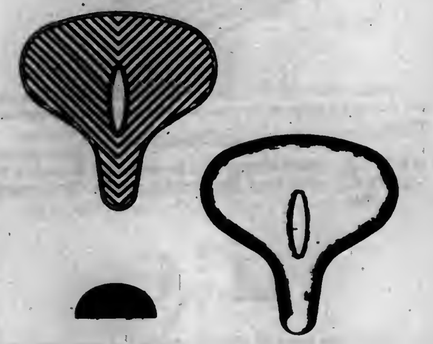
Claim.—The design for a bicycle-stand as shown and described.

28,755. BICYCLE-HOLDER SPRING. LYMAN H. SEYMER, Bristol, Conn. Filed Apr. 21, 1898. Serial No. 678,204. Term of patent 7 years.



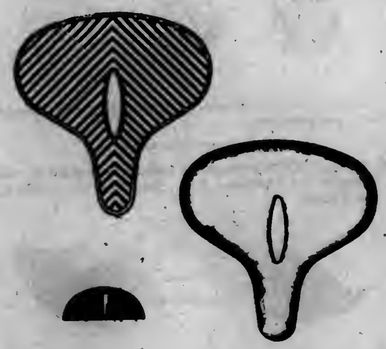
Claim.—The design for a bicycle-holder spring as herein shown and described.

28,756. SADDLE-SEAT. WILLIAM I. BOOKER, La Grange, Ill. Filed Apr. 30, 1898. Serial No. 679,498. Term of patent 14 years.



Claim.—The design for a saddle-seat, substantially as herein shown and described.

28,757. SADDLE-SEAT. WILLIAM I. BOOKER, La Grange, Ill. Filed May 2, 1898. Serial No. 679,547. Term of patent 14 years.

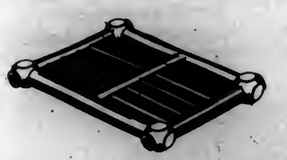


Claim.—The design for a saddle-seat substantially as herein shown and described.

28,758. SADDLE-SEAT. WILLIAM I. BOOKER, La Grange, Ill. Filed May 4, 1898. Serial No. 679,734. Term of patent 14 years.

Claim.—The design for a saddle-seat substantially as herein shown and described.

28,759. SADDLE-SEAT. WILLIAM I. BOOKER, La Grange, Ill. Filed May 5, 1898. Serial No. 679,853. Term of patent 14 years.



Claim.—The design for a saddle-seat substantially as herein shown and described.

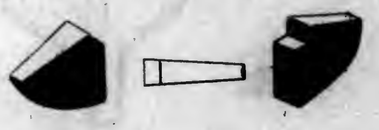
28,760. RADIATOR-SECTION. ARTHUR H. FOWLER, Philadelphia, Pa., assignor to the Fowler & Webb Manufacturing Company, of Pennsylvania. Filed Dec. 15, 1897. Serial No. 662,095. Term of patent 14 years.

Claim.—The design for a radiator-section consisting of a flat section having the shape or conformation substantially as described and shown.

28,761. RADIATOR-SECTION. ARTHUR H. FOWLER, Philadelphia, Pa., assignor to the Fowler & Webb Manufacturing Company, of Pennsylvania. Filed Dec. 15, 1897. Serial No. 662,096. Term of patent 14 years.

Claim.—The design for a radiator-section consisting of a flat section having the shape or conformation substantially as described and shown.

28,762. PLATE-KEEPER SHELL. RAIMBRIDGE W. BURDICK, Albany, N. Y. Filed Mar. 4, 1898. Serial No. 672,608. Term of patent 14 years.



Claim.—The design for a plate-keeper shell as herein shown and described.

28,763. FOUNDER'S CORE-SUPPORTING SHELL. RAIMBRIDGE W. BURDICK, Albany, N. Y. Filed Mar. 4, 1898. Serial No. 672,609. Term of patent 14 years.

Claim.—The design for a founder's core-supporting shell as herein shown and described.

28,764. STOVE-DOOR-CATCH SHELL. RAIMBRIDGE W. BURDICK, Albany, N. Y. Filed Mar. 4, 1898. Serial No. 672,611. Term of patent 14 years.

Claim.—The design for a stove-door-catch shell as herein shown and described.

28,765. STOVE-URN. DAVID M. IRELAND, Detroit, Mich. Filed Sept. 27, 1897. Serial No. 653,262. Term of patent 3½ years.

Claim.—The design for an urn substantially as herein shown and described.

28,766. HEATING-STOVE. BRADLEY WOODRELL, Dunmore, Pa., assignor to the Scranton Stove Works, Scranton, Pa. Filed Feb. 25, 1898. Serial No. 671,701. Term of patent 14 years.

Claim.—1. In a design for a stove, the design for the base; substantially as shown and described.

2. In a design for a stove, the design for the top base-section B; substantially as shown and described.

3. In a design for a stove, the design for the ash-pit section; substantially as shown and described.

4. In a design for a stove, the design for the ash-pit door; substantially as shown and described.

5. In a design for a stove, the design for the central body-section; substantially as shown and described.

6. In a design for a stove, the design for the front door of the lower part of the body-section; substantially as shown and described.

7. In a design for a stove, the design for the side door of the lower part of the body-section; substantially as shown and described.

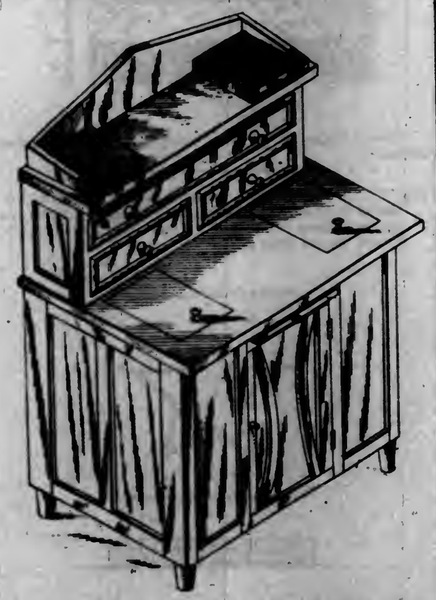
8. In a design for a stove the design for the front door of the upper portion of the body-section; substantially as shown and described.

9. In a design for a stove, the design for side door of the upper portion of the body-section; substantially as shown and described.

10. In a design for a stove, the design for the jacket; substantially as shown and described.

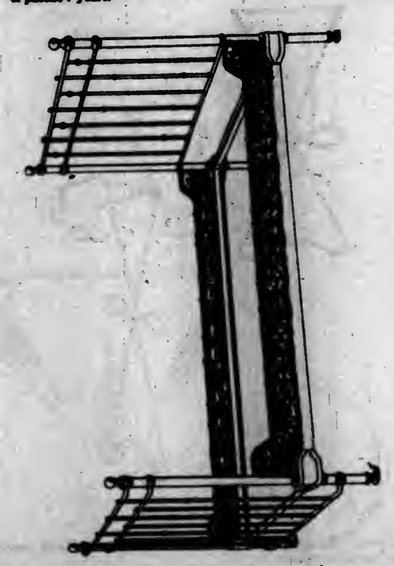
11. In a design for a stove, the design for the top ring; substantially as shown and described.

12. In a design for a stove, the design for the cover K; substantially as shown and described.



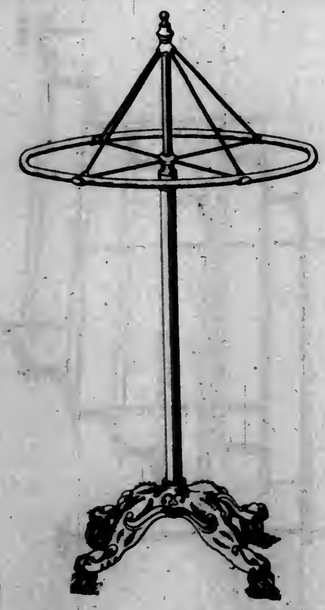
13. The design for a stove, substantially as herein shown and described.

28,767. KITCHEN-CABINET. SAMUEL RAMBERG, Leavenworth, Kans. Filed Apr. 23, 1898. Serial No. 678,677. Term of patent 7 years.



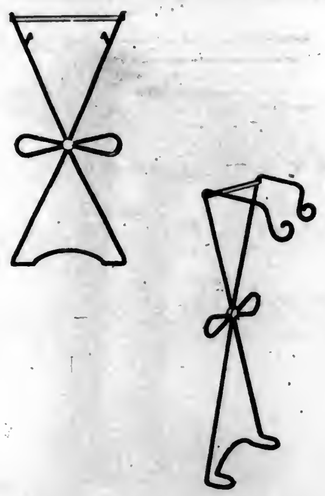
Claim.—The design for a kitchen-cabinet, as herein shown and described.

28,768. KITCHEN-CABINET. JOHN P. MURRAY, Newton, Ill. Filed Feb. 11, 1898. Serial No. 669,894. Term of patent 14 years.



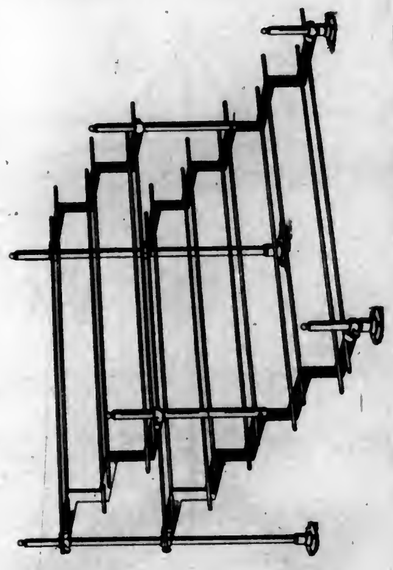
Claim.—The design for a kitchen-cabinet, substantially as shown and described.

28,769. BEDSTEAD. WILLIAM W. BALDWIN, Cleveland, Ohio, assignor to the Cleveland Co-Operative Stove and Hollow Ware Foundry Company, same place. Filed June 4, 1897. Serial No. 639,478. Term of patent 7 years.



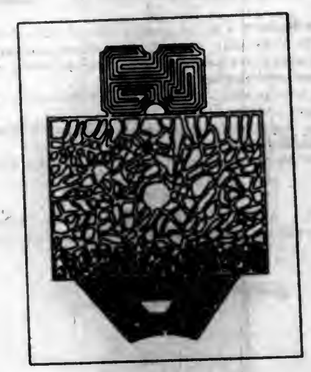
Claim.—The design for a bedstead, substantially as herein shown and described.

28,770. GARMENT-RACK. EDWARD LEDER, Chicago, Ill. Filed Mar. 21, 1898. Serial No. 674,683. Term of patent 14 years.



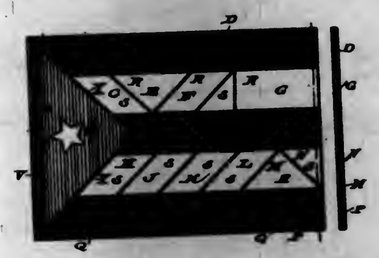
Claim.—The design for a garment-rack, substantially as herein shown and described.

28,771. DISPLAY-RACK. AMERIGUS C. MILLS, JR., Rochester, N. Y. Filed Apr. 28, 1898. Serial No. 678,143. Term of patent 7 years.



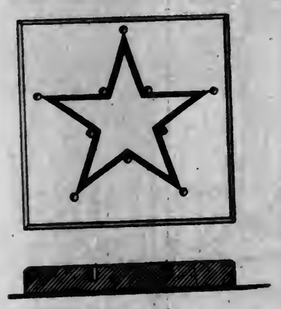
Claim.—The design for a display-rack, substantially as herein shown and described.

28,772. DISPLAY-RACK. CHARLES B. MORROW, Chicago, Ill., assignor to the Great Western Fixture Works, same place. Filed Apr. 11, 1898. Serial No. 677,237. Term of patent 7 years.



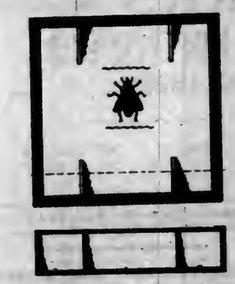
Claim.—The design for a display-rack, substantially as shown and described.

28,773. PUZZLE BOARD OR CARD. HENRY D. HOUSEN, Brooklyn, N. Y. Filed Dec. 20, 1897. Serial No. 662,702. Term of patent 3½ years.



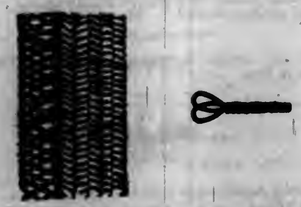
Claim.—The design for a puzzle board or card, as herein shown and described.

28,774. PUZZLE-BOARD. OTTO SHELLHORN, Philadelphia, Pa. Filed Apr. 14, 1898. Serial No. 677,669. Term of patent 7 years.



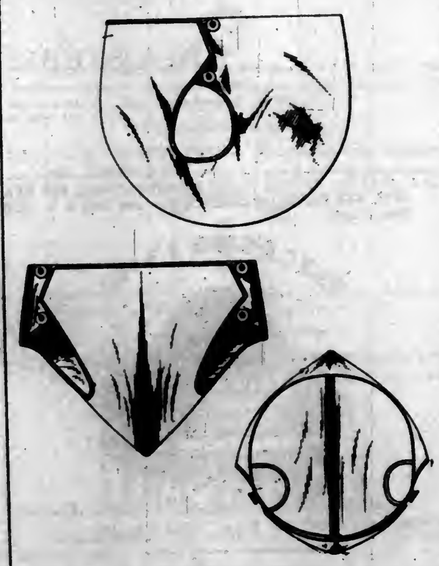
Claim.—The design for a puzzle-board, substantially as described and shown.

28,775. PUZZLE-BLOCK. OSMYN GATEWOOD, Washington, D. C., assignor to himself, and Robert H. Davis, Alexander T. Harms, and Thomas B. Harms, New York, N. Y. Filed Apr. 11, 1898. Serial No. 677,240. Term of patent 3½ years.



Claim.—The design for a puzzle-block, herein shown and described.

28,776. TOY. HENRY CLAYTON BIRTH, Toronto, Canada. Filed Feb. 16, 1898. Serial No. 670,568. Term of patent 3½ years.



Claim.—The design for a toy, as herein shown and described.

28,777. BRAID. FREDERICK WM. KLEIN, Reading, Pa., assignor to the Reading Braid Company, same place. Filed Mar. 5, 1898. Serial No. 672,753. Term of patent 14 years.

Claim.—The design for braid, substantially as herein shown and described.

28,778. CHILD'S NAPKIN. ELLA MATILDA YARRINGTON and THOMAS HALL, New York, N. Y. Filed June 11, 1897. Serial No. 640,267. Term of patent 14 years.

Claim.—The design for a child's napkin as herein shown and described.

TRADE-MARKS

REGISTERED MAY 31, 1898.

81,608. CERTAIN NAMED WEARING-APPAREL FOR MEN, BOYS, AND YOUTHS. M. Ballin & Sons, New York, N. Y. Filed Feb. 16, 1898.

BEE HIVE

Essential feature.—The representation of a beehive, either with or without the words "Bee Hive." Used since 1865.

81,609. CERTAIN NAMED ARTICLES OF LADIES' WEAR. Franklin K. Hixon, New Haven, Conn. Filed Mar. 12, 1898.

CENTURY

Essential feature.—The word "Century." Used since February 1, 1896.

81,610. CERTAIN NAMED UNDERWEAR AND UMBRELLAS. Sibley, Lindsay & Curr Company, Rochester, N. Y. Filed May 20, 1897.

VIVE UT POSTEA VIVAS.

Essential feature.—The motto "Vive ut Postea Vivas." Used since May 12, 1894.

81,611. MEN'S AND WOMEN'S SHOES. William J. Martens, New Orleans, La. Filed Apr. 6, 1898.

ORANGE BLOSSOM

Essential feature.—The words "Orange Blossom." Used since September 10, 1896.

81,612. COTTON SHEETINGS. Boston Manufacturing Company, Waltham, Mass. Filed Apr. 5, 1898.

HARVEST HOME

Essential feature.—The words "Harvest Home." Used since February 1, 1898.

81,618. COTTON SHEETINGS. Boston Manufacturing Company, Waltham, Mass. Filed Apr. 5, 1898.

GREAT MOGUL

Essential feature.—The words "Great Mogul." Used since February 1, 1898.

81,614. DOLLS. Hausburg & Company, New York, N. Y. Filed Feb. 19, 1898.

Essential feature.—The picture of an eagle in connection with the word "Imperial." Used since February 4, 1896.

81,615. INDIA-RUBBER PRODUCTS. Hose Rubber Company, Boston, Mass. Filed Feb. 9, 1898.

HELMET.

Essential feature.—The word "Helmet." Used since October 1, 1897.

81,616. INDIA-RUBBER PRODUCTS. Hose Rubber Company, Boston, Mass. Filed Feb. 9, 1898.

TUFF

Essential feature.—The word "Tuff." Used since March 1, 1897.

81,617. ART PHOTOGRAPHS. Curtis & Cameron, Boston, Mass. Filed Apr. 7, 1898.

Essential feature.—A portrait of the late John Singleton Copley. Used since March, 1898.

81,618. WRITING-PAPER. Whiting Paper Company, Holyoke, Mass. Filed Mar. 8, 1898.

EXPOSITION

Essential feature.—The word "Exposition." Used since August, 1894.

81,619. METALLIC PENS. C. Brandauer & Co., Birmingham, England. Filed Mar. 14, 1898.

TIMES

Essential feature.—The word "Times." Used since January, 1875.

81,620. METALLIC PENS. C. Brandauer & Co., Birmingham, England. Filed Mar. 14, 1898.

FIGARO

Essential feature.—The word "Figaro." Used since January, 1875.

81,621. METALLIC PENS. C. Brandauer & Co., Birmingham, England. Filed Mar. 14, 1898.

HERALD

Essential feature.—The word "Herald." Used since January, 1875.

81,622. METALLIC PENS. C. Brandauer & Co., Birmingham, England. Filed Mar. 14, 1898.

GLOBE

Essential feature.—The word "Globe." Used since January, 1875.

81,623. METALLIC PENS. C. Brandauer & Co., Birmingham, England. Filed Mar. 14, 1898.

SCRIBBLER

Essential feature.—The word "Scribbler." Used since October, 1877.

81,624. METALLIC PENS. C. Brandauer & Co., Birmingham, England. Filed Mar. 14, 1898.

MAIL

Essential feature.—The word "Mail." Used since January, 1875.

81,625. METALLIC PENS. C. Brandauer & Co., Birmingham, England. Filed Mar. 14, 1898.

REVIEW

Essential feature.—The word "Review." Used since January, 1875.

81,626. METALLIC PENS. C. Brandauer & Co., Birmingham, England. Filed Mar. 14, 1898.

POST

Essential feature.—The word "Post." Used since January, 1875.

81,627. OPAL GLASSWARE. G. F. Meriden Company, Meriden, Conn. Filed Mar. 14, 1898.

WAVE CREST

Essential feature.—The words "Wave Crest." Used since October 1, 1892.

81,628. SOAP POWDERS. Joseph M. Woolfe and Rosser F. Kenney, Philadelphia, Pa. Filed Aug. 14, 1897.

Essential feature.—The letters and character "W. & K.," with a representation of the aurora borealis, showing a bank or mountain of snow or ice. Used since January 1, 1897.

81,629. WASHING-POWDER. H. C. Lehnert & Co., Cincinnati, Ohio. Filed Mar. 5, 1898.

WASHING GAS

Essential feature.—The words "Washing Gas," with the representation of a Greek cross. Used since August, 1896.

81,630. CALCIMINE—A MIXTURE OF DRY POWDER WITH WATER. F. O. Pierce Company, New York, N. Y. Filed Apr. 7, 1898.

PLASTINITE

Essential feature.—The word "Plastinite." Used since March 1, 1898.

81,631. MUCILAGE AND PASTE. Theodore Davis Company, New York, N. Y. Filed Apr. 8, 1898.

GENERAL

Essential feature.—The representation of a bust of a man and the word "General." Used since December, 1868.

81,632. VEGETABLE ACIDS. Charles Lichau, Paris, France. Filed Mar. 14, 1898.

OENOLIC

Essential feature.—The word "Oenolic." Used since November 15, 1897.

81,633. HAVANA CIGARS. Chicago Athletic Association, Chicago, Ill. Filed Feb. 7, 1898.

Essential feature.—The letter "C" in a circle, the width of the "C" being the same as the circle, and the width between the "C" and the circle is the same as the width of the "C." Used since August, 1892.

81,634. PREPARED POPCORN. ST. LOUIS POP CORN COMPANY, St. Louis, Mo. Filed Apr. 4, 1898.

ANGEL

Essential feature.—The word "ANGEL." Used since February 3, 1898.

81,635. COMBINATION OF MILK AND MOLASSES CANDY. THE P. C. WIENT COMPANY, York, Pa. Filed Mar. 26, 1898.

P
M K

Essential feature.—The letters "P M K." Used since January 1, 1898.

81,636. WHISKY. ALFRED R. HORNE, Philadelphia, Pa. Filed Mar. 22, 1898.

Essential feature.—A cut or design inclosing the picture of a mounted trooper and the word "TROOPER" directly over it. Used since February 14, 1898.

81,637. MEDICATED TONIC WINES. MARKAR G. DARNEHAM, New York, N. Y. Filed Apr. 7, 1898.

SHARTONE

Essential feature.—The word "SHARTONE." Used since March 14, 1898.

81,638. COFFEE. C. F. BLAKE'S TEA AND COFFEE COMPANY, St. Louis, Mo. Filed Apr. 8, 1898.

MAKOBA

Essential feature.—The word "MAKOBA." Used since March 21, 1898.

81,639. ROASTED COFFEE AND ROASTED AND GROUND COFFEE. THE ENTERPRISE COFFEE COMPANY OF BALTIMORE CITY, Baltimore, Md. Filed Mar. 26, 1898.

Essential feature.—The letters "O K" in an oval. Used since July 9, 1877.

81,640. ROASTED AND GROUND COFFEE. THE ENTERPRISE COFFEE COMPANY OF BALTIMORE CITY, Baltimore, Md. Filed Mar. 26, 1898.

Essential feature.—The word "ATLAS" and the pictorial representation of Atlas. Used since September, 1876.

81,641. INTERNAL REMEDY FOR RHEUMATISM. THE JAMES T. REGAN CO., Boone, Iowa. Filed Feb. 14, 1898.

James T. Regan's RADICAL RHEUMATISM RELIEF.

Essential feature.—A copy of the signature of "JAMES T. REGAN" written in backhand, with the words "RADICAL RHEUMATISM RELIEF" printed across the face of the signature. Used since January 1, 1898.

81,642. BICYCLES. THE AMERICAN NEWS COMPANY, New York, N. Y. Filed Mar. 30, 1898.

ARENA

Essential feature.—The word "ARENA." Used since May 1, 1896.

81,643. BICYCLES. THE AMERICAN NEWS COMPANY, New York, N. Y. Filed Mar. 30, 1898.

CHAMPION

Essential feature.—The word "CHAMPION." Used since May 1, 1896.

81,644. SAFETY-BICYCLES AND THEIR COMPONENT PARTS. GEORGE M. HENDEE, Springfield, Mass. Filed Apr. 1, 1898.

SILVER KING

Essential feature.—The words "SILVER KING." Used since December, 1893.

81,645. DROP-FORGINGS, WRENCHES, AND BICYCLE PARTS. SPRINGFIELD DROP FORGING COMPANY, Springfield, Mass. Filed Apr. 2, 1898.

Essential feature.—The representation of the letter "S" inclosed by the letter "D." Used since March 1, 1898.

THE HORRIS PETERS CO., PHOTO-LITHO., WASHINGTON, D. C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

PARK v. CAIN.

Decided April 20, 1898.

1. APPLICATIONS—SECOND APPLICATION—ABANDONMENT.

Park filed an application May 8, 1895, which disclosed but did not claim the subject-matter of the issue and which was passed to issue November 16, 1895. The application in the interference was filed July 30, 1896, containing and claiming the subject-matter of the first application, and in addition thereto new matter. The first application became abandoned after the second application was filed. *Held* that the subject-matter of the first application being a part of the second application, any idea that Park intended to abandon the subject-matter of the application is negatived.

2. SAME—SAME—CONTINUING APPLICATION.

Held, further, that while, strictly speaking, the second application for all purposes may not be susceptible of being treated as a continuation of the first application, yet for many purposes it can be so treated.

3. SAME—SAME—SAME—INTERFERENCE—CONSTRUCTIVE REDUCTION TO PRACTICE—PRIORITY.

Held, further, that the second application is, for the purpose of showing a constructive reduction to practice, a continuation of the first application, and that Park, having disclosed the subject-matter of the issue in his first application at a date prior to any date that can be given to Cain, is entitled to an award of priority.

APPEAL from Examiners-in-Chief.

BOILERS.

Application of Kennedy Park filed July 30, 1896, No. 601,089. Patent granted to John J. Cain June 2, 1896, No. 561,257.

Messrs. Wright, Brown & Quinby for Park.

Mr. Charles W. Forbes for Cain.

DUELL, *Commissioner:*

This is an appeal from the decision of the Examiners-in-Chief awarding priority of invention to Cain on the following issue:

In a sectional boiler, the combination of vertical pipes or chambers, rectangular headers, the ends of each of which are in substantially the same horizontal plane and connected to and securing together the front vertical pipes, rectangular headers, the ends of each of which are in substantially the same horizontal plane and connected to and securing together the rear vertical pipes, said headers being angularly set so that the inner faces of the front headers are opposite and parallel to the inner faces of the rear headers in lower planes, and a series of tubes longitudinally and angularly arranged and connected at their ends to each opposite pair of headers, each series of tubes and their connected headers constituting a section of the boiler.

In arriving at their conclusion the Examiners-in-Chief affirmed the decision of the Examiner of Interferences.

Several reasons of appeal are assigned by the attorneys for Park, only one of which, in view of the conclusion at which I have arrived, is necessary to be considered. That one is as follows:

The Examiners-in-Chief erred in not giving due weight to the Park exhibit, first application.

In order to fully understand the point raised by this reason of appeal, it will be necessary to briefly set forth the facts in the case.

Park filed the application involved in this interference July 30, 1896, and it was placed in interference with patent to Cain, No. 561,257, granted June 2, 1896, on an application filed December 11, 1895. Testimony was taken on behalf of Park, and his testimony proves beyond a doubt that he disclosed to others the invention in issue some time in the year 1893. The Examiner of Interferences and the Examiners-in-Chief concurred in finding that he reduced the invention to practice some time in the summer of 1896. Both tribunals concurred in finding that Park had not been diligent in reducing the invention to practice, and therefore awarded priority to Cain, who was the second to conceive and disclose the invention, but the first, according to their view, to reduce to practice.

The record shows that Park filed an allowable application for patent on May 8, 1895, which application disclosed the invention in issue. No claim, however, for the subject-matter of the issue was made in that application, and it was passed to issue November 16, 1895. The present application was filed July 30, 1896, after the allowance of the prior application, but before it had become abandoned.

On comparing the drawings and specification of Park's first application with the drawings and specification of the second application—the one involved in this interference—it is found that the drawings of the first application are the same as the first sheet of the drawings of the second application and that the specification of the first application is incorporated substantially word for word in the second application. It is true that additional drawings were filed with the second application and that additional matter is found in the second specification. The fact, however, that the drawings and specification of the first application form a part of the second application negatives any idea that Park intended to abandon the subject-matter of his first application. Without doubt Park, having devised certain additional features of invention, decided to combine all in one application instead of reviving the first application and filing the second application for the purpose of embodying the new features.

While, strictly speaking, the second application for all purposes may not be susceptible of being treated as a continuation of the first application, yet for many purposes it can be so treated. For example, had a patent issued to Park on his second application, (no interference having been declared,) suit been brought upon the patent, and the defense of two years' public use been raised by the answer I take it that the party making that defense would have had to show a two years' public use prior to the date when Park's first application was filed. I think the court would have been compelled to take into account the fact that the subject-matter of the second application was embraced in the first and that the invention in controversy was described in the specification and drawings which constituted a part of the first application. (*Smith* v. *Goodgear Dental Vulcanite Co.*, 93 U. S., 500; *Graham* v. *McCormick et al.*, 21 O. G., 1533.)

This interference was declared February 3, 1897, and at that time the prior application, filed May 8, 1895, could have been renewed, and when a claim warranted by the specification and drawings of that application had been made that application could have been placed in interference with the patent to Cain.

It is contended by Park that this prior application, which clearly discloses the issue of this interference, was a constructive reduction to practice and that therefore the finding of the Examiner of Interferences and the Examiners-in-Chief that he was not diligent in reducing his invention to practice is not well founded. If Park is entitled to the date of May 8, 1895, as the date of a reduction to practice, then he would be clearly entitled to an award of priority, for the reason that he conceived the invention and disclosed it to others and also reduced it to practice by filing an allowable application before Cain filed his application for the patent involved in this interference. If the lower tribunals are correct in their finding, which, in effect, is that because Park did not make the claim which has become the issue of this interference in his first application he is therefore not entitled to have the benefit of the filing date of such prior application as the date of a constructive reduction to practice, then their ruling in favor of Cain was correct. If, however, Park is entitled to a date of constructive reduction to practice as of the date of filing his first application disclosing this invention, which is the issue of the interference, then their ruling was wrong and priority should be awarded to Park.

In my opinion Park is entitled to claim a constructive reduction to practice as of May 8, 1895, for in that application there was clearly disclosed the issue of this interference. It was certainly an allowable application, for the Office records show that it was allowed, and at the time when this interference was declared, as has been stated, the application could have been renewed. Instead of renewing that application Park saw fit to file a new application embodying what was disclosed in the prior application, with certain new matter, which of course he could not have incorporated into the prior application by renewing it. It seems to me that the second application is, for the purpose of showing a constructive reduction to practice, a continuation of the first application, and that, having disclosed the subject-matter of the issue in the first application at a date prior to any date that can be given to Cain, he is entitled to an award of priority.

I believe that an injustice would be done Park by holding that by filing the second application he is deprived of the earlier date of a constructive reduction to practice, which he would clearly have been entitled to by renewing his first application. Park was the first to conceive and disclose to others, the first also to reduce to practice, and guilty of no laches.

The decision of the Examiners-in-Chief awarding priority to Cain is reversed.

EX PARTE WILLIAMS.

Decided April 28, 1898.

DIVISION—INDEPENDENT DEVICES.

Where two devices are independent of each other and they do not mutually contribute to produce a single result and the action of one does not in any manner modify or affect the action of the other, *Held* that division should be required.

ON petition.

HAME ATTACHMENTS.

Application of Charles W. Williams filed May 19, 1897, No. 637,296.

Messrs. C. A. Snow & Co. for the applicant.

DUELL, *Commissioner:*

This is a petition from the action of the Primary Examiner requiring division between claims 1 and 2 and claims 3 and 4 of the above-entitled application.

The invention relates to attachments for hames by which the lines or other parts of a harness may be held in place on the hames when it is desired to unhitch the horse. The device covered by claims 1 and 2 consists of a bar or rod pivotally attached at its lower end to the upper outer end of the hame and means for engaging the upper end of the bar to hold or lock it in place in close engagement with the upper end of the hame. Claims 3 and 4 cover a device consisting of a strip of spring metal pivoted or otherwise secured to the outer edge of the hame, having its upper end bent over the upper end of the hame and downwardly inside the hame and a loop or link pivoted to the inner end of this strip and adapted to engage or lie loosely against the inner surface of the hame.

The Examiner's ruling is that the two devices are different species of the same invention, and he required division under *ex parte Eagle*, (C. D., 1870, 170.) No generic claim to cover both forms of the device has been made by applicant, and whether or not the two devices can be covered by such a claim or whether they are for different species, I am not willing, nor is it necessary, to say. I am of opinion, however, that the two devices are independent of each other and that they do not mutually contribute to produce a single result. The action of one does not in any manner modify or affect the action of the other. Of these two devices applicant states in his specification that—

I may provide my hames with either the attachment 6 on the outside thereof, or with the extension 8 on the inside thereof, or may employ both, as desired.

I am of the opinion that the subject-matter of the two sets of claims should be in separate applications. The petition is therefore denied.

DECISIONS OF THE U. S. COURTS.

Court of Appeals of the District of Columbia.

DENTON v. COMMISSIONER OF PATENTS.

Decided April 4, 1898.

1. REISSUE—ABANDONMENT OF INVENTION—SCOPE OF CLAIM.

Where the claim sought by reissue was not as broad as the claim made in the original application and canceled, *Held* that this is of no consequence where the reissue claim was included in the original claim. It is well-settled law that a reissue cannot be allowed for the restoration of claims once rejected and withdrawn.

2. SAME—LIMITING SCOPE OF CLAIM—ABANDONMENT.

Where an applicant for a reissue had amended and limited an original claim to a greater extent than was necessary, *Held* that such limitation may have been a mistake of judgment, but it was certainly an abandonment of all that was contained in the original claim and which was not contained in the subsequent amendment. There can be no middle ground or retrogression to take back part of what has been abandoned any more than to take back the whole.

Mr. Fred L. Chappell for the appellant.

Mr. W. A. Megrath for the Commissioner of Patents.

MORRIS, *J.:*

This is an appeal from a decision of the Commissioner of Patents refusing to the appellant the reissue of a patent granted for an improvement in sleeping-garments, which reissue was sought in order to cover a broader claim than that contained in the specification annexed to the patent.

It appears from the record that on March 20, 1895, the appellant applied to the Patent Office for Letters Patent for an alleged improvement in sleeping-garments which he claimed to have devised, and which consisted in the attachment of pockets to the lower portion of such garments for the insertion therein of the feet of the wearer, so as to insure them against accidental uncovering of the bedclothes and also their protection in the event that the person had occasion to leave the bed and to walk about the room or house. The invention contemplated the use of the device upon two classes of garments—the gown and the bifurcated garment composed of a combination of the nightshirt and night-drawers—and the original specification filed with the application contained six claims, which seem substantially to have been no more than six different ways of stating the same invention. Subsequently the applicant abandoned the claim with reference to the combination-garment in view of the fact that in this he had been anticipated by a previous patent issued to a previous inventor. In fact, by repeated modifications and amendations all the original claims were abandoned and others, reduced in number, were substituted in their place. Finally the specification was reduced to one claim, and for this a patent was allowed and issued to the applicant on July 2, 1895. This claim is in the following terms:

A sleeping-garment consisting of a gown extending from the neck to the feet of the wearer and having its lower portion provided with vertical slits forming a front and a rear flap, and a pocket for one of the feet secured on the inside of each flap near said slits as set forth and shown.

The function of the slits, it may be noted, was for the purpose of securing freedom and facility of locomotion, as otherwise it would be as if one were incased in a bag.

By an instrument of writing, without date, but recorded in the Patent Office on October 2, 1896, the patentee assigned his rights under the patent to a company of which he was himself the principal stockholder. Subsequently, on October 14, 1896, acting on behalf of his company, he made an application to the Patent Office for leave to surrender the patent and for its reissue to him with modifications. The proposed modifications were to the effect that in addition to the claim in the specification annexed to the patent there should be a second claim inserted of a broader and more comprehensive character, which was stated to be comprised in the invention, but to have been omitted from the specification through inadvertence and mistake on the part of the applicant, and which was in the following terms, as set forth with the application for reissue:

In a garment a gown adapted to extend to the feet of the wearer with foot-pockets secured to the bottom thereof and opening toward the inside of said gown, for the purpose specified.

The substantial difference between this claim and that contained in the specification annexed to the patent, as will be noted, consists in this, that while the latter limits the invention to garments containing slits at the bottom the claim now proposed has no such limitation, and it is said that the invention itself has, in fact, no such limitation. It seems to have been discovered that the slits were not an essential element of the garment, and it may be presumed that the applicant's patent had been evaded by the construction of garments without the slits.

With the application for reissue was filed an affidavit by Denton to the effect that the patent was invalid and inoperative by reason of the defective specification and that the error arose through inadvertence and mistake on the part of the applicant, without any fraudulent intention on his part, such error having been occasioned by the applicant's illness, ultimately resulting in his death, as appears from the record, on account of which he failed to communicate to his attorney the fact that the improvement was applicable to other garments than those having slits at the bottom, and there were other affidavits also in support of the application intended to support the theory of the applicant's inadvertence and to account for the delay in the application.

The application for reissue was rejected by all

the tribunals of the Patent Office, and from the final decision of the Commissioner appeal has been taken to this court.

The controversy before us has been very greatly narrowed by the elimination of several of the questions that were raised in the Patent Office. It is conceded on behalf of the appellant that all reasonable care was exercised in the prosecution of the application for a patent, and it is conceded that there was no inadvertence or mistake or error of any kind on the part of the applicant if substantially the same claim now made was included in the original application. The theory of the Patent Office is that there could have been no inadvertence or mistake if such claim had, in fact, been made and had subsequently been abandoned or withdrawn, and that the withdrawal or abandonment, even though improvidently done, must be regarded as an error of judgment, which would constitute no ground in law for a reissue of the patent. There is no controversy between the parties as to the law. It is conceded that the reissue of the patent should not be granted if the claim now sought to be incorporated in it was substantially made in the original application for the patent or in the course of the proceedings thereupon and was subsequently abandoned and the patent taken for the only claim contained in it. The appellant contends that no such claim was advanced or abandoned, and to the determination of this question the controversy has been reduced. In fact, the controversy may be regarded as being still further narrowed by the parties, for it is conceded—a concession of course made necessary by the record—that there were in the original specification two claims apparently broad enough to cover that which is now contended for. These are the following:

A sleeping-garment having pockets in the lower portion thereof for the feet, as set forth and shown.

A sleeping-garment extending from the neck to the feet of the wearer and provided with sleeves and with socks formed partly of blanks sewed to the lower ends of the garment, as set forth.

It is claimed on behalf of the appellant that the Patent Office virtually substitutes the word "gown" for the word "garment" in these two claims and that it is error so to do, so that in the ultimate analysis of the controversy the question to be determined is whether a claim for a "garment having pockets in the lower portion thereof for the feet" covers and includes a claim for "a gown having pockets in the lower portion thereof for the feet," and to our minds the answer to the question does not seem difficult. The term "garment" includes the term "gown." This appears conclusively from the very claim now sought to be established. The express words of it are, "In a garment, a gown adapted," etc. The claim originally made by the applicant is broader than that now made, but it includes this claim, and it is well-settled law that reissue cannot be allowed for the restoration of claims once rejected and withdrawn. The authorities are unanimous on this point and need not here be cited.

That the claim sought in the reissue is not as broad as the original claim is of no consequence. It was included in it. When the applicant amended and limited that original claim, if he limited it to a greater extent than was necessary, such extreme limitation may have been a mistake of judgment; but it was certainly an abandonment of all that was contained in the original claim and which was not contained in the subsequent amendment. There can be no middle ground. There can be no retrogression to take back part of what has been abandoned any more than to take back the whole.

It may be that it was a mistake on the part of the applicant to limit the invention to the extent only of the claim contained in the specification annexed to the patent; but with this of course we have nothing to do here. The only question for us is whether the claim now put forward on his behalf was so far contained in his original claims that were abandoned by him as to be itself thereby necessarily abandoned, and this we must answer in the affirmative, for the abandonment of the whole necessarily implies and involves the abandonment of all the parts except such as are expressly and specifically retained.

Being of this opinion, we are constrained to affirm the decision of the Commissioner of Patents in the premises.

This opinion and the proceedings in the cause in this court will be certified to the Commissioner for record in his Office, according to law.

Court of Appeals of the District of Columbia.

DICKEY v. FLEMING.

Decided April 5, 1898.

INTERFERENCE—PRIORITY.

After reviewing the testimony, *Held* that the explanation of Dickey as to delay in applying for a patent, while plausible, was not satisfactory; but the proofs show that he was the first inventor, and priority awarded to him over the patentee, Fleming.

Mr. H. C. Townsend for the appellant.

Mr. Frederic Carragan for the appellee.

SHEPARD, *J.*:

This is an appeal from a decision of the Commissioner of Patents in an interference proceeding involving the following issues:

1. A dynamo-brush consisting of successive layers of wire-gauze formed into the desired shape, and then compacted by pressure.

2. A dynamo-brush consisting of successive layers of wire-gauze in which the wires are disposed diagonally to the length of the brush, compacted together by pressure.

The appellee, Fleming, filed his application November 13, 1893, and obtained a patent January 30, 1894. The appellant, Dickey, filed his application December 4, 1894, and the interference was soon after declared.

Fleming claims to have invented the brush of the two issues about December, 1891, and to have reduced to practice in March, 1892. Dickey alleges invention about the last of December, 1892, and reduction to practice from January to March, 1893.

The Examiner of Interferences decided in favor of Fleming, and on appeal was reversed by the Examiners-in-Chief. They in turn were reversed by

the Commissioner, and final award of priority was made to Fleming.

The question is one of fact, and there is quite a conflict in the evidence.

After careful examination of the evidence and the views in respect of its credibility and weight, set out at length in the separate opinions of the tribunals of the Patent Office, our conclusion is with the Examiners-in-Chief, that Dickey is entitled to the award of priority.

Concurring generally in the views expressed by them, no useful purpose would be subserved by an elaborate review of the voluminous evidence. We shall content ourselves, therefore, by referring to the opinion of the Examiners-in-Chief, with some additional comments more fully explaining the grounds of our conclusion.

Fleming was an expert electrician or electrical engineer and was the general manager and agent of a partnership called the "International Supply Co." during 1891, 1892, and part of 1893. This company dissolved and was succeeded in March, 1893, by a corporation called the "International Trading and Electrical Company," of which Fleming, who was an incorporator also, became manager and agent. Having some difference with his associates, he retired about the last of March, 1894, and contracted for the sale of his brushes with the Manhattan General Construction Company.

Dickey was a skilled mechanic who made a specialty of electrical work. He contracted with the Supply Co. in 1892 for work on jobs, and soon after moved into a machine-shop owned by one Herkner, who was the financial "backer" of that company. There he remained, working for that company, its successor, and the Manhattan Company, until August 31, 1894.

During that time those companies paid for his room in the shop and use of machinery, furnished materials, and paid him by the piece, he furnishing his own help.

All orders and materials came to him from the company through Fleming. His dealings were with Fleming, and he followed the latter's fortunes when he changed to the Manhattan Company and continued to make the brushes upon similar terms.

While Dickey was so employed in March, 1893, he unquestionably made his first brushes of the kind described in the second issue. About January 1, 1893, Fleming came to him with an order for some brushes to be furnished the navy-yard at Brooklyn. He produced a sample brush made of a wire bundle or wire-gauze and solid metal. Dickey said that he found he could stiffen the brush by compressing the folds of gauze and dispense with the solid metal, which was for stiffening merely. He without doubt made the brushes to the number ordered in this manner. They were received and put in use on several Government vessels. They were better than the sample, but still objectionable on account of stiffness.

About March, 1893, Dickey claims to have discovered the construction of the second issue. Instead of rolling the wire-gauze straight, as before, he cut it diagonally in strips and then rolled it. When compressed, it was found that the objectionable stiffness of the first had disappeared. It is certain that Dickey had not before seen a brush constructed in either of the above ways, for Fleming admits that the sample given to Dickey was substantially as described.

Notwithstanding the patent to Fleming, applied for long after this date, this evidence would give priority to Dickey unless it appears either that Fleming furnished him the idea or that Fleming actually invented and reduced to practice in April, 1892, as he claims.

Fleming in giving evidence said that some time late in 1891 he produced a wire-cloth brush of foreign construction on some one of the Atlantic steamers. The folds were not compressed, but were held together by stitches of strong copper wire; that he conceived the idea of improving by compressing and took the brush to the shop of one Beinert, who was a repairer of electrical machinery; that after some trials in compressing the gauze cut straight he discovered the great advantage in cutting diagonally before rolling or folding. The compressing was first done with the aid of a wooden box and a vise and clamps, which is the same process used by Dickey until he resorted to a hydraulic press; that sixteen of these improved brushes were sent to the electrician of the steamship *City of Paris* on or before April 6, 1892, for trial on its outward passage.

It appears that Beinert had two assistants—a man and a boy—in the shop at the time. These were called as witnesses by Dickey. They neither saw nor heard of these brushes, the construction of which was public, according to Beinert, and occupied some time. Assistance in making them, while probably not necessary, must have been desirable. Fleming, who testified to difficulty in procuring the wire-gauze, was unable to tell where or from whom he purchased it. He had no memorandum, bill, or receipt. There was no entry in the books of his company showing purchase of goods, expense of manufacture, or receipt or delivery of the brushes from or to any one. He accounts for the absence of charge against the ship by saying that they were experimental and for his benefit. Beinert corroborated Fleming in respect of the manufacture of the brushes, which, he says, were delivered by him to the company at its office. His books had been burned and he had no memorandum of the transaction; said that he sent a bill to the company for the work, received pay, and gave a receipt. No such receipt was produced, nor was search made for it. Fleming said that in moving offices he had destroyed a number of such papers, and, further, that the company's books had been badly kept.

Again, no brush of this new construction was preserved by Fleming or Beinert, and hence, as we have seen, Fleming had to furnish Dickey a sample of general likeness to that which he had shown to Beinert.

It is true that the two electricians of the *City of*

Paris testified to the receipt of the brushes aforesaid on board of that ship in April, 1892; but the sales-books of the International Electric Company show the delivery of brushes made by Dickey to that ship on April 8, 1893, and none prior thereto. Following that date are similar entries of sales to the *Paris* and sister ships. The two electricians could refer to nothing which would certainly establish the date given by them, and without reflecting upon their integrity it is at least not improbable that they made a mistake of a year in the date.

Considering, however, the burden that is upon him who claims priority over a patentee whose date of issue is prior to his own application, the foregoing evidence is such that we would not disturb the decision in favor of Fleming were it not for certain circumstances connected with the subsequent manufacture by Dickey with which it cannot be reconciled.

Having, strangely, preserved no sample of the new construction by Beinert, Fleming says that upon procuring the navy-yard order he furnished Dickey the wire-gauze with which to fill it, and a sample brush, as before described, and directed him how to cut and compress the wire as Beinert had done. Now, certainly, if Fleming had made such a brush and sent it for trial to the *City of Paris*, April 6, 1892, as claimed, there had been ample time for the satisfactory test which he says the electricians of that ship made and reported. Knowing it to be successful, he would no doubt have described it to Dickey and directed him to finish his order in the same way. The construction is so simple that Fleming himself says an ordinary mechanic could readily understand and accomplish it. Dickey was certainly too good a mechanic not to understand it if explained to him in a general way. Yet, notwithstanding the statement of Fleming that he gave such explanation and instruction, the fact is proved beyond doubt that the wire-gauze brushes made by Dickey, sent to the navy-yard, and accepted there were not rolled from material cut diagonally at all. Grant that Fleming may have suggested to Dickey the idea of compressing the folds, still if he had pointed out and directed the far greater improvement in the cutting and folding of the wire-gauze it is not reasonable to believe that Dickey would either misunderstand or refuse to obey. The brushes as first made were accepted by the navy-yard officers, and Fleming made no suggestion to Dickey or any one else of the failure to follow his instructions in respect of this last improvement.

Shortly after the delivery of the next set of brushes in March, which Dickey had made after the plan of the second issue, Fleming called the attention of the navy-yard electrician to this improvement. Fleming said to him:

> I have had an improvement made on these brushes, which is, having them cut on the bias, making the brush more pliable—

and asked him what he thought of it. There was not one word of the earlier date of invention or of the experiment made with it upon the *Paris* nearly a year before. Evidently the remark made created and was calculated to create the impression that the improvement had been discovered during or since the construction of the lot delivered in January and February, 1893.

A circumstance against Dickey is his long delay in applying for a patent even after learning that Fleming claimed the invention. His explanation is that he was not familiar with the patent law and was poor; that he understood from Fleming that he was to be interested in the patent and was content to share with him, and that he was doing all the work on satisfactory terms. As we have seen, he did all the work on Fleming's orders, and when Fleming went to the Manhattan Company he followed him there and continued to make all the brushes until they had a misunderstanding, about August 31, 1894. Dickey's own words are:

> So long as I was connected in the business with Mr. Fleming I had hopes that he would rectify the matter and give me my rights. I had no money myself to carry on any proceedings, but after Mr. Fleming had seen fit to throw me out of the business entirely, or at least tried to do so, I at once made it a point to find some one who was willing to take up the case with me and furnish the money to carry it to a point where I could obtain my rights.

The explanation is plausible, though not satisfactory. Turning to Fleming and considering all the surrounding circumstances, his delay is hardly so well accounted for, if he in fact made the invention at the date claimed, and that date he cannot depart from. He was not ignorant of the value of a patent or of the steps necessary to procure it. His reasons for not applying earlier than November 13, 1893, are that he wanted to thoroughly satisfy himself as to the behavior of the brushes furnished the *City of Paris* for trial in April, 1892; that he did not at the time know that there would be a demand justifying the expense, and that he was much occupied with other work.

The first reason is not at all satisfactory, for if true that the experimental brushes were delivered to the *Paris* in April, 1892, there had been ample time for their complete test before he gave Dickey the navy-yard order to fill.

The second reason is quite plausible, but under the circumstances applies more strongly in favor of Dickey's delay than his own. Dickey had no means and easily filled all the orders taken by Fleming. Fleming, however, had the money, and, in fact, when he did apply paid the fees with the funds of the company, with which he was still employed.

The third reason is of no practical importance.

During the conversation before referred to between Fleming and the navy-yard electrician concerning the improvement in the brush the latter remarked that no doubt he would soon be getting a patent. Fleming laughed and walked away. Returning two weeks later, he handed the electrician his card with a drawing of the brush and the words "The Fleming patent wire-gauze brush." In the opinion of the Commissioner stress is laid on the fact that Fleming had advertised his invention. The above is the only evidence of advertisement that we have found in the record. No one else saw this card, and if its exhibition to the witness was really in or about March, 1893, it was about six months before a patent was even applied for.

For the reasons given the decision will be reversed, and this decision, with the proceedings herein, will be certified to the Commissioner of Patents, as required by law. It is so ordered.

Attorneys.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., May 27, 1898.

SIR: The Secretary of the Interior has ordered that Bernard D. O'Connell, of Lowell, Mass., be not recognised after this date as attorney or agent in the prosecution of any claim or other matter before this Department or any Bureau thereof.

Very respectfully,

EDWARD M. DAWSON,
Chief Clerk.

The Commissioner of Patents.

Notice to Show Cause.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., May 7, 1898.

The following notice to show cause is published in the OFFICIAL GAZETTE for the reason that it has been found impracticable to serve notice in the usual way, a registered letter containing notice to the same effect, mailed to Mr. Holgate at his last-known address, having been returned with the report that it could not be delivered.

To George H. Holgate, doing business under the name of the Association American Inventors, last known address Betz Building, Philadelphia, Pennsylvania, present address unknown:

SIR: Copies of charges filed against you as representative of the Association American Inventors by the following-named persons were sent you on the dates mentioned below, and you were given until February 12, 1898, to answer the same, if you desired to do so:

L. N. Fickes, of Holland, Kans.....January 21, 1898.
Nathan Lloyd, of Greenbrier, Mo.....January 22, 1898.
J. L. Zeiger, of Cleveland, Ohio.....January 28, 1898.
John McWilliams, of Egypt Mills, Mo..February 5, 1898.

You were informed in the letters accompanying the charges of McWilliams, Lloyd, and Fickes that, inasmuch as you were not registered as a patent attorney, disbarment proceedings would not be instituted. It has been determined, however, that inasmuch as you still represent a number of applicants before this Office in applications filed before the 1st of January, 1898, as is shown by a list of such cases filed by your representative on January 14, 1898, and in which registration was waived, said list numbering 171 cases, you are practicing before the Office and within the provisions of the statute you are subject to disbarment proceedings. In view of this fact and in view of the fact that in some of the foregoing cases the filing of the answer was made optional with you you are hereby required to show cause on or before the 15th day of June, 1898, in each of these cases, why you should not be disbarred from practice and why the Commissioner of Patents should not refuse to recognize you as patent agent in accordance with the statutes in such cases made and provided.

C. H. DUELL,
Commissioner.

Attorneys' Use of Assignment Records.

(ORDER No. 1,207.)

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., May 31, 1898.

It has been brought to my attention that certain attorneys and other persons have made use of the assignment records to obtain the addresses of persons having applications pending before this Office, in order to send them letters and circulars offering to secure foreign patents or to transact other business which it may be presumed the attorneys of record in such applications are competent and willing to do. Such use of the assignment records is not a proper or legitimate use. These records are not open to the public for any such purpose.

It is hereby ordered that any attorney or other person who is known to make such use of the assignment records of this Office will be denied access thereto.

C. H. DUELL,
Commissioner.

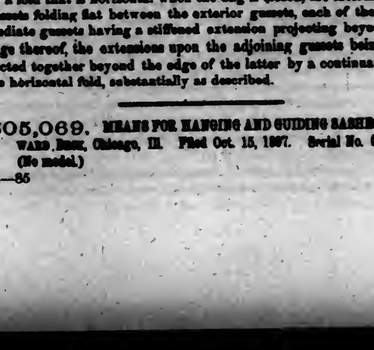
GRANTED JUNE 7, 1898.

605,067. ELECTRIC SWITCH. CHARLES C. BARNAM, Schenectady, N. Y. Filed Sept. 17, 1897. Serial No. 651,903. (No model.)

Claim.—1. In an electric switch, the combination of a switchboard, stationary switch members secured to said board, a pivoted switch-blade cooperating with said switch members and made from a strip of metal bent lengthwise upon itself, and of substantially uniform width throughout, and a handle secured to the switch-blade at the bend, substantially as herein specified.

2. In an electric switch, the combination of a switchboard, stationary switch members bent into L shape and passed through holes in the switchboard and held in position by bolts screwed into the parts of the switch members underneath the switchboard, the bolts being provided with nuts for clamping circuit-terminals to the parts of the switch members underneath the switchboard, a pivoted switch-blade made from a strip of metal bent lengthwise upon itself, and a handle secured to the switch-blade at the bend, substantially as herein specified.

3. In an electric switch, the combination of a switchboard, stationary switch members bent into L shape and passed through holes in the switchboard and held in position by bolts screwed into the parts of the switch members underneath the switchboard, the bolts being provided with nuts for clamping circuit-terminals to the parts of the switch members underneath the switchboard, a pivoted switch-blade made from a strip of metal bent lengthwise upon itself, and having a loop formed at the bend, and a handle secured to the switch-blade at the bend, substantially as herein specified.



4. In an electric switch, the combination of a switchboard, stationary switch members bent into L shape and passed through holes in the switchboard and held in position by bolts screwed into the parts of the switch members underneath the switchboard, the bolts being provided with nuts for clamping circuit-terminals to the parts of the switch members underneath the switchboard, a pivoted switch-blade made from a strip of metal bent lengthwise upon itself, and having a loop formed at the bend, a spacing-block between the switch-blade, and a handle secured at the bend, substantially as herein described.

5. In an electric switch, the combination of a switchboard, L-shaped stationary switch members passed through a slot in the switchboard formed by drilling a series of holes, a slotted covering-plate for each stationary switch member for covering said holes and which plates are provided with bolt-holes, bolts passing through said plates and the switchboard and screwed into the parts of the stationary switch members underneath the board whereby said members and the covering-plates are secured to the board, and a pivoted switch-blade made from a strip of metal bent lengthwise upon itself, the two ends being pivoted to one of the stationary switch members, and having a handle secured to it at the bend, substantially as herein specified.

605,068. BAG OR POUCH. WILLIAM F. BRADLEY, Baltimore, Md. Filed Nov. 6, 1897. Serial No. 657,867. (No model.)

Claim.—1. A bag having a series of gussets around its upper edge, the intermediate gussets being formed by folding in the edges of the bag and being provided with stiffened extensions toward the medial line of the mouth, and folding flat between the exterior gussets, substantially as described.

2. The combination with a bag having a series of gussets, around its upper edge, the intermediate gussets being formed by folding in the corners of the bag and folding flat between the exterior gussets, the said intermediate gussets being stiffened, of male members upon two of the gussets upon each side of the bag, and female members upon the gussets opposite thereto, substantially as described.

3. The combination with a bag having a series of gussets around its upper edge, the intermediate gussets being formed by folding in the corners of the bag and folding flat between the exterior gussets, the intermediate gussets having stiffened extensions thereon projecting toward the medial line of the bag, of means for locking the exterior gussets together passing through the extensions on the intermediate gussets, substantially as described.

4. The combination with a bag having a series of gussets around its upper edge, the intermediate gussets being formed by folding in the corners of the bag and folding flat between the exterior gussets, of male members on two gussets on each side of the bag, and female members upon the gussets opposite to the gussets having the male members, whereby the intermediate gussets are held against lateral motion and means for locking the exterior gussets together, substantially as described.

5. A bag having a series of gussets around its upper edge, the intermediate gussets being formed by folding in the corners of the bag and folding flat between the exterior gussets, the intermediate gussets having plates thereon extending toward the medial line of the mouth and projections on the said plates adapted to form a positive engagement with the exterior gussets, substantially as described.

6. A bag having a series of gussets around its upper edge, the intermediate gussets being formed by folding in the corners of the bag, and folding flat between the exterior gussets, of undercut shoulders and overhanging shoulders upon the opposite gussets whereby they are held against lateral displacement, in combination with means for locking the exterior gussets together, substantially as described.

7. A bag having a series of gussets around the upper edge thereof, the intermediate gussets being formed by oblique folds uniting them with the exterior gussets and being connected to each other by a fold that is horizontal when the bag is closed, the intermediate gussets folding flat between the exterior gussets, each of the intermediate gussets having a stiffened extension projecting beyond the edge thereof, the extensions upon the adjoining gussets being connected together beyond the edge of the latter by a continuation of the horizontal fold, substantially as described.

605,069. MEANS FOR HANGING AND GUIDING SASHES. EDWARD BENT, Chicago, Ill. Filed Oct. 15, 1897. Serial No. 655,206. (No model.)

Claim.—1. The combination of guide rods or tubes situated at one side of a window-frame, a sash having a grooved stile fitted to said rod or tube, plates attached to said sash and provided with rolls which ride upon the rod or tube and serve to guide the sash in its vertical play and to connect the sash with said rod or tube when the sash is turned horizontally, and a weight-cord connected to the opposite side of the sash, as and for the purposes described.

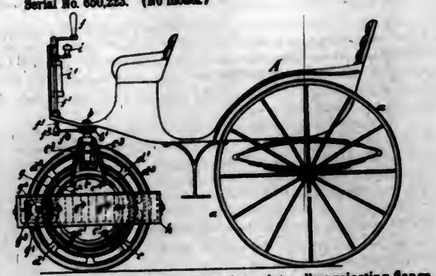
2. The combination with a window casing or frame, of guide tubes or rods attached within the casing adjacent to one of the jambs thereof, sashes each having one stile thereof grooved to receive one of the rods or tubes, plates attached to the sash and carrying rolls which ride upon said guide rods or tubes, and independent weight-cords connected with the opposite sides of the sashes from the guide tubes or rods, as and for the purposes described.

3. The combination with a guide rod or tube, a sash, and a weight-cord attached to the opposite side of the sash from the guide rod or tube, of carrying-plates attached to the sash at top and bottom and fitting the rod or tube, and a pair of rollers journaled in each plate and arranged to ride against opposite faces of the rod or tube, as and for the purposes described.

4. The combination with a guide rod or tube, a sash, and a weight-cord attached to one edge or side of the sash, of the adjustable carrying-plates fastened to the top and bottom of the sash and having openings or slots which fit loosely around said rod or tube, and a pair of rollers journaled in each plate and arranged to ride against opposite sides of the rod or tube, one of said rollers being grooved to closely embrace the rod or tube and enable the sash to turn in a horizontal direction thereon, as and for the purposes described.

5. The combination with a window frame or casing, of the sashes each having one stile provided with a continuous channel and its other stile with a groove which extends only part way of the length of the sash, guide-rods fitted in the channeled stile of the sashes, rollers carried by the sashes to ride against the guide-rods, and weight-cords detachably connected to the grooved edges of the sashes, for the purposes described, substantially as set forth.

6. The combination with a window-frame, and guides therein, of vertically-movable plates fitted to said guides, and a sash fitted to said plates to slide thereon and to turn at an angle to the plates, for the purposes described, substantially as set forth.



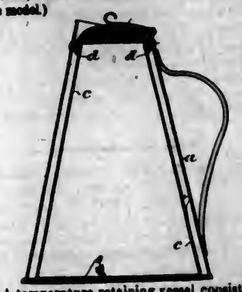
7. The combination with a frame, and guides therein, of extensible supports or carriers fitted to the guides to travel vertically thereon and to turn outwardly at an angle to the guides, and a sash carried by one member of the extensible support or carrier and adapted to turn pivotally thereon in a horizontal plane to occupy a position substantially parallel to the plane of the window-frame when projected therefrom into a room, substantially as described, for the purposes set forth.

8. The combination with a frame, guides therein, and plates fitted to said guides to travel vertically and to turn horizontally thereon, of sash-plates fitted to the traveling plates to slide thereon in a horizontal direction and to turn on said traveling plates when the sash-plates have reached the limit of their sliding play, and a sash attached to and carried by the sash-plates, whereby the sash may be projected into a room and thence turned to a position substantially parallel to the plane of the frame, for the purposes described, substantially as set forth.

9. The combination with a frame, and a guide-rod therein, of roller-plates fitted to the guide-rod to travel vertically and to turn horizontally thereon and provided with longitudinal slots, box-like sash-plates fitted to the traveling roller-plates to slide horizontally thereon and constructed with recesses to permit of angular adjustment of the sash-plates on the roller-plates, pins carried by the sash-plates and fitted in the slots of the roller-plates, and a sash carried by the sash-plates, for the purposes described, substantially as set forth.

10. The combination with a frame, and a guide rod or tube therein, of plates fitted to said rod or tube to travel vertically and turn horizontally thereon, and a sash slidably fitted to said plates, whereby the sash may travel with the plates vertically within the frame and be extended therefrom when the plates are turned inwardly on the rod or tube, substantially as described.

605,070. VEHICLE-WHEEL. JOHN E. M. BECKER, New York, N. Y., assignor to Emily M. Dunton, Hollis, N. Y. Filed Sept. 1, 1897. Serial No. 650,223. (No model.)



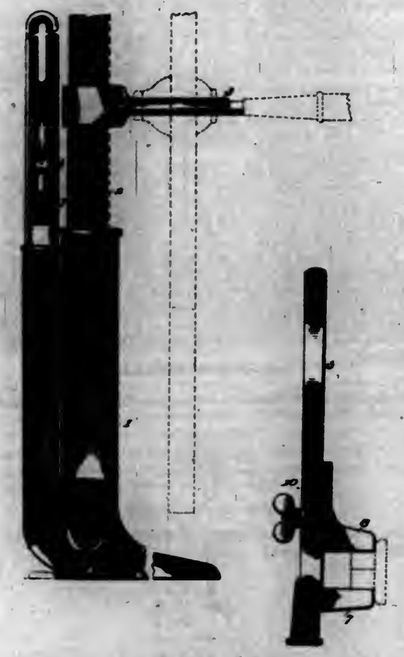
Claim.—1. A vehicle-wheel having a laterally-projecting flange combined with a frame having a correspondingly-projecting flange that surrounds the wheel-flange, and antifriction-balls interposed between the flanges, substantially as specified.

2. A vehicle-wheel having a laterally-projecting flange combined with a duplex frame having a pair of inwardly-projecting flanges that surround the wheel-flange, and antifriction-balls interposed between the wheel-flange and the frame-flanges, substantially as specified.

3. A vehicle-wheel having a laterally-projecting doubly-grooved flange combined with a duplex frame having a pair of inwardly-projecting flanges that surround the wheel-flange, and antifriction-balls interposed between the wheel-flange and the frame-flanges, substantially as specified.

4. In a vehicle, the combination of a wheel having a laterally-projecting flange, with a pivoted frame having a correspondingly-projecting flange that surrounds the wheel-flange, antifriction-balls interposed between the flanges, means for imparting rotary motion to the wheel, and means for turning the frame on its pivot, substantially as specified.

605,071. JUG OR VESSEL FOR CONTAINING LIQUIDS. WILLIAM A. S. BENSON, London, England. Filed July 26, 1897. Serial No. 646,022. (No model.)

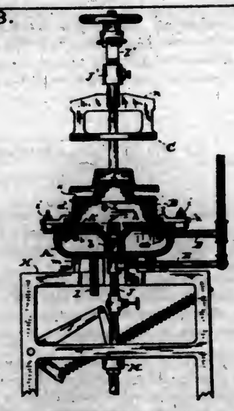


Claim.—1. A temperature-retaining vessel, consisting of a jacket and a receiver, both tapered and smaller at the neck than below, the receiver being formed with an annular flange at its upper end turned outwardly, and the jacket being formed with an annular recess opposite the flange of the receiver, an elastic compressible ring embracing the receiver at its neck or smallest diameter below the flange and arranged in the recess in the jacket, and a plate closing the lower end of the jacket after the receiver has been inserted.

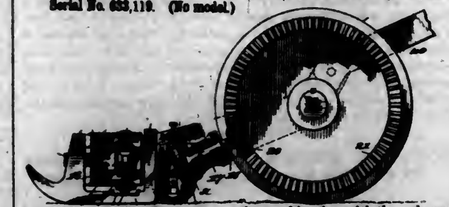
2. The combination of a tapered receiving vessel having an annular outwardly-turned flange at its upper end, an outside tapered jacket formed with an annular recess opposite the flanged end of the receiving vessel, an elastic compressible ring seated in the recess of the jacket and arranged below the flange of the receiving vessel, and means for closing the bottoms of the jacket and the receiving vessel.

3. A temperature-retaining vessel consisting of a jacket and a receiver both tapered and smaller at the neck than below, an elastic ring embracing the receiver at its neck or smallest diameter, an annular recess or seating in the neck of the jacket to receive the elastic ring when the receiver is thrust up into its place within the jacket, and a plate closing the lower end of the jacket after the receiver has been inserted.

605,072. LIFTING-JACK. PERRY BROWN, Wilmington, Del. Filed June 6, 1896. Serial No. 594,575. (No model.)



Claim.—In a wagon-jack, a two-part lever for operating the same, one part being detachable and the other part pivoted to the standard, the detachable part being provided with a fixed jaw and a movable jaw forming a wrench, and one of the two parts having a socket independent of the jaws of the wrench to receive the end of the other part, whereby the nut of the wagon-axle may be held in the wrench while the two parts are in operative connection, substantially as described.

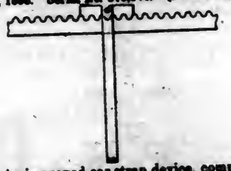


605,073. HAT-BODY-SHAPING APPARATUS. JOSEPH B. BOWMAN, Cleveland, Ohio. Filed Mar. 20, 1896. Renewed Nov. 17, 1897. Serial No. 658,200. (No model.)

Claim.—In a hat-shaping apparatus, a heating-chamber, and suitable supply and exhaust pipes connected thereto, combined with a shaping-chamber, placed upon the top of the heating-chamber, and having a perforated top, a spring-valve located in the shaping-chamber, a sprayer located over the valve, supply and exhaust pipes connected to the shaping-chamber, a follower for descending upon the top of the shaping-chamber, and a mechanism for operating the mold, substantially as described.

605,078.

605,074. LAWN-MOWER. PAUL C. BURNAM, Sedgwick, Kans., assignor of one-half to William Finn, same place. Filed Apr. 21, 1897. Serial No. 633,119. (No model.)

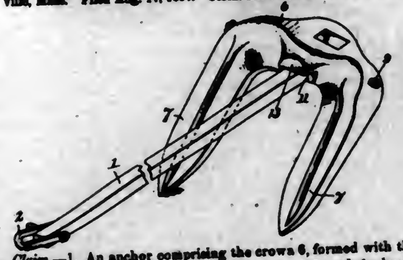


Claim.—1. In a lawn-mower, the combination with the axle and the draft-wheels secured thereto, one of said draft-wheels being also a driving-wheel, of an arm pivoted on the axle adjacent to the inner face of the driving-wheel and extending down in front thereof and having spaced ears extending laterally therefrom across and beyond the outer face of the wheel, a sprocket-wheel journaled between said spaced ears, an arm pivoted on the axle outside of the other draft-wheel and having spaced ears at its forward end, a roller journaled between said ears, an endless cutter-chain mounted on the said sprocket-wheel and roller, a guide for the chain extending across between the arms and secured at its ends between the spaced ears of the respective arms, and gearing interposed between the driving-wheel and said sprocket-wheel to drive the chain, substantially as described.

2. In a lawn-mower, the combination with the axle and the draft-wheels secured thereto, one of said draft-wheels having teeth on its outer face, of an arm pivoted on the axle adjacent to the inner face of the toothed draft-wheel and extending down in front thereof and having spaced ears extending laterally therefrom across and beyond the outer face of the wheel, a sprocket-wheel journaled between said spaced ears, the shaft of said sprocket-wheel having a gear exterior of the rear ear, a bracket extending laterally from the said arm across the toothed draft-wheel, a shaft journaled in said bracket and having gears on its ends meshing with the gear on the sprocket-shaft and the teeth on the draft-wheel respectively, an arm pivoted on the axle outside of the other draft-wheel and having spaced ears at its forward end, a roller journaled between said ears, an endless cutter-chain mounted on the said sprocket-wheel and roller, and a guide for the chain extending across between the spaced ears of the respective arms, substantially as described.

3. In a lawn-mower, the combination with the axle and the draft-wheels secured thereto, one of said draft-wheels being also a driving-wheel, of an arm pivoted on the axle adjacent to the inner face of the driving-wheel and extending down in front thereof and having spaced ears extending laterally therefrom across and beyond the outer face of the wheel, said ears each having a horizontal slot extending transversely of the machine, bearing-blocks adjustably supported in said slots, an idle-roller journaled in said blocks, a sprocket-wheel journaled between said spaced ears, an arm pivoted on the axle outside of the other draft-wheel and having spaced ears at its forward end, a roller journaled between said ears, an endless cutter-chain mounted on the said sprocket-wheel and roller, and running under the idle-roller, a guide for the chain extending across between the arms and secured at its ends between the spaced ears of the respective arms, and gearing interposed between the driving-wheel and said sprocket-wheel to drive the chain, substantially as described.

605,075. CAR-STRAP. FREDERICK W. BURKE, Rochester, N. Y. Filed Feb. 15, 1898. Serial No. 670,570. (No model.)

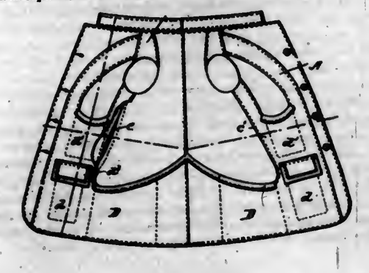


Claim.—1. An improved car-strap device, comprising a sustaining rod or bar, and a supporting-strap carried upon a clamp or block adapted to interlock with said sustaining-rod, substantially as and for the purpose set forth.

2. An improved car-strap device, comprising a sustaining rod or bar, a clamp or block adapted to interlock with said rod or bar, and a supporting-strap carried by and depending from said clamp or block and embracing the rod or bar, substantially as and for the purpose set forth.

3. An improved car-strap device, comprising a sustaining rod or bar provided with a corrugated or toothed top edge, a clamp or block having a corresponding corrugated or toothed bottom edge adapted to interlock with the top edge of the rod or bar, and a supporting-strap carried by said clamp or block, substantially as and for the purpose set forth.

4. An improved car-strap device, comprising a sustaining rod or bar having a corrugated or toothed top edge, a clamp or block having a corresponding corrugated or toothed bottom edge adapted to interlock with the top edge of the rod or bar, said clamp being movable or adjustable with relation to said sustaining member, and a supporting strap connected with the sides of the clamp or block and depending therefrom and embracing the sustaining member, substantially as and for the purpose set forth.



605,076. STOCKLESS ANCHOR. GEORGE H. BURROWS, Somerville, Mass. Filed Aug. 17, 1897. Serial No. 648,526. (No model.)

Claim.—1. An anchor comprising the crown 6, formed with the integral parallel and rearwardly-extending flukes 7 7, and the longitudinal rectangular orifice 8, formed between the parallel walls 11, 11, and having V-shaped recesses formed in their opposite faces, in combination with the rectangular shank 1, provided with the T-shaped head 3, having lateral lugs 4 4, adapted to engage said V-shaped recesses, substantially as shown and described.

2. An anchor comprising the crown, the flukes, the shank, and the shackling-pin, the crown having a central aperture formed with stop-shoulders and the shank having a head pivoted in said aperture at the rear of the stop-shoulders by said shackling-pin, whereby, should the shackling-pin break, the head will engage said shoulders and prevent the parts separating.

605,077. HUNTING-COAT. WILLIAM S. CARTER, Lebanon, N. H. Filed Sept. 17, 1896. Serial No. 606,122. (No model.)

Claim.—As an improved article of manufacture, the hunting-coat herein described having the outer pockets D, d, d', the inner pocket D' and the entrance c' to the inner pocket with its flap, the whole formed of three layers of cloth made by the patterns A, B, C, each pattern forming with a corresponding pattern one layer of the coat, substantially as described.

605,078. NUT-LOCK. CHARLES H. CHARLTON, Jr., and JOHN F. CHARLTON, New Orleans, La. Filed Aug. 17, 1897. Serial No. 648,566. (No model.)

Claim.—1. In a nut-lock, the combination with a bolt having a longitudinal groove along its screw-threaded portion; of a metallic plate provided with an opening adapted to fit over said screw-threaded portion of the bolt, and having a lug extending into said opening, adapted to take in said groove on the bolt; and a spring-arm at one side of said plate bent first toward the back of the plate and then toward the front and having its free end extending outward from the face of the said plate, substantially as described.

2. In a nut-lock the combination with a bolt having a plurality of longitudinal grooves along its screw-threaded portion; of a metallic plate provided with an opening adapted to fit over said screw-threaded portion of the bolt, and having a plurality of lugs extending into said opening adapted to take in said grooves in the bolt; and a plurality of spring-arms upon side edges of said plate bent first toward the back of the plate and then toward the front and having their free ends extending outward from the face of the said plate, substantially as described.

3. A combined nut-lock and washer comprising the flat metallic plate C, having central opening C^0, and lugs c protruding into said opening; and spring-arms C' bent first toward the back of the plate and then toward the front and having their free ends c' extending outward from the face of the said plate, substantially as described.

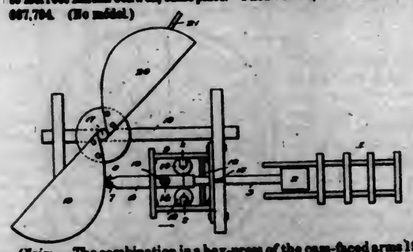
4. A combined nut-lock and washer comprising a flat metallic plate having a central opening therethrough for the passage of the bolt; a plurality of lugs thereon protruding into said central opening; and a plurality of spring-arms upon side edges of said plate bent first toward the back of the plate and then toward the front and having their free ends turned outward from the face thereof, substantially as described.

605,079. WINDMILL. JOHN COATES, Olive, Cal. Filed June 26, 1897. Serial No. 642,381. (No model.)

Claim.—1. As an improvement in windmills, a divided pitman or pump rod comprising two sections, a joint mechanism comprising a connecting-rod secured to the top section and having a sliding connection with the lower section and a pivotally-mounted ratchet-bar adapted to engage and actuate the lower section, and mechanism for controlling the operation of the ratchet-bar, substantially as and for the purpose set forth.

2. As an improvement in windmills, a divided pitman or pump rod comprising two sections, a joint mechanism comprising a connecting-rod secured to the top section and having a sliding connection with the lower section and a pivotally-mounted ratchet-bar adapted to engage and actuate the lower section, spring devices governing the ratchet-bar, and mechanism for actuating the ratchet-bar against the tension of said spring devices, substantially as and for the purpose set forth.

3. An improved windmill, comprising a divided pitman or pump rod embodying an upper and lower section, a joint mechanism connecting said sections and embodying a connecting-rod secured to the top section and having a sliding connection with the lower section and a pivotally-mounted ratchet-bar adapted to engage and actuate the lower section, spring devices for throwing the ratchet-bar out of engagement with the lower section, connecting cords or rods extending between the ratchet-bar and a controlling mechanism, and a controlling mechanism for drawing upon said cords or rods to cause the same to actuate the ratchet-bar against the tension of the spring, substantially as and for the purpose set forth.



4. An improved windmill, comprising a divided pitman or pump rod embodying two sections, a joint mechanism permanently connecting said sections but permitting an independent movement of the lower section with relation to the upper section and embodying a device for intermittently bearing upon the lower section, mechanism for retaining said intermittently-bearing device out of engagement with the lower section, devices connected with said intermittently-bearing device and adapted to draw against the action of said retaining mechanism, and means for operating said connection devices, substantially as and for the purpose set forth.

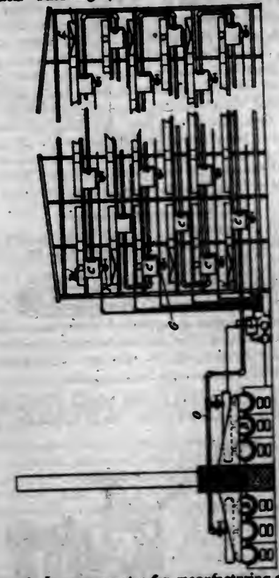
5. As an improvement in windmills, a divided pitman or pump rod comprising upper and lower sections, a joint mechanism permanently connecting said sections and comprising a connecting rod or device having a movable connection with the lower section and permitting an independent movement of the same with relation to the upper section and a device intermittently bearing upon the lower section, and means for governing the operation of said intermittently-operating device, substantially as and for the purpose set forth.

6. An improved windmill, comprising a divided pitman embodying an upper section and a lower section, the upper section being connected to the main operating mechanism of the windmill, devices supporting the lower section independently of the upper section, a sliding joint connecting said sections, devices for intermittently engaging the lower section, and means for operating the devices which engage the lower section in their intermittent movement, substantially as and for the purpose set forth.

7. An improved windmill, comprising a divided pitman embodying an upper section and a lower section, the upper section being connected to the main operating mechanism, devices supporting the lower section independently of the upper section, a sliding joint connecting said sections, a ratchet-bar pivotally carried upon the upper section and adapted to engage the lower section, and mechanism for throwing said ratchet-bar into and out of engagement with the lower section, substantially as and for the purpose set forth.

605,080. HAY-PRESS. JOHN D. CORWELL, Augusta, Ga., assignor to Harriett Instin Corwell, same place. Filed Jan. 24, 1898. Serial No. 667,794. (No model.)

Claim.—The combination in a hay-press of the cam-faced arms 19, 20, the press-box and the guide-frame 9, with the follower, the follower-rod, the sleeve 4 formed with socket 13 and the set-screw 14, the roller 8 journaled in the front end of said sleeve, the spring 5 interposed between the head of the sleeve and the end of the follower-rod and the retractile spring 15, extending from the frame 9 to the follower-rod 3, substantially as shown and described.



605,081. TONGS FOR STRETCHING WIRES. ELIAS CRAMER, Dundee, N. Y. Filed Nov. 18, 1897. Serial No. 658,903. (No model.)

Claim.—1. A pair of tongs for stretching wire consisting of two jaws pivotally connected to each other and provided with two extended legs or handles, two opposing grooves formed across the inner faces of the jaws, said grooves being adapted to hold the wire, a series of wedge-shaped teeth situated on the upper end and on one side of the said jaws, said teeth being made flush with the inner faces of the said jaws and tapering toward the top faces of the jaws, substantially as described and for the purpose set forth.

2. A pair of tongs for stretching wires comprising two jaws pivotally connected to each other and provided with two extended legs or handles, two or more opposing grooves formed across the inner faces of the jaws, a series of teeth tapering toward the top faces of the jaws, located on one or more sides of the jaws, substantially as described and for the purpose set forth.

605,082. SALT-MAKING APPARATUS. THOMAS CRANEY, Bay City, Mich. Filed Aug. 1, 1896. Serial No. 601,334. (No model.)

Claim.—1. In an apparatus for manufacturing salt from brine, the combination of a horizontally-extending grainer, a circulating-heater depending from the under side at one end of said grainer and communicating with the bottom thereof, an open return-conduit entering through the walls of the grainer to a point above the heater, a vertical inflow-pipe connecting the end of said conduit with the bottom of the heater and a mechanical device for impelling the brine in said inflow-pipe.

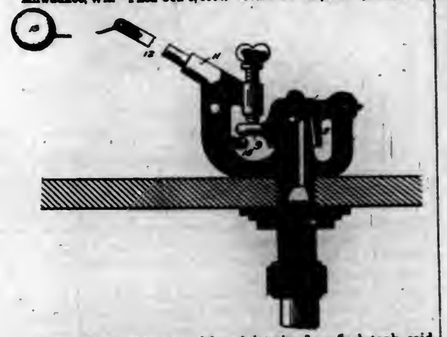
2. In an apparatus for making salt from brine, the combination of a horizontally-extending grainer, a heater contained within an outer shell secured to the under side at one end of the grainer, and containing an upper heating chamber a lower brine-chamber, a series of outflow-pipes from the brine-chamber into the bottom of the grainer through the heating-chamber, a return-conduit from the grainer with the end to which the heater is attached and an inflow-pipe communicating therewith and extending down through the heater into the brine-chamber.

3. In an apparatus for making salt from brine, the combination of a horizontally-extending grainer, a heater depending from the bottom at one end of the grainer and comprising a cylindrical outer shell formed with diaphragms dividing the shell into an upper and lower chamber means for supplying the upper chamber with steam, a system of vertical circulating-pipes from the lower chamber communicating with the bottom of the grainer, a vertical inflow-pipe for the lower chamber centrally of the heater and a horizontal open return-conduit communicating with said inflow-pipe.

4. In an apparatus for manufacturing salt from brine, the combination of a horizontally-extending grainer, a cylindrical vessel attached to the under side at one end of the grainer and formed with

a conical bottom having a valve-controlled discharge-opening, diaphragms dividing the vessel into a lower brine-chamber and an upper steam-chamber provided with means for admitting steam thereto, an inflow-pipe for the brine-chamber centrally of the heater and extending into the grainer, an open return-conduit leading from the grainer into the end to which the heater is connected and communicating with the inflow-pipe and a series of vertical circulating-pipes from the brine-chamber through the heating-chamber into the bottom of the grainer.

5. In an apparatus for manufacturing salt from brine, the combination of a series of horizontally extending loop-shaped grainers grouped side by side upon a common floor and with the last grainer extended into proximity to the first grainer and provided with a supply of fresh brine, a heater in one end of each grainer provided with a circulating system of pipes and passages connected in circuit with the adjacent grainer for heating the brine and circulating it through all the grainers, a source of steam supplying the heaters with steam and a system of scrapers operating to remove the granulated salt from the grainers.



6. A plant for manufacturing salt from brine, comprising a plurality of circulating systems of grainers supported one above the other and on different floors of a building, each system being composed of a series of loop-shaped grainers grouped side by side and provided with means for removing the granulated salt, the last grainer being extended into proximity to the first grainer of the series and connected to the source of brine-supply, each grainer being provided in one end with a circulating steam-heater depending from the under side of the grainer, said heaters connecting the grainers into a closed system for heating and circulating the brine therein, the arrangement being such that the heaters are all nested in one and the same end on each floor contiguous to a common source of steam while the scraper devices operate all toward the opposite end to remove and collect the granulated salt separately on each floor.

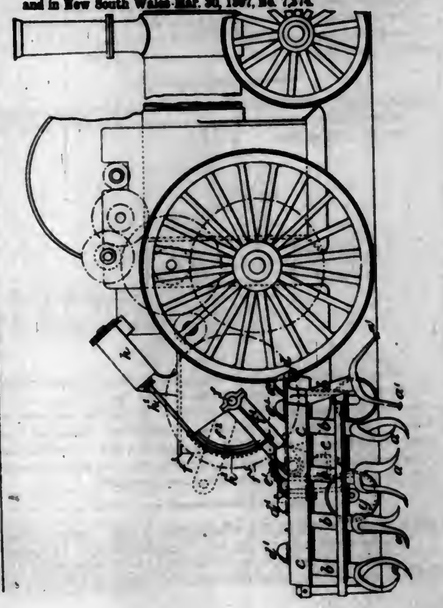
605,083. HARMONICA. CHARLES L. CURTIS, New York, N. Y., assignor to Ferdinand Strauss, same place. Filed Jan. 6, 1896. Serial No. 665,738. (No model.)

Claim.—A harmonica composed of a continuous case having closed outwardly-bulged ends to form centering-pockets, and of a reed-block which projects with its ends into such pockets, substantially as specified.

605,084. INLET-VALVE FOR FLUSH-TANKS. BERT DALE, Milwaukee, Wis. Filed Oct. 6, 1897. Serial No. 654,236. (No model.)

Claim.—The combination with an inlet-pipe for a flush-tank, said pipe having upwardly-extending arms on its opposite sides, a cup-valve pivoted to one of said arms and provided with a lug, a lever pivoted to the other arm and provided with a toe projecting under said lug and with a screw projecting over said lug, and a float connected with the lever, whereby when the float is elevated the valve will be closed, and when lowered it will be opened, substantially as set forth.

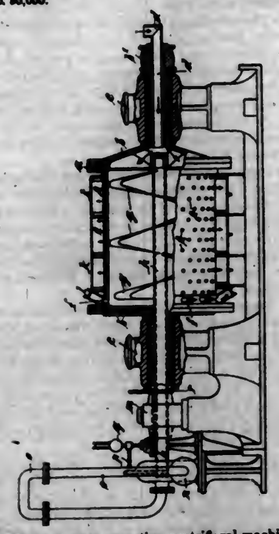
605,085. SULKY-PLOW. WILHELM G. DANIELSEN and WILLIAM MERRILL, Richmond, Utah; said Merrill assignor to said Danielsen. Filed May 6, 1897. Serial No. 635,383. (No model.)



Claim.—1. In a sulky-plow, the combination with the plow-frame and its carrying-wheels, of the plow-standard connected rigidly thereto, the plow attached rigidly to said standard, a wheel arranged in rear of said plow and mounted upon an inclined axle, and a hollow cap secured to said wheel and inclosing the end of said axle, said cap being arranged to bear against the end of the axle for taking the lateral thrust on said wheel, and also constituting an oil-cup, substantially as described.

2. In a sulky-plow, the combination with a share-carrying standard, of a presser-wheel having a beveled rim, an inclined angular hanger arranged to extend in front of the presser-wheel and provided at its rear extremity with a transverse inclined axle on which the presser-wheel is mounted, and a clamp attached to the standard and engaging with the front part of the hanger to hold the latter rigidly on the standard, substantially as described.

3. In a sulky-plow, the combination with a frame and a plow-share, of a hanger attached to the frame and provided with a transverse axle, an inclined landside pressure-wheel journaled on the axle of said hanger, a supporting-arm attached to the frame and extending rearwardly therefrom over the landside pressure-wheel, a scraper hung on the supporting-arm, a treadle-shaft journaled on the plow-frame and provided with a crank-arm, and a pitman connected to the crank-arm of said treadle-shaft and to the scraper, for the purpose described, substantially as set forth.

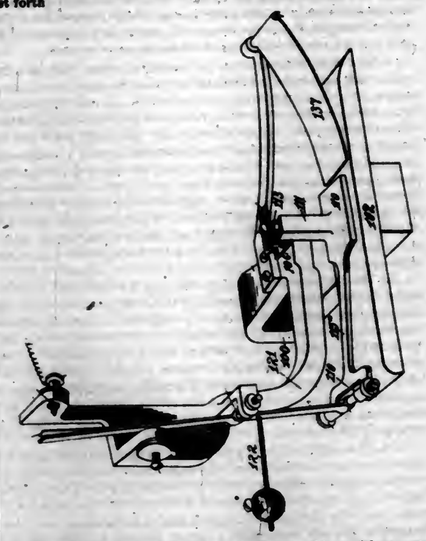


605,086. IMPLEMENT FOR DIGGING OR CULTIVATING LAND. THOMAS A. DARBY and SIDNEY C. DARBY, London, England. Filed Mar. 11, 1897. Serial No. 626,969. (No model.) Patented in England Dec. 13, 1895, No. 23,923; in France Dec. 11, 1896, No. 262,100; in Belgium Dec. 11, 1896, No. 126,123; in Germany Dec. 12, 1896, No. 93,986; in Hungary Feb. 10, 1897, No. 5,571; in Austria Feb. 26, 1897, No. 47/625; in Canada Mar. 26, 1897, No. 55,439; in Victoria Mar. 30, 1897, No. 14,046, and in New South Wales Mar. 30, 1897, No. 7,374.

Claim.—1. In implements for digging or cultivating land, the combination of a suitable supporting-frame, a series of rotating tools mounted upon slightly-inclined shafts and arranged in rows and carried by said frame, the cutting members of said tools in each row being so arranged with relation to each other as to act upon the ground one after another, and gearing connected with said shafts and adapted to rotate them in a direction to cause said tools to act upon the ground in a rearward direction only to aid in propelling the implement forward, substantially as described.

2. In implements for digging or cultivating land, the combination of a V-shaped frame, a series of inclined shafts carried by said frame in diagonal lines or rows, a series of tools carried by said shafts, the cutting members of said tools in each row being so arranged with relation to each other as to act upon the ground one after another in succession, and gearing connected with said shafts and adapted to rotate them in a direction to cause the corresponding tools of each row to act simultaneously upon the ground in a rearward direction to aid in propelling the implement forward, substantially as described.

605,087. CENTRIFUGAL MACHINE. MEYER DAVIDSEN, Paris, France. Filed Dec. 20, 1897. Serial No. 664,724. (No model.) Patented in France Apr. 15, 1896, No. 255,563, and in Germany Nov. 20, 1896, No. 95,055.



Claim.—In continuous-operating centrifugal machines, the combination with the drum *a* and the screw *g*, of brake mechanism, connected to the shaft *h* substantially as and for the purpose hereinbefore set forth.

605,088. PAPER-FEEDING MACHINE. TALBOT C. DEXTER, Pearl River, N. Y. Filed Apr. 17, 1897. Serial No. 632,699. (No model.)

Claim.—1. The combination, in a paper-feeding machine, with an automatic clutch mechanism constructed to throw the machine out of operation, of a sheet-calipering clutch-controlling device comprising an electromagnetic trip mechanism, a lower stationary calipering member over which the sheets pass, an upper adjustably-supported sliding calipering member supported over the stationary member and capable of moving in a plane parallel with and in the direction of travel of the sheets and an electric contact device comprising a contact-point, and a contact-lever connected with the sliding calipering member, the contact point and lever being in circuit with the electromagnetic trip mechanism, substantially as set forth.

2. The combination, in a paper-feeding machine, with an automatic clutch mechanism constructed to throw the machine out of operation, of a sheet-calipering clutch-controlling device comprising an electromagnetic trip mechanism, a lower stationary calipering member over which the sheets pass, an upper adjustably-supported calipering member supported over the stationary member and capable of moving in the direction of travel of the sheets, an arm extending from the movable calipering member, and an electric contact device in circuit with the electromagnetic trip mechanism and comprising a contact-lever extending transversely to the line of movement of the sheets and pivotally connected with the arm of the movable calipering member, and a contact-point with which the lever is brought into contact by the movement of the calipering member, substantially as set forth.

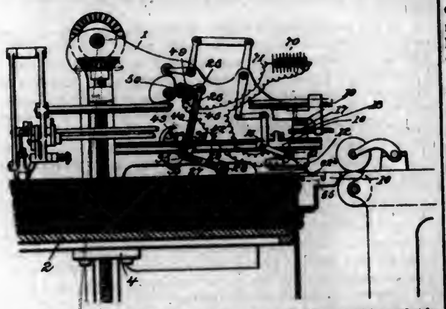
3. The combination, in a paper-feeding machine, with an automatic clutch mechanism constructed to throw the machine out of operation, of a sheet-calipering clutch-controlling device comprising an electromagnetic trip mechanism, a lower stationary calipering member over which the sheets pass, an upper adjustably-supported calipering member supported over the stationary member and capable of moving in the direction of travel of the sheets and an electric contact device in circuit with the electromagnetic trip mechanism comprising a contact-point, a contact-lever connected with the movable calipering member, and a weighted arm extending from the contact-lever and arranged to hold the parts in normal position, substantially as set forth.

4. The combination, in a paper-feeding machine, with an automatic clutch mechanism constructed to throw the machine out of operation, of a sheet-calipering clutch-controlling device comprising a lower stationary plate over which the sheets pass, a rigidly-supported slotted plate above the stationary plate, a movable calipering member, a pin or screw passing through the slotted plate and engaging the movable calipering member and supporting it in proper relation to the stationary plate, and means connected with the movable calipering member for tripping the clutch mechanism, substantially as set forth.

5. The combination, in a paper-feeding machine, with an automatic clutch mechanism constructed to throw the machine out of operation, of a sheet-calipering clutch-controlling device comprising a lower stationary plate over which the sheets pass, a calipering-wheel journaled in a movable support above the stationary plate, means for adjusting the movable support for regulating the distance between the periphery of the wheel and the stationary plate, means of engagement between the wheel and its support to arrest the rotation of the wheel and cause the support to move, and means operatively connecting the movable support with the trip mechanism of the clutch, substantially as set forth.

6. The combination, in a paper-feeding machine, with an automatic clutch mechanism constructed to throw the machine out of operation, of a sheet-calipering clutch-controlling device comprising a lower stationary plate over which the sheets pass, a vertically-adjustable calipering-plate supported above the stationary plate and arranged to move with the sheets, means connecting the movable calipering-plate to the clutch mechanism, a friction-wheel freely journaled upon the plate with its periphery projecting below the lower face, and a stop device adapted to arrest the rotation of the wheel and cause the calipering-plate to move with the sheets, as set forth.

7. The combination, in a paper-feeding machine, with an automatic clutch mechanism constructed to throw the machine out of operation, of a sheet-calipering clutch-controlling device comprising a lower stationary plate over which the sheets pass, a vertically-adjustable calipering-plate supported above the stationary plate and arranged to move with the sheets, means connecting the movable cali-



pering-plate to the clutch mechanism, posts or lugs on the calipering-plate, a slot in the plate between the lugs or posts, a friction-wheel journaled between said posts or lugs with its periphery projecting through said slot below the under surface of the plate, and a pin extending from one face of the wheel and adapted to engage one of the posts or lugs, substantially as and for the purpose set forth.

8. The combination, in a paper-feeding machine, with an automatic clutch mechanism constructed to throw the machine out of operation, of a sheet-calipering clutch-controlling device comprising a lower stationary plate over which the sheets pass, a vertically-adjustable calipering-plate supported above the stationary plate and arranged to move with the sheets, means connecting the movable calipering-plate to the clutch mechanism, posts or lugs on the calipering-plate, a slot in the plate between the lugs or posts, a friction-wheel journaled between said posts or lugs with its periphery projecting through said slot below the under surface of the plate, a friction-block of soft rubber inserted in the periphery of the friction-wheel, and a pin extending from one face of the wheel and adapted to engage one of the posts or lugs, substantially as and for the purpose set forth.

9. The combination, in a paper-feeding machine, with an automatic clutch mechanism constructed to throw the machine out of operation, of a sheet-calipering device, a rock-shaft adapted to operate the clutch, a constantly-reciprocating driving-rod operatively connected with the machine and formed with a detent-shoulder, a bar connected with the rock-shaft, a detent pivoted to said bar and adapted to engage the shoulder of the driving-rod, and an electromagnetic trip device under the control of the calipering device, and adapted to hold the detent out of engagement with the driving-rod, substantially as set forth.

10. The combination, in a paper-feeding machine, with an automatic clutch mechanism constructed to throw the machine out of operation, of a sheet-calipering device, a rock-shaft adapted to operate the clutch, a constantly-reciprocating driving-rod operatively connected with the machine and formed with a detent-shoulder, a bar connected with the rock-shaft, a detent pivoted to said bar and adapted to engage the shoulder of the driving-rod, and an electromagnetic trip device under the control of the calipering device and adapted to hold the detent out of engagement with the driving-rod, and a cam-shoulder on the operating-rod adapted to engage the detent and throw it into engagement with the trip mechanism, substantially as set forth.

605,089. PAPER-FEEDING MACHINE. TALBOT C. DEXTER, Pearl River, N. Y. Filed Sept. 16, 1896. Renewed Oct. 16, 1897. Serial No. 655,490. (No model.)

Claim.—1. The combination, in a paper-feeding machine, of suitable feeding devices, having a normally-active frictional engagement with the paper on their forward stroke, means for imparting a uniform stroke to the feeding devices, and means for automatically rendering the frictional engagement of the feeding devices inactive at certain points on their forward stroke without elevating them from the paper or arresting their uniform motion, said automatic means being controlled by the advance edge of the paper being fed off, substantially as set forth.

2. The combination, in a paper-feeding machine, of suitable feeding devices, means for imparting a uniform feeding motion thereto, and suitable electric controlling devices operated by a passing sheet for rendering the feeding devices active or inactive according to the position of the sheet being fed off and without interfering with or interrupting their uniform feeding motion or elevating the feeding devices from the paper, substantially as set forth.

3. In a paper-feeding machine for automatically moving sheets of paper from a pile, the combination of a feeding-finger, means for operating it, a friction feed-roller journaled in said finger and adapted to bear upon the paper, an automatic device for holding said roller against rotation to cause it to move the paper, and suitable means operated by the moving sheet for automatically controlling the action of said automatic device causing it to release the roller to free rotation over the paper when the sheet has a certain position, and to hold the roller against rotation when in another position to cause it to feed the succeeding sheet, substantially as set forth.

4. In a paper-feeding machine for automatically moving sheets of paper from a pile, the combination of two feeding-fingers arranged transversely of the line of feed a suitable distance apart above the pile of paper, means for operating said feeding-fingers in parallel planes, feed-rollers journaled in said feed-fingers and adapted to bear upon the paper, independent automatic devices for holding the respective rollers against rotation to cause them to move the paper, and suitable independent controlling devices operated by the moving sheet for automatically controlling said automatic holding devices and causing them to free the roller for rotation and thereby arrest the feed of each roller when the edge of the sheet in front of it reaches a certain point, substantially as set forth.

5. In a paper-feeding machine, the combination of a feeding-finger, a friction feed-roll journaled in said finger, a dog or detent carried by the finger and adapted to hold the roller against rotation, and suitable automatic means operated by a moving sheet for controlling the operation of the dog and consequent action of the feed-roll, substantially as set forth.

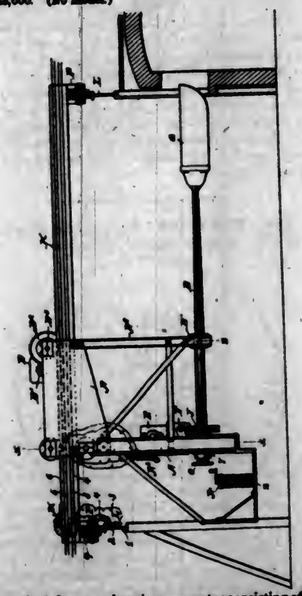
6. In a paper-feeding machine, the combination of a feeding-finger, a friction feed-roll journaled in the finger, a ratchet-wheel secured to the journal of the feed-roll, a spring-released dog or detent carried by the feed-finger and adapted to be moved into engagement with the ratchet-wheel for holding the roll against rotation, and a suitable automatic device controlling the dog or detent and operated by the advance edge of the sheet being fed off for releasing the dog from engagement with the ratchet to allow the rotation of the roll, substantially as set forth.

7. In a paper-feeding machine, the combination of a feeding-finger, a friction feed-roll journaled in the feed-finger and provided with a ratchet-wheel on one of its journals, a dog or detent carried by the feeding-finger and adapted to engage the ratchet, an electromagnetic device adapted to move the dog into engagement with the ratchet, and an electric-contact controlling device operated by a passing sheet for controlling the action of the electromagnetic device, substantially as set forth.

8. In a paper-feeding machine, the combination of a feeding-finger, a rock-arm upon which said finger is mounted, a friction feed-roll journaled in said finger and having a ratchet-wheel secured to its journal, a dog or detent supported on the feed-finger and adapted to engage the ratchet, an armature-lever pivoted to the rock-arm and engaging the dog or detent and carrying an armature, an electromagnet supported on the rock-arm, and an electric-contact-controlling device operated by a passing sheet for controlling the action of the electromagnet, substantially as set forth.

9. In a paper-feeding machine, the combination of a feeding-finger, a friction feed-roll journaled in said finger and having a ratchet-wheel secured to its journal, a dog or detent supported upon the finger and adapted to engage the ratchet-wheel, a pivoted lever engaging the dog or detent, an armature on said lever, an electromagnet, a normally-closed electric circuit including the electromagnet, and a circuit making and breaking arm or lever in said circuit supported in the path of the paper to be operated thereby, substantially as set forth.

10. In a paper-feeding machine, the combination of a feeding-finger, a friction feed-roll journaled in the feed-finger, an electromagnetic device for holding the feed-roll against rotation in the feed-finger, an electric battery, a contact-point, a contact-lever supported in the path of the paper formed with a curved lower end adapted to be engaged by the paper, and an electric circuit including the magnetic device, the battery and contacts, substantially as set forth.



11. In a paper-feeding machine, the combination of a feeding-finger having a friction feed-roll journaled in it, means for automatically elevating the feed-finger from the surface of the paper at the end of its forward stroke and for lowering the feed-finger upon the paper at the end of the rear stroke, means for holding the roller against rotation in the feed-finger, and an automatic controlling device operated by the passing sheet for regulating the roller-holding device, substantially as set forth.

12. In a paper-feeding machine, the combination of a paper-feeding finger having a feed-roll journaled in its end, a suitable device for holding the roll against rotation, an automatic controlling device operated by a passing sheet for regulating the action of the roller-holding device, and suitable buckling mechanism for separating the rear corners of the sheet from the pile, substantially as set forth.

13. In a paper-feeding machine, the combination of paper-feeding fingers having friction feed-rolls journaled in their ends, means operated by the passing sheet for automatically holding said rollers against rotation or allowing them to rotate, with a sheet-separator

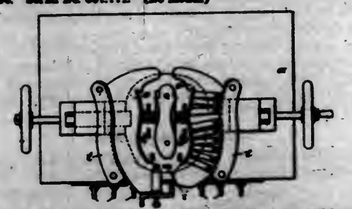
comprising a bed disposed in front of the delivery end of the machine, and a friction-pad reciprocating over said bed and moving vertically at the ends of its stroke, substantially as set forth.

605,090. ELECTRICAL APPARATUS FOR CHARGING FURNACES. JOSEPH P. ROE, Muncie, Ind. Filed Aug. 12, 1897. Serial No. 648,000. (No model.)

Claim.—1. A furnace-charging apparatus consisting of a charger-track adapted to travel across the face of the furnace, a charger-frame adapted to run upon said track, a charger-bar pivotally suspended within said frame, a rod rotatable in the charging-bar, a cam adapted to enter the wall of the charging-bar and engage the shank of the pan, means for raising and lowering the outer end of said charger-bar, and suitable electric motors in proper circuit for operating the various parts of the apparatus, as specified.

2. In combination, supporting-tracks arranged parallel with the front of the furnace, a charger-track mounted upon trucks adapted to travel upon said supporting-tracks, a charger-frame, a truck from which said frame is suspended, said truck being adapted to run upon the charger-track, a casting suitably pivoted within the charger-frame, a charger-bar journaled within said pivoted casting, a vertically-movable casting fitted to slide within the charger-frame, and through which the charger-bar passes, and mechanism for revolving the charger-bar, an electric motor for operating said mechanism, and an electric motor for causing the charger-truck to travel upon its track, and an electric motor for causing the charger-truck to move to and fro upon the supporting-track, as specified.

3. In combination with a charging apparatus, two charging-trucks, two trucks adapted to run thereon, a shaft for connecting the trucks, a hollow charging-bar, an operating-rod journaled in the ends of the charging-bar, a cam formed at one end of the operating-rod adapted to engage the shank of the charging-pan, substantially as described.



4. In combination with a traveling charger-truck of the character described, a truck adapted to run thereon, an electric motor carried by said truck, suitable gearing connecting the wheels of said truck with said motor, a trolley carried by the truck and adapted to travel upon suitable line-wires for transmitting an electric current to and from said motor, a charger-frame depending from the truck, a casting pivoted within the frame, a hollow charging-bar journaled within said pivoted casting, a vertical movable casting in which the rear end of the charger-bar is journaled, suitable mechanism for raising and lowering said casting, an electric motor for operating said mechanism, a trolley carried by the charger-frame for transmitting an electric current from suitable line-wires, and a platform containing the controller and switchboards upon which the operator may stand for bringing about the proper movements of the charger, substantially as shown and described.

5. In combination with a charger-frame of the character described, a casting pivoted to said frame, a hollow charger-bar journaled in said pivoted casting, a vertical movable frame fitted to slide within the charger-frame and in which the rear end of the charger-bar is journaled, suitable mechanism for raising and lowering said frame, an electric motor carried by the charger-frame for operating this last-named mechanism, suitable gearing connected with the charger-bar for turning the same upon its axis, an electric motor suitably mounted for operating this gearing, suitable trolleys for transmitting an electric current from line-wires to the motors, a cam-rod journaled within the hollow charging bar, a cam carried upon the inner end thereof adapted to enter into engagement with the shank of the charging-pan, thereby locking the same upon the charger-bar, a hand-wheel upon the outer end of the cam-rod for manipulating the same, and a platform upon which the operator may stand, for controlling the movements of the apparatus, as specified.

6. In combination with a charger-frame of the character described, a charger-bar pivotally attached thereto, mechanism for raising and lowering the outer end thereof, mechanism for turning said charger-bar upon its axis, a charger pan with which the outer end of the charger-bar is adapted to engage, a rod journaled within the hollow charger-bar, a cam carried upon the inner end thereof and adapted to enter into engagement with the shank of the charging-pan for locking the same upon the charger-bar, and means for bringing about the several movements of the charger-bar, as shown and described.

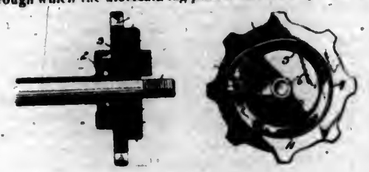
7. In combination with a hollow charging-bar of the character described, a rod journaled therein, a cam carried upon the inner end of said rod and adapted to be turned upward through an opening in said bar, a hand-wheel for manipulating said rod, and a charging-pan having a shank in which is formed a square hole for the entrance of the square end of the charger-bar and also having a notch formed therein, with which the cam may engage for locking the pan upon the charger-bar, substantially as and for the purpose set forth.

605,091. LASTING-MACHINE. CHRISTIAN BERNSDORF, Berlin, Germany, assignor to Schönfliess Brothers, same place. Filed Oct. 3, 1896. Serial No. 607,771. (No model.)

Claim.—1. A machine for manufacturing shoes, comprising a last-holder, stretching-clamps, devices for drawing down said clamps, frames corresponding in shape to the sides of the sole, and devices for bringing said frames up to said sole, and pin-driving devices mounted in said frames and adapted to drive pins through the inner sole and upper in directions substantially parallel to the bottom of the shoe.

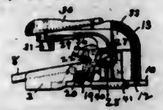
2. The combination in a shoe pulling-over and fastening machine, of two stretching-clamps, bars connected thereto, a pedal, and a bar connected to said pedal, and an arm connected to the pedal-bar and engaging with either of the stretching-clamp bars.

3. The combination in a shoe-fastening machine, of pin-holders, pin-driving devices operating in substantial parallelism to the bottom of the shoe, and a frame engaging with a number of said devices and driving the same simultaneously.



4. The combination in a shoe-fastening machine, of a sole-plate having rounded recesses in its side, and pin-drivers operating to drive pins against the sides of said sole-plate and into said recesses.

5. The combination in a shoe-fastening machine, of a pin-driving device for driving pins in substantial parallelism to the bottom of the shoe, and adjusting devices for said pin-driving device whereby the same can be adjusted vertically and longitudinally.

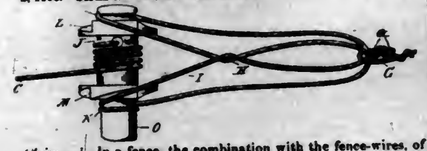


605,092. BICYCLE-BRAKE. CHARLES M. PERRY, West Williamsfield, Ohio. Filed Aug. 5, 1896. Serial No. 601,781. (No model.)

Claim.—In a brake for bicycles and similarly-propelled machines, the combination of a disk applied to the hub of the drive-wheel and having its periphery screw-threaded, a sprocket-rim internally threaded and mounted upon the said disk to turn thereon, cooperating stops applied to the sprocket-rim and disk to limit the forward movement of the rim, a friction-disk concentrically mounted with the drive-wheel and having a lateral leg entering the slot in the fork member of the frame adjacent to the brake, a brake-strap surrounding the friction-disk and normally held out of action, and having its termi-

nals secured, respectively, to the sprocket-rim and disk, and a casing inclosing the friction-disk, brake-strap and stops, and having an opening through which the aforesaid lug passes, substantially as set forth.

605,093. ENVELOP-OPENER. WILLARD H. FOX, New Haven, Conn. Filed Feb. 21, 1896. Serial No. 580,224. (No model.)



Claim.—1. In an envelop-opener, the combination with a suitable frame, of the stationary knife 15 adjustably mounted upon said frame, knife-bar 25 pivotally mounted upon said frame and carrying the knife 22, said knife-bar being provided with the operating-handle 29 to the under side of which is secured the elastic buffer 31, the closely-coiled spring 13 for retracting said knife-bar, and table 8 mounted upon said frame in front of said knives, substantially as described.

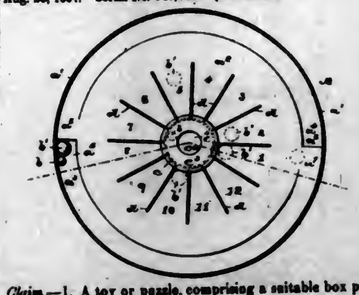
2. The combination with the frame provided with the end pieces 1 1 and cross-bars 5 6, of the knife-bar 17 supported at its ends by the conical-pointed screws 19 passing through said end pieces and carrying the knife 15, adjusting-screws 21 passing through said cross-bars 5 6 and bearing against opposite sides of said knife-bar, and knife-bar 25 supported at its ends by the conical-pointed screws 27 and having knife 22 mounted thereon at an angle to its axis of movement, substantially as described.

3. The combination with the frame having mounted thereon the stationary cutter 15 and the rotary cutter 22, with means for operating the latter in opposite directions, of the bottom piece 40 pivotally secured to the under side of said frame, substantially as and for the purpose described.

605,094. FENCE. DANIEL D. FREMEN, Detroit, Mich. Filed Mar. 2, 1898. Serial No. 672,266. (No model.)

Claim.—1. In a fence, the combination with the fence-wires, of a tension device for each fence-wire, comprising a piece of wire bent into the form of a link and doubled upon itself, a spool having journals supported in the loops formed by doubling the link, flanges having side teeth on the ends of the spool with which the sides of the loop are adapted to engage, the fence-wire having its adjacent ends connected to the loop and the spool respectively.

2. In a fence, the combination with the fence-wires, of a tension device for each fence-wire, comprising a closed loop of wire doubled upon itself, its ends connected to one end of the fence-wire and the spool connected to the other end of said wire, bearings on the end of the spool engaging in the loops in the doubled portion of the link, flanges on the end of the spool having inclined side teeth, one side of the doubled loop being contracted as by twisting at H to form the inclinded portions I which engage with the ratchet-teeth on the flanges, substantially as described.



605,095. SEAT FOR COUCHES. JOSEPH R. GARDINER, Boston, Mass., assignor of one-half to Albert H. Sawyer, Newburyport, Mass. Filed Oct. 20, 1897. Serial No. 656,804. (No model.)

Claim.—1. A seat for an article of furniture, composed of a base or frame having rails a and a^2, and a series of springs each consisting of a single piece of spring-wire bent to form coils 2, 4 and 6 with intermediate arms 3 and 5 and having a short end 1 and a long arm 7 terminating in a coil 8, the said springs having their ends 1 secured to the said rails a and a^2 alternately, the arms 7 alternating in their direction of extension across the top, rigid rods passing through the coils 2 and flexible wires or rods passing through the coils 6 and 8 to string them together.

2. A seat for an article of furniture, composed of a base or frame having rails a, a^2 and a^3, and a series of springs each consisting of a single piece of spring-wire bent to form coils 2, 4 and 6 with intermediate arms 3 and 5 and having a short end 1 and a long arm 7 terminating in a coil 8, the said springs having their ends 1 secured to said rails a and a^2 alternately, the arms 7 alternating in their direction of extension across the top, rigid rods passing through the coils 2, flexible wires or rods passing through the coils 6 and 8 to string them together, and springs s interposed between the rail a^2 and the arms 7 of the springs.

605,096. PUZZLE. OTTO J. HAARLANDER, Newark, N. J. Filed Aug. 23, 1897. Serial No. 649,142. (No model.)

Claim.—1. A toy or puzzle, comprising a suitable box provided with a base, a raised central pen or chamber upon said base, having an opening in one side, and radially-arranged partitions on said base, forming compartments disposed around the outside of said central pen or compartment, and a tapering channel or groove on said base and concentric with said central pen or compartment, substantially as and for the purposes set forth.

2. A toy or puzzle, consisting, essentially, of a base a and surrounding side a', said base having a raised portion a^2, and tapering channels or grooves, a central pen or chamber upon said part a^2 of the base, having an opening in one side, radially-arranged partitions on said part a^2 forming compartments around the outside of said central pen or chamber, and a ball or balls movable on said base and in said channels or grooves, substantially as and for the purposes set forth.

3. A toy or puzzle, consisting, essentially, of a base a and surrounding side a', said base having a raised portion a^2, and tapering channels or grooves, a central pen or chamber upon said part a^2 of the base, having an opening in one side, radially-arranged partitions on said part a^2 forming compartments around the outside of said central pen or chamber, a large ball or marble b' and a smaller ball or marble b, both movable on said base and in said channels or grooves, substantially as and for the purposes set forth.

605,097. TELEPHONE SYSTEM. EDWIN W. HAM, Worcester, Mass. Filed Apr. 22, 1897. Serial No. 633,236. (No model.)

Claim.—1. In a telephone-switchboard, the combination of a base-plate, a plurality of plungers mounted therein, each plunger having a conical operating-section and a detent for holding the same in its operative position, two spring-arms engaging the conical section of each plunger to normally force said plungers outwardly, a contact-piece cooperating with each spring-arm, whereby each plunger is adapted to make two electrical connections when pushed in, a single stop-bar engaging said detents, and means for actuating said stop-bar, substantially as described.

2. The combination of a yoked contact piece 19, a telephone-hook and a piece of insulating material mounted on said telephone-hook, said parts being arranged so that the piece of insulating material will lift the contact-piece when the telephone-hook rises, and so that said piece of insulating material will move the contact-piece out of engagement with the telephone-hook after the same has had a momentary contact therewith when said telephone-hook is moved down, substantially as described.

3. The combination of a switchboard comprising a base-plate, a plurality of plungers mounted therein, each plunger having a conical section, and a detent for holding said plunger in its operative position, two normally open spring-terminals engaging the conical section of each plunger to normally force said plunger outwardly, a single stop-bar engaging said detents, releasing-magnets having armatures arranged to actuate said stop-bar, and connections for energizing said magnets from a telephone-hook, substantially as described.

4. The combination of a switchboard comprising a base-piece, a plurality of plungers mounted therein, each plunger having a conical section and a detent for holding said plunger in its operative position, two normally open spring-terminals engaging the conical section of each plunger to normally force said plunger outwardly, a single stop-bar engaging said terminals, and releasing-magnets for operating said stop-bar, a telephone-hook, and a contact-piece cooperating therewith to momentarily energize said magnets, substantially as described.

5. The combination of a switchboard comprising a base piece or plate, a plurality of plungers mounted therein, each plunger having a conical, operating-section and a detent for holding said plunger in its operative position, two normally open spring-terminals engaging the conical section of each plunger to normally force said plunger outwardly, a single stop-bar engaging said detents, and releasing-magnets for operating said stop-bar, a telephone-hook, a contact-piece cooperating therewith, an insulated, operating-piece carried by the telephone-hook, said parts being arranged so that when the telephone-hook rises, the contact-piece will be moved into position to momentarily close a circuit through the magnets when the telephone-hook is again moved down, substantially as described.

605,098. PIPE-JOINT AND UNION. TRONVALD F. HANNER, Branford, Conn. Filed July 30, 1897. Serial No. 646,460. (No model.)

Claim.—1. In unions for pipe-joints and the like, two tubular members having adjacent ends, and having concave sockets in said ends, and a nut coupling said ends together, in combination with a ring clamped between said ends, unattached to either of said members, and having a convex exterior fitting in said sockets and separating the ends of said members, said members clamped by said nut against said ring, and relatively movable laterally of each other, said nut permitting relative lateral movement of said members and said ring free to move in said sockets to compensate for imperfections.

2. In unions for pipe-joints and the like, two tubular members the one having an external screw-thread and the other an external head on their adjacent ends, and having opposite sockets in such ends, in combination with a separate ring between and separating said ends, and seated in said sockets, and a nut screwing on said thread and having a flange embracing said head and drawing said parts together against said ring, said nut and head having engaging faces j and k for drawing said parts together, and separated walls f g h and i permitting lateral movement of the headed member relatively to the nut.

3. In unions for pipe-joints and the like, the combination with two tubular members having adjacent ends having flaring sockets in such ends, the one having an external screw-thread and the other an external head at such ends, of a ring between and separating said ends, having a bulbous exterior entering said sockets and free to move therein to seat itself, and a nut screwing on the end of the threaded member, and having a flange engaging the head of the headed member for drawing the members together against said ring, said nut loosely engaging the headed member and permitting axial tilting thereof, and said nut and headed member having engaging concave and convex faces, whereby the headed member can be tilted around said ring.

4. In unions for pipe-joints and the like, two tubular members having adjacent ends having opposite sockets, the one member having an external screw-thread and the other an external head near their ends, in combination with a ring having a bulbous exterior between and separating said ends and fitting in said sockets, and a nut screwing on said thread and having a flange engaging said head and clamping said members against said ring, said head having a bearing-surface engaged by said flange which is parallel with the adjacent bulbous-shaped surface of said ring, whereby said headed member can be tilted around said ring within said flange.

5. In unions for pipe-joints and the like, two tubular members having adjacent ends having opposite sockets in said ends, the one having an external screw-thread and the other an external head, in combination with a ring between and separating said members, having a bulbous-shaped exterior fitting in said sockets, and a nut screwing on said thread and having a flange engaging said head and clamping said members against said ring, said flange having a bearing-surface engaging said head and parallel with the adjacent bulbous-shaped surface of said ring, whereby the headed member can be tilted axially without disturbing said ring.

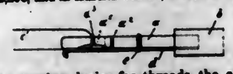
6. In unions for pipe-joints and the like, two tubular members having adjacent ends, and having concave sockets in said ends, and means coupling said ends together, in combination with a separate ring clamped between said ends, unattached to either of said members, and having a convex exterior fitting in said sockets and separating the ends of said members, said members clamped by said means against said ring and movable laterally relatively to each other, said means permitting relative lateral movement of said members, and said ring free to move in said sockets to compensate for imperfections.

605,099. SINGLE-WHEEL SULKY AND DEVICE FOR ATTACHING HORSES THERETO. THOMAS S. HEATH, Cross Timbers, Mo. Filed Sept. 28, 1897. Serial No. 653,335. (No model.)

Claim.—1. The herein-described combination of a vehicle-frame, a single wheel upon which said frame is mounted, means for varying the relative position of said wheel to the frame, two arches attached to the thills, a girth secured upon the horse, and ball-bearings connecting said girth and arches, as specified.

2. In combination with a vehicle of the character described, an upperly-curved arch attached to the thills, a corresponding arch extending downward also attached to the thills, a girth adapted to be secured around the body of a horse, a saddle carried by said girth, balls also carried by the girth and fitted to the arches so as to form swiveled points, and means for staying the upper arch, as specified.

3. In combination, a vehicle-frame, housings projecting downward therefrom, boxes fitted to slide within said housings, springs arranged above and below the boxes, an axle adapted to revolve within the boxes, a single wheel secured to the axle, rods connected to the boxes, bell crank levers to which said rods are attached, a turn-disk pivoted to the frame of the vehicle, rods for connecting said turn-disk with the bell-crank levers, and a foot-lever connected by rods to the turn-disk, whereby the position of the axle relative to the vehicle-frame may be varied, as specified.



4. In combination with a vehicle of the character described, a turn disk or lever, a bell-crank lever, rods for connecting the first-named member to said bell-crank lever, each of said rods being made in two sections having a spring interposed therebetween, substantially as and for the purpose set forth.

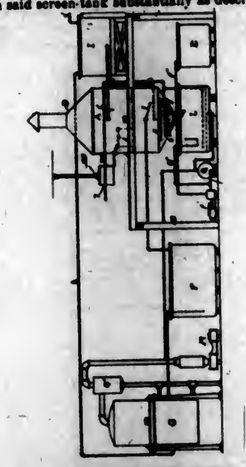
605,100. TABLE ATTACHMENT FOR CHAIRS OR BEDS. FRANCIS T. HEATLY, Camanche, Iowa. Filed Oct. 19, 1897. Serial No. 655,707. (No model.)

Claim.—In an attachment for chairs, beds, and the like, the combination of a support or rest, a ball applied thereto, a ball-socket clamp of tubular form comprising an end sleeve, an end clamp consisting of separated parts, and an intermediate ball-socket formed in the meeting faces of the separated parts of the end clasp, said ball-socket receiving the ball applied to the support or rest, clamp-screws connecting the separated parts of the aforesaid end clamp upon opposite sides of the ball-clamp to contract the ball-socket and grip the aforesaid ball and hold the support in an adjusted position, and a standard having an adjustable connection with the sleeve portion of the said socket-clamp, substantially as set forth.

605,101. THREAD-TENSION DEVICE. ISAAC HERR, Zurich, Switzerland. Filed Mar. 30, 1897. Serial No. 629,954. (No model.) Patented in France July 24, 1896, No. 253,330; in Switzerland Aug. 26, 1896, No. 12,858; in Germany Aug. 28, 1896, No. 92,008; in Italy Sept., 1896, LV, 42,290, and in Austria Oct. 24, 1896, No. 46/4,272.

Claim.—In a tension device for threads, the combination with the rigid bar *a* having eye *a'* and open slit a^2, of the flat spring *d* secured fixedly at one end and adjustably at the other end to the bar *a* and the keeper or runner *e* embracing bar and spring and capable of being shifted along the same, and means for confining said runner in engagement with said bar and said spring, substantially as set forth.

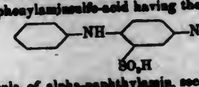
605,102. APPARATUS FOR MAKING CAUSTIC SODA. WILLIAM F. JOHNSEN, Aurora, Ill., assignor of one-half to Joseph Van Ruymbeke, same place. Filed Oct. 6, 1897. Serial No. 654,347. (No model.)



Claim.—1. In an apparatus for making caustic lye, the combination with a converting or causticizing kettle, a basket within said kettle for removing the lime, and a chute for directing the lime into said basket, of a screen-tank located adjacent to said kettle for receiving the sludge therefrom, substantially as set forth.

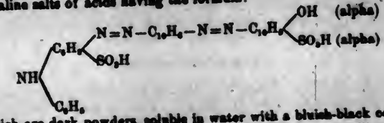
2. In an apparatus for making caustic lye, the combination with a converting or causticizing kettle, a perforated pipe or pipes located within said kettle, and a swinging pipe in said kettle for decanting the liquid therefrom, of a screen-tank located adjacent to said kettle for receiving the sludge therefrom, substantially as set forth.

3. In an apparatus for making caustic-soda lye, the combination with a converting or causticizing kettle having heating and agitating devices therein of the screen-tank adjacent thereto provided with a false bottom therein and an exhaust-pump connected with said screen-tank below said false bottom substantially as described.



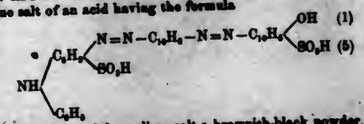
4. In an apparatus for making caustic-soda lye, the combination with a converting or causticizing kettle having heating and agitating devices therein of the screen-tank adjacent thereto provided with a false bottom therein and an exhaust-pump connecting with said screen-tank below said false bottom and a wash-water tank connected with said screen-tank substantially as described.

5. In an apparatus for making caustic-soda lye, the combination with a converting or causticizing kettle having heating and agitating devices therein of the screen-tank adjacent thereto provided with a false bottom therein and the exhaust-pump connecting below said false bottom and a wash-water tank adjacent to said screen-tank and having connections thereto, and the concentrators or condensers connecting with said screen-tank substantially as described.



605,103. BLACK DISAZO DYE AND PROCESS OF MAKING SAME. MYRTIL KAHN and KARL HEUSSNER, Elberfeld, Germany, assignors to the Farbenfabriken of Elberfeld Company, of New York. Filed Dec. 24, 1897. Serial No. 662,403. (Specimens.)

Claim.—1. The process for producing new disazo dyestuffs which process consists in first combining one molecule of the diazo derivative of amidodiphenylamin-sulfo-acid having the formula



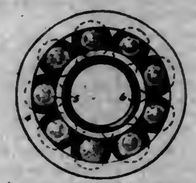
with one molecule of alpha-naphthylamin, secondly diazotizing the resulting amidoazo compound and finally coupling the diazoazo compound thus obtained with an alpha-naphthol-alpha-monosulfo-acid such as 1.4 naphtholsulfo-acid, 1.5 naphtholsulfo-acid substantially as hereinbefore described.

2. As new articles of manufacture the new disazo dyestuffs being alkaline salts of acids having the formula:

which are dark powders, soluble in water with a bluish-black color, dyeing wool in acid-baths black shades which are fast to milling and against the action of light substantially as described.

3. As a new article of manufacture the specific dyestuff being an alkaline salt of an acid having the formula

being in the form of the sodium salt a brownish-black powder, soluble in water with a bluish-black color, in concentrated sulfuric acid (66° Baumé) with a greenish-black color which changes into violet-black on adding a small quantity of ice while a violet-black precipitate is obtained on the addition of a larger quantity of ice to the sulfuric-acid solution, dyeing wool in acid-baths black shades fast to milling and against the action of light substantially as described.



605,104. PULLEY. JOHN C. KNOBLOCK, South Bend, Ind. Filed Nov. 29, 1897. Serial No. 660,107. (No model.)

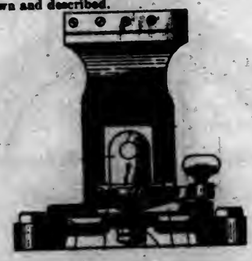
Claim.—A pulley, having opposite air-channels formed within the rim and leading from the edge of said pulley to a point of intersection at the center, and a series of perforations through the rim communicating with said channels, substantially as described.

605,104.

605,105. ANTIFRICTION-WASHER FOR HINGES. HENRY LEFFERT, New Britain, Conn., assignor to the Russell & Erwin Manufacturing Company, same place. Filed Aug. 16, 1897. Serial No. 648,672. (No model.)

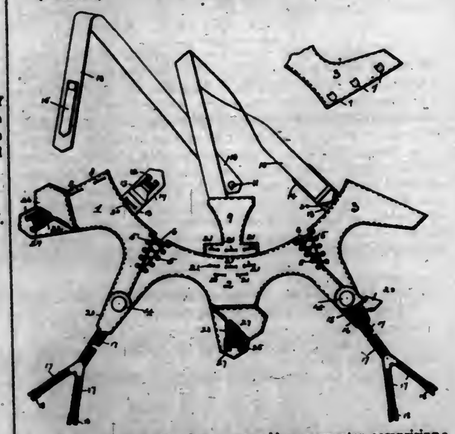
Claim.—The herein-described antifriction-washer consisting of the outer ring, the series of balls projecting from said ring, and an inner holding-ring consisting of a short tube formed in a single piece of thin metal, with both ends of the said tube curved over the said series of balls, substantially as described.

605,106. BENCH-VISE. MONTIMER G. LEWIS, New York, N. Y. Filed Dec. 24, 1897. Serial No. 663,305. (No model.)



Claim.—1. In a bench-vise, the sliding bar having the flat top and bottom parts united on one side by the upright piece, the top being provided with a flange extending down part way on the other side and bearing against the adjacent vertical wall of the opening in the rear vise-head, substantially as shown and described.

2. In a bench-vise, the combination of the screw, the sliding bar having a flange on one side, and the nut located within the stationary head and at the side thereof, said nut being braced or extended in the direction of the length of the bar, substantially as shown and described.



605,107. BENCH-VISE. MONTIMER G. LEWIS, New York, N. Y. Filed Mar. 2, 1898. Serial No. 672,222. (No model.)

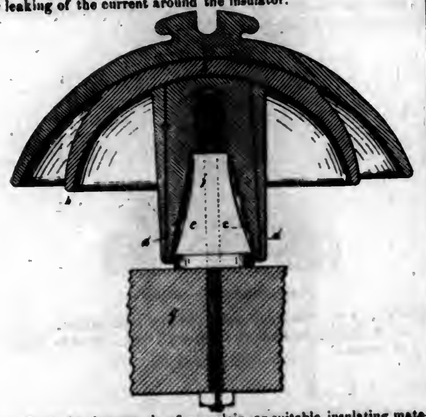
Claim.—1. In a bench-vise, the combination with the base and the vise-head mounted thereon, of a central bolt and a lever engaging with said bolt, the lever extending outside the head and provided with means for raising its outer end, substantially as and for the purpose set forth.

2. In a bench-vise, the combination with the base and vise-head mounted thereon, of a clamping-lever fulcrumed within the head, located in a recess in the lower portion of the head, engaging the head of the central bolt, and extending to the exterior where it is provided with means for raising its outer end, said means arranged to bear upon the extended lower portion of the vise-head, substantially as shown and described.

605,108. COMBINED GARMENT AND HOSE SUPPORT. CORA A. W. LINDSAY, Pittsburg, Pa. Filed Oct. 7, 1897. Serial No. 654,906. (No model.)

Claim.—1. A combined garment and hose supporter, comprising a head or body portion consisting of sections laced together at their proximate edges, in combination with depending hose-supporting straps pivotally secured to the body portion, and depending front and rear napkin-supporting attachments, substantially as described.

2. The combination with the body portion consisting of the sections 1, 2 and 3 secured together by rivets and lacing-cords, of hose-supporting straps pivotally secured to the body portion by the rivets which secure the sections of the body portion together, depending napkin-supporting attachments at the front and rear of the body portion, an upwardly-extending tab-piece 9 secured to the rear section of the body, shoulder-straps the rear ends of which are adapted to be secured to the piece 9, and fastenings 12 and 13 secured to the front sections of the body portion, to which the front ends of the shoulder-straps are secured, substantially as described.

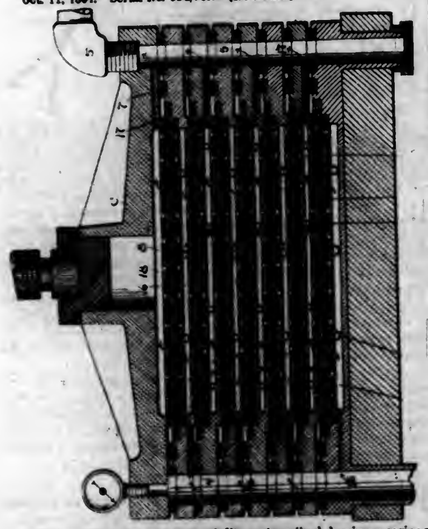


3. The combination with the body portion consisting of the sections 1, 2 and 3, secured together by rivets and lacing-cords, said sections 1 and 2 being provided with elastic straps 22 and 23 having secured thereto napkin-supporting attachments 24 and 25, and with flap-protectors 26 and 27 for covering the elastic straps, substantially as described.

605,109. INSULATOR. FRED M. LOCKE, Victor, N. Y. Filed Apr. 23, 1898. Serial No. 678,547. (No model.)

Claim.—1. An insulator made of porcelain or suitable insulating material, constructed of two or more parts fitted one into the other, and secured together, the inner part being provided with a socket by which it is mounted, said inner part or shell extending down to a point adjacent to the cross-arm, forming a sleeve for the purpose of protecting the pin from static discharge, or arcing, or leaking of the current around the insulator.

2. An insulator made of porcelain, or suitable insulating material, constructed of two or more parts fitted one into the other, and



secured together, said inner part extending down to a point adjacent to the cross-arm, or resting upon the cross-arm, and forming a sleeve for the purpose of protecting the pin from static discharge, or arcing or leaking of the current around the insulator.

3. An insulator made of porcelain, or suitable insulating material, having one or more petticoats, the inner petticoat being constructed of two or more parts secured together, and extending down to a point adjacent to the cross-arm, or resting upon the cross-arm forming a sleeve for the purpose of protecting the pin from static discharge, or arcing, or leaking of the current around the insulator.

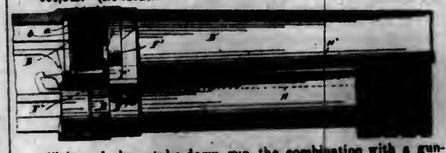
4. An insulator made of porcelain, or other suitable insulating material, constructed of two or more shells, fitted one into the other, and fused together with glaze, the inner shell extending down to a point adjacent to the cross-arm, or resting upon the cross-arm forming a sleeve for the purpose of protecting the pin from static discharge, or arcing, or leaking of the current around or through the insulator.

605,110. FILTER. CHARLES H. LOEW, Cleveland, Ohio. Filed Oct. 11, 1897. Serial No. 654,749. (No model.)

Claim.—1. A filter, substantially as described, having a series of primary perforated filtering-plates and a series of secondary filtering-plates forming together an alternately-open chamber between them for liquid, and chambers for filtering material, in combination with a series of stepped borders supporting said plates and packing between said borders, said borders having fluid-passages, substantially as described.

2. A filter for fermented and other liquids, consisting of a series of primary plates having each a perforated body and a raised border, a series of secondary perforated plates resting against said border and apart from the body of the primary plate to provide a chamber between them, and filtering material held between the perforated portions of said plates on opposite sides of said chambers, substantially as described.

3. The filter substantially as described, consisting of a series of primary plates having each a ledge about its border and a perforated body within said ledge, secondary perforated plates resting on said ledges and spanning the body of said primary plates, filtering material overspreading said primary plates packing about the borders of said primary plates and inlet and outlet passages to the spaces between said plates, substantially as described.



4. The filter-base, a series of perforated primary filtering-plates resting on said base having each a ledge at its border forming a support for a series of secondary filtering-plates and packing between said borders, in combination with a series of secondary filtering-plates and a layer of filtering material between each of said primary and secondary filtering-plates, the said borders being provided with vertical inlet and outlet passages, respectively, and packing about said passages, substantially as described.

5. The filter consisting of the base and the uprights and a cross-beam connecting the uprights at their top, in combination with a series of perforated primary and secondary plates arranged alternately and having open spaces between them on one side and filtering material between them on the other side, a cap for the filter and a screw in said cross-head to press said plates and filtering material together, the said primary plates having integral borders and the passages 4, 5, and 20 through the same, substantially as described.

6. In a filter substantially as described, the filter-base and a plate above said base to support the filtering material, in combination with means to pack the material on said plate comprising a casing to inclose the said material at the sides and a follower to press the material into said plate, substantially as described.

7. The filter-base, a perforated plate supported in said base at its sides and at intervals over its surface and having a space for liquid beneath it, in combination with a casing upon said plate to receive the filtering material in saturated condition, and a follower to enter said casing and press the liquid out of said material and produce a layer of compact filtering material on said plate, substantially as described.

605,111. DETACHABLY UNITING BARRELS TO STOCKS. WILLIAM MASON, New Haven, Conn., assignor to the Winchester Repeating Arms Company, same place. Filed Dec. 13, 1897. Serial No. 661,645. (No model.)

Claim.—1. In a take-down gun, the combination with a gun-frame having an internally-threaded barrel-receiving opening, of a gun-barrel having its butt-end threaded, an internally and externally threaded take-up sleeve mounted upon the threaded butt-end of the gun-barrel, and taking into the threads of the said barrel-receiving opening, and a locking-ring formed independently of but coupled with the said sleeve, and mounted upon the butt-end of the gun-barrel at a point forward of the sleeve.

2. In a take-down gun, the combination with a gun-frame having an internally-threaded barrel-receiving opening, of a gun-barrel having its butt-end threaded, an internally and externally threaded take-up sleeve mounted upon the threaded butt-end of the gun-barrel, taking into the threads of the barrel-receiving opening, and having its forward edge formed with coupling-slots, and a locking-ring mounted upon the threaded butt-end of the gun-barrel at a point forward of the said sleeve, and having rearwardly-projecting coupling-lugs which enter the said coupling-slots of the sleeve.

3. In a take-down gun, the combination with a gun-frame having an internally-threaded barrel-receiving opening, of a gun-barrel having its butt-end threaded, an internally and externally threaded take-up sleeve mounted upon the threaded butt-end of the gun-barrel, and taking into the threads of the said barrel-receiving opening, a locking-ring formed independently of but coupled with the said sleeve for rotating the same, and means for holding the ring and hence the sleeve normally against rotation in either direction.

4. In a take-down gun, the combination with a gun-frame having an internally-threaded barrel-receiving opening, of a gun-barrel having its butt-end threaded, an internally and externally threaded take-up sleeve adjustably mounted upon the threaded butt-end of the gun-barrel, and taking into the threads of the said barrel-receiving opening, a locking-ring mounted upon the said threaded butt-end of the gun-barrel at a point forward of the said sleeve, and a spring-actuated dog engaging with a serrated portion of the locking-ring for holding the same against rotation.

5. In a take-down gun, the combination with a gun-frame having an internally-threaded barrel-receiving opening, of a gun-barrel having its butt-end threaded, a tubular magazine located below the gun-barrel, a band uniting the butt-ends of the barrel and magazine and having the rear face of its upper end recessed, an internally and externally threaded take-up sleeve mounted upon the threaded butt-end of the gun-barrel, and taking into the threads of the said barrel-receiving opening, and a locking-ring made independently of but coupled for rotation with the sleeve, mounted upon the butt end of the barrel at a point forward of the sleeve, and located within the recess formed in the said band.

6. In a take-down gun, the combination with a gun-frame having an internally-threaded barrel-receiving opening, and a magazine-receiving opening, of a gun-barrel, a magazine located below the same, a sliding supporting and operating handle mounted upon the magazine, an action-bar connected with and extending rearwardly from the said handle, and adapted at its rear end to be connected with the action mechanism of the gun, an internally and externally threaded take-up sleeve, adjustably mounted upon the threaded butt-end of the gun-barrel, and taking into the threads of the said barrel-receiving opening, and a locking-ring formed independently of the said sleeve, mounted upon the threaded butt-end of the gun-barrel at a point forward of the said sleeve, and coacting with the said action-bar which holds it against rotation except when the handle and bar are at the limit of their rearward excursions when the bar clears the ring and permits the same to be turned.

7. In a take-down gun, the combination with a gun-barrel, of a tubular magazine which is formed with external screw-threads at a point forward of its rear end, and a band applied to the rear ends of the barrel and magazine, formed in its lower portion with an internally-threaded magazine-opening into which the magazine is screwed, having its lower portion split for the expansion and contraction of the said opening, and provided with a clamp by means of which the said opening is contracted and the lower portion of the band firmly clamped upon the threaded portion of the magazine.

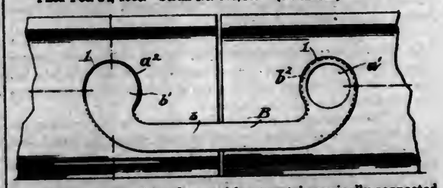
605,112. WHEEL. GEORGE MILLER, San Antonio, Tex., assignor of one-half to Louis Bergstrom, same place. Filed July 3, 1897. Serial No. 643,409. (No model.)

Claim.—1. In a wheel, the combination with the spokes, the tire, and the fellies provided with longitudinal vertical slots opening out at their ends and with recesses in the lower portions of their ends, of a clip having horizontally-disposed flanges to receive and support the ends of adjacent fellies, said flanges having openings to register with the slots in the fellies, a spoke-receiving socket extending above the flanges to seat in the said recesses in the ends of adjacent fellies, and a vertically-disposed plate extending across the socket to fit in the said slots in the fellies, and bolts passing through the tire, the slots in the fellies and the openings in the flanges, substantially as and for the purpose specified.

2. In a wheel, the combination with the spokes, the tire, and the fellies provided with longitudinal vertical slots opening out at their ends and with recesses in the lower portions of their ends, of a clip having horizontally-disposed flanges to receive and support the ends of adjacent fellies, said flanges having openings to register with the slots in the fellies, vertical ears extending up from the flanges to engage opposite sides of the adjacent ends of the fellies, a spoke-receiving socket extending above the flanges to seat in the said recesses in the ends of adjacent fellies, and a vertically-disposed plate extending across the socket midway between the said ears to fit in the said slots in the fellies, bolts passing through the tire, the slots in the fellies, and the openings in the flanges, and a horizontal bolt passing through the said ears, the vertical plate, and the abutting ends of the fellies, substantially as and for the purpose specified.

605,118. RIB FOR UMBRELLAS. JACOB G. MESSNER, Philadelphia, Pa. Filed Jan. 22, 1898. Serial No. 667,563. (No model.)

Claim.—A rib of the character stated, having thereon a cylindrical eye, the same extending at a right angle to the longitudinal direction of the rib, and a coiled neck intermediate of said eye and the body of the rib.



605,114. BUCKLE. WILLIAM A. MITCHELL, Weaverville, N. C. Filed July 8, 1897. Serial No. 643,572. (No model.)

Claim.—A buckle for the purpose set forth, consisting of a rectangular frame having a recess in the inner side of one of the end cross-bars and recesses in the side bars near the opposite cross-bar, the latter being disposed at an inclination with respect to the frame, as shown; together with an independent plate presenting a cross-bar which engages the recesses in the side bars of the frame and a central tongue which engages the recess in the end cross-bar, the parts being placed in engagement with the straps, substantially as herein shown and described.

605,115. RAIL-BOND. GEORGE MOFFAT, New York, N. Y. Filed Feb. 24, 1898. Serial No. 671,445. (No model.)

Claim.—1. A rail-bond comprising two telescopically-connected members, the said members adapted for engagement with openings in adjacent rail-sections, substantially as shown and described.

2. A rail-bond comprising two members composed of metallic loops having projections and recesses arranged opposite to each other, whereby they may be telescopically connected for engagement with apertures in two adjacent sections of a railway-rail, substantially as shown and described.

3. A rail-bond comprising two metallic loops, each loop having a tapering plug on one end thereof, and a tapering sleeve upon the other, the plugs and sleeves of the oppositely-arranged loops adapted for telescopic engagement with each other, and the sleeves adapted to respectively pass through openings in adjacent rail-sections for the purpose of connecting said sections to each other, substantially as shown and described.

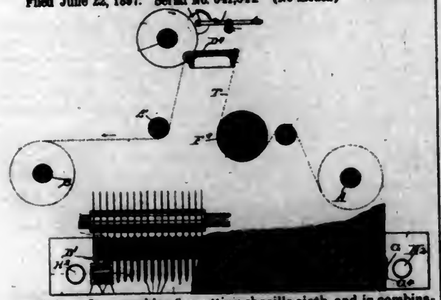
4. As a rail-bond, a combination of two loops arranged parallel with each other, each loop being supplied upon its respective ends with a plug of tapering contour and a sleeve with a tapering opening, the said sleeves and plugs engaging telescopically with each other: with adjacent sections of a railway-rail, said sections having apertures leading therethrough engaging the sleeves of the rail-bond, substantially as shown and described.

605,116. HAT-FASTENER. WILLIAM H. MURDOCK, Boston, Mass., assignor to John C. Hollings, same place. Filed Aug. 4, 1897. Serial No. 647,045. (No model.)

Claim.—As an article of manufacture, a hat-fastener, comprising a comb having a band to embrace the comb above and transversely of the teeth of the comb, said band having slender, sharp-pointed teeth punched therefrom in a series along the middle of the band and from end to end of the comb, said teeth being integral at their bases with the band, substantially as described.

605,117. VEHICLE-TIRE. WILLIAM H. MURDOCK, Boston, and JOHN G. HOLLINGS, Cambridge, Mass.; said Murdock assignor to said Hollings. Filed Aug. 26, 1897. Serial No. 649,894. (No model.)

Claim.—1. The combination with a vehicle-wheel, of a yielding, compressible tire mounted directly flat upon and coextensive with the width of the felly of the wheel in immediate contact with the felly, and free to move longitudinally thereon, and provided at the edges of the felly with retaining devices to prevent the tire from being moved transversely to the felly, without interfering with said longitudinal movement, substantially as described.

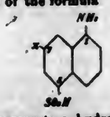


2. The combination with a vehicle-wheel, of a yielding, compressible tire mounted thereon and free to move longitudinally of the felly, said tire being provided at its inner annular side with retaining-flanges permanently secured thereto, and said felly being provided with overhanging portions at its edges lapped over toward each other and on top of said flanges to form ways for said flanges to travel within substantially as described.

3. The combination with a wheel, of a yielding, compressible tire mounted thereon to move freely along its felly, said tire having a holding-rib permanently secured to its inner side, said holding-rib being provided with lateral flanges throughout its length, and overhanging portions bent in toward each other in a plane approximately parallel to the bearing-surface of the felly to embrace and retain said flanges, substantially as described.

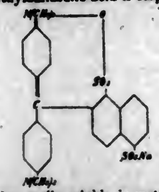
4. A tire having a holding-rib permanently formed on its inner side, said rib having fixedly embedded therein a wire bent sharply zigzag, the angular portions thereof projecting out laterally from the edges of the said rib and overhanging the adjacent portions of the tire proper, substantially as described.

5. The combination with a vehicle-wheel, of a tire mounted immediately upon and against the felly or rigid rim of the wheel, said tire being freely yielding and resilient throughout its entire cross-section from its tread to and including the portion in contact with the felly, and free to move longitudinally on the felly, and retaining means preventing lateral movement but not interfering with the said free resiliency and yielding of the entire tire nor with said longitudinal movement, substantially as described.



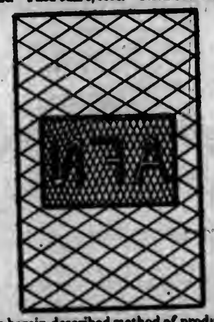
605,118. CHENILLE-CUTTING MACHINE. WILLIAM MCCLEARY, Amsterdam, N. Y., assignor to McCleary, Wallin & Crouse, same place. Filed June 22, 1897. Serial No. 641,844. (No model.)

Claim.—In a machine for cutting chenille cloth, and in combination, a series of rotary disk cutters; a bed-plate slotted on one edge to receive the several cutters and having its opposite edge plain and formed by the intersection of the plane upper and side surfaces of the plate, the slotted edge and neighboring upper surface of the plate being provided with warp-thread grooves located intermediately of the cutter-slots and terminating in the upper plane surface of the plate; transverse feed mechanism located in the path of the cloth near the cutters; a cloth-roll; and a brake-controlled tension-roll having a roughened cloth engaging surface located between the bed-plate and cloth-roll, substantially as described.



605,119. DIPHENYLNAPHTHYLMETHANE DYE. OSCAR NASTVOGEL, Elberfeld, Germany, assignor to the Farbenfabriken of Elberfeld Company, of New York. Filed Nov. 23, 1897. Serial No. 659,547. (Specimens.)

Claim.—1. The process for producing a new diphenylnaphthylmethane dye by first condensing tetralkyldiamidobenzhydrol with a naphthylaminsulfo-acid of the formula



in which formula x represents a hydrogen atom or a sulfo group, secondly diazotizing the resulting leuco compound, thirdly transforming the diazo group of the body thus obtained into the sulfonic group and finally changing the so-produced leuco sulfonic-sulfonic acid into the corresponding dyestuff sulfonic acid by means of oxidizing agents.

2. As a new article of manufacture the new dyestuff obtainable from tetramethyldiamidobenzhydrol having in the form of the sodium salt in case 1.5 naphthylaminsulfo-acid is employed the formula

being a brown powder, easily soluble in water with a greenish-blue color, in concentrated hydrochloric acid with a yellow color, in concentrated sulfuric acid with a yellowish-color which changes into green on the addition of a sufficient quantity of ice, being partly dissolved with a reddish-violet color under evolution of dimethylamin when heated with a strong soda-lye (35° Baumé) dyeing wool in acid-baths clear greenish-blue and even shades fast to alkalies.

605,120. METHOD OF MARKING MEATS. ALBERT F. NATHAN, Kansas City, Mo. Filed Jan. 6, 1898. Serial No. 665,902. (No model.)

Claim.—The herein-described method of producing a distinguishing-mark on meats, which consists in placing the meat while fresh on a support having on its face a projection or projections of the form of the mark to be produced, letting the meat lie thereon until the projections indent the mark in the meat, and then rendering the mark permanent by drying and hardening the meat by smoke or otherwise.

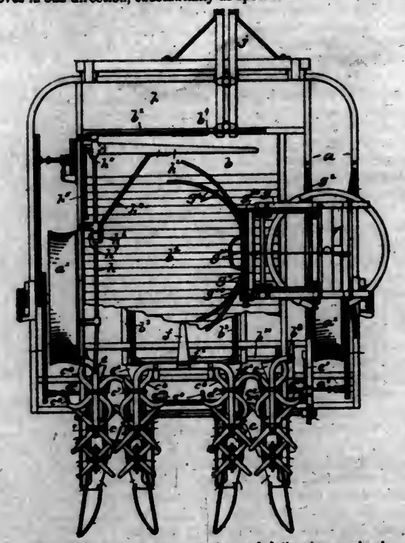
605,121. CORN-HARVESTER. ADAM HEER, St. Paris, Ohio. Filed Sept. 21, 1897. Serial No. 652,465. (No model.)

Claim.—1. In a corn-harvester, the combination of a platform having side passages, guards at the sides of the said passages and having their front ends inclining in opposite directions, forming flaring mouths, cutting apparatus at the inner ends of the side passages, an elevated holder at the rear end of the platform and having side spaces between its front ends and the rear edges of the outer guards, means for closing the side spaces, and a horizontal bar intermediate of the platform and dividing the holder longitudinally, substantially as set forth.

2. In a corn-harvester, the combination of a platform having side passages, guards at the sides of the said passages, the inner guards having their rear end portions inclining inwardly and rearwardly, cutting apparatus at the inner ends of the side passages, a holder at the rear end of the platform and having side spaces between its ends and the rear edges of the outer guards, means for closing the side spaces, and a horizontal bar dividing the holder longitudinally and having the rear converging ends of the inner guards secured thereto, substantially as set forth.

3. In a corn-harvester, the combination of a platform having side passages provided at their inner ends with cutting apparatus, guards at the sides of the said passages having their front ends flaring, the inner guards having their rear ends inclining inwardly, a horizontal bar intermediate of the platform and having the rear ends of the inner guards secured thereto, standards for supporting the horizontal bar at a distance above the platform, a rod bent intermediate of its ends forming a substantially U-shaped holder having its middle portion supported by the rear standard, and having its front end portions bent vertically and attached to the platform and disposed so as to provide side spaces in the rear of the outer guards, means for closing the side spaces, substantially as and for the purpose set forth.

4. In a corn-harvester, the combination of a platform having a passage provided at its inner end with a cutting apparatus, guards at the sides of the passage, a holder at the rear end of the platform and having a space between its front end and the rear edge of the outer guard, and a bar for closing the said space and adapted to be turned aside to admit of access to the platform, substantially as set forth.



5. In a corn-harvester, the combination with a platform having side passages at its front end provided with cutting and stalk-feeding mechanisms, an elevated holder over the platform to receive the stalks, a longitudinal bar subdividing the holder and separating the stalks and having its rear end inclined, and an arm pivoted to the rear portion of the longitudinal bar and having its rear end beveled to match with the beveled extremity of the said longitudinal bar to support and hold the pivoted arm horizontally, said arm being adapted to fold upon the longitudinal bar and assist in supporting the stalks as they are received upon the platform, substantially as set forth.

605,122. CORN-HARVESTER. JOHN H. NEWELL, Urbana, Ohio. Filed Jan. 14, 1896. Serial No. 576,080. (No model.)

Claim.—1. In a corn-harvester having projecting guides and cutting mechanism between said guides, hinged gathering-fingers pivoted at the front of said guiding projections, said fingers being each formed of a single piece, the rear end of which is bent in the arc of a circle, and a bearing in the guide through which the bent portion is adapted to slide, and means for raising and lowering said fingers on their pivoted connections, substantially as specified.

2. In a corn-harvester, a cutting apparatus and a gathering apparatus, said gathering apparatus consisting of vertical shafts having radial arms arranged on each side of and above said cutting apparatus, with the radial arms adapted to overlap and cross the throat of said cutting apparatus, in combination with packers, each consisting of a series of arms mounted on vertical shafts arranged in the rear of said cutting apparatus, each of said arms being radial for a portion of its length and curved concentric to the axis of its supporting-shaft for the remainder of its length, with the radial portion adapted to overlap the radial arms of the gathering device, substantially as and for the purpose specified.

3. The combination with the cutting mechanism, and the reciprocally-movable platform having an abutment, as described, of a hinged arm mounted adjustably above said platform and abutment and adapted normally to remain stationary to retard the tops of the corn while the butts move with the platform when the said platform moves in one direction, substantially as specified.

4. The combination with a cutting and delivering mechanism, of a movable platform and abutment as described, a shocking device adapted to be turned to different positions with relation to said platform, said abutment being formed in two parts, one of said parts being movable to permit the free movement of said shocking device, substantially as specified.

5. The combination with a movable platform, a movable shocker and an abutment, said abutment being formed in two parts, one of which is adjustable as described, and an adjustable arm or bar arranged above said platform and above said abutment, said arm being provided with a brace, substantially as and for the purpose specified.

6. In a corn-harvester, the combination with a movable platform and abutment, a movable shocking device having a hinged frame as described, of a spreader consisting essentially of a frame hinged to the frame of said shocking device, said spreader-frame having mounted therein pivoted arms, and means for moving said arms in said spreader-frame independent of the hinged movement of said frame, substantially as specified.

7. In a corn-harvester, a shocking device consisting essentially of a main frame and a movable frame, a compressing device on said movable frame, and a spreader hinged to said movable frame, said spreader consisting essentially of a frame having pivoted arms therein, and means for retracting and extending said arms, substantially as specified.

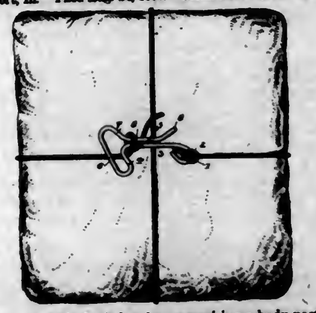
8. The combination with a shocking device having a movable part on which the shock is formed, of a pivoted frame hinged to said movable part and having a slotted opening therein, a series of pivoted arms connected to a sliding bar arranged within said slotted opening, a backwardly-extending arm having holding devices for said bar, said pivoted arms being so constructed as to be drawn wholly within said slotted opening or extended therefrom by means of said bar, substantially as and for the purpose specified.

9. The combination with the main frame and a cutting device, of a tongue connected to the rear of said frame, a guiding-wheel supporting said tongue, said wheel being formed in sections, each section being journaled independently on the same axle, one or more of said sections having a plain periphery and the remaining section or sections being flanged on the periphery, substantially as specified.

10. A caster or guiding-wheel for corn-harvesters or similar devices consisting essentially of a yoke, and an axle extending through the same, three independent wheels or wheel-sections journaled loosely on said axle, the middle section having a plain periphery and the outer sections having peripheral flanges, substantially as specified.

11. A caster or guiding-wheel for corn-harvesters or similar machines consisting essentially of a pivoted yoke and an axle therein, independent wheel-sections journaled on said axle, one or more of

said wheel-sections having a plain periphery and the remaining sections being flanged on the periphery, substantially as specified.



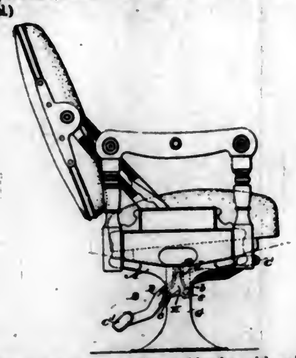
12. In a shocking device, the combination with a main traveling frame, an auxiliary frame sliding in bearings on said main frame, intermediate bars on said sliding auxiliary frame arranged slightly in advance and removed from said auxiliary frame and connected thereto at a point above said sliding bearings, and shock-supporting arms on said intermediate bars, one of said arms being connected to said intermediate bars below the point of connection to said sliding frame, substantially as specified.

13. The combination with a main traveling frame, and a sliding auxiliary frame hinged thereto, intermediate bars connected to said auxiliary frame and adapted to extend downwardly in front of and parallel with said auxiliary frame to a point below the bearings in which said frame slides, and a spreader and shocking-arms supported on said intermediate bars, said shocking-arms being secured to said intermediate bars below the point of attachment to said auxiliary frame, substantially as specified.

14. The combination with a cutting device, and a backwardly-moving platform having an abutment as described, a series of radial arms supported on vertical shafts arranged on each side of said cutting apparatus, with the radial arms extending across and above said cutting apparatus, a series of packer-arms also mounted on vertical shafts in the rear of said radial arms and adapted to coact therewith, said packer-arms being formed radial for a portion of their lengths and concentric with their axes on their outer peripheries, with the radial portions adapted to overlap the adjacent radial arms, the concentric portions being adapted to deliver and press the stalks operated on onto said movable platform, substantially as specified.

15. The combination with a traveling platform and an abutment thereon, a cutting mechanism having vertical shafts arranged in series on each side thereof, a portion of said shafts having radial arms adapted to move across and above said cutting apparatus, and the remaining shafts being provided with radial arms having curved concentric extremities as described, reciprocating butters also arranged on each side of said cutting apparatus and arranged below said arms having the curved extremities, and means for simultaneously reciprocating said butters, substantially as specified.

605,123. TIE FOR BALES, BUNDLES, &c. ANTHONY NICKLAS, Freeport, Ill. Filed Aug. 24, 1897. Serial No. 649,209. (No model.)



Claim.—1. A tie for bales, &c., comprising a body portion having at one end a shoulder and having on the side opposite the shoulder a spring-tongue, said tongue extending adjacent to the body portion parallel or substantially so to the same; whereby a cord or band may be passed around the body portion and tongue and against the shoulder and have its end firmly secured between the tongue and body portion.

2. A tie for bales, &c., formed from a single piece of wire bent to form a body portion 3, an inclined shoulder 4 at one end, and a spring-tongue 5 extending adjacent to the body portion toward its opposite end parallel or substantially so to the same.

3. A tie for bales, &c., formed from a single piece of wire bent to form a body portion 3, an eye 1 at one end arranged to one side of the longitudinal axis of the body portion, a shoulder at the opposite end of the body portion extending in the same direction as the eye, and a spring-tongue on the side of the body portion opposite the eye, said tongue extending from the shoulder parallel or substantially so to the body portion.

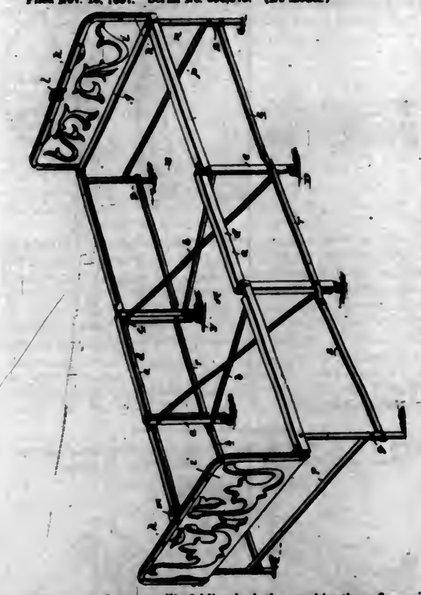
4. A tie for bales, &c., consisting of a single piece of wire bent to form an eye 1, and extending straight to form a body portion 3, then laterally at an acute angle, as at 4 to form a hook 4×, then returning on itself and extending toward the body portion at an inclination as at 6, then parallel or substantially so to the body portion as at 5 in the form of a spring-tongue.

605,124. FOOT-REST FOR CAR-SEATS. WILLIAM M. NEWMANN, Philadelphia, Pa., assignor to the Hale & Kilburn Manufacturing Company, of Pennsylvania. Filed July 28, 1897. Serial No. 646,165. (No model.)

Claim.—1. In a car-seat, the combination with end supports, of a rocking-foot-rest frame, and connecting supporting devices between the rocking-foot-rest frame and the end supports, consisting of a trifurcate groove or slot on the end support and a pair of pins or projections on the foot-rest frame adapted to engage simultaneously two arms of the trifurcate groove or slot.

2. In a car-seat, the combination with end supports each provided with a trifurcate slot or groove H, of a rocking-foot-rest frame B, composed of two longitudinal foot-rest bars C, C, and cross-bars D, D each provided with projections *d*, *e*, adapted to engage the trifurcate grooves or slots H, substantially as and for the purposes described.

605,125. STOPPER. WILLIAM HUTZ, Indianapolis, Ind. Filed Jan. 14, 1896. Serial No. 666,700. (No model.)

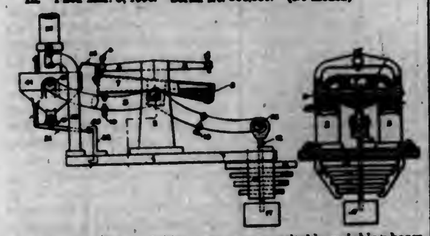


Claim.—1. The combination with a flexible stopper having a socket therein, of an expanding device in said socket, said expanding device comprising a split thimble, a thumb-piece adapted to turn freely therein, and a screw adapted to enter the thimble and a socket in the thumb-piece, said screw having a head to engage the inner wall of the thimble and force the same outwardly or permit it to contract according to the direction in which the thumb-piece is turned, substantially as set forth.

2. The combination with a flexible stopper having a socket therein, of an expanding device for said stopper, said expanding device comprising a slit thimble, having a portion of its interior made tapering, an internally-screw-threaded thumb-piece adapted to enter said thimble, and a screw adapted to enter the tapering interior of the thimble and bear against the wall thereof, said screw being also adapted to enter the screw-threaded interior of the thumb-piece, whereby the turning of the thumb-piece will move the screw and cause the split thimble to be expanded or contracted, substantially as set forth.

3. The combination with a flexible stopper having a socket therein, of an expanding device adapted to enter said socket, said expanding device comprising a thimble having longitudinal slits, an annular shoulder within said thimble, the portion of the thimble below said shoulder being tapering internally, a thumb-piece having a screw-threaded socket and adapted to loosely enter the upper end of the thimble and rest on said internal annular shoulder, a screw adapted to enter said screw-threaded socket in the thumb-piece, a head on said screw disposed within the tapering portion of the thimble and a pin or projection on said head of the screw and adapted to move in one of the longitudinal slots in the thimble whereby to prevent said screw from turning, substantially as set forth.

605,126. FOLDING BED. ROBERT C. ORELL, New York, N. Y. Filed Nov. 19, 1897. Serial No. 658,875. (No model.)



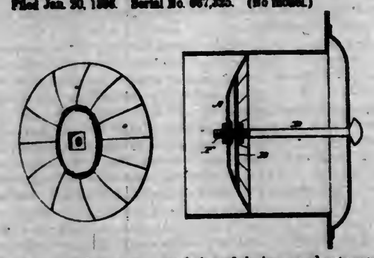
Claim.—1. In a metallic folding bed, the combination of a main frame comprising a body and end sections pivotally connected with the body and adapted to swing in a vertical plane, a suitable means for supporting the end sections in their horizontal position, and end boards connected to the end sections and each comprising a thin plate of sheet metal susceptible of being embossed and possessing resiliency and a suitable marginal reinforcement; one of said boards being provided with a keeper-loop and the other with a hook whereby they may be connected when the bed is folded, substantially as specified.

2. In a metallic bed, the combination of a frame having an angle-iron leg, a caster having a shank provided with an aperture, a piece of sheet metal looped to form a bight and having its ends riveted to the leg, and a pintle extending through the aperture of the caster-shank and having a head at its lower end and also having its upper portion held by frictional contact in the loop of sheet metal, substantially as specified.

3. In a metallic bed, the combination of a frame having a suitable leg, a pintle, a caster loosely mounted on the pintle so as to turn thereon, and a piece of sheet metal tightly looped around the pintle so as to hold the same by frictional contact and having its ends connected to the legs, substantially as specified.

605,127. WEIGHING APPARATUS. FRANKLIN W. OLIN, Alton, Ill. Filed Mar. 5, 1896. Serial No. 581,980. (No model.)

Claim.—1. In a weighing apparatus, a suitable weighing-beam, a tilting receptacle independent of said beam, a shifting liquid contents for said receptacle adapted to be shifted from one end of the receptacle to the other upon the successive tiltings of the weighing-beam, and mechanism arranged to be operated by such tilting receptacle, substantially as set forth.



2. In a weighing apparatus, a suitable weighing-beam, a tilting receptacle independent of said beam, a liquid contents for said receptacle independent of said beam actuated by the swinging of the beam, a mercury contents for said receptacle adapted to shift from one end of the receptacle to the other with each swing of the beam or tilting of the receptacle, a suitable source of supply for the material to be weighed, and intermediate connections between the mercury-receptacle and said source of supply whereby the latter is controlled with each oscillation of the receptacle, substantially as set forth.

4. In a weighing apparatus, a suitable receptacle pivoted at its medial portion, a bottom for the same inclining downward on each side from the pivotal line of the receptacle, means for limiting the degree of tilt or inclination for said receptacle, a mercury contents for said receptacle, the surface of said mercury when resting on the inclined bottom on one side of the pivotal line being substantially on a level with the inclined bottom on the opposite side of the pivotal line, whereby upon a sufficient impact against the bottom on which the mercury rests the latter will gradually shift to the opposite end of the receptacle, substantially as set forth.

5. In a weighing apparatus, a suitable weighing-beam pivoted on a suitable frame, a receptacle pivoted independently on said frame and actuated by the swinging of the beam, a mercury contents for said receptacle adapted to shift the center of gravity of the receptacle with each swing of the beam, a suitable source of supply for the material to be weighed, and intermediate connections between the receptacle and said source of supply for controlling the latter, substantially as set forth.

6. In a weighing apparatus, a suitable frame, a receptacle pivoted on the same and having a shifting contents, an oscillating or swinging beam actuating said receptacle, suitable arms carried by the frame and having adjustable bolts for limiting the degree of oscillation of the receptacle, a suitable hopper, a spring-actuated plate for closing and opening the mouth of said hopper, a conical head carried at one end of the plate, a spring-arm having a terminal catch adapted to engage the head, a trigger pivoted on the outer wall of the hopper and having one arm interposed permanently between the mouth of the hopper and the base of the conical head, an arm carried by the adjacent end of the receptacle, a finger carried at the end of the arm adapted to engage the second arm of the trigger upon oscillation of the receptacle in one direction, and an extension forming a part of the arm carried by the receptacle adapted to actuate the catch and release the conical head therefrom upon the oscillation of the receptacle in the opposite direction, substantially as set forth.

605,128. FLUE-STOPPER. JAMES M. PADGETT, Topeka, Kans. Filed Jan. 30, 1896. Serial No. 667,295. (No model.)

Claim.—A flue-stopper consisting of the inner and outer sections, the inner section being dished and slit radially from its edge toward its center, a clamping-disk fitted to the dished side of the inner section of the stopper, said sections and the clamping-disk provided with alined openings, the said inner section of the stopper being provided on its outer convex face around its opening with a nut-seat, a bolt extending through the holes in the stopper-sections and the disk, a stop shoulder or nut secured on the bolt at the inner side of the disk, and a nut seated in the recess of the inner section of the stopper against rotation, whereby when said bolt is rotated the circumference of the inner section of the stopper will be varied, substantially as set forth.

605,129. HEAT OR COLD INDICATOR. EMIL B. PETERSEN, Kearny, N. J. Filed Aug. 11, 1897. Serial No. 647,862. (No model.)

Claim.—1. In a heat or cold indicator, the combination, with an indicating mechanism, of a base-plate, a longitudinal channel or chamber therein, a metallic strip in said channel or chamber, secured at one end to said base, and a pivoted lever on said base, with which

the other end of said strip is connected, and said lever being adapted to actuate said indicating mechanism.

2. In a heat or cold indicator, the combination, with an indicating mechanism, of a channeled base-plate *a*, a tension device at one end of said base, a pivoted lever at the opposite end of said base, and a strip supported at its ends by said tension device and said lever, said lever being adapted to actuate said indicating mechanism, substantially as and for the purposes set forth.

3. In a heat or cold indicator, the combination, with an indicating mechanism, of a channeled base-plate *a*, a tension device at one end of said base, consisting, essentially, of a hook-shaped rod *b* and an adjusting screw or nut thereon, a pivoted lever *c* at the opposite end of said base, having a hook-shaped end *c'*, and a strip supported at its ends by said hook-shaped rod *b* and the hook end of said lever *c*, said lever being adapted to actuate said indicating mechanism, substantially as and for the purposes set forth.

4. In a heat or cold indicator, in combination, with a base, having a longitudinal channel or chamber therein, a metallic strip in said channel or chamber, secured at one end to said base, a pivoted lever on said base, with which the other end of said strip is connected, and an electrical-contact device, adapted to be actuated by said lever, substantially as and for the purposes set forth.

5. In a heat or cold indicator, in combination, with a base, having a longitudinal channel or chamber therein, a metallic strip in said channel or chamber, secured at one end to said base, a pivoted lever on said base, with which the other end of said strip is connected, and an electrical-contact device, consisting, essentially, of a fixed contact-arm f^5 and a pivoted contact-arm f^6 adapted to be engaged by the end of said lever, to cause said arms to make electrical contact, substantially as and for the purposes set forth.

6. In a heat or cold indicator, in combination, with a base, an index-dial, a metallic strip, secured at one end to said base, a pivoted lever on said base, a tension device on said base, a strip supported at its ends by said tension device and said lever, and an electrical-contact device, adapted to be actuated by said lever, substantially as and for the purposes set forth.

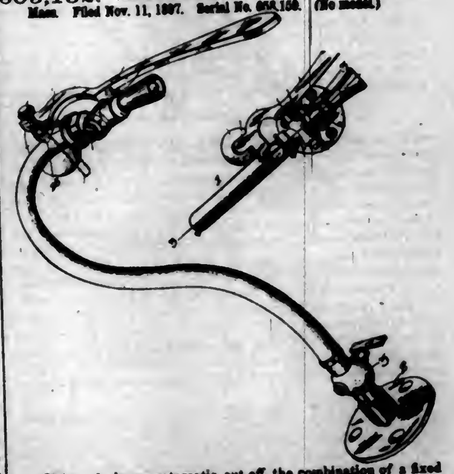
7. In a heat or cold indicator, in combination, with a channeled base, an index-dial, and a tension device at one end of said base, a pivoted lever at the other end of said base, a strip supported at its ends by said tension device and said lever, and an electrical-contact device, consisting, essentially, of a fixed contact-arm f^5 and a pivoted contact-arm f^6 adapted to be engaged by the end of said lever, to cause said arms to make electrical contact, substantially as and for the purposes set forth.

8. In a heat or cold indicator, in combination, with a channeled base, an index-dial and a tension device at one end of said base, consisting of a hook-shaped rod *b* and an adjusting screw or nut thereon, a pivoted lever *c* at the opposite end of said base, having a hook end *c'*, a strip supported at its ends by said hook-shaped rod *b* and the hook end of said lever *c*, and an electrical-contact device, adapted to be actuated by said lever substantially as and for the purposes set forth.

9. In a heat or cold indicator, in combination with a channeled base, an index-dial and a tension device at one end of said base, consisting of a hook-shaped rod *b* and an adjusting screw or nut thereon, a pivoted lever *c* at the opposite end of said base, having a hook end *c'*, a strip supported at its ends by said hook-shaped rod *b* and the hook end of said lever *c*, and an electrical-contact device consisting, essentially, of a fixed contact-arm f^5 and a pivoted contact-arm f^6 adapted to be engaged by the end of said lever, to cause said arms to make electrical contact, substantially as and for the purposes set forth.

605,180. BUTTON. LEWIS A. PLATT, Waterbury, Conn., administrator of Irving G. Platt, deceased. Filed June 10, 1897. Serial No. 640,179. (No model.)

Claim.—1. A button formed with a hub or shank in the form of a truncated cone, and containing a movable severed ring, and a tack or fastener passed through the bottom of said button and through said ring, and bearing against said ring, and means for retaining said ring in position, substantially as described.



2. A button having a hollow hub or shank in the form of a truncated cone, and provided with an internal rib, a movable severed ring contained in said hub, between the bottom thereof and said rib, and a conical tack or fastener adapted to pass through said ring and be held thereby, substantially as described.

605,181. SPARK-EXTINGUISHER. MAX PEMBER, Marxville, Wis. Filed Dec. 6, 1897. Serial No. 660,889. (No model.)

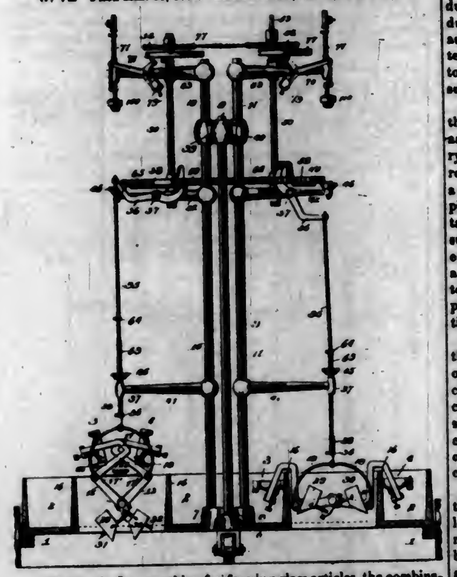
Claim.—The combination with a smoke-stack, and an exhaust-nozzle below said stack, of an insertible spark-arrester slipped into the stack to rest upon the exhaust-nozzle and comprising an elongated tube, 5, of less diameter than the stack, a short lower tube, 6, situated below the tube, 5, and arranged in the plane of the vertical axis thereof to rest upon the exhaust-nozzle, the inclined arms which join the tubes rigidly together and are spaced to provide large openings for the passage of the products of combustion to the elongated tube, an inverted conical deflector, 7, with its apex extending into the elongated tube, and arms which join the deflector to the tube, substantially as described.

605,182. CUT-OFF FOR GAS-JETS. LAWSON RANAGE, Holyoke, Mass. Filed Nov. 11, 1897. Serial No. 658,159. (No model.)

Claim.—1. In an automatic cut-off, the combination of a fixed stand-pipe, a valve attached to said pipe, a burner-tip secured to the valve, a horizontal vertically-movable lever attached to the valve-plug and projecting in advance of the burner-tip, and a retractor for the lever and valve, substantially as described.

2. In an automatic cut-off, the combination of a fixed stand-pipe, a valve attached thereto, a horizontal burner projecting from the pipe and valve, a horizontal vertically-movable lever attached to the valve-plug and having one end thereof extending in advance of the burner-tip, a retractor for returning the lever and valve to their normal positions, and means for limiting the return movement of the valve under the influence of the retractor, substantially as described.

3. In an automatic cut-off, the combination with a fixed stand-pipe, a valve thereon, of a horizontal burner-tip projecting in advance of the pipe and valve, a horizontal vertically-movable operating-lever fixed at a point intermediate of its length to the valve-plug to turn therewith and having its front end projecting in advance of the burner-tip, a retractor connected with the heel of the lever, and an adjustable stop-screw carried by the heel of the lever and adapted to engage with the stand-pipe, substantially as described.



4. In a cut-off for gas-burners, the combination with a stand-pipe and a valve, of a horizontally-arranged burner, a horizontal protector-hood attached to the valve and surrounding the burner, and an operating-lever connected to the valve and having its free end projecting in advance of the hood, for the purpose described, substantially as set forth.

5. In a cut-off for gas-burners, the valve having an axially-turning plug, a valve-shell in which the plug is seated, the horizontal nozzle attached to the valve-shell, a burner tip attached to the nozzle, and a horizontal flame-protector hood attached to the nozzle to surround the burner-tip, in combination with a vertically-movable lever provided, at an intermediate point of its length, with a lug which is attached to the valve-plug, means for returning the lever and valve-plug to a position to insure a limited flow of gas to the burner-tip, and means for limiting the play of the lever and valve, substantially as described.

6. In a cut-off for gas-burners, the combination with a valve, and a burner, of a vertically-movable lever attached to a turning plug of said valve and provided, at its rear end, with branches or arms, an adjustable stop-screw mounted in one of said arms, and a drop-weight carried by the other arm, substantially as described.

7. In a cut-off for gas-burners, the combination with a fixed stand-pipe, a valve and a burner, of a lever operatively connected with the valve-plug to open the same, and having one end extending in advance of the burner, a flexible stop-chain attached to the stand-pipe and the lever, for arresting the movement of the lever and the valve-plug when the former is operated to open said valve, and a retractor to return the lever and valve-plug to their normal positions, substantially as and for the purposes described.

605,183. GLASS-MOLD. HENRY I. REINHARDT, Wheeling, W. Va. Filed Mar. 18, 1897. Serial No. 628,163. (No model.)

Claim.—1. In a machine for forming glass articles, the combination with the mechanically-operated mold-sections, of a blowpipe, means for supporting the same, means for imparting to said blowpipe a rotary movement, and an air-conduit adapted to automatically lower on and raise from the blowpipe after the placing of said blowpipe in its operative position in the machine, substantially as specified.

2. In a machine for forming glass articles, the combination with the mold-sections, of a blowpipe, an air-conduit, and means for automatically opening and closing the mold sections, rotating the blowpipe, and coupling and uncoupling the air-conduit, said means comprising a lever suitably connected with the mold-sections, a lever connected with the air-conduit, and a driven shaft having assembled thereon and operating therewith, a cam for imparting a periodic movement to the said mold-operating lever, a wheel adapted to rotate the blowpipe, and a segment or cam for engaging and operating the lever for raising and lowering the air-conduit, substantially as and for the purpose set forth.

3. In a machine for forming glass articles, the combination with the mold-sections, of a blowpipe, means for supporting the same in operative position to the said mold-sections, an air-conduit adapted to be lowered onto the blowpipe and raised therefrom during the operation of the machine, a lever for operating said air-conduit, a lever for operating the mold-sections, a shaft carrying means, substantially as described, for operating said levers and rotating the blowpipe, and a clutch mechanism carried by said shaft for imparting an intermittent movement thereto and adapted to be automatically thrown into engagement with a constantly-driven shaft by the introduction of the blowpipe, and automatically thrown out of engagement with said constantly-driven shaft upon the completion of each revolution of the shaft carrying the clutch, substantially as set forth.

4. In a machine for forming glass articles, the combination with the rotatable blowpipe, air-conduit, and means for operating the same, of a two-part mold having the sections thereof mounted upon pivoted operating-arms, a spring-yoke connecting said operating-arms, a reciprocatory rod connecting said spring-yoke, a lever for reciprocating said rod, and a rotatable shaft, and a cam mounted on said shaft adapted to impart an intermittent movement to said lever, substantially as set forth.

5. In a machine for forming glass articles, the combination with the mold formed in sections, means for operating the same, and an air-conduit, of a removable blowpipe adapted to be supported in operative position relative to said mold and air-conduit, means for automatically imparting rotation to said blowpipe, the same comprising a gear-wheel carried by a rotatable shaft, and a pinion carried by said blowpipe and adapted to be engaged by said gear, substantially as set forth.

6. In a machine for forming glass articles, the combination with the mold formed in sections, means for operating the same, and a blowpipe supported in operative position to the mold, of an air-conduit and means for automatically lowering and raising the said conduit, the same comprising a lever to which said air-pipe is connected, and a rotatable shaft carrying a cam for imparting to said lever an intermittent movement, whereby to raise the air-conduit and permit it to descend by gravity at the proper point of the machine's operation, substantially as set forth.

7. In a machine for forming glass articles, the combination with the two-part mold and its operating means, a removable blowpipe, an air-conduit, and their operating means, of a rotatable shaft carrying mechanism for automatically opening and closing the mold, rotating said blowpipe, and coupling and uncoupling the air-pipe, and a clutch mechanism comprising a constantly-driven pulley, a locking pin or bolt vertically movable in a support carried by the said rotatable shaft, a sliding block in which said pin is mounted, means such as a spring, for normally exerting a pressure to keep the pin in engagement with the said pulley, and a stationary projection having a cam-face, arranged in the path of the said sliding block, whereby to force it down against the pressure of said spring and release the pin from its engagement with said constantly-driven pulley, substantially as set forth.

8. In a machine for forming glass articles, the combination with the two-part mold having each section thereof carried by a pivoted operating-arm, a spring-yoke connecting said arms, a vertically-reciprocatory rod connected to said yoke and operating to open and close the sections of the mold through the same, a lever to which said rod is connected, a rotatable shaft having mounted thereon a cam, whereby, as the said shaft rotates, the said lever will be acted on by the cam and movement imparted to the rod for opening and closing the mold, substantially as set forth.

9. In a machine for forming glass articles, the combination with the two-part mold having each section carried by pivoted arms or levers, an operating-rod suitably connected thereto, and a lever for reciprocating said rod, of a blowpipe carrying a pinion, adapted to be supported in operative position to said mold, a rotatable shaft, a gear carried thereby adapted to mesh with the blowpipe-pinion, and a cam carried by said gear, and adapted to engage the lever for reciprocating said mold-operating rod, substantially as set forth.

10. In a machine for forming glass articles, the combination with the two-part mold, of a lever, a rod connected thereto and to the mold-sections, and a cam carried by a rotatable shaft, for operating upon the lever, said cam having a vertical face for raising the mold-sections to a position to receive the gathering of glass, an engaging face lying in a horizontal plane, whereby the sections are held against further movement at that point, an inclined face for bringing the mold-sections together through the agency of the lever operated upon thereby, and a segmental track portion lying in a horizontal plane, adapted to hold said lever in the position assumed when the mold is closed and during the time said segmental portion is traveling over the engaged lever, substantially as set forth.

11. In a machine for molding glass articles, having the mold-sections of which adapted to dip into a cooling-tank, and having a blowpipe held in operative position to said mold, the combination of a rod for operating the mold-sections, a lever for reciprocating said rod, a pinion carried by said blowpipe, a main operating-shaft carrying a mutilated gear-wheel, adapted to rotate said blowpipe during a part of the shaft's rotation, and a cam carried by said gear, adapted to engage said lever and through it raise the mold-sections,

bring them into a closed position and hold them closed, said cam being so arranged upon the mutilated gear as to allow the mold-sections to open slightly after the rotation of the blowpipe ceases, and to raise the sections to the position in which they receive the gathering of glass, before there is rotation of the blowpipe, substantially as set forth.

12. In a machine for forming glass articles, the combination with pivoted mold-operating arms, of a divided mold, the sections of which are pivotally mounted upon said arms, respectively, whereby the sections are adapted to turn upon their pivots in a vertical plane during the operation of the machine, and means for opening and closing the mold, as and for the purpose set forth.

13. In a machine for forming glass articles, the combination with a tank, of a sectional mold, pivoted arms carrying the mold-sections and formed with a bend whereby they are adapted to straddle the wall of the tank, and dip the mold-sections into the tank, and means for operating the said arms, substantially as set forth.

14. In a machine for forming glass articles, the combination with a tank, of a sectional mold, pivoted arms carrying the mold-sections, the same having a hooked portion for straddling the wall of the tank, and an extension formed at the end of said hook portion adapted to project over the tank at all times, and means for operating the arms, substantially as set forth.

15. In a machine for forming glass articles, the combination with the tank having a depression in the side wall thereof, of a two-part mold, pivoted arms supporting the same, working in said depression, and means for operating the said arms, substantially as set forth.

16. In a machine for forming glass articles, the combination with the pivoted arms, of a mold-section carried by each arm, and means intermediate the sections and the arms, for adjusting said sections relatively to each other and to the arms, substantially as set forth.

17. In a machine for forming glass articles, the combination with a tank, of a two-part mold, pivoted arms carrying the sections of mold, a spring-yoke connecting said arms, adapted to normally exert a pressure to bring the mold-sections together, a rod connected to said yoke for operating the mold-sections, means for raising said rod, and means for normally exerting the power to force said rod down after it has been raised, whereby the mold-sections may be actuated by gravity in their dipping movement, substantially as set forth.

18. In a machine for forming glass articles, the combination with a tank and the mold-sections adapted to dip therein, of a water-tight chamber extending down into said tank, and having supported therein a foot-rest, substantially as set forth.

19. In a machine for forming glass articles, the combination with the tank and the mold-sections adapted to dip therein, of a water-tight chamber extending down into the tank, a foot-rest supported in said chamber and operating in conjunction with the mold, and a burner, substantially as described, whereby the foot of the article being formed and the foot-rest are kept heated

20. In a machine for forming glass articles, the combination with the mechanically-operated mold-sections, a blowpipe, means for rotating the same, and an air-conduit, of a horizontally-movable coupling carried by said air-conduit, said coupling consisting of a rigid bearing attached to and projecting laterally from the end of the conduit, and a mouthpiece movable thereon, adapted to receive the end of the blowpipe, as and for the purpose set forth.

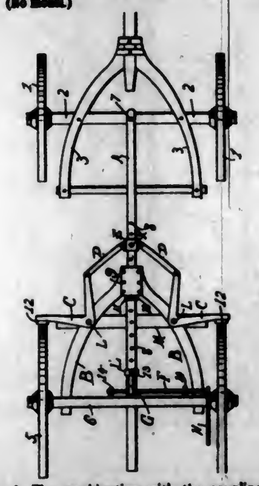
21. In a machine for forming glass articles comprising mold-sections, a blowpipe, an air-conduit, and means for automatically operating the said specified parts, of the horizontally-movable coupling consisting of a flanged disk and an inclosing portion adapted to slide thereon, having formed therein an opening for the reception of the blowpipe, substantially as set forth.

605,134. MECHANICAL MUSICAL INSTRUMENT. ADOLF RICHTER, Rudolstadt, Germany. Filed Sept. 21, 1896. Serial No. 606,565. (No model.)

Claim.—1. In a mechanical musical instrument, the combination with a steel comb, of a vibratory lever, a star-wheel carried thereby and adapted to rotate thereon and an abutment adapted to engage a tooth of said star-wheel and hold the same against movement to enable the vibratory lever to move the star-wheel into contact with a tongue of the comb to vibrate the same.

2. In a mechanical musical instrument, the combination with a steel comb, of a vibratory lever, a star-wheel carried thereby and adapted to rotate thereon and a pawl adapted to engage a tooth of the star-wheel and hold the same against movement to enable the vibratory lever to move the star-wheel into contact with a tongue of the comb to vibrate the same.

3. In a mechanical musical instrument, the combination of a steel comb, a vibratory lever, a star-wheel carried thereby and adapted to rotate thereon and a pawl pivoted to said lever and controlled by the note-sheet, said pawl being adapted to engage a tooth of the said star-wheel and hold the same against movement to enable the vibratory lever to move the star-wheel into contact with a tongue of the comb to vibrate the same.



4. In a mechanical musical instrument, the combination with a plurality of steel combs, of a vibratory lever, a plurality of star-wheels carried thereby and adapted to rotate thereon, an abutment adapted to engage a tooth of each of said star-wheels and hold the same against movement to enable the vibratory lever to move the star-wheels into contact with a plurality of tongues of the combs to vibrate the same.

5. In a mechanical musical instrument, the combination with a steel comb, of a vibratory lever, a star wheel carried thereby and adapted to rotate thereon, an abutment adapted to engage a tooth of said star-wheel and hold the same against movement to enable the vibratory lever to move the star-wheel into contact with a tongue of the comb and vibrate the same and a damper controlled by the movement of said lever.

6. In a mechanical musical instrument, the combination of a plurality of guide-pins each of which is adapted to constitute a pivot for a note sheet or disk and means for throwing one of said pins into operative position and for maintaining the other pin or pins out of operative position, substantially as described.

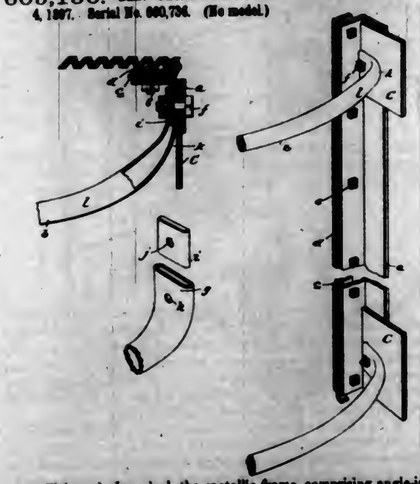
7. In a mechanical musical instrument, the combination of a plurality of movable guide-pins each of which is adapted to constitute a pivot for a note sheet or disk and mechanical means for moving said guide-pins to throw one of said pins into operative position and to maintain the other pin or pins out of the operative position.

605,185. AUTOMATIC WAGON-BRAKE. JOHN G. ROBINSON, Warsaw, Ky. Filed Apr. 10, 1897. Renewed May 2, 1898. Serial No. 680,281. (No model.)

Claim.—1. The combination with the coupling-pole and hind wheels and axle provided with hounds slidingly secured to the coupling-pole, of a brake mechanism including elbow brake-levers pivotally mounted at their elbows on the opposite limbs of the hounds, a sleeve rigidly but removably attached to the coupling-pole in front of the said hounds and connecting-links between said sleeve and the inner arms of the elbow brake-levers, whereby when the hind carriage is moved forward the brakes are automatically applied to the hind wheels.

2. The combination with the coupling-pole and hind wheels and axle provided with hounds slidingly secured to the coupling-pole, of a brake mechanism comprising elbow brake-levers pivotally mounted at their elbows on the opposite limbs of the hounds, a sleeve rigidly but detachably arranged on the coupling-pole in front of the said hounds, connecting-links between said sleeve and the inner arms of the elbow brake-levers and a suitable connection between the axle and the coupling-pole to prevent the hind carriage from moving forward the sliding sleeve on the coupling-pole.

3. The combination with the coupling-pole, hind wheels and axle provided with hounds, of a sleeve uniting the forward end of the hounds and slidingly arranged on the coupling-pole, elbow brake-levers fulcrumed at their elbows on the opposite limbs of the hounds, a sleeve on the coupling-pole in front of the hounds, fastening means to hold said sleeve to a set position on the coupling-pole, links between said sleeve and the inner arms of the brake-levers, a stop on the coupling-pole to prevent the hounds from sliding backward beyond a determined point and means on the axle and coupling-pole to stop the hind carriage from moving forward on the coupling-pole.



4. The combination with the coupling-pole, hind wheels and axle provided with hounds, of a sleeve uniting the forward end of the hounds and slidingly arranged on the coupling-pole, elbow brake-levers fulcrumed at their elbows on the opposite limbs of the hounds, a sleeve on the coupling-pole in front of the hounds and adjustably secured thereto, an adjustable sleeve or pin to stop the backward movement of the hounds, a stop on the coupling-pole adjacent to the hind axle, a bar supported and journaled to the brake, and provided with a lug to engage the said stop on the coupling-pole and prevent the forward movement of the hind carriage on the coupling-pole.

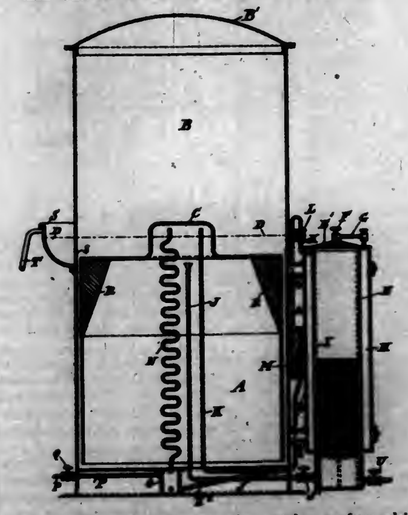
5. The combination with the brake mechanism arranged to be operated by a forward-sliding movement of the hind carriage of the vehicle, of a stop on the coupling-pole adjacent to the front of the hind axle, bearings secured to the hind axle, a rocking bar journaled and secured in the bearings, and provided with a lug or arm to engage the stop on the coupling-pole and a lever to rock the bar and throw the lug into and out of engagement with the stop on the coupling-pole.

6. The combination with the brake mechanism arranged to be operated by the forward-sliding movement of the hind carriage, of the front-bolster bearing-plate on the under face of the bolster formed with a transverse, T-shaped slot, and a king-bolt having its head disposed in the slot.

7. The combination with the coupling-pole, hind wheels, and axle provided with hounds slidingly secured to the coupling-pole, of a brake mechanism comprising elbow brake levers fulcrumed at their elbows to the opposite limbs of the hounds, a sleeve adjustably secured to the coupling-pole in advance of the hounds, links between the said sleeve and the elbow brake-levers, and a cross-piece secured to the hounds with its ends projecting to serve as supports for the braking-arms of the elbow brake-levers.

605,186. BED. PATRICK B. ROONEY, New York, N. Y. Filed Dec. 4, 1897. Serial No. 660,736. (No model.)

Claim.—1. In a bed, the metallic frame comprising angle-iron end bars having upper portions for the attachment of a mattress and also having other, depending portions and depending extensions thereon adapted to bear on the rails of a bedstead and form supports for elevating the mattress above the rails, the said mattress connected to the upper portions of the angle-iron end bars, and longitudinal bars interposed between the depending portions of the angle-iron end bars and connected with said end bars, substantially as and for the purpose described.

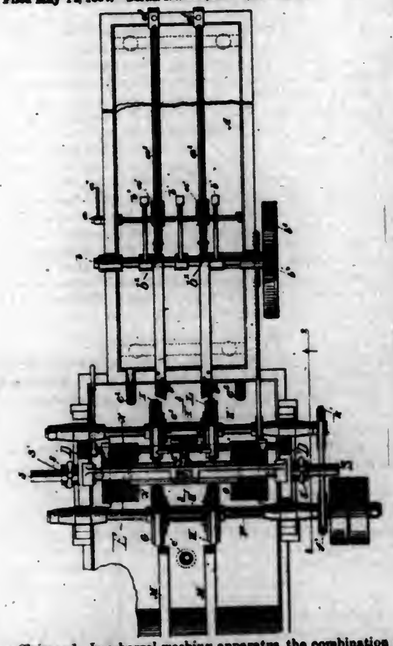


2. In a bed, a suitable mattress, and a metallic frame comprising end bars of angular form in cross-section having portions for the attachment of a mattress and also having depending portions adapted to bear on the rails of a bedstead and form supports for elevating the mattress above said rails, tubular, longitudinal bars having their end portions flattened and bent upwardly, and bolts taking through and connecting the flattened ends of the longitudinal bars and the depending portions of the end bars, substantially as specified.

3. In a bed, a suitable mattress and a metallic frame comprising end bars of angular form in cross-section having portions for the attachment of a mattress and also having depending portions adapted to bear on the rails of a bedstead and form supports for elevating the mattress above said rails, the longitudinal truss-bars having their end portions bent upwardly and flattened and also having reinforcing-pieces welded in said flattened portions, and bolts taking through and connecting the flattened and reinforced end portions of the truss-bars and the depending portions of the end bars, substantially as specified.

4. In a bed, a metallic frame comprising end bars of angle-iron having a horizontal portion and a depending vertical portion, a mattress connected to the horizontal portions of said angle-irons, plates arranged adjacent to the ends of the angle-irons and extending below the same whereby they are adapted to bear on the rails of a bedstead and support the mattress in an elevated position, longitudinal truss-bars having the upwardly-directed end portions, and bolts connecting the said end portions of the truss-bars, the depending portions of the end bars and the plates or supports, substantially as specified.

5. In a bed, a mattress, and the metallic frame comprising angle-iron end bars having upper portions for the attachment of the mattress and also having other, depending portions, the metallic plates connected to the depending portions of the angle-iron end bars and adapted to bear on the rails of a bedstead and form supports for elevating the mattress above the rails, and the longitudinal, tubular bars interposed between the depending portions of the angle-iron end bars and also between the metallic plates thereon and connected with said end bars, substantially as specified.



605,187. APPARATUS FOR GENERATING ACETYLENE GAS. JOHN W. SCARTH, Pudsey, and WILLIAM A. THORNTON, Wetherby, England. Filed Oct. 25, 1897. Serial No. 656,239. (No model.)

Claim.—In apparatus for generating acetylene gas from calcium carbid, the combination of the gas-holder A inclosed within a water-cylinder B partially filled with water and provided with an inlet-funnel S and overflow-pipe T, a gas-chamber C in top of the said gas-holder, a conical displacer E arranged within the said gas-holder near its top, a gas-generating chamber E arranged at the side of the said water-cylinder, closed at its top by lid E' and provided with a water-jacket H in communication at its top and bottom by means of pipes A A' with the said water-cylinder, bridge G and screw F for retaining the lid E' in position, perforated carbid-holder I inserted within the generator E, a cartridge-case V constructed as described, and provided at its base and sides with strengthening-pieces W and at its top with a loop Y, for receiving the charge of calcium carbid, water-pipe J communicating respectively with the bottom of generator E, and interior of the gas-holder A, and armed with a stop-cock J', gas-pipe K divided into two portions, one of which is armed with a stop-cock

L, said gas-pipe being in communication at its extreme ends respectively with the gas-chamber C and top of the generating-chamber I, a water-lock M interposed between the extremities of the said gas-pipe for receiving the divided ends, a gas-cooling coil N in communication with the gas-chamber C and a collecting-box, a collecting-box O arranged at the base of the water-cylinder, a service-pipe P armed with a stop-cock Q in communication with said collecting-box, and a discharge-cock U arranged at the bottom of the generator, all arranged and operating as set forth.

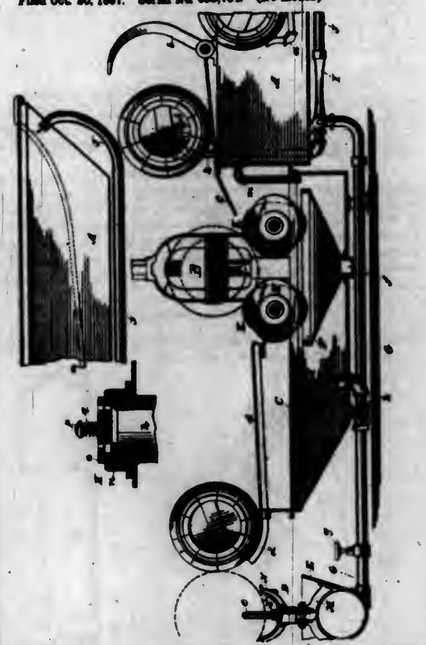
605,188. BARREL-WASHER. GUSTAV SCHOCK, New York, N. Y. Filed May 14, 1897. Serial No. 636,435. (No model.)

Claim.—1. In a barrel-washing apparatus, the combination of a barrel-feed tank, an inclined run in said tank adapted to support a plurality of barrels and to enable them to move thereon in one direction and revolving hooks and means for revolving them in the opposite direction so that they will mechanically pick the first of said barrels off of the inclined run in the feed-tank, substantially as described.

2. In an apparatus for soaking, scrubbing and washing barrels at one continuous operation, the combination of a scrubbing device, a feed-tank, mechanism for transferring the barrels from the feed-tank to the scrubber and gravity-runs within the feed-tank for automatically feeding barrels in one direction to the transferring mechanism moving in the opposite direction.

3. In a barrel-washing apparatus, the combination of a barrel-feed tank, gravity-runs therein in pivotal connection with the tank, and means for adjusting the said runs so as to give the keg the desired quantity of water so that large and small packages can be supplied with water to the desired extent, substantially as described.

4. In a barrel-washing apparatus, the combination of a barrel-feed tank, movable gravity-runs therein, means for raising and lowering one end of the runs whereby to supply the barrels on the runs with the desired quantity of water, and means for lifting the barrels off of said runs.



5. In a barrel-washing apparatus, the combination of a barrel-feed tank, gravity-runs therein, arms for picking up barrels from the gravity-runs and delivering the same from the tank, and gear for operating the arms in a direction opposite to the motion of the barrels on the gravity-runs.

6. In a machine of the character described, the combination of barrel-carrying wheels comprising a spider grooved at the edge and provided with dowel-pins n^2, a plurality of adjacent blocks n^3 embracing the dowel-pins, and key-blocks n^4 secured to the wheels to lock the blocks in place.

7. In an apparatus for soaking, scrubbing and washing barrels by one continuous operation, the combination of a barrel-feed tank, inclined runs therein, means for adjusting the runs to various inclinations, means for lifting the barrels from the barrel-feed tank, and a barrel-scrubber to which the barrels are delivered by the lifting mechanism, the barrel in the scrubber being automatically discharged and replaced by the next succeeding barrel delivered from the lifting means.

8. In an apparatus for soaking, scrubbing and washing barrels by one continuous operation, the combination of a barrel-feed tank adapted to contain a plurality of barrels, inclined gravity-runs within said tank along which runs the barrels are free to move from end to end, a barrel-scrubber, revolving hooks moving in a direction opposite to that of the feed of the barrels, said hooks being adapted to lift the first barrel of the series off the runs and deliver it from above to the scrubber, the barrel in the scrubber being automatically replaced by the next succeeding barrel delivered from the revolving hooks.

605,189. BARREL-WASHER. GUSTAV SCHOCK, New York, N. Y. Filed Oct. 20, 1897. Serial No. 655,784. (No model.)

Claim.—1. In an apparatus for handling and cleaning barrels, the combination of a soaking-tank, an intermediate tank having a barrel-scrubbing apparatus, and a sprinkling-tank, having a sprinkling apparatus in operative combination with each other and a circulating system connecting the sprinkling-tank and the soaking tank, whereby the clean water employed for sprinkling the barrels is drawn off for use in the soaking-tank, substantially as described.

2. In a barrel handling and cleaning apparatus, the combination of a soaking-tank, an intermediate tank containing a barrel-scrubbing device and a sprinkling-tank having a sprinkling apparatus and combined together in operative relation and a water-circulating system connecting the sprinkling-tank with the soaking-tank and the soaking-tank with the intermediate tank.

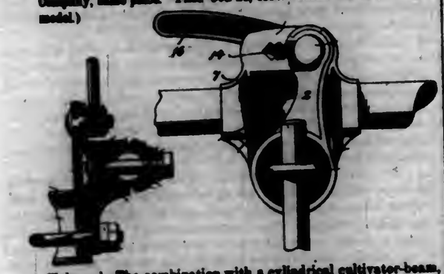
3. In a barrel handling and cleaning apparatus, the combination of a soaking-tank, an intermediate tank provided with a barrel-scrubbing apparatus, a sprinkling-tank having a sprinkling apparatus, a water-circulating system connecting the sprinkling-tank and the intermediate tank and a steam-injector in the water-circulating system for heating and effecting the circulation of the water, substantially as described.

4. In a barrel-scrubbing apparatus, the combination of a scrubbing device, a tank and a mud hopper beneath said scrubbing device, the said mud hopper having an outlet adapted to discharge its contents outside of the tank.

5. In a barrel-scrubbing apparatus, the combination of a scrubbing device, a tank therefor and a mud-hopper contained within said tank and located beneath the scrubbing device, the said mud-hopper having an outlet adapted to discharge its contents outside of the tank.

6. In a barrel-scrubbing apparatus, the combination with a supporting frame of a plurality of elliptical barrel-supporting rolls mounted in pairs on separate shafts and placed at right angles to each other on said shafts respectively.

7. In a barrel-scrubbing apparatus, the combination with a supporting-frame of a plurality of elliptical barrel-supporting rolls mounted in pairs on separate shafts and placed at right angles to each other on said shafts respectively, in combination with a pivoted self-adjusting top-brush adapted to bear upon the top of the barrel and to adjust itself to the oscillations of the said barrel.



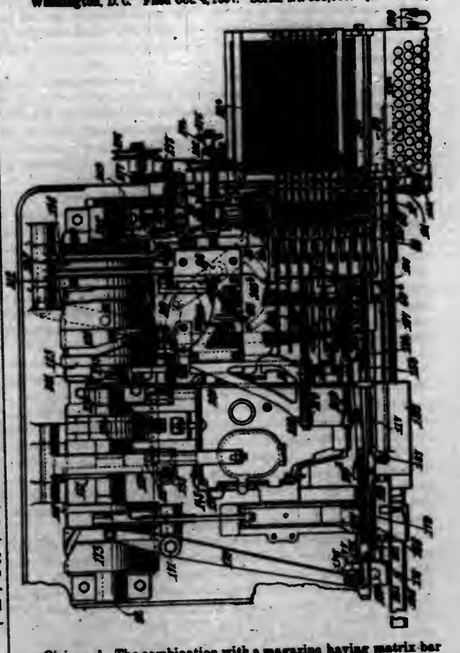
8. In a barrel soaking, washing and scrubbing apparatus, the combination of a soaking-tank, a scrubbing device, an intermediate tank therefor, a mud-hopper beneath said scrubbing device, said mud-hopper having an outlet adapted to discharge its contents outside of the intermediate tank, a sprinkling device, a tank for said sprinkling device and connections between said tanks for conveying water therethrough.

9. In a barrel soaking, washing and scrubbing apparatus, the combination of a soaking-tank, a scrubbing device, an intermediate tank therefor, a mud-hopper beneath said scrubbing device, said mud-hopper having an outlet adapted to discharge its contents outside of the intermediate tank, a sprinkling device, a tank for said sprinkling device, connections between said tanks for conveying water therethrough, the inlet of the soaking-tank being at one end and an outlet in the nature of an overflow at the other end, a steam-injection nozzle in said tank connections for heating the water and maintaining a circulation thereof through and between the tanks and means for controlling the efflux of water from said intermediate and sprinkling tanks.

10. In a sprinkler, the combination of a sprinkler-support, a water-inlet in said support, a valve-section carried by the support, a second coöperating valve-section provided with means for conveying water to the nozzle, barrel-supporting arms separable from but adapted to be supported by said last-named valve-section and a nozzle adapted to be secured to the second-named valve-section and to secure the valve-supporting arms thereto.

11. In a sprinkler, the combination of a sprinkler-support, a water-inlet in said support, a removable valve-section adapted to be secured against movement in the support, a second coöperating valve-section provided with a coned bearing and with means for conveying water therethrough to a nozzle, barrel-supporting arms separable from but adapted to be supported by the cone-bearing of said valve-section and a nozzle adapted to be secured to the second-named valve-section and to secure the barrel-supporting arms upon its cone-bearing.

605,140. ADJUSTABLE CULTIVATOR-TOOTH SEAT. JAMES D. SEMPERLA, Dallas, Tex., assignor to the Texas Implement and Machine Company, same place. Filed Oct. 28, 1897. Serial No. 656,606. (No model.)



Claim.—1. The combination with a cylindrical cultivator-beam, of a tooth-fastening having a concaved seat fitting said beam, the seat of said fastening being provided with an elongated opening, a bolt passed through the beam and the opening and of less diameter than the length of the opening, and a clamping-washer interposed between the head of the bolt and that portion of the tooth-fastener surrounding the elongated opening.

2. The combination with a cylindrical cultivator-beam, of a cultivator-tooth seat mounted and adapted for circumferential adjustment thereon, and means for securing the said tooth-seat at any point of its said circumferential adjustment.

3. The combination with a cultivator-beam cylindrical in cross-section, of a tooth-fastener having a concaved seat fitting the beam and provided with a vertically-elongated opening having a raised toothed surrounding surface and aligned with smaller, transverse open-

ings formed in the beam, a bolt passing through the openings in the beam and fastener and having a diameter less than the length of the opening in the latter, a nut on the rear end of the bolt and a concaved, toothed washer having an opening fitting the bolt and designed to interlock with the teeth surrounding the opening in the fastener and interposed between the head of the bolt and the fastener.

605,141. MONOLINE COMPOSING-MACHINE. WILBUR S. SWEDER, Brooklyn, N. Y., assignor to the Monoline Composing Company, Washington, D. C. Filed Oct. 4, 1897. Serial No. 653,969. (No model.)

Claim.—1. The combination with a magazine having matrix-bar chambers and channels leading therefrom to the front of the magazine, and pins on the front of the latter, of a transparent door vertically hinged to the magazine and constructed to swing open for access to said channels, and a gravitating door-locking slide having oblique slots receiving said pins, and provided with a projection to be struck by the door when it is closed for moving the slide so that the door will pass thereby and the slide then gravitate to locking position, substantially as described.

2. The combination with a matrix-bar magazine having separate chambers for each species of matrix and a delivery-channel arranged substantially at right angles to each matrix-chamber, and an assembling-box below the delivery-point into which the matrix-bars from all the channels are received, of spring-retracted matrix-bar-delivery gates having projecting lugs, pivoted pawls having hooked extremities engaging said lugs to hold the delivery-gates advanced, detent-levers for operating said pivoted pawls to release the delivery-gates, and means for operating the detent levers, substantially as described.

3. The combination with a magazine having separate chambers for each species of matrix and a delivery-channel extending from each chamber to the point of delivery, and an assembling-box arranged below the delivery-point of said channels, of spring-retracted-delivery-gates which support the matrix-bars in the channels, pivoted pawls having hooked extremities engaging the delivery-gates to hold them advanced against the tension of their springs, detent-levers for operating the pawls to disengage them from the delivery-gates, and a finger-key mechanism connected with the detent-levers, substantially as described.

4. The combination with a space-bar magazine-chamber having a delivery channel, of a space-bar lifter and a space-bar pusher connected together, and a pusher for pressing the space-bar into the delivery-channel when it is raised by the lifter, substantially as described.

5. The combination with a space-bar magazine-chamber having a delivery-channel, of a space-bar lifter, and a spring-pusher moved out of the path of the space-bar by the lifter and serving to press

the space-bar into the delivery-channel when it is raised by the said lifter, substantially as described.

6. The combination with a space-bar magazine-chamber having a delivery-channel, of a space-bar lifter and a space-bar pusher connected together, a spring-pusher for pressing the space-bar into the delivery-channel when it is raised by said lifter, and a friction leaf-spring located in the delivery-channel and acting to temporarily arrest and support the space-bar until it is thrust downward by the space-bar pusher, substantially as described.

7. The combination with a space-bar magazine-chamber having a delivery-channel, of an elbow space-bar lever having one arm overhanging the magazine, a vertical slide connected with one end portion of the overhanging arm and provided with a space-bar lifter and a space-bar pusher, and means for operating said lever, substantially as described.

8. The combination with a magazine space-bar chamber having a delivery-channel, of an elbow space-bar lever pivoted at or near its angle to the rear portion of the magazine and having one arm overhanging the latter, a vertical slide loosely connected with the end portion of the overhanging arm and provided with a space-bar-lifting horn and a space-bar-pushing arm, and means for oscillating the lever, substantially as described.

9. The combination with a space-bar magazine-chamber having a delivery-channel, of an elbow space-bar lever pivoted at or near its angle to the rear portion of the magazine and having one arm overhanging the same, a vertical slide loosely connected with the end portion of the overhanging arm and provided with a space-bar-lifting horn and a space-bar-pushing arm, a retaining device for holding the lever with its overhanging arm lifted, means for releasing said retaining device by the action of the space-bar key, and an oscillator which in its forward motion acts on the lever and resets the same, substantially as described.

10. The combination with the space-bar magazine-chamber having a delivery-channel, of an elbow space-bar lever having one arm overhanging the magazine and the other arm extending vertically in rear thereof, a space-bar lifter and pusher connected with the front end portion of the overhanging arm, a detaining dog or pawl for engaging and retaining the vertical arm of the lever to normally hold the lifter and pusher elevated, means for disengaging the dog or pawl from the lever, a spring connected with the lever for throwing the overhanging arm downward when the lever is disengaged from the dog or pawl, and means for resetting the lever in operative connection with the dog or pawl, substantially as described.

11. The combination with a space-bar magazine-chamber having a delivery-channel, of an elbow space-bar lever having one arm overhanging the magazine and the other arm extending vertically in rear thereof, a space-bar lifter and pusher connected with the front end portion of the overhanging arm, a detaining dog or pawl for engaging and retaining the vertical arm of the lever to normally hold the lifter and pusher elevated, a spring connected with the lever for throwing the overhanging arm downward when the lever is released from the dog or pawl, and an oscillator which in its forward motion acts on the vertical arm of the lever to reset the same and raise the lifter and pusher, substantially as described.

12. The combination with a space-bar magazine-chamber having a delivery-channel, of an elbow space-bar lever pivoted at or near its angle to the magazine and having one arm overhanging the latter, a space-bar lifter and pusher connected with the front end portion of the overhanging arm, a spring connected with the lever to throw the overhanging arm downward, a lever-detaining dog or pawl for holding the lever against the tension of the spring, a space-key connected with the dog or pawl, and an oscillator which in its forward motion resets the lever after it is released by the detaining dog or pawl, substantially as described.

13. The combination with a magazine space-bar chamber having a delivery-channel, a slide having means for first lifting and subsequently pushing downward a space-bar, and means for operating said slide, of a spring-pusher for pressing the space-bar into the delivery-channel when raised by the slide, substantially as described.

14. The combination with a magazine having matrix-bar-delivery gates, means for holding the delivery-gates and throwing them rearward when released, and an oscillator which in its forward movements resets the gates, of means for arresting the back stroke of the oscillator, and means for automatically releasing the said arresting means to permit the oscillator to complete its back stroke, substantially as described.

15. The combination with a magazine, matrix-delivery gates, an oscillator, means by which the oscillator is moved rearward, and a rotary cam and roller by which the oscillator is moved forward, of a stop for arresting the rearward stroke of the oscillator after it is moved forward by the cam and roller, and means for automatically operating said stop to release the oscillator and permit it to complete its rearward stroke, substantially as described.

16. The combination with a magazine having matrix-bar-delivery gates, means for holding the delivery gates to support the matrix-bars and forcing the said gates rearward when released, an oscillator having a rotary cam, and means for operating said cam to throw the oscillator forward, of an arresting device for arresting the back stroke of the oscillator and holding the cam from engagement with its operating means, and means for automatically operating the arresting device to permit the oscillator to complete its back stroke and cause its cam to engage said operating means, substantially as described.

17. The combination with a magazine, matrix-bar-delivery gates, means for holding the delivery-gates advanced to support the matrix-bars, means for moving the delivery-gates rearward when released, and an oscillator which in its forward motions resets the gates, of an arresting device arranged to arrest the back stroke of the oscillator and constructed to be operated by the delivery-gates to release said oscillator, substantially as described.

18. The combination with a magazine, matrix-bar-delivery gates, means for holding the gates advanced to support the matrix-bars, and means for forcing the gates rearward when released, of an oscillator having at its upper portion a series of pivotally mounted levers which respectively act upon the gates when the oscillator is moved forward for advancing said gates into position to support the matrix-bars, substantially as described.

19. The combination with a magazine, matrix-bar-delivery gates, means for holding the gates advanced to support the matrix-bars, and means for forcing the delivery-gates rearward when released, of an oscillator having at its upper end portion a series of independently-movable spring-pressed lever-arms which respectively act on the delivery-gates to advance them to support the matrix-bars when the oscillator is moved forward, substantially as described.

20. The combination with a magazine, matrix-bar-delivery gates, means for holding the delivery-gates advanced to support the matrix-bars, and means for moving the delivery-gates rearward when they are released, of an oscillator having at its upper portion a plurality of spring-pressed pivotally-mounted lever-arms which respectively act upon the delivery-gates to advance them to support the matrix-bars when the oscillator is thrown forward, and an automatic arresting device which arrests the back stroke of the oscillator and is operated by the delivery-gates, to release said oscillator, and permit it to complete its back stroke, substantially as described.

21. The combination with a magazine having matrix-bar chambers and delivery-channels, matrix-bar-delivery gates, devices which hold the delivery-gates advanced, and a keyboard mechanism for releasing the gate-holding devices, of an oscillator having a rotary cam and provided at its top portion with a series of pivotally-mounted lever-arms which act upon the delivery-gates to advance them when the oscillator is swung forward, an arresting device for arresting the back stroke of the oscillator after it has been moved forward to advance a delivery-gate, means for actuating the arresting device to release the oscillator and permit it to complete its back stroke, and means for operating said cam of the oscillator, substantially as described.

22. The combination with a magazine, of spring-pressed delivery-gates arranged side by side and each having a lug, a pawl for each gate, having a hooked end to engage the lug of the gate, and levers constructed to press against the tail ends of said pawls, substantially as described.

23. The combination of a serrated or toothed roller, and means for rotating the same, with an oscillator having a serrated or toothed cam to engage with and be rotated by the serrated or toothed roller, a magazine, matrix-bar-delivery gates which are advanced to support the matrix-bars by the forward motion of the oscillator, and an arresting device which arrests the back stroke of the oscillator and is operated by the delivery-gates to automatically release said oscillator, substantially as described.

24. The combination with a magazine having matrix-bar chambers and delivery-channels, spring-retracted gates, means for retaining the delivery-gates advanced to support the matrix-bars, and means for releasing the gates, of an oscillator having a rotary cam and provided in its top portion with a series of double-armed spring-pressed levers which respectively act upon the rear ends of the gates to advance the same when the oscillator is moved forward, a stop dog or pawl constructed to arrest the back stroke of the oscillator, and provided with a pendent portion arranged in the path of the delivery-gates for operating the stop dog or pawl to release the oscillator, and means for operating the cam of the oscillator, substantially as described.

25. The combination with a magazine having matrix-bar chambers and delivery-channels, of spring-retracted matrix-bar-delivery gates having the lower portions of their rear ends cut away, an oscillator having a series of independently-acting lever-arms at its upper portion, each of which when a gate is retracted rearward, acts upon the uncut portion of the rear end of the said gate, substantially as described.

26. The combination with the delivery-gates, the oscillator having a rotary cam, and means for operating the cam, of a series of double-armed levers pivotally mounted in the upper portion of the oscillator, springs connected respectively with said double-armed levers, and an arresting device which automatically engages the oscillator and arrests its back stroke after it has been moved forward to reset a delivery-gate, said arresting device being operated when a delivery-gate moves rearward to release the oscillator and permit it to complete its back stroke, substantially as described.

27. The combination with the main or line shaft, the drive-gearing for rotating the same, of the oscillator having a rotary cam, a spindle having a roller to operate said cam and provided with means to drive it independent of the drive-gearing which rotates the main or line shaft, a magazine, matrix-bar-delivery gates held advanced to support the matrix-bars, and means for releasing the gates, substantially as described.

28. The combination with the stop-bars for arresting the matrix-bars, means for advancing the stop-bars, and a yoke for retracting the bars, of an oscillator pivotally mounted intermediate its upper and lower end portions, and a loose connection between the said yoke and the lower end of the oscillator below the pivotal point thereof for retracting the yoke by the rearward motion of the lower end of the oscillator, substantially as described.

29. The combination with a main shaft, drive mechanism therefor, the oscillator having a rotary cam, and the roller for operating said rotary cam, of mechanism disconnected from the drive mechanism of the main shaft, for operating said cam-actuating roller, at the will of the operator, independent of the motion of the main-shaft-driving mechanism, substantially as described.

30. The combination with an assembly-box, a reciprocatory ejector therein, an oscillator, and means for operating said oscillator, of a bell-crank lever having one arm loosely engaged directly with the ejector, and a slide-bar connection between the other arm of the lever and the oscillator, for reciprocating the ejector, substantially as described.

31. The combination with an assembly-box, a reciprocatory ejector therein, an oscillator pivoted between its upper and lower ends, and means for operating said oscillator, of a bell-crank lever having one arm connected with the ejector, and a slide-bar joined to the other arm of said lever and connected with the lower end of the oscillator below its pivotal point, substantially as described.

32. The combination with the assembly-box having opening and closing jaws, and an ejector for opening the jaws and ejecting the matrices, of a bar spanning the box and having spring holding-shoulders by which undue spreading of the jaws is prevented and the jaws are closed when the ejector is retracted, substantially as described.

33. The combination with an assembly-box, and means for introducing the matrix-bars therefrom and ejecting them therefrom, of a line-abutment carriage or slide-block having a spring-projected line-abutment finger, a look for locking the finger projected, means for releasing the look, a vibrating lever, means for moving the lever in one direction after the line-abutment finger is released, and a link connection between the carriage or slide-block and the lever, substantially as described.

34. The combination with an assembly-box, and means for introducing the matrix-bars therefrom and ejecting them therefrom, of a line abutment carriage or slide-block having a spring-projected line-abutment finger, a look for locking the finger projected, means for releasing the look, a vibrating lever, means for moving the lever in one direction after the line-abutment finger is released, and a link connection between the carriage or slide-block and the lever, and an audible signal operated by the action of said vibrating lever, substantially as described.

35. The combination with an assembly box, and means for introducing the matrix-bars therefrom and ejecting them therefrom, of a line abutment carriage or slide-block having a spring-projected line-abutment finger, a look for locking the finger projected, means for releasing the look, a vibrating lever, means for moving the lever in one direction after the line-abutment finger is released, a link connection between the carriage or slide-block and the lever, a bell or gong, and a bell hammer or striker operated when the line is approximately of the required length, substantially as described.

36. The combination with a magazine, of a movable line abutment carriage, an angular spring-projected line-abutment finger pivoted to the carriage, a device for locking said finger projected, means for actuating said locking device to release the finger, a spring-actuated vibrating lever, and a connection between said lever and the line-abutment carriage, substantially as described.

37. The combination with a sliding line-abutment carriage, of an angular line-abutment finger pivoted at one extremity thereto, a spring acting on one end of the finger to project the same, a pivoted dog for locking the finger projected, means for swinging the dog to release the finger, a spring-actuated vibratory lever, and a connection between the lever and the said carriage, substantially as described.

38. The combination with a magazine for containing matrix-bars, and an assembling-box, of a carriage or slide having a yielding line-abutment, means for holding and releasing the abutment, a spring-actuated vibratory lever for restoring the carriage to normal position after the line-abutment is released, and a connection between the lever and the carriage, substantially as described.

39. The combination with a magazine for containing matrix-bars, and an assembling-box, of a carriage or slide having a yielding line-abutment, means for holding and releasing the line-abutment, a spring-actuated vibratory lever for restoring the carriage to normal position after the abutment is released and yields inwardly, and audible-signal devices operated by the said vibratory lever for indicating when the line-abutment has nearly reached the point required for producing a line of the necessary length, substantially as described.

40. The combination with the line-carriage having a wing which swings vertically into and out of the line-raceway, of a spring-bolt mounted on a part of the line-carriage and springing into engagement with the wing when it is raised into the line-raceway, a bolt-actuating lever arranged on the carriage and connected with the bolt, and a device in the path of the said lever for retracting the bolt to unlock the wing as the line-carriage is shifted toward the assembly-point, substantially as described.

41. The combination with a line-carriage, means for assembling a line of matrix-bars, a casting mechanism, a primary line-releasing mechanism, and a distributing mechanism, of a secondary line-releasing mechanism by which the line is released as the line-carriage moves from the casting-point to the distributer, substantially as described.

42. The combination with an assembling or composing mechanism, a line-carriage, a casting mechanism, a line-depressor, and a distributer, of two line-releasing mechanisms, one operating to release the line in proper relation to the depressor and the other to release the line in proper relation to the distributer, substantially as described.

43. The combination with the line-depressor, and the distributer, of a line-casting machine, of a traveling line-carriage, and primary and secondary line-releasing mechanisms for releasing the line at two different points in the travel of the line-carriage, substantially as described.

44. The combination with a line-carriage having devices between which the line of matrix-bars is seized, a slide movable vertically on the line-carriage and provided with projecting studs, means operated by the motion of the slide for expanding the line-carriage to release the line, a transversely-movable dog for raising the slide, and a pivoted dog or pawl mounted on the front of the machine and acting on one of said studs to raise said slide and thus effect a second release of the line as the line-carriage is restored to normal position, substantially as described.

45. The combination with a distributer, and a main or primary line-depressor, of a safety or secondary line-depressor, and means for advancing and retracting the safety or secondary line-depressor, substantially as described.

46. The combination with a distributer, and a main or primary line-depressor, of a safety or secondary line-depressor for insuring the correct depression of all the matrix-bars in the line after the main or primary line-depressor has acted, substantially as described.

47. The combination with a distributer, and a main or primary line-depressor, of a safety or secondary line-depressor arranged in the path of the line of matrices to insure their correct depression as the line moves from the main or primary line-depressor toward the distributer, substantially as described.

48. The combination with a distributer, a main or primary line-depressor, a casting-pot, a movable mold-carrying frame, and a mold mounted in said frame, of a safety or secondary line-depressor mounted on the movable mold-carrying frame and advanced and retracted by the movements thereof, substantially as described.

49. The combination with a distributer, a main or primary line-depressor, a casting-pot, a movable mold-carrying frame, and a mold mounted in said frame, of a safety or secondary line-depressor consisting of a plate secured to the mold-carrying frame and having a beveled under side, for insuring the correct depression of all the matrix-bars in the line as the latter moves from the main or primary line-depressor toward the distributer, substantially as described.

50. The combination with the distributer-levers carrying horizontal distributing rods or wires, of mechanism for raising and lowering the outer ends of the distributer-levers and constructed to release the levers and permit loose motion or play of the distributing-wires between their highest and lowest positions, to avoid clamping or holding the matrix-bars as they are elevated, substantially as described.

51. The combination with the distributer-levers carrying the distributing rods or wires, and mechanism for raising and lowering the outer ends of the levers and the distributing-wires, of devices constructed to slightly release the levers and permit a limited loose motion or play of the distributing-wires between their highest and lowest

positions to avoid clamping or gripping the matrix-bars, as the rods or wires rise to the distribution-point, substantially as described.

52. The combination with the pivoted distributer-levers carrying the horizontal distributing rods or wires and provided with tail ends having studs, a vertically-movable slide-bar for raising and lowering the outer ends of the levers, and release-blocks mounted on the slide-bar and having cut-away portions for releasing the tail ends of the levers as the distributing-wires rise to the point of distribution for the purpose of preventing the distributing rods or wires clamping or gripping the matrix-bars as they are moving to the distributing-point, substantially as described.

53. The combination with the pivoted distributer-levers having tail ends provided with roller-studs and carrying at their outer ends the distributing rods or wires, a vertically-movable slide-bar for raising and lowering the outer ends of the levers, and means for operating the slide-bar, of lever-release blocks fixed in the slide-bar and constructed with release-surfaces by which the tail ends of the levers are released between the highest and lowest positions of the distributing rods or wires, substantially as described.

54. The combination with the casting-pot, of a line-casting machine, of the well suspended in the pot and having a bottom wall bodily elevated some distance above and separated from the bottom wall of the pot, said well having the metal-delivery channel or throat, whereby a body of molten metal will lie in the pot between the bottom wall of the latter and the bottom wall of the well, substantially as described.

55. The combination with the mold, and the pot-jacket, of a casting-pot suspended in the jacket, and means for adjusting the pot in the jacket in two planes at right angles to each other, substantially as described.

56. The combination with the mold, and the pot-jacket, of the casting-pot suspended in the jacket, and screws for adjusting the pot in the jacket in two planes at right angles to each other, substantially as described.

57. The combination with a movable justifying-shoe, a casting-pot, and a mold, of a pot cut-off plate, and devices actuated by the justifying-shoe when it unduly rises, due to the presence of a loose line, to move said cut-off plate into position to close the mouth of the casting-pot, substantially as described.

58. The combination with a justifying mechanism, a casting-pot, and a mold, of a pot cut-off mechanism operated by the justifying mechanism to close the mouth of the pot when the justifying mechanism unduly moves due to the presence of a loose line, substantially as described.

59. The combination with a justifying-shoe, a casting-pot, and a mold, of a pot cut-off arranged to close the mouth of the casting-pot, a spring-actuated lever connected with the pot cut-off, a bell crank lever connected with the said lever for operating the same when the justifying-shoe unduly rises due to the presence of a loose line, a trip-pawl with which one arm of the bell-crank lever engages, and audible-signal devices operated by said trip-pawl, substantially as described.

60. The combination with the movable justifying-shoe, casting-pot, and mold, of a line-casting machine, of a pot cut-off arranged to close the mouth of the casting-pot, a loose-line signal, and devices operated by the undue movement of the justifying-shoe, incident to the presence of a loose line, for moving the pot cut-off to close the mouth of the pot and for operating the loose-line signal, substantially as described.

61. The combination with the justifying mechanism, casting-pot, and mold, of a line-casting machine, of an arm or dog mounted on a movable part of the justifying mechanism, a bell-crank lever constructed to be operated by said arm or dog, a trip-pawl engaged with an arm of the bell-crank lever, a vibratory lever actuated in one direction by said bell-crank lever, a pot cut-off plate arranged to move and close the mouth of the casting-pot, and a connection between the pot cut-off plate and said vibratory lever, substantially as described.

62. The combination with the casting-pot, the mold, and the justifying mechanism, of a line-casting machine, of an arm or dog on a movable part of the justifying mechanism, a bell-crank lever constructed to be operated by the arm or dog, a spring-actuated trip-pawl with which an arm of said lever engages, a rock-shaft having a tappet and a bell hammer or striker, a bell or gong, a vibrating lever moved in one direction by said bell-crank lever, a pot cut-off plate arranged to move and close the mouth of the casting-pot, and a connection between the pot cut-off plate and the vibrating lever, substantially as described.

63. The combination with the casting-pot, the mold, and the justifying mechanism, of a line-casting machine, of an automatic pot cut-off constructed and arranged to close the mouth of the casting-pot and actuated by a part of the justifying mechanism when a loose line is present, substantially as described.

64. The combination with a casting-pot, a mold, a justifying mechanism and a line-carriage, of a pot cut-off and a loose-line signal both operated when a loose line is present in the line-carriage, said pot cut-off being constructed and arranged to close the mouth of the casting-pot, substantially as described.

65. The combination with the casting-pot, mold, assembly mechanism, and traveling line-carriage, of a line-casting machine, of a main shaft having a cam-sleeve for operating the line-carriage, and means actuated by the operator for throwing the cam-sleeve out of operative connection with the main shaft, whereby any desired number of printing-bars can be cast from one and the same line of assembled matrices while the line-carriage remains motionless, substantially as described.

66. The combination with a casting-machine, a line-carriage, and a line-carriage lever, of a main or line shaft having a cam-sleeve thereupon and constructed to actuate the line-carriage lever to shift the line-carriage, and devices thrown into action by the operator to disconnect the cam-sleeve from the main or line shaft and permit the line-carriage to remain motionless at the casting mechanism, for the purpose of recasting any desired number of printing-bars from one and the same line of matrices, substantially as described.

67. The combination with a line-carriage, a casting-pot, and a mold, of a main or line shaft having a cam-sleeve thereupon for actuating the line-carriage, a notched collar rigid on the main or line shaft, a slidable locking-bar which normally engages the notched collar, and mechanism under control of the operator for disengaging the locking-bar from the notched collar for recasting purposes, substantially as described.

68. The combination with a main or line shaft, of a cam-sleeve mounted on the shaft, a notched collar rigid on the shaft, a locking-bar movable on the cam-sleeve and constructed to engage the notch in the rigid collar, an arm having an incline for pressing the locking-bar out of engagement with the notched collar, and means for swinging the said arm into and out of the path of the locking-bar, substantially as described.

69. The combination with a movable casting-pot, and a movable mold-frame, of a mold shiftable longitudinally on the mold-frame, and a connection between a part of the casting-pot and the mold-frame, for directly operating the latter from the pot, substantially as described.

70. The combination with a movable casting-pot, a pivoted swinging mold-frame, and a mold slidable longitudinally in the mold-frame, of a pivoted connection between a part of the pot and the pivoted mold-frame, substantially as described.

71. The combination with a movable casting-pot having a lateral projection, a pivoted swinging mold-frame having an attached projecting bracket, and a mold mounted in the mold-frame, of a link pivotally connecting the bracket of the mold-frame with the lateral projection of the casting-pot, substantially as described.

72. The combination with a trimmer, a printing-bar ejector, a sliding casting-pot, a pivoted swinging mold-frame, and a mold slidable in the mold-frame from the pot to the ejector and conversely, of a connection between the pot and the pivoted mold-frame, substantially as described.

73. The combination with trimming-knives, a mold-frame, and a sliding mold mounted in the mold-frame, of a traveling, pivotally-mounted knife-wiper, substantially as described.

74. The combination with trimming-knives, a mold-frame, and a mold sliding in the latter, of a longitudinally-movable wiper-arm, and means for raising the lower end of the wiper-arm as it moves in one direction, substantially as described.

75. The combination with trimming-knives, a mold-frame, and a mold carried by the latter, of a pivoted wiper-arm normally standing substantially vertical, and means for swinging the wiper-arm to an inclined position as it moves in one direction and holding it substantially vertical when it moves in the opposite direction, substantially as described.

76. The combination with a printing-bar trimmer, and a printing-bar ejector, of a shifting mold, a pivoted wiper-arm normally standing substantially vertical, a spring-pressed pin carried by the wiper-arm, and a guide-rail constructed to act on the pin when the wiper moves in one direction to raise the lower end thereof, and having means to press the pin outward as the wiper-arm moves in the opposite direction, to enable the pin to resume normal position for a subsequent operation, substantially as described.

77. The combination with a printing-bar trimmer, a printing-bar ejector, a mold-frame, and a mold shiftable in the frame, of a wiper-arm, and means acting on the wiper-arm for raising its lower end to clear the printing-bar trimmer when the wiper-arm moves in one direction, substantially as described.

78. The combination with a printing-bar trimmer, a printing-bar ejector, and a shifting mold, of a movable carrier provided with a movable wiper-arm, means for moving the mold and the carrier back and forth, and means for raising and lowering the wiper-arm, substantially as described.

79. The combination with a printing-bar trimmer, a printing-bar ejector, a mold-frame, and a mold shiftable in the mold-frame, of a wiper-carrying slide, means for moving the slide back and forth, a wiper-arm movably mounted on the slide, and means for raising and lowering the wiper-arm, substantially as described.

80. The combination with a printing-bar trimmer, and a printing-bar ejector, of a wiper-carrier movable longitudinally of the machine, a wiper arm pivotally mounted on the carrier, a spring-pressed pin connected with the wiper-arm, and a guide-rail having an incline to act on the pin to tip the wiper-arm as the mold moves in one direction, and a bevel to press the pin outward as the mold moves in the opposite direction, substantially as described.

81. The combination with a printing-bar trimmer, a printing-bar ejector, a mold-frame, and a mold shiftable in the latter, of a guide-rod carried by the mold-frame, a wiper-arm carrier slidable on the guide-rod, a spring-actuated wiper-arm pivoted to said carrier, a spring-pressed pin connected with the wiper-arm, and a guide-rail having an incline and a bevel, the incline operating on the pin to tip the wiper-arm as the mold moves in one direction and the bevel acting to press the pin outward as the mold moves in the opposite direction, substantially as described.

82. The combination with the movable mold-carrying frame, and the mold slidable longitudinally in said frame, of a lever pivoted between its ends at the upper side of the bed-plate, a cam engaging one end of said lever, and a link connecting the other end of said lever with the mold for sliding the latter longitudinally, substantially as described.

83. The combination with a horizontally-sliding mold, and a horizontally-sliding wiper-carrier, of a lever pivoted between its ends at the upper side of the bed-plate of the machine, a cam engaging one end of the lever, and connections between the other end of the lever and the mold and the wiper-carrier, whereby the one lever serves to slide both the mold and the wiper-carrier, substantially as described.

84. The combination with a bracket or shelf projecting from the front of the machine and provided with a spring-pressed locking-pin, of a galley-box detachably mounted on said bracket or shelf and locked in position thereupon by said locking-pin, a sliding block moving in the galley-box, a rock-shaft having an attached upwardly-projecting finger, an arm on the rock-shaft, and a sliding mold provided with a device for acting on said arm to rock the shaft and thereby vibrate said finger, substantially as described.

85. The combination with a galley-box mounted on the machine, of a vibrating finger, a horizontally-sliding mold, and devices operated by said sliding mold to vibrate said finger, substantially as described.

86. The combination with a galley-box supported at the front of the machine, and devices for detachably holding the galley-box in position, of a vibrating finger, a rock-shaft with which said finger is connected, a horizontally-sliding mold, and devices operated by said mold for rocking said shaft and thereby vibrating said finger, substantially as described.

87. The combination with a galley-box supported at the front of the machine, of a vibrating finger, a rock-shaft with which said finger is connected, a rigid tappet-arm secured to said rock-shaft, a horizontally-sliding mold carrying a tappet-dog for acting on the rigid tappet-arm to move it in one direction, and a spring for moving said tappet-arm in the opposite direction, whereby the rock shaft is rocked and the finger is vibrated, substantially as described.
